**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Aug. 24 | Aug. 17 | Aug. 10 | Aug. 24 |
| Index | 172 | 167 | 166 | 165 |
| Weighted average price | $2.08 | $2.02 | $2.01 | $2.00 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to he proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

---

following the advances in southern quotations. If so, Mt. Olive and middle grade coals will probably come in for a larger share of business. Outside of deliveries on apartment and school contracts, Standard coal is in doldrums. Neither carload nor wagon steam trade is active.

## Demand for Kentucky Coals Broadens

The Louisville market is humming along at a good pace despite a 50c. advance on all grades. Domestic and gas coal demands are expanding and even the steam trade is more lively.

Eastern Kentucky mine-run has jumped from $1.25@$1.35 to $1.50@$1.75. Screenings are firm at $1.10@$1.25, with little tonnage for sale under the maximum. The general run of 4-in. block is quoted at $2.75@$3; some off grade stuff can be had at $2.65 or less; fancy grades bring up to $3.25. Lump and egg are $2.25@$2.50.

Some western Kentucky operators ask $1.85 for August and $2.05 for September delivery for 6-in. block; the general market is $1.75@$2. Lump and egg are $1.60@$1.85; nut, $1.35@$1.65; mine-run, $1.10@$1.50; screenings, 70c.@85c.

Western Kentucky is showing marked improvement in production, but with the increased movement in prepared sizes screenings have worked lower. Eastern Kentucky, while advancing prepared prices, has maintained quotations on steam coals.

Milwaukee coal circles report a steady improvement in demand for all grades of fuel. Cargoes are arriving steadily. Lake receipts to Aug. 20 aggregated 1,984,537 tons—452,534 tons of anthracite and 1,532,003 tons of bituminous coal. Anthracite receipts were 15,389 tons less than a year ago but bituminous receipts were 372,642 tons greater than last season.

## Northwestern Improvement Continues

Retailers at Minnesota and North Dakota points have been ordering on moderate tonnages from the docks at the Head of the Lakes, and industrial companies over the Northwest have also been better buyers. The railroads are still helping out the docks by removing storage coal to their fueling depots over the territory. Northern Minnesota hydro-electric utilities are putting out feelers for bituminous coal to operate auxiliary plants called into play by the dry weather.

The consuming public is showing supreme indifference over an anthracite strike next week. Even the regular users of hard coal have been backward in ordering fill-ups. Retailers throughout the territory have been complaining that until very recently they have not had enough orders to keep their delivery outfits going. The indifference to the strike threat is attributed to the growing use of substitute fuels. The Northwest bought liberally of Pocahontas last season for domestic purposes, and new-won customers are being held. The use of mixtures of coke and buckwheat or pea, and briquets has also been gaining.

The movement of coal from Lake Erie ports is keeping up well but the anthracite run has completely dried up. Thirty-eight cargoes of bituminous coal were unloaded at the docks last week and eleven cargoes including one of anthracite were en route. Prices are firm and unchanged.

While the approach of fall has stimulated buying at the Twin Cities, no wild enthusiasm is displayed. Demand from the interior has been fair for some time. In the cities, there is the usual pick-up to be seen in August. Despite the expectation of a hard coal strike, there is no great attempt at stocking beyond a modest amount.

The figures as to the dock stocks for the season assure the Northwest of a reasonable supply of coal of all kinds. Up to Aug. 1 there had been received 6,611,000 tons of coal, including the carry-over, a gain of 500,000 tons over the preceding year. While the docks may count upon somewhat greater demand this winter than last, yet the greater tonnage and the probabilities that August will also show a gain, means that there will be sufficient for all probable needs.

The price situation holds steady. Prices have not varied during the season. Southern Illinois coal is holding at the new figure of $3 for the larger size, and $2.75 for the smaller. Other all-rail prices are the same as they have been. Dock prices are steady, with no change noted.

## Southwestern Domestic Demand Expands

The domestic market in the Southwest is improving as autumn approaches. Dealers are buying more extensively and there is a heavier call from consumers. Some recent price lists quote Kansas shaft lump as high as $4.50, while none quote it at less than $4.25. Improvement in the screenings market has been more marked than in the domestic and still necessitates the extensive crushing of shovel mine run.

There has been a substantial improvement in both domestic and steam demand in the Colorado fields, pushing operations up to an 85 per cent basis. Some of the larger producers are booked up through September and the orders are coming in so fast that a further increase in production will be necessary to insure prompt deliveries. Walsenburg domestic lump is now quoted at $5.25; washed nut, $4.50; washed pea, $3. Nos. 1 and 2 Crested Butte anthracite bring $7 and Nos. 3 and 5 (base burner size), 50c. more. An advance of 25c. is predicted for the first of the month. Outside of some of the smaller fields, such as the Canon City district, the labor situation is quiet.

The Utah coal trade continues draggy, but prices are steady. Winter storage orders are hanging fire in spite of the efforts being made by retail dealers, backed by the operators, to get the public to store coal. The weather is cooler, however, and a little coal is being bought for immediate consumption. There are less no-bill cars on the tracks than there were due to strict policing by the carriers.

The mines served by one big railroad suffered a slight loss of working time last week as a result of car shortage. It is feared that this shortage will become serious and general as the heavy crops begin to move, which will be at an early date.

The slack situation continues fairly easy. A few of the big consumers have been short, but are taken care of now.

The metal mining and smelting industries continue to be the biggest industrial consumers.

### Strike Threats Help West Virginia

Reports from the mining centers of West Virginia indicate that both the low-volatile and the high-volatile fields in the southern part of the state are enjoying a larger share of the nation's coal business as a result of the strike threat in the anthracite region. Heavier orders from eastern markets have enabled the producers in the Pocahontas and New River fields to approach an equalization in the prices on prepared sizes for eastern and western deliveries. Mine-run, too, is attracting more attention in eastern quarters and slack also has become firmer in price. The Winding Gulf field, with its principal outlets in the East, has been compelled to speed up production to care for demand.

Under present market conditions, southern West Virginia high-volatile producers are finding their territory of distribution larger and more diversified than has been their lot for some time. Inland demand is keeping up at a good rate and there is a healthier undertone to the tidewater market. Increased production of prepared sizes to take care of domestic and the specialty steam trades has not broken down the prices on slack. It is estimated that the Kanawha and Coal River sections are now shipping at the rate of 350,000 tons a week and the Logan district, with night shifts at some operations, is doing 50,000 tons better. The Kenova-Thacker field, with weekly shipments approximating 200,000 tons, is operating close to a 67 per cent basis.

Despite the continued efforts of the United Mine Workers to cripple activities in the northern counties because the operators have broken away from the uneconomic terms of the Jacksonville-Baltimore agreements, that section of West Virginia is now loading more coal than at any time since February, 1924. The greater part of the tonnage is coming from open shop mines. There has been some increase in the organized Scott's Run field, but the total output from that district, even under the most favorable circumstances, is relatively small. It is estimated that the output for the northern region as a whole is now in the neighborhood of 500,000 tons a week. Approximately one-half of this total comes from operations on the Monongah division of the Baltimore & Ohio R.R. Mines on the Monongahela line are averaging about 180,000 tons.

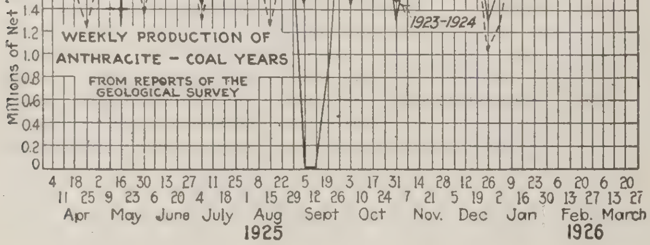
### Smokeless Booming in Cincinnati

Demand for smokeless coal in the Cincinnati market exceeds the supply. Practically all the big companies are oversold. Although the chief call is for domestic grades, steam sizes are almost equally active. Much of the tonnage is moving at old contract rates, but spot sales on domestic sizes are about $1 per ton higher and operators refuse to quote for September delivery. Mine-run at tidewater has reached the highest point in several years and is still climbing.

High-volatile coals are in less urgent demand, but current supply is readily absorbed and the prices are firmer. A good deal of this coal is going to upper Mississippi Valley points. The South also is buying, largely from southeastern Kentucky, and paying higher because of the limited competition.

Local retailers are favoring smokeless and the better grades of high-volatile, fearing an anthracite tie-up may divert these coals to the East. Retail prices have been increased 50c.

Industries which have long permitted their reserves to run low, depending on spot purchases, have begun to buy for stocking fearing a continuously rising market.



Coal movement through the Cincinnati gateway last week —14,727 cars—constituted 53.5 per cent of the total freight tonnage handled. This was a gain of 697 cars over the previous week and of 5,272 cars over the corresponding week last year. There were 3,352 cars consigned to lake ports.

Quotations f.o.b. mines are: Smokeless slack, $1.50@$1.60; mine-run, $2.25@$2.50; nut-and-slack, $2.25@$2.75; lump and egg, $3.50@$4. High volatile nut-and-slack is quoted at $1.10@$1.35; mine run, $1.35@$1.75; egg $1.85@$2.25; 2-in. lump, $1.85@$2; 4-in. block, $2.25 to $2.50, with premium coals up to $3@$3.30. Low volatile mine-run is bringing about $4.60 gross at tidewater.

Improvement, particularly in domestic demand, has taken place in Ohio. Retailers are asking for immediate shipments to replenish depleted stocks as householders come into the market for their winter's supply. Columbus retail prices have advanced to $8.25@$8.75 for smokeless and $7.50@$8 for high volatile West Virginia. Ohio coals run a poor second for domestic favor.

Steam business has also shown more life. There is practically no distress coal on the market and the surplus in Toledo and Detroit has been cleaned up. Some contracts are being closed as large users are showing some anxiety as to their fuel supply. Some railroads have signed up and utilities are making inquiries, but general industrial demand still lags.

Production in the southern Ohio field is now about 30 to 35 per cent of capacity.

### Shift to Non-Union Operations Continues

The shift to non-union operations in the central Pennsylvania field continues. Outside of the operations of the three large companies that have clung to the Jacksonville scale and scattered mines here and there, the field, for the time being at least, seems definitely committed to the 1917 wage scale. The steady increase in output in recent weeks is attributed to that scale, which has allowed operators to compete on more near equal terms with West Virginia coals.

Demand for coal in the Pittsburgh district showed distinct improvement in the past week. Consumption has increased somewhat and there is a little more disposition to accumulate stocks. Domestic coal is seasonably active. However, there has been no broadening of the area of distribution.

Gas lump has stiffened to $2.50 flat, against $2.40 @ $2.50 a week ago and $2.30 @ $2.50 for a long time previous; slack hangs at $1.50 @ $1.60; mine-run is still easy at $2.10 @ $2.25, because there are so many mines which cannot screen conveniently. Steam coal is no stronger in price, but is easier to sell.

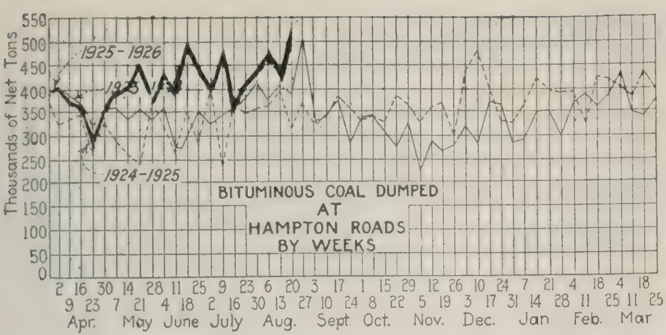
Domestic coal, according to quality and popularity, ranges from $2.40 @ $2.60 for 1¼-in.; $2.60 @ $2.75 for 2-in. and $2.75@$3.00 for 3-in. lump.

### New England Market Stronger

A distinctly firmer trend was in evidence in New England last week. Accumulations at Hampton Roads were reduced, and a few of the agencies had steamers waiting more than two to three days for coal to arrive. There was even a demand for small lots to clear some of this tonnage, and prices re-acted under a mild pressure for spot supply. Where a week ago the range could hardly be said to touch $4.50 gross f. o. b. vessels, the level is now up to $4.60 @ $4.75 for prompt coal of Navy Standard grade. There are those who doubt whether today's firmness can be maintained, especially in view of the increased production that heretofore this season has invariably followed each advance in price, but should the anthracite suspension materialize there would surely be a better demand for prepared coal for domestic use.

On cars Boston and Providence there has been a similar tendency to higher prices. Enough buyers have been in the market to make advances of 15 to 25c. easily secured, and at both points there have been sales of small tonnages all the way from $5.75@$6. Along with spot coal there have been more than a few contracts undertaken for delivery through the winter on about the same basis. It gives the impression that shippers and other distributors are still inclined to hedge a little on the future.

As yet there has been only slight change in minimum prices of steam coal all-rail from Pennsylvania. There continues to be moderate demand for deliveries west and along the line, but very little buying has developed here.



Pocahontas and New River are still low enough in price to dominate the large area accessible to tidewater.

The Buffalo bituminous market pays no attention to strike possibilities in the anthracite regions, and neither prices nor demand show any material change. Current quotations are as follows: Fairmont lump, \$1.60@\$1.75; mine-run, \$1.40@\$1.50; slack, \$1.25@\$1.40; Youghiogheny gas lump, \$2.25; Pittsburgh and No. 8 steam lump, \$2@\$2.25; slack, \$1.30@\$1.60; Allegheny Valley mine-run, \$1.75@\$2.

### Strike Threat Tones Up New York Market

Increase in demand and prices featured the bituminous trade at New York. Less coal was available at the minimum quotations, and consumers showed greater readiness to place orders. There is every indication that there will be a much stronger market the next few weeks due to fall buying and requirements of industrial plants.

Although most shippers believe it will be at least a month before the effect of an anthracite strike will be felt in the soft coal industry, many consumers are taking advantage of the current prices to increase their reserves.

Measured by increased demand, bituminous trade in the Philadelphia market is on the up-grade. Prices, however, have not kept pace and little improvement is forecast in that direction for some time. The anthracite strike threat is reflected in heavier buying of soft coal, not alone for local industries, but from New England and Canadian consumers.

The tidewater market is still quiet and no signs of a boom are apparent. Hope that there may be a sudden boom in shipments to New England and other northern points, however, is still cherished. No clearances were reported last week.

Bituminous market conditions at Baltimore suffered a reversal of form last week. Demand for home consumption took the lead and export and bunker trade slide towards the nadir in business. Industrial buyers, believed to be influenced by the strike threats in the soft-coal regions, showed a revival of interest in the market and a number of contracts for Cambria County coals were closed. Competition for business, however, is still keen, but quotations have advanced 5 to 15c.

### Alabama Movement on Up-Grade

While there has been no rush of orders, the Birmingham market has shown unmistakable improvement the past week. Domestic demand, after weeks of abnormal sluggishness, is picking up. Inquiries and spot orders are more numerous, while the movement of contract is more satisfactory. Retail trade is still slow, as the weather is extremely warm.

Spot bookings of steam coal are improving and there is some increase in shipments against contracts. The cotton gins, ice plants and cement mills are using coal in increasing volume while the dry weather forces heavier power plant consumption. The anticipated anthracite strike is indirectly being felt here in a small way as more coal from Kentucky is going north, leaving a bigger tonnage to Alabama in the Southeast.

Bunker coal business is ahead of last month. There is a small export movement to South America and Cuba.

Quotable prices have shown no change

### Would Substitute Welsh Coals

Outside of the rapid advance in demand and a corresponding increase in quotations on independent anthracite, the outstanding feature of the market at New York last week was inquiries as to the possibilities of importing Welsh coal. Most of these inquiries come from New England and it is likely that considerable Welsh anthracite will find its way to this country soon after Sept. 1 if there is a shut-down in the hard-coal region.

Some individual operators are refusing orders. Some of the larger companies are pro-rating their output.

The demand at tidewater is fully as strong as along the line. Many loaded boats are in the harbor and freights are advancing. Egg is apparently as strong in demand as stove. Chestnut also is more active, while pea is moving easily. Some producers are loading pea and nut out of storage.

Steam sizes are firm, with barley tonnage very limited.

The Philadelphia trade is working on the theory that Sept. 1 will usher in an indefinite suspension in anthracite mining. Solicitation of business ceased a fortnight ago and some of the larger companies now refuse to book anything but steam tonnage, which is increased to such an extent that the producers are drawing upon their storage piles. This demand, however, has not developed premium prices.

The domestic consumer views the situation calmly. Aside from stove there is no great pressure for deliveries by the householder. Retail stocks are not being depleted at a great rate because buying has been fairly active all summer.

Baltimore exhibits no signs of panic at the pendency of an anthracite strike. Retail stocks are fair, with current receipts in excess of deliveries. Cellar reserves, while not as great as in some former periods, are comfortable. At worst the market expects no long suspension or sees no necessity for rationing.

There is a rush for anthracite in the Buffalo market and all the distributors are short of coal. There ought to be a chance to see if the consumer wants coke or smokeless coal. He has been buying a little more of both than is common in summer and he may hesitate now till he needs to start up his furnace. Coke sells at \$4.50@\$4.75 at the ovens, domestic size, on a \$3.28 freight rate. At the curb the price is \$9@\$9.50. Smokeless coal, curb price, is \$6.

Anthracite lake shipments were light last week totaling 39,600 tons, of which 10,700 tons cleared for Fort William, 9,700 tons for Duluth, 6,700 tons for Chicago, 6,500 tons for Milwaukee and 6,000 tons for Escanaba.

Freight rates are 55@60c. to Chicago, 50c. to Milwaukee, Escanaba and 40c. to Duluth, Fort William.

### Connellsville Coke Advance Halted

The Connellsville coke trade has taken another sudden turn. A fortnight ago there was a spurt of activity after a long period of stagnation, and furnace coke advanced sharply. Last week there was practically no live inquiry of any consequence. The market simply held at \$3.25. Heating coke had advanced nearly if not quite to \$3.25 and it is now relatively dull.

Some members of the trade now have suspicions that eastern consumers have obtained some special information leading them to doubt whether there will be much of a suspension. The important buying had been largely by gas companies in the East, who do not like to switch from anthracite to coke, but who would hardly balk at a 25c. or even a 50c. advance in price, as the price of coke, when so much below that of anthracite is merely a sort of detail.

During the excitement two blast furnace interests concluded to cover for fourth quarter without delay, one paying \$3.50, the other \$3.75. Last June third quarter contracting was done at an average scarcely as high as \$3, some business running over fourth quarter at but a slight advance.

Foundry coke has been unaffected by the stiffening in furnace coke, spot remaining quotable at \$3.75 @ \$4.25, with buying increased but little, if any.

Late production figures show little change.

### Car Loadings, Surplusages and Shortages

# Foreign Market And Export News

## August Bank Holiday Contributes to British Market Sag

Much British coal business has been lost through the diversion of orders to Germany and America. It is, perhaps, fortunate that the sudden reversal of the postion should have occurred on the eve of the August holidays, during which the pits in any case would have been entirely closed for Monday, Tuesday, and Wednesday. Colliery salesmen realized the futility of maintaining quotations on the basis of those of the last fortnight of July, and in many cases reverted to the figures ruling previously, involving a general drop in values of about 1s. 6d. to 2s. per ton. Whether this will attract business or not remains to be seen. There has not yet been an adequate opportunity of testing conditions since the settlement.

Though the crisis is over in the Newcastle coal, and work at the pits is continued as usual, the coal market conditions are very unsatisfactory. Business for early August shipment is exceedingly scarce. Exporters are offering coal freely and indicating to the clients abroad that prices will now be on a lower basis. When the question of Government subsidies has been settled, it is expected that several of the pits recently closed will reopen.

British production for the first week in August dropped to less than 3,000,000 tons because of the August bank holiday, a cable to *Coal Age* states.

### French Coal Market Improves Slightly

The situation of the French collieries has slightly improved recently. This is not a rally but is due to a faintly better consumption in the metallurgical, textile and glass-making industries. Domestic fuel business is quite satisfactory.

In the Sarre, after a week of strike the men took up work again, after accepting the governmental proposals of an increase of 5 per cent in salaries and an improvement of piece-work rates. This is what had been offered by the Minister before the conflict.

During the first twenty-five days of July, German indemnity fuels in France totaled 506,900 tons, including 268,500 tons coal, 216,500 tons coke and 21,900 tons lignite briquets, which make a daily average of about 20,300 tons. Coke reparations from the Ruhr totaled 232,926 during July.

### Hampton Roads Expects Big New England Business

Coal agencies at Hampton Roads are predicting an increase in tonnage of transient prepared coal from West Virginia to New England via Tidewater as a result of the Interstate Commerce Commission's recent rate decision. Already there has been considerable talk of handling methods to transfer the coal from cars to ships without breaking it up. Some are of the opinion that this handicap will be overcome now that the rates are favorable.

### Bunker Coal Shipments Rise

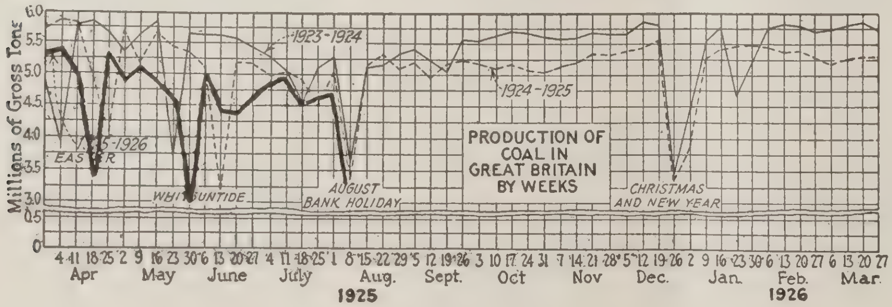
United States bunker coal laden on vessels engaged in foreign trade totaled 1,137,997 long tons in the second quarter of 1925 compared with 933,567 tons in the first quarter, an increase of about 214,000 tons or 23 per cent, according to the Coal Division of the Department of Commerce.

The following table shows in long tons the quantity of bunker coal sold in the principal customs districts for the first two quarters of 1925:

| Customs Districts | January, March | April, June |
|---|---|---|
| New York | 269,422 | 301,869 |
| Philadelphia | 75,975 | 84,828 |
| Maryland | 46,647 | 47,854 |
| Virginia | 376,874 | 468,795 |
| St. Lawrence | 927 | 16,984 |
| Florida | 42,825 | 43,821 |
| Mobile | 21,181 | 26,686 |
| New Orleans | 50,734 | 44,523 |
| Ohio | 1,902 | 36,234 |
| Michigan | 35 | 13,064 |
| Other districts | 47,045 | 63,339 |
| Total | 933,567 | 1,147,997 |

### Belgian Market Strengthens

In spite of the continuance of the metallurgical strike a very slight industrial improvement in the Belgian market is noticeable, with regard to industrial descriptions. The demand for dry smalls and for coking smalls is stronger. Better qualities of briquets have risen by 10 francs, and even industrial beans, have benefited by a comparative rally. Domestic fuel is really and truly at last on the mend.



Coal difficulties in the domestic mines of Chile are still troubling that country. Prices are well maintained in that country on import coal. Pocahontas and New River is selling there for more than $8 at northern ports and is rising. Aug. 1 Cardiff Admiralty coal was quoted there at $8.38 and for August shipment the price was set at $8.50.

The United States had exported a total of 1,654,202 tons of anthracite during 1925 to June 30 as compared with 1,752,900 tons during the same period last year. Soft-coal exports totaled 6,398,419 tons this year and 7,131,968 tons for the period in 1924 but coke exports rose from 286,317 tons to 351,895 tons.

# News Items From Field and Trade

## ALABAMA

The Alabama Public Service Commission has ordered a reduction of 10c. per ton from coal mines on the Frisco System in Group No. 1 to Florence, Sheffield and Tuscumbia, and allowed an increase of 5c. per ton to the same points from Group No. 3 mines. The commission also ordered a general reduction in coal rates from all mines on the Frisco System in Alabama to all points on the Memphis division of the Southern Ry. This represented action on complaints filed by the Florence Chamber of Commerce.

## COLORADO

Because charges that their daily production had not been up to standard could not be proved against four miners by the Clayton Coal Co., of Weld County, the men, Gus Brock, John K. Davis, W. T. Lambert and T. J. Preecs were ordered reinstated to their old positions at the mine by the state industrial commission, following a hearing on the case Aug. 14.

The total production for Colorado for July is 602,000 tons compared with 616,000 tons a year ago which is a decrease of 14,000 tons. The decrease is due to the production in the lignite fields. The month of August may show a substantial increase over the same period a year ago.

The Colorado Fuel & Iron Co. has filed with the state industrial commission notice of a wage agreement between the company and employees in ten of its coal mines in Las Animas and Huerfano Counties, and the coke ovens at Segundo. Between 3,000 and 4,000 men will be affected by the new scale. The scale agreed on is approximately 11 per cent below present wages, which scale was adopted several months ago on a 20 per cent reduction. The commission announced the new scale will leave the wages of Colorado Fuel & Iron employees slightly higher than other operators in the same counties.

## ILLINOIS

Wasson Mine No. 1, Herrin, which had been closed down six weeks, resumed work Aug. 10.

Approximately 2,000 southern Illinois miners in Williamson and Franklin Counties were scheduled to resume work last week. This means there will be more miners working in those counties than at any time during the past two years. Mines that will resume are: Consolidation Coal Co. Mine No. 7 at Herrin, the Valier mine, at Valier, Old Peabody No. 3 at Marion, the Orient No. 1 mine and one of the Old Ben mines at West Frankfort and another mine of the Old Ben Coal Co. at Christopher. Several smaller mines in that district were also scheduled to begin operations last week.

Much conversation concerning a proposed merger of Standard district and Mt. Olive region mines in Illinois continues to be heard around St. Louis, Mo. The plan involves properties capable of producting about 30,000,000 tons annually. The Consolidated Coal Co. of St. Louis, the Mt. Olive & Staunton Coal Co. and the Rutledge & Taylor Coal Co., holding some of the choice mines of the proposed consolidation have not yet agreed to go in, so that many insurmountable obstacles may yet arise. In this merger the name of H. E. Bell, of Bell & Zoller Coal Co. of Chicago, one of the biggest southern Illinois producers, has been mentioned as a negotiator. This gives rise to the rumor that Franklin County interests are encouraging the plan as one means of lessening the cut-throat competition their own output now meets.

The Wallsend Coal Co., of Delaware, early in August acquired the holdings of the old Wallsend Coal Co. at Wallsend, and plans expenditure of about $60,000 on improvements, including a coaling station for the L. & N. R.R. Co., miners' homes, etc. The work will be in charge of J. D. Roper.

Electric Mine No. 1, west of the Kistler Hill on the Danville-Champaign road, sustained a slide of about 100 car loads of earth July 30, which cost the lives of two miners. The large 250-ton steam shovel was practically buried. A careful check-up of the mine's payrolls showed that no further casualties were to be expected.

## INDIANA

Receivership for the Joan Coal Mining Co., operating a mine near Riley, was asked Aug. 14 in two suits on account filed against the firm by the Bruns Powder Co. and the industrial Supply Co. in superior court in Terre Haute.

The opening of several of the larger coal mines in western Indiana and the possibility of resumption of operations at other mines, indicates a partial return, at least, of prosperity in that section of the state. A mine operated by the Fort Harrison Mining Co. is being cleaned up preparatory to opening. The mine suspended last March 16. Preliminary operations for reopening the Baker mine in the Sullivan field also are reported. Reports from Terre Haute banks show the volume of payroll money is gaining each semimonthly period.

A coal bed 16 ft. thick has been struck on the farm of Frank Harter, in Spencer County, one mile north of Newtonville. The coal is said by experienced mine men to be of excellent quality. Most of the beds uncovered in this section range from 4 to 6 ft. thick.

## IOWA

Iowa's much-discussed coal mine merger appears to have failed to develop. The original plan was to consolidate most of the producers of Appanoose and Wayne Counties into a group controlling about 25,000 acres of coal. Options were given on forty-nine properties. The Iowa Southern Utilities Co. took a hand and early in August it was said the merger was nearly complete. Since then, however, the usual difficulties involved in determining valuations arose and the effort has been given up.

## KANSAS

The Lone Star Coal Co. has leased 400 acres of coal land four miles west of Pittsburg and has ordered a large shovel to put on it. The tract will afford work for twelve or fifteen years. The officers of the company are R. G. Nesch, president; L. G. Schmaltz, vice-president; and J. J. Nesch, secretary-treasurer. The same men own the N. & S. Coal Co., which operates a steam shovel mine at Hume, Mo.

Two Kansas coal mines that have been idle since soon after the World War are swinging back into action. The Hamilton Coal & Mercantile Co. has resumed operation of its mine No. 9 near Cherokee, employing 200 men. The Domestic Coal Co. is electrifying its shaft No. 3 north of Gross, preparatory to having it operated by a lessee.

The Western Coal & Mining Co. has leased its mine No. 21 near Scammon to John Lyons of Pittsburg and Francis Fern of Scammon and has leased its No. 14 at Fleming to Wilbert & Schreeb, who operate a mine west of Pittsburg. While the cream of production has been taken from both mines a large tonnage remains, J. D. Delaney, superintendent of the Western company, says. The Western has let contracts for sinking shafts for two large mines, No. 22 north of Arma and No. 23 near Minden.

## KENTUCKY

Announcement was made at Covington, Aug. 8, of a voluntary petition in bankruptcy by the Daisy Coal Co., of Krypton, listing liabilities of $4,010 and assets of $3,524. The company operated in Perry County.

The mine of the bankrupt Co-Operative Coal Mining Co., at Nebo, in western Kentucky, near Madisonville, is being dismantled, the equipment sold, and the mine mouth will be sealed. The company at one time produced a fine grade of steam coal, but had a bad roof, and excessive production cost.

Judge Charles I. Dawson in the United States District Court recently issued a restraining order against Sheriff L. R. Ray, of Hopkins County, preventing him from collecting taxes and penalties assessed against the St. Bernard Coal Co. for 1924. The decision was based on a suit brought by the St. Bernard Coal Co. against the county on the grounds that the assessment was made on August 8, 1924, when the State Tax Commission had no power to act as a State Board of Equalization.

Plans are being made by the West Kentucky Coal Co. to drill new oil wells on its property in the Suthards section, where it recently brought in a well at 2,200 ft. The well now is producing oil of 41 per cent specific gravity and of a fine grade. It is still on test.

The Hawley-McIsaac Coal Co. which recently acquired almost 10,000 acres of coal land in the region of Nebo, including 700 acres of stripping land, has already spent $60,000 remodeling the old top works of the Circle City mine. A conveyor, crusher and fifteen electric motors have been installed. Three dinky engines and cars for hauling the coal to the tipple and a switch engine for use in the yards complete the equipment for one of the finest top plants in that field. In addition a steam shovel has been purchased to remove the overburden and a smaller shovel to load the cars. There will be about 70 men employed in the operation of the stripping plant. It is planned to have a 40-car daily output.

The Dawson Daylight Coal Co., near Dawson Springs, while rebuilding its burned frame tipple, is producing mine run and some sizes over a temporary loading tipple. Following the fire at this plant, which was one of three in western Kentucky field, within a period of a few days, mines posted armed guards and no other fires have been reported.

## MINNESOTA

The 350 ft. extension to the Inland Coal & Dock Co.'s plant at Duluth may be completed by Oct. 1, with part of it scheduled to be ready Sept. 1. Officials of that company are looking forward to an active period this fall and winter.

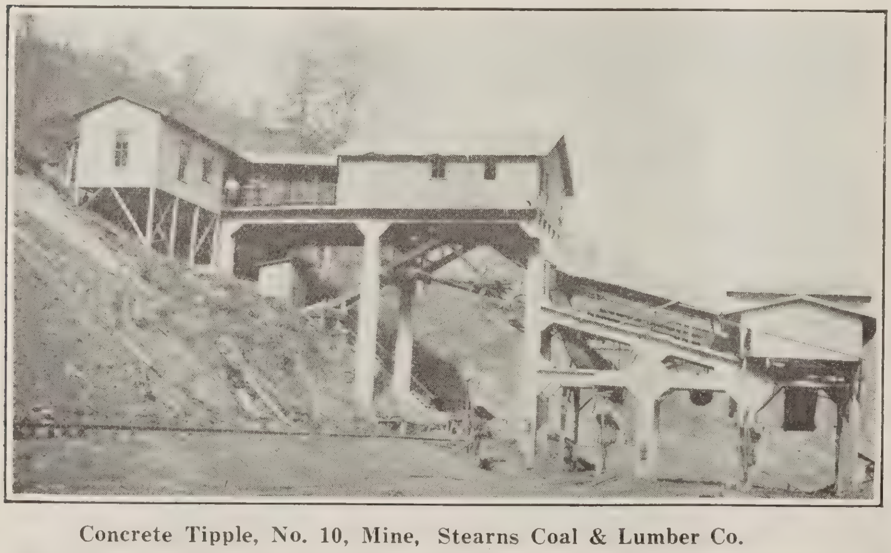
The Berwind Fuel Co. set a record one day during the first week of August by unloading 10,000 net tons of bituminous coal from the steamer Fred G. Hartwell in 7 hrs.

Whitney Bros., contractors of Duluth, have completed a coal dock for F. B. Spear & Sons at Marquette, Mich. It has a storage capacity of 300,000 tons and is to be equipped with a 5-ton 300-ft. unloading bridge. It will be ready to go into commission by Oct. 1. It is of pile and concrete construction.

## MISSOURI

Coal has been struck at a depth of 236 ft. a mile east of Pattonsburg, giving that town the thrill of its life. A seam about 4 ft. thick was encountered by drillers working for a company formed by W. G. Cline of Chillicothe. Pattonsburg people are interested in the company and hope they will soon see coal produced there in commercial quantity.

State Labor Commissioner Roye B. Hinkle has started a campaign to urge Missourians to use coal produced in that state. He believes that miners in the state will benefit from the drive. "Missouri's coal ranks with that of other states," Hinkle said, "but there has been little demand for it." "Have you bought your Missouri coal for next winter?" is the question Commissioner Hinkle propounds to all persons he meets or has correspondence with.



**Concrete Tipple, No. 10, Mine, Stearns Coal & Lumber Co.**

This simple but sturdy and relatively incombustible tipple is located at Yamacraw, Ky.

## OHIO

About 1,000 men employed by the Ohio Collieries Co. at Glouster, walked out Aug. 20 as a result of a disagreement with the company officials over the hiring of 750 idle miners living in the Sugar Creek district nearby. The miners employed by the Ohio Collieries Co. desiring to aid their fellow miners, took them into their local and wanted to split the work with them. The company agreed to hire all but the drivers. As a result the men walked out. Lee Hall, president of the Ohio Mine Workers' organization was on the ground and is trying to make a settlement. Four large mines are effected.

Michael Gallagher, of the M. A. Hanna Co., after visiting with President Coolidge at the "summer White House" in Swampscott, Mass., last week told interviewers that he had not talked about the coal situation with the President.

On bids opened recently the Columbus Purchasing Department has awarded a contract to the Hisylvania Coal Co., for 7,000 tons of nut, pea and slack, to be delivered to the Columbus Water Works. This is to be Ohio coal, as was burned in years past, except when other coal was all that was available. The Hisylvania company's bid was $1.24 f.o.b. mines, although there is $1.26 freight rate attached to this. This supply will last until Jan. 1.

Two mines of the Clarkson Coal Co. near St. Clairsville have resumed operations after being closed a week. These mines employ nearly 800 men and other mines in Belmont County resuming during August will bring the total returning to work up to 2,500. The Taplan mine of the Morgan Coal Co. at Bennock, idle three years, is to resume, and the Diamond mine at Neff, idle several months, will be started during the week.

The work of dismantling the equipment of Tropic mine, near Crooksville, has been completed and about 900 acres of coal land has been abandoned. The mine has not been in active operation for more than two years.

The Ohlinger & Wolfe Coal Co. has opened its mine on Brush Fork, which had been closed down for months. The Powell Creek Coal Co., in the same vicinity, also is arranging to open its mine. The announcement is made that both will be operated on the Jacksonville wage scale.

Papers have been filed with the Secretary of State increasing the capital of the Peerless Elkhorn Coal Co., of Columbus, from $150,000 to $200,000 in order to provide capital for the purchase of equipment at the mine located at Betsy Layne, Ky. F. G. Hatton is president and George F. Schwartz is secretary of the company. Both are connected with Hatton, Brown & Co., Inc., of Columbus, and the product is sold through the Hatton-Brown company. The output is about 2,000 tons monthly.

Among the mines in the Crooksville field recently placed in operation are Mine No. 9 of the Sunday Creek Coal Co., at Corning, employing 200 men, and Mine No. 19 of the same company, at Buckingham, employing about 225 men. Mine No. 24 of the Northern Fuel Co., at Jackson, has resumed, giving employment to 100 men, and Mine No. 226 of the George M. Jones Coal Co., at Hollister, employing about 300 men, also has resumed. Mines that are being cleaned up preparatory to operation are: Gosline Coal Co., at New Lexington, to employ 200 men; Mine No. 25 of the Pittsburgh Coal Co., at Chauncey, to employ 250 men, and Mine No. 10 of the Sunday Creek Co., at Mortonville, to employ about 250 men. In addition several small railroad mines between New Lexington and Moxahala have resumed.

## OKLAHOMA

Intrastate rates on coal in Oklahoma have been ordered reduced by the state corporation commission. The new rates take effect Sept. 15. Rates of common carriers for the transportation of coal between points in Oklahoma were ruled "unreasonable and unduly prejudicial" by the commission's findings and new rates were prescribed. Mines were regrouped as to shipping points by the order.

## PENNSYLVANIA

When asked about the huge merger of coal companies in Pennsylvania, the story of which appeared in the New York papers, officials of the Pennsylvania Coal & Coke Co., operating large mines in central Pennsylvania, stated that they had received no information about it and had no intention of entering such a combine.

Operators in central Pennsylvania believe that the district has received its worst blow in years in the decision that has been rendered by the Interstate Commerce Commission establishing joint all-rail rates from West Virginia to points in the Middle Atlantic states. They have not yet determined what action will be taken on the decision. The district joined the northern railroads, including the Pennsylvania and the Baltimore & Ohio, and the associations of operators in Somerset and Westmoreland Counties and in Pittsburgh, in opposing the proposal, during the course of the hearings which concluded on April 4, 1924. The effect of this decision, coming just previous to another anticipated suspension, is obvious. It places West Virginia coal in direct competition with central Pennsylvania throughout the region east of Rochester, N. Y., and Harrisburg, Pa., where, heretofore, the same competition was restricted to points on or near the coast.

The gross tonnage of revenue bituminous coal transported by the Reading Co. during the month of June, 1925, was 1,494,346 as compared with 1,196,126 for June, 1924.

Governor Pinchot has not intimated what part he will play in the event of a strike in the anthracite region. It is believed he will offer his services or at least those of the industrial relations board of the Department of Labor and Industry. The Governor of Pennsylvania has refused to discuss the situation other than to say he is keeping in touch with it through the State Department of Mines and in other ways. Before leaving the Capitol this week he conferred several times with Joseph J. Walsh, Secretary of Mines, who has been one of his official observers at Atlantic City, although he has not been there for the past two weeks.

**Guild Hall, Edgewater Mine, Tennessee Coal, Iron & R.R. Co.**

Edgewater, Ala., is an attractive town and it is only fitting that a place of assembly such as this should be of neat and inviting appearance. Brick, slate and white trimmings assure an effect that is pleasing to the eye.

The time limit for holders of D., L. & W. Coal Sales Co. stock to deposit their certificates in exchange for equal shares of Glen Alden Co. stock with the financial agents of the latter concern in New York City expired at 3 o'clock Aug. 17. According to reports the required number of shares had been deposited to insure carrying out the provisions of the plan for absorption of the sales company by the producing company.

The Pittsburgh Terminal Coal Corporation reports net income of $98,646 for the quarter to June 30, equal, after preferred dividends, to 32c. a share earned on the $12,000,000 common stock outstanding.

Several hundred men and boys who were idle Aug. 12 at the colliery of the Alden Coal Co., Alden Station, returned to their posts the next day. The strike was called when a number of miners refused to enter the mine and work an 8-hr. shift near the scene of the mine fire that has been burning for several months past. The men, it seems, have only been working in short shifts at the scene of the fire but since the fire has been gotten under control the company requested the men to go back to the 8-hr. shift basis.

Flushing of the 8-ft. vein of the Se-Rob Coal Co.'s workings in West Scranton, located in an area which has been devastated by mine caves, was started Aug. 1 by the city in co-operation with the Se-Rob and Glen Alden Coal Companies. The Se-Rob company is doing the inside work which includes the erection of "batteries" in the workings. The Glen Alden company is furnishing machinery and labor for the work on the surface and the city is providing the ashes. The flushing is being supervised by City Mine Cave Engineers Frank Davenport and Frank Gaffney.

Four independent coal and coke companies at Uniontown ordered 600 coke ovens put into blast Aug. 20. They include the Century Coke Co., Puritan Coke Co., Lincoln Coal and Coke Co., and the Rich Hill Coke Co.

It is reported that an additional 1,000 ovens will be ordered in at independent coke operations before Sept. 1. One 6,000-ton order of coke is reported by a large steel company.

## UTAH

Otto Herres, assistant to the vice-president and general manager of the United States Fuel Co., of Salt Lake City, has been promoted to the position of assistant manager of the company, a new office in the organization. Mr. Herres, who is a mining engineer, and for sometime was superintendent of the Hiawatha mine of the company, has been with the United States Fuel Co. about nine years.

R. M. Magraw, general superintendent of the United States Fuel Co., of Salt Lake City, has resigned and will be succeeded by J. B. Forrester, chief engineer of the company and acting general superintendent during Mr. Magraw's recent absence in the East where he went because of ill health. Mr. Magraw had been with the company about 10 years.

## WASHINGTON

To meet the necessity for a larger output of Bellingham coal important improvements costing upwards of $50,000 have just been completed at the mines in Bellingham. These mean an increase of 50 per cent in capacity, bringing the daily coal output up to 1,500 tons from this oldest mine in the state of Washington. Announcement of these improvements was made by John C. Eden, president of the Bellingham Coal mines, who commented particularly on the unique feat of mining engineering which was accomplished in driving an 1,800 ft. slope from both ends and meeting at a central point not an inch out of line. The work was carried to completion by James H. Pascoe, mining engineer, under the direction of E. P. Lucas, mine superintendent.

## WEST VIRGINIA

Four carpenters retimbering the airshaft at the Lochgelly mine of the New River Coal Co., near Fayetteville, were killed Aug. 19 in a fall of 200 ft. down the shaft when the scaffolding on which they were working gave way.

The Jamison Coal & Coke Co. has awarded a contract for forty miners' houses, twenty at mine No. 9 and twenty at No. 8 in the Farmington section.

Five barges of the 30 ordered by the Ohio River Coal Co., the river transportation department of the West Virginia Coal & Coke Co., were delivered Aug. 19. The company's boats and barges will be used on the Ohio

River and the Kanawha River, chiefly between Huntington and Cincinnati, although some of the barges will be used to transport coal from points on the Ohio River.

A new daily leading record was attained recently at the Lowsville mine of the New England Fuel & Transportation Co., when 800 mine cars were loaded.

In the week ended Aug. 15, the mines of northern West Virginia produced 537,150 net tons, which is the largest weekly coal production since any week early in 1923. The maximum weekly production in northern West Virginia is 763,200 net tons.

The Kay Moor mines, which were acquired a short time ago by the New River & Pocahontas Co., have been breaking records recently. June was the banner month with an output of 23,000 tons.

Thomas DeVenny, superintendent of the Portsmouth By-Products Coke Co., with operations in the Williamson field, recently announced that the company would immediately increase its production schedule from 40,000 tons to 60,000 tons a month because of an increase in the demand for steel products manufactured by the American Rolling Mills Co., at Middletown, Ohio, one of the owners of the company.

Approximately one-half of Mine No. 41 of the Bethlehem Mines Corporation, at Barrackville, is rock-dusted and the remainder will be completed within a month. As soon as the work has been finished in this mine rock-dusting will be started at the Dakota mine of the same company.

Although no definite announcement has been made, indications point to the fact that coal not long ago discovered on the C. & I. branch of the Western Maryland near Elkins in a section where it was not known coal existed in commercial quantities, may be developed. Prospecting has been in progress for some time and the fact that those in charge of such work are seeking permanent quarters is taken to mean that development will be undertaken. Surveys are being made on lands where the coal has been discovered. The coal is said to be in the Sewell seam, though the northern West Virginia section is far removed from the New River and Winding Gulf districts where such coal usually is found.

The Arnetteville mine of Robert Talbott & Co., at Arnetteville, Monongalia County, will resume on an open-shop basis early in September. The slope was recently concreted.

An improvement program requiring expenditures of approximately $150,000 has been outlined by the Berwind-White Coal Co. to provide facilities at Kenova for handling coal for river shipments from mines of the company in the Norfolk & Western fields. The company has acquired 50 acres of river front property. Improvements contemplated under the program include the erection of coal docks near the foot of Sixteenth Street on the Ohio River. Construction is to begin at once. Improving the river transportation facilities at Kenova is said to be the forerunner of a plan of the Berwind-White Co. to open up new mines on the Levisa Fork of Big Sandy River, which is served by the Chesapeake & Ohio Ry. The company now operates a number of mines in Mingo and Mercer Counties, and also controls the Pocahontas Consolidated Coal Co.

Several changes have been made in the staff of the Coal River Collieries Co. John Barrett has resigned as sales manager. F. L. Smith, of Cleveland, has been appointed acting sales manager. Col. A. B. McCutcheon, formerly assistant sales manager, has been transferred to the fiscal department, and is working in the St. Louis territory. R. E. Edginton, who has been with the company for some time, is now assistant sales manager.

The Sitnek Coal Mining Co., has awarded a contract to the Fairmont Mining Machinery Co. to install shaker screen and other equipment at the new wooden tipple to be erected by the company at its Katherine mine, at Lumberport.

M. A. Jolliff, Fairmont business man, has purchased 300 acres of undeveloped Pittsburgh coal land in the vicinity of Fairview, from the Kennedy, Price and Yost heirs and from Lon Underwood. The coal land is in the McCurdysville section.

Operations have been resumed at the Raymond City Coal mines in Putnam County, the affairs of the company having been placed in the hands of a receiver. The company has offices in Cincinnati. Approximately 1,500 men are employed at the Raymond City mines.

### WYOMING

The Union Pacific Coal Co. is sponsoring a baseball tournament among eight southern Wyoming teams which will be held in Rock Springs, Aug. 28 to 30. E. R. Jefferis, stores manager, has charge of the tournament, assisted by M. F. Roberts, chief operator of that company's power plant at Rock Springs, and A. Reynolds, a newspaper man.

James Morgan, Secretary of United Mine Workers, District No. 22, Wyoming, and George Young, vice-president, spent a few days in the Rock Springs sector recently conferring with several commercial companies upon labor conditions growing out of the introduction of mechanical loading devices.

### CANADA

Because of the strike menacing the Pennsylvania fields, the price of American anthracite advanced 50c. a ton in Montreal, Aug. 15. The rise is an annual event at this season, but in years past the advance has been made on Sept. 1. From Aug. 15 on the price of American household sizes was $16 a ton instead of $15.50. Careful survey of coal stocks in Montreal leads dealers in American fuels to the opinion that a one-month strike would hardly disturb the local supplies in the fall. Two months' cessation of mining, however, would prove troublesome.

More coal is to be developed on Hat Creek by a company now driving slopes into a hillside tract about 15 miles east of Pavilion on the Pacific Great Eastern Ry. The company, mainly composed of Vancouver men, is drilling the balance of a large acreage, claiming the results indicate one of the biggest deposits in Canada. The two tunnels now driven are 115 ft. and 165 ft. in length.

Welsh anthracite mine owners are anxiously assessing the prospects of a strike on the Pennsylvania coal fields, since they consider it will throw the Canadian market open to them. It was the previous American strike which gave Welsh hard coal its first chance in Canada. and since that time the trade has grown steadily. Senator Lorne Webster, of Montreal, is in London making arrangements for increased supplies of Welsh coal in the event of a United States coal strike. The only fly in the ointment of the Welsh colliery owners is that they have labor troubles of their own. The "red" movement among the hard coal workers has resulted in the last few weeks in great damage to mines by flooding and other causes.

## Traffic

### Belleville Operators Get Rate To St. Louis Suspended

Belleville district coal operators have succeeded in temporarily blocking a freight reduction of 3½c. a ton on the rate to St. Louis, Mo., from other southern Illinois mines. The Interstate Commerce Commission has suspended the new rates announced by the Missouri Pacific, Illinois Central and Chicago & Eastern Illinois lines until Dec. 17, pending an investigation. The Belleville operators insisted that the 22½c. differential in favor of the inner group of mines established in 1920 be maintained. The Belleville rate to St. Louis is $1.16 per ton and from other southern Illinois mines $1.38½c. per ton.

### Freight Traffic Is Heavy

Freight traffic during the first six months this year amounted to 212,509,796,000 net ton miles, according to reports for the first half of the year filed today by the carriers with the Bureau of Railway Economics. This was an increase of 7,782,890,000 net ton miles or 3.8 per cent over the corresponding period last year but a decrease of 12,974,000.000 net ton miles or 5.8 per cent under the corresponding period in 1923, when the volume of freight, measured in net ton miles, was the greatest on record for any corresponding period.

## Obituary

**Charles J. Fischer**, secretary and treasurer of the Underhill Coal Co., died Aug. 18, from complications following an attack of influenza. He had been with the company for more than 30 years and was about 55 years old and unmarried. He left no near relatives but his brother, John A. Fischer, with whom he lived.

## New Companies

**The New North Coal Mining Co.,** 1700 N. 11th St., Springfield, Ill., has been incorporated with a capital of $50,000, to mine and sell coal by Bette Scheibner, Chas. H. Sutton and C. I. Scheibner. Correspondent: B. L. Carton, 205½ S. Sixth St., Springfield, Ill.

**The Whitelye Creek Coal Co.,** of Diliner, Pa., has been organized under the laws of West Virginia with a capital stock of $10,000. Principally interested in the new company are C. H. Burnside, D. W. Lewis, O. C. Hillberry, J. S. Shelton and Charles Jeffries, all of Morgantown, W. Va.

**The Southern Illinois Coal Co.** was incorporated in St. Louis, Mo., the latter part of July, by John S. Steuber, 5,426 Ruskin Street, and others.

**The Wickens-Haas Mining Co.,** Elba, Ohio, has been chartered with an authorized capital of $50,000 to mine and produce coal. Incorporators are John H. Arnold, E. W. Haas, Way Wickens, J. P. Heldman and P. J. Way.

## Industrial Notes

**The Kuhlman Electric Co.,** of Bay City, Mich., has appointed the Stevens Sales Co., of 134 West Second South Street, Salt Lake City, Utah, as district representative for the State of Utah and parts of Idaho and Nevada adjacent to Utah. The Stevens company will handle Kuhlman power, distribution and street-lighting transformers.

**The W. A. Jones Foundry & Machine Co.,** Chicago, has inaugurated a new sales arrangement for Minneapolis territory with an office at 614 Builders Exchange, F. S. Van Bergen, district sales manager. The territory covered includes all of Minnesota, North Dakota and South Dakota, also parts of Iowa and Wisconsin which adjoin Minnesota.

## Coming Meetings

**American Institute of Mining and Metallurgical Engineers.** 132d meeting, at Salt Lake City, Utah, Aug. 31 to Sept. 3. Secretary, H. Foster Bain, 29 West 39th St., New York City.

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

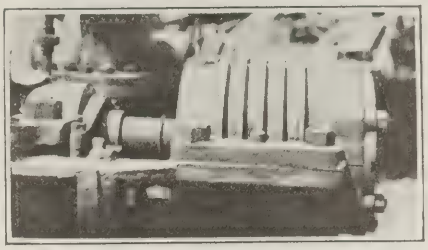
# New Equipment

## Roller Bearings Function In Centrifugal Pump

One of the main difficulties with the operation of centrifugal pumps has been to obtain successful operation of the bearing on the suction end of the casing. For the first time rollers have been used in this important bearing with good results. In all types of centrifugal pumps, regardless of the type of bearing, an end thrust must be taken care of. Various types of bearings other than rollers have been designed to take this end thrust, and although some have been successful, these types have, under certain conditions, given considerable trouble.

With pumps used for handling acidulous mine water the difficulty is usually magnified. Most of the bearings previously used have been cooled by water usually taken from one stage of the pump and conducted to a jacket around the bearing. With such a bearing an arrangement has to be made in the pipe connection between the pump and water jacket to prevent air from entering the casing, when the pump is being primed ready for operation. A ball check valve is often placed in the water line but soon becomes corroded. Besides, the spillage of water around the water jacket is usually unsightly. Where the water contains much acid the water-feed pipe in time corrodes or becomes blocked, even if the pipe is of brass.

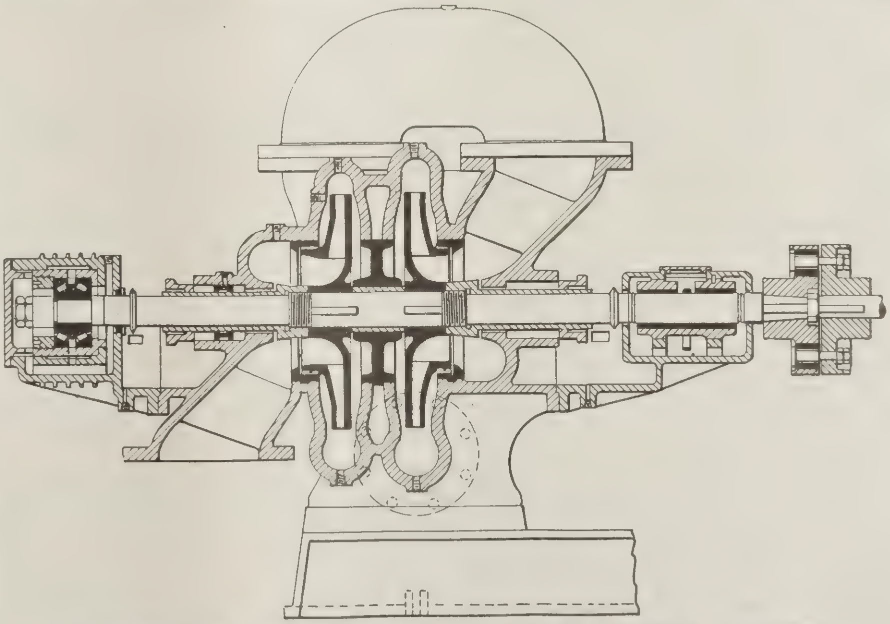
To overcome these difficulties, the Goyne Pump Co., of Ashland, Pa., in developing its new line of centrifugal pumps, has incorporated in its pumping units an end-thrust bearing which has proved to be remarkably successful. It consists of a double Timken roller bearing arranged to take end thrusts in either direction. One of the accompanying figures shows an outline of a pump and how the bearing is mounted. Instead of being lubricated with grease, as is common with most bearings of this type, this bearing is lubricated with oil. The oil jacket is arranged so that there is practically no leakage.



**Inclosed End-Thrust Bearing**

Instead of being lubricated with grease this bearing runs in oil. Fins on the outside of the housing aid in dissipating heat.

The other illustration shows the housing around the bearing. The ribs or fins were placed on the bearing to aid in dissipating any heat which might be generated. The success obtained by bearings of this type on centrifugal pumps has been such that the bearing is considered one of the most important recent improvements on centrifugal pumping units.

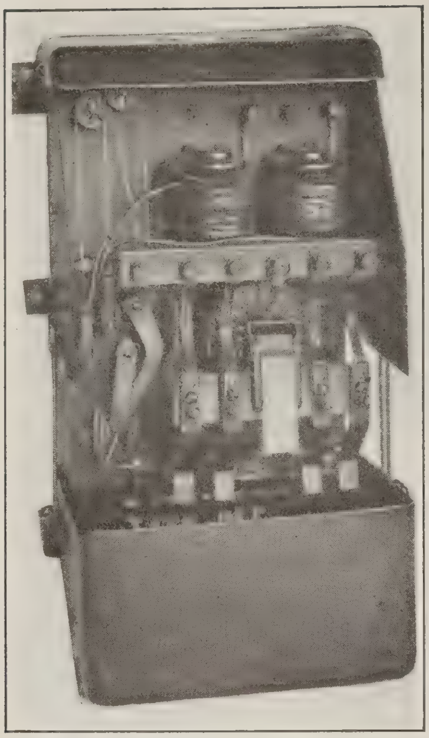


**Bronze Type Roller Bearing Pump with Back-to-Back Impellers**

Although this pump is well balanced, because the impellers are arranged back-to-back, a heavy thrust bearing has been added. This Timken tapered bearing has now been made a standard feature on this type pump.

## Oil Starting Switch Protects Induction Motors

The Electric Controller & Manufacturing Co. has just announced a new push button operated oil switch for starting squirrel-cage induction motors directly across the line. This device, known as the type ZO starting switch,



**Switch Gives Automatic Protection**

All conditions of overload, phase failure and no voltage are taken care of by this switch.

is controlled from one or more push button stations which may be located at convenient points. The starting switch is provided with four pairs of heavy contact fingers three of which handle the main line in the case of three-phase or two-phase three-wire motors, and the fourth pair handles the control circuit to the push button when the switch is arranged for no-voltage protection. In the case of two-phase four-wire switches all four lines are disconnected in the "off" position when the switch is wired for no-voltage release. When wired for no-voltage protection one line runs directly to the motor.

The starting switch uses an accurate inverse time element temperature overload device which consists of two alloy wires, each attached at one end to an adjusting screw, and at the other end to a multiplying lever which operates a quick make-and-break contact circuit. The wire is connected across the secondary of a small current transformer. The gage of the expansion wire and the winding of the secondary of the transformer remains the same regardless of the horsepower ratings or voltage of the switch. The size wire and number of turns of the primary is proportioned to suit the rating of the motor.

An increase in current or an overload on the motor produces an increase in the current flowing in the secondary circuit, this causes the expansion wires to lengthen and, if the overload is severe enough or is of sufficient duration the wires lengthen sufficiently to trip the overload relay causing the starting switch to open and disconnect the motor from the line. The wires then cool and the overload relay contact automatically resets, if the switch is wired for no-voltage protection. A hand reset of the overload device by means of a small button projecting through the case is provided on switches arranged for no-voltage release.

The overload device protects the motor against injury due to phase failure. If an attempt is made to start the motor with one phase open, the switch will open in less than five seconds, and the manufacturer states that it is impossible to burn out a motor due to phase failure or overloading when protected by this starting switch.

The oil tank is drawn from a single piece of sheet steel and cannot leak. The tank latches are arranged so that the tank can be lowered and left suspended to catch oil dripping from the contacts while the switch is being inspected.

On account of creepage of oil due to capillary attraction and from splashing when the magnet surfaces engage, all moving parts of the switch are kept lubricated, which protects the switch from corrosion when installed in corrosive atmospheres. The switch is arranged for conduit connection and is compact.

## Trade Literature

**Classification and Washing.** The Dorr Co., New York City. Bulletin 11. Pp. 20; 6 x 9 in.; illustrated. Discusses the general subject of classification and describes its application in many industrial processes.

**Zeolite Water Softener.** Graver Corporation, East Chicago, Ind. Bulletin 509. Pp. 7; 8½ x 11 in.; illustrated. The advantages claimed for this softener are the rapidity with which the capacity of the zeolite can be utilized and the very short installation period.

The Crouse-Hinds Co., Syracuse, N. Y., has issued a folder illustrating its **Screw Cover Junction Condulets.**

**Conveying and Storage Equipment.** The Stearns Conveyor Co., Cleveland, Ohio. Pp. 8; 6 x 9 in.; illustrated. Describes the roller-bearing troughing idler pulley, with high-pressure grease lubrication; roller-bearing return roller; "Holotile" storage bin and self-propelled self-reversing belt-tripper.

**Messiter Conveyor Scales.** The Stearns Conveyor Co., Cleveland, Ohio. Pp. 8; 6 x 9 in.; illustrated. Describes this scale for weighing material while in process of being conveyed.

The Griscom-Russell Co., New York City, has issued a leaflet on its new **Stratton Separator,** which has been improved with a larger helical path and a spatter cap on the outlet pipe to increase the separating efficiency. The leaflet is No. 408.

Detroit Stoker Co., Detroit, Mich., has issued Bulletin No. 1018, of 32 pp., describing its **Stokers of the Single Retort Type.**

**Allis Adjustable Delivery Motor Drive for Alternating Current.** The Louis Allis Co., Milwaukee, Wis. Pp. 7; 8x10½ in.; illustrated. Describes the multi-speed motor, control drum, contactor panels and principle of operation.

**The Automatic Operation of Centrifugal Pumps.** Barrett, Haentjens & Co., Hazleton, Pa. Pp. 24; 8½x11 in.; illustrated. Describes the methods used to make centrifugal pumps start, stop and run without constant attention.

**Everything for Mine and Industrial Safety.** Mine Safety Appliances Co., Pittsburgh, Pa. Catalog No. 3. Pp. 126; 7¾x10½ in.; illustrated. A very complete book describing safety appliances used in and around the mines.

The L. J. Wing Co., New York City, has issued Bulletin No. 77, of 32 pp., describing its **Turbine Blowers.** This contains some new information not included in the previous bulletin, including data relative to the application of the blowers to stokers and graphic representation of their use for hand-fired boilers.

## Publications Received

**Analyses of Utah Coals.** Bureau of Mines, Washington, D. C. Technical paper 345. Pp. 90; 6x9 in.; tables. Prepared under a co-operative agreement between the U. S. Bureau of Mines and the Industrial Commission of Utah. Besides the analyses a brief description of the geologic structure of the coal fields, a summary of the mining methods used, uses and markets of the coal and a statement of production by counties as compiled by the U. S. Geological Survey, are included.

**Coal Losses in Alabama,** by J. J. Forbes, School of Mines, University of Alabama, in co-operation with U. S. Bureau of Mines and U. S. Coal Commission. Bulletin No. 1. Pp. 52; 6x9 in.; illustrated.

**Year Book American Engineering Standards Committee,** 1925, 29 West 39th St., N. Y. City. Pp. 72; 8x10 in.

**Our World Trade,** January-March, 1925. Foreign Commerce Department, Chamber of Commerce of the United States, Washington, D. C. Pp. 15; 6x9 in.; tables. Value and volume of principal exports and imports between United States and chief foreign markets are included.

**Investigation of Antennae by Means of Models,** by J. Tykocinski-Tykociner. Engineering Experiment Station, University of Illinois, Urbana, Ill. Bulletin No. 147. Pp. 60; 6x9 in.; illustrated. Discusses the theoretical considerations involved in the use of such models.

**The Coal Resources of New South Wales,** by the Staff of the Geological Survey, New South Wales. Pp. 154; 6x9 in.; illustrated. Parts I and II; the former covering geology, and the second part, coal analyses and byproducts.

**Thirtieth Annual Report of the Mineral Resources of Tennessee.** Department of Labor, Division of Mines, Nashville, Tenn. Pp. 148; 6x9 in.; illustrated.

**Home Environment and Employment Opportunities of Women in Coal-Mine Workers' Families.** Women's Bureau, U. S. Dept. of Labor, Washington, D. C. Bulletin No. 45. Pp. 61; 6x9 in.; tables.

**Small Hose Streams for Fighting Mine Fires,** by L. D. Tracy and R. W. Hendricks. Bureau of Mines, Washington, D. C. This paper represents work done under a co-operative agreement between the U. S. Bureau of Mines, the State Geological Survey Division of the State of Illinois and the Engineering Experiment Station of the University of Illinois. Technical paper 330. Pp. 23; 6 x 9 in.; illustrated.

**Permissible Explosives, Mining Equipment and Rescue Apparatus Approved Prior to Jan. 1, 1925,** by J. E. Crawshaw, L. C. Ilsley, D. J. Parker and A. C. Fieldner, Bureau of Mines, Washington, D. C. Technical paper 376. Pp. 35, 6 x 9 in.; tables.

**Cleaning Tests on Central Illinois Coal,** by Thomas Fraser and H. F. Yancey. This paper represents work done under a co-operative agreement between the U. S. Bureau of Mines, State Geological Survey Division of the State of Illinois and the Engineering Experiment Station of the University of Illinois. Technical paper 361. Pp. 23; 6 x 9 in.; illustrated. The data reported in this paper indicated what results may reasonably be expected from washing the coal mined in this field, in so far as the samples tested represent average conditions.

**Geology of the Foothills Belt Between McLeod and Athabaska Rivers,** by Ralph L. Rutherford. Scientific and Industrial Research Council, University of Alberta, Edmonton, Alberta, Canada. Report No. 11. Pp. 82; 6½ x 10 in.; illustrated. This report deals with the geology and physiography of a part of the foothills belt and is a continuation to the northwest of the area discussed in Report No. 9 by the Scientific and Industrial Research Council. It is accompanied by a geological map.

**Carbon Ratios and Petroleum in Illinois,** by Gail F. Moulton. Department of Registration and Education, Division of the State Geological Survey, Urbana, Ill. Report of Investigations No. 4. Pp. 18; 6¾ x 10 in.; maps and tables.

## The Public and the Anthracite Strike

THE SILENCE OF SUSPENSION has settled down upon the anthracite mining districts of northeastern Pennsylvania. The frantic peace efforts of the business men of the region, who must become the unwilling financiers of the contest, have gone the way of the conciliatory words of the producers put forth after President John L. Lewis of the United Mine Workers had returned to Atlantic City in a thunder of ultimatums. Barring intervention, victory is promised to the side with the longest purse and the greatest endurance—and the odds, under such conditions, are not chalked up against the miners at the figure the public commonly thinks.

A shrewder psychologist than his opponents, Mr. Lewis was quick to seize the opportunity to use the efforts of the committee which he had insulted in his first comments on the activities of the business men as a medium for the promulgation of some effective propaganda designed to rehabilitate the union cause in the public eye. The operators, displaying more intellectual honesty than finesse, passed by the opportunity to reply to Mr. Lewis in kind. The union leader was left dictating terms of resumption which the operators could accept only with their tongues in their cheeks and they could not bring themselves to reopen negotiations on a basis of hypocrisy.

Although the public now moans that the miners and the operators have completely disregarded its interests in the controversy, the fact is that the public, by its earlier inaction, has definitely stated its position. The operators entered the wage conferences with two announced objectives—arbitration of all questions upon which the conferees could reach no agreement so that a suspension might be avoided and opposition to any changes which would increase the cost of coal to the consumer. To neither proposal would the miners give their assent. To the first proposal they voiced a most vigorous, not to say bitter, dissent. After trotting out a few old friends, such as freight rates, profits and the hazards of the industry, the miners made it plain that they would not agree to the stopping of the steady advance of wages.

The public was frankly enamoured with the proposal to check increases in fuel prices. It seemed, for the most part, strangely indifferent to the suggestion to avoid a suspension. Its attitude, reflected in the nonchalance in evidence at Washington and Swampscott, was one of "let 'em fight it out; we should worry." When the public and the administration might have thrown the weight of their influence on the side of arbitration as public protection against an interruption to the production of hard coal, both were silent.

Since the public, in the weeks during which the operators and miners were meeting at Atlantic City elected to adopt a "hands off" policy, the industry today has the right to demand that the public and the administration at Washington continue that policy of noninterference. The pressure that in times past has compelled the operators to agree to settlements framed in a spirit of fear should not be exerted. Friendly offices, of course, are always in order, but the public has surrendered whatever right it may have had to dictate terms. A sense of fair play should keep Washington as calm when excited New England Congressmen descend upon it with the cry of "peace at any price" as it is today. The public acted as if it knew what it wanted: let it not later complain of the bargain.

## Don't Hamstring the Bureau of Mines

THE LONG DELAY in choosing a director for the Bureau of Mines has created a situation in Washington that merits some attention from the coal industry. The proposal has been put forth that this bureau and the Bureau of Standards be directed by the same executive. Opposition to this should rise at once from men and organizations interested in coal. The Bureau of Standards is a laboratory engaged largely in experiments of a physical or chemical character. Some of these experiments have a direct application to mining but these are by no means the controlling activities of the Bureau.

The Bureau of Mines is performing and must continue to perform a valuable service to the coal industry as well as to other industrial groups whose business interests are bound up with the nation's mineral resources, and it certainly should not be made subservient to or dominated by any other government bureau. The industry should make it clear to everybody in Washington that it has little patience with bureau rivalry or personal ambitions.

An opportunity now exists to centralize the mining activities of the federal government where there is a good chance to have it made a grand division of a department with recognition of mining in the department's title. Now that it is settled that the Bureau of Mines is to be under the jurisdiction of a friendly secretary, it is felt that the industry has everything to gain and nothing to lose by strengthening and building up its service.

## Time to Make Repairs

NOW THAT THE anthracite industry is shut down, many opportunities are presented for improvements. When things are going strong little time is available for planning changes which will result in better operation, but during a suspension the officials and engineers will have a chance to look around and survey the properties with this idea in mind.

Some will say that these men will be supervising the care of pumps, hoists, etc. or keeping the important equipment in repair and thus will find little time to do constructive work. However, isn't this an occasion to plan for the future? These men will now be out in the field where they will be able to obtain for themselves first-hand information of the conditions surrounding the places and systems that should be improved.

But aside from these men there are always many others who can be employed repairing apparatus which, during the great push before the suspension, was taxed up to or even beyond its limit. Even in the ordinary work of taking care of equipment during the suspension, occasions will be found to do the work better and thus put the equipment in good condition for resumption of activities. For example, a storage battery on a locomotive rarely receives proper attention during operating periods, but now it can be replenished with acid and charged so as to bring it back to good condition. Then again, consider the mine locomotives: nearly every one of them has something that should be repaired; headlights, brake shoes and bearings could all be repaired or at least adjusted.

With the resumption of work, regardless of the results of the present wage controversy, the mines must in future be operated so as to keep the selling price of coal as low as possible. Therefore, the day has arrived to take time by the forelock.

## Make Haste Slowly

OF ALL REVEALING things few are more interesting than the slow "movie" that shows us motions slowed down to meet the imperfections of the human eye. Those motions could not in most cases be duplicated at such speed. Gravity and muscular effort work more rapidly, so that the screen picture is an impossible one.

This furnishes an illustration in the art of modern mining. A few companies are trying to test roof action with certain specific conditions of operation and are using the ordinary slow methods of loading coal in order that they may discover what will be the roof action with those same conditions and with more rapid loading methods. But with such experiments they can get only misleading results. The slow "movie" represents nothing truly. Something essentially different would happen if we tried to imitate those motions at such slow speed. Similarly the roof undermined slowly will not act as it would if speedily undermined.

Nothing is more certain than that roof action is complicated in the extreme. It is a progressive series of movements, and they take place in a serial order. One action must wait for another and all of them take a certain length of time. This is no theory. Experience has shown that speed in operation modifies roof action profoundly and what would be a failure with slow extraction is a complete success when coal is removed with speed.

## Personnel Building

OPPORTUNITIES for improving the personnel at the mines are offered by these lean times in industry, and they should be used whenever possible. Men who are habitual risk takers, should be let out of the organization. The bootlegger, the man who is a bad citizen or who has a record for working short time should be dropped when any men are let out.

An industry is no better than its personnel. A business that has the record of having rough characters working in it does not stand well with the public. If the coal industry had a better class of miners, the operators would be in better favor and have fewer strikes. Some men may argue that they will get more coal from roughnecks than from men with less of fire in their blood, but those who act on that principle will find before long that all their men will be of that class.

Selective employment is the basis of success. A big burly, rough man may be a good tonnage producer, but he may, nevertheless, destroy the morale of the personnel and so be of more harm than good. When a man finds that standing to order is necessary to retain his job in a mining village he will straighten up and the town will be made endurable to the peaceable citizen and his wife. If the roughneck finds the atmosphere restraining and displeasing let him take the open road. The coal industry is judged by the men it hires and by their wives and families.

## Soft Coal's Job

THERE IS A CERTAIN pleasure in turning from anthracite's troubles to a contemplation of soft coal's service to the country. The harvest is on. The nation is filling its elevators, its warehouses, its storage yards. It is advancing into the autumn with a confidence born of economic virility. One excellent indication of this condition is found in the most recent Car Service Division report from the American Railway Association.

For the fifth consecutive week, loading of revenue freight exceeded one million cars a week, the total for the week ended Aug. 15 having been 1,064,793 cars. This could mean nothing less than business health for the country. The number of cars loaded with revenue freight up to date this year has exceeded all previous years and the week of Aug. 15 was the greatest week of 1925. It was 111,385 cars in excess of the corresponding week last year and 24,855 cars ahead of 1923.

The movement of coal to market is, of course, important in these figures. Coal loading for the week totaled 190,979 cars which was 45,716 cars greater than the same week a year ago and 1,800 cars over 1923. However, it is not coal alone that swells the freight movement to its unwonted flood. Livestock loadings were 2,153 cars ahead of last year. Less than carload freight totaled 259,210 cars which exceeded last year by 17,272 cars and two years ago by 17,922 cars. Here is a sure indication of business strength. Miscellaneous freight was 33,934 cars ahead of 1924 and 30,308 cars in excess of 1923. And so it goes.

All this heavy flow of the nation's freight is moved by soft coal sold to the railroads at an average price low enough to satisfy anyone barring possibly the hard-boiled railroad coal buyer whose profession it is to be absolutely insatiable. The tremendous volume of manufactures represented by the freight flood was produced with the aid of coal which has been lower in price this summer in proportion to the cost of production than ever before—this week the *Coal Age* national average is but $2.10 even after the autumn rise had set in. Coal's service deeply effects the whole economic fabric of the land and, for once, coal cannot be petulantly blamed for chaos in industry generally, for there is no chaos.

Soft coal is abundantly available at low cost as the country begins another winter and the railroads are admirably equipped to deliver it. We can only hope that John Lewis' blind lust for combat will not impel him to risk calling his men out of bituminous mines this fall for punitive purposes or for any other reason. Soft coal ought not to be deprived by the miners of its full opportunity to continue serving America.

# Utah Storms Burst Futilely About Meeting of Rocky Mountain Coal Mining Institute

## Washouts Do Not Upset Program at Price—Engineers and Executives Discuss Loading Machines, Conveyors, Rock Dust and Other Technical Subjects Important to the Industry

**By R. Dawson Hall**
Engineering Editor of *Coal Age*

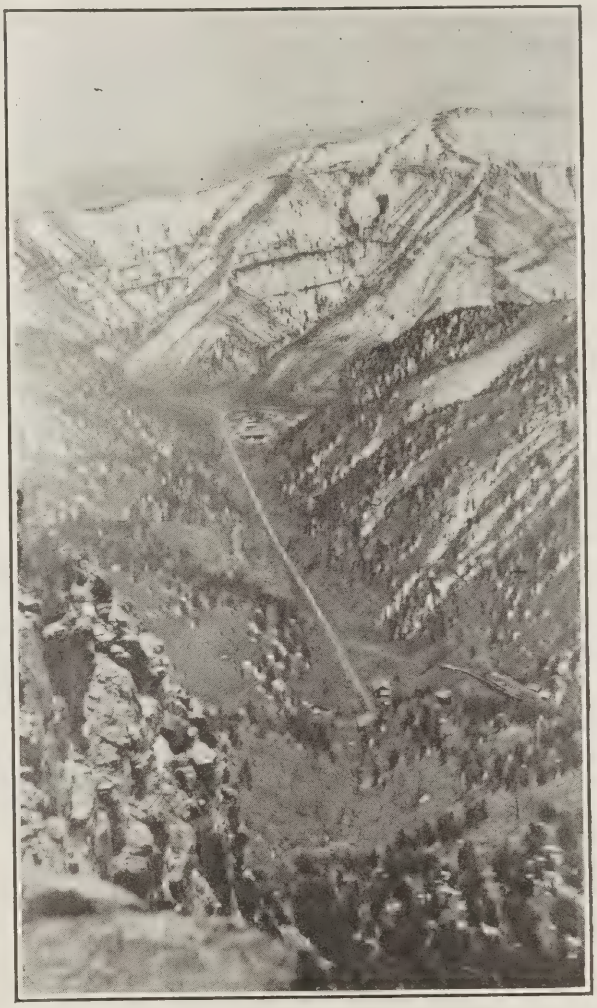
TYPICAL Utah August storms with half-hour floods ruining roads and disrupting railroad service did not stop the summer meeting of the Rocky Mountain Coal Mining Institute at Price, Utah, Aug. 26, 27 and 28. Engineers, executives, and other coal mining men including a good many representatives of machinery and equipment companies assembled in large number and made the town a busy place with their discussions, their dinners and their group goings and comings to nearby mines which have made Carbon County noteworthy in coal production. Rock dusting, machine loading and the use of underground conveyors were the main subjects considered, but these by no means filled the program.

Despite the absence of J. B. Marks, the president, who telegraphed that he could not be present because of extreme pressure of business, the Institute measured this year fully up to its former records, a large crowd having gathered in the Star Theater when the meeting was opened by Benedict Shubart the secretary. George B. Pryde presided. The slides for the paper on "Electric Shotfiring" not having been made and the paper itself having been delayed in the mails, the article by Robert Williams, Jr. could not be presented. A film made by the E. I. duPont de Nemours Co., entitled "The Story of Dynamite" was shown by A. E. Anderson.

J. M. Jennings described the New Hiawatha tipple of the United States Fuel Co. which the Institute planned to visit in the afternoon. During the night the road between Price and Hiawatha had been washed out, but as the weather was propitious in the morning the road commissioners managed to provide an easy detour down into and up out of the arroyo where the washout occurred. The trip to Hiawatha over the desert was pleasantly accomplished but the smiling little village was barely reached when a heavy storm broke. However, the guests were afforded a fine spread in the amusement hall, and after it was over they visited the tipple which is one of the finest in the West.

In the evening the visitors paraded the street from the Savoy Hotel to the Tabernacle of the Latter Day Saints where an informal banquet in the basement of the building was addressed by the mayor of Price and several leading mining men, the entrance to the banquet hall being decorated to look like a mine and the passageways being labeled like its underground workings. On the way one of the distinguished guests was seized and treated to first-aid, the ambulance being requisitioned to carry him to his destination. The evening closed with a ball in the City Hall.

At the morning meeting of Thursday A. W. Dickinson presented an interesting review of the many forms of loading machines, including the Hamilton machine, the Jeffrey entry machine, the O'Toole and McKinley cutting and loading machines, the Thew "S" loader, the Joy loaders 4, 5 and 6 B.U., the Coloder, the Myers Whaley, the Riley, the Stockley, the Burnell, the Goodman Hydraulic loader, the Goodman types A and B scrapers, the Ace, the MacEachen and the Jeffrey Pitcar loaders. He also gave much information regarding the Movor, Fairmont, Echoff, Link-Belt, and Jeffrey sectional conveyors and the Jeffrey 44-A conveyor loader. Clearances, lengths and power required were given for each loading machine.



**In the Coal Wilds of Utah**

Looking down the incline from the Standardville mine in bottom foreground to the town and tipple in the middle ground at the foot of the snowy mountain.

Mr. Dickinson then read Glen A. Knox's paper on the operations at the Sweetwater mine of the Gunn-Quealy Coal Co., where conveyors have been used with great success. Modifications of longwall are being used. At first the faces were made at an angle about half way between the strike and pitch, the conveyors proceeding down the pitch as the cutting progressed. Later the faces were made at a similar angle, but the main conveyors were moved along the strike. Finally the faces were aligned with the pitch, the main conveyors being laid in the direction of the strike.

At the conclusion of Mr. Knox's paper O. G. Sharrer read an interesting account of his experiences with mechanical loaders in central Pennsylvania, describing his early operation of Joy loaders while with the Pennsylvania Coal Co., declaring that there were no particular advantages in a complicated track system as the expense of laying and repairing eats up the profits that might accrue due to greater speed in handling cars. He also described experiments with scrapers where the coal was only 30 in. thick. Difficulties arose because the method of operation could not be modified to suit the scraper, because the mines worked irregularly and because a scale could not be obtained for this type of work. Other tests of the Myers-Whaley and Jeffrey heading machines were described. The V-system of West Virginia did not seem suitable for Pennsylvania conditions, according to Mr. Sharrer.

Mr. Sharrer said that too many men should not be put on the job at first, because if the number is reduced later misunderstandings arise. He declared that it was difficult to use enough water to prevent the creation of excessive dust. In his opinion the haulage problem was not the principal difficulty and that loaders were so erratic in performance that it would not pay to give maximum haulage facilities till it was made clear that the loading equipment would work without delays other than those arising from haulage. With all Mr. Sharrer's criticism he was confident that the future of the machine loader was assured, and that success would be achieved "in the next few years."

In the haste to reach the lunch provided by the Spring Canyon Coal Co., the address by G. A. Murphy, general manager of the company was omitted.

### Discuss Mechanical Loading

In the evening a session was held in the Carbon County High School at which the articles on mechanical loading were exhaustively discussed. Benedict Shubart favored the use of metal conveyors and said that belt conveyors, though much used in England, were almost unknown for face operations in the United States. He regarded the H. C. Frick Coke Co. belt at Colonial Mines as something more than mere main haulage. It corresponded more nearly to railroad transportation and the continued operation of the belt without injury was largely due to the fact that the coal was not being deposited on the belt at all sorts of angles but was being carried forward without disturbance on its flat surfaces.

John Forrester said that, in his belief, the reason why metal conveyors were preferred was because they could be lengthened and shortened at pleasure and so they could be operated with greater flexibility than belt conveyors. W. C. Holman said that to obviate brushing where the coal was low the Phelps Dodge Co. was using two Jeffrey belt conveyors in tandem.

The time-honored question as to whether the introduction of longwall and conveyors had resulted in a larger percentage of the smaller sizes of coal was introduced and J. M. Jennings said that Mr. Knox was getting unusually large coal with conveyors, as long as he sought to get the larger sizes. Later the market required smaller coal and accordingly he had it broken up smaller with heavier shooting.

Otto Herres said that with longwall working such as that in operation at Sweetwater the coal would be broken up into smaller sizes due to the crush. George B. Pryde took a different view. Longwall was not as destructive to the integrity of coal as shooting from the solid and that was the practice at Sweetwater. He would say that the present methods had not increased the percentage of slack.

The discussion then shifted to hazards. Mr. Dickinson said there was an increase of dust in machine loading, especially with the McKinley loading and cutting machine which was extremely dusty. Mr. Forrester declared that more dust was to be expected because, when loading by machine, the coal is shot harder in order to make it easier for the machine to pick it up. However, he believed there was less hazard because, with the closer supervision possible by reason of the concentration of operations, it was easy to keep down the dust.

### Concentration Has Dangers

Eugene McAuliffe believed that machine loading was more dusty than hand loading. D. Harrington thought the hazards greatly increased by modern methods of loading. Not only did the methods increase the quantity of dust but they also increased the rapidity of mining and the increased quantity of coal broken down caused large quantities of gas to be released. The number of motors on loading machines and conveyors greatly added to the hazard. No more dangerous places could be found for such motors than at the working face where there were excessive quantities of pure coal dust and where there was more gas than at any other point. In reply to Mr. Herres' suggestion that machine loading was safer because of the concentration and the possibility of close supervision that went with such concentration, Mr. Harrington said that he believed concentration likely to prove a source of danger rather than its preventive. At Dolomite, Ala., a number of men had assembled and as a result what was a relatively small explosion killed a large number of men. Concentration, he said, is not without its dangers in mine operation.

To Mr. McAuliffe these arguments did not appeal. Few places, he averred, were better sprinkled than the working places in a machine-loading mine. There was more supervision there, and there could be more ventilation. In this belief the machine loading would increase safety by that very concentration that Mr. Harrington deplored.

At the close of this discussion on the safety of mechanical loading D. Harrington read an article on rock dusting practice in the Rocky Mountain region and L. C. Clare one on "Mudite's Relation to Nature." Mr. Harrington said that owing to a lack of funds the U. S. Bureau of Mines had made no experiments in the Bruceton mine in the use of mudite.

H. A. Wylan, of Superior, Wyo., said that the wetting down of empty cars was more important than the sprinkling of loads. Cars should be sprinkled when entering the mine as well as when leaving them. The "empty" car distributed more dust and finer dust than the loaded car.

E. K. Judd said that though gypsum had been found disposed to fall off the ribs when being applied, he believed that its merits as an inert material should not be overlooked because it absorbed heat rapidly and that seemed a primary quality in a good explosion-preventive dust. The Bureau of Mines had made endeavors to ascertain the temperatures reached momentarily in mine explosions. Gold and silver foil were suspended in the Bruceton experimental mine. The first was melted only once and the second frequently was found to be fused, showing that the temperature was sometimes above 1,832 deg. F.

The specific heats of earthy bodies used for rock dusting range generally from 0.19 to 0.22. Taking the larger figure and assuming the temperature to rise 1,765 deg. the number of British thermal units absorbed will be 388 per pound of dust. Dry gypsum contains 21 per cent of water of constitution which, at as low a temperature as 250 deg. F., begins to be expelled. Let us assume that the whole of the water of constitution is drawn off at 250 deg. F. Then the heat absorbed in British thermal units will be: 47 in raising the temperature of the gypsum to 250 deg. F., 48 in decomposition, 203 in evaporation, 237 in heating the calcium sulphate to the temperature of 1,832 deg. and 166 in raising the steam to the same temperature—a total of 701 B.t.u.

Limestone has also been regarded with favor. Does not limestone also break up under heat? Unfortunately the temperature at which that dissociation occurs is so great that it is doubtful if the action ever takes place during an explosion and much more doubtful whether, if it should occur, it would progress in any great measure. Only at 1,700 deg. F. and under exceptionally favorable circumstances does the limestone begin to lose carbon dioxide. Prior to that time 352 B.t.u. are absorbed, the decomposition adds to this 765 B.t.u. and the heating of the products to 1,832 deg. F. adds to the heat absorption 30 B.t.u., making a total of 1,138 B.t.u. This is an impressive figure 1,138 as against 388 for the indecomposable bodies and 701 for gypsum.

Mr. Judd believed, however, that under actual conditions the limestone would absorb no more heat than any indecomposable dust such as silica sand, leucite or shale and that gypsum was the more desirable material. Gypsum might make ideal tamping. The experiments being made by J. K. Mabbs up to the present showed that gypsum was by far the least absorbent of moisture of any of the inert bodies tested, that limestones varied greatly, some being slightly more absorbent than gypsum and some far and away more absorbent. Silica sand was quite highly disposed to take up moisture.

On Friday morning a paper on "Domestic Fuel Stokers," written by Joseph Harrington, was read by the secretary of the Institute, Benedict Shubart. The author asserted that much cheaper coal could be used with a stoker and that about 25 per cent less coal would be needed for the same purpose. The stoker would also be more flexible, raising the temperature rapidly if desired and holding that temperature at any level which might seem necessary. With such a mechanism for continuous feeding it would be possible to eliminate smoke when burning the smokiest of fuels.

Mr. Herres said that the Pacific Coast Coal Co. had a small stoker furnace that was more simple than the Harrington. Pulverized coal equipment was being adapted to use in apartment houses. Two other stokers were mentioned, one developed, but not being commercially manufactured, by Mr. Garrison, the state engineer of Utah, who resides in Salt Lake City, and one which Mr. Mageath, of Omaha, Neb., has been manufacturing. Mr. McAuliffe said that Mr. Mageath recommended his small unit only for Rock Springs coal.

A short discussion on rock dusting followed, Mr. Harrington declaring that nearly all the operators were dusting too lightly for safety. With Utah coal it was necessary to have the dust in the roadways 75 per cent inert matter. R. M. Magraw stated that on inquiry at the Bureau of Mines he had been told that about 5 tons of dust should be used for 1,000 tons of output.

**Hiawatha Has a Fine Tipple**

The Institute journeyed from Price to Hiawatha in spite of storms and washed-out roads. This plant, of the United States Fuel Co., one of Utah's best, was visited. It receives coal from an incline on which 16-car trips operate. It can size, clean and load 400 tons an hour. Nearly 20 sizes are within the range of the horizontal screens.

T. C. Harvey then read a brief description of the Columbia tipple and mine. The secretary announced that detours had been arranged around three bad washouts between Columbia and Price and that cars were ready to take the visitors to the former place where an elaborate luncheon had been prepared by the Columbia Steel Co. At this mine all the coal was being crushed, the picking tables not being in operation when the visitors went through the tipple. The coal at this mine and at Sunnyside does not have an equal quantity of resin with that of Hiawatha and Spring Canyon; in fact it is believed by some to be part of a different seam. After lunch the automobiles returned to Price after a short visit to the historic tipple at Sunnyside.

On one occasion when the Sunnyside tipple burned, the smelters of almost the entire West were deprived of fuel. Ten days after the fire the tipple was re-erected and was crushing coal as merrily as ever, the Denver & Rio Grande R.R. having disrupted its service to get the material from Salt Lake City to Sunnyside. On another occasion a shovel got into the disintegrator and the sparks that resulted though merely the result of mechanical violence served to explode the dust. Evidences of the burning of the shales due to the crop fires in the coal should be seen near the tipple. This was the Institute's last mine visit.

# West Tries Everything in Rock Dusting

**By D. Harrington**
Consulting Engineer, Salt Lake City, Utah

PRACTICALLY every method of rock dusting coal mines is now used in the Rocky Mountain states. Experience and strict mining safety laws have driven mining men to this form of explosion prevention—and most of them are convinced water is also a necessary safeguard. They have tried all the dusting processes known and it is interesting to note that the most successful have turned clear back to the practice of 1916 as it was developed, beginning in 1912, at the Delagua mine of the Victor-American Fuel Co. in Colorado. This was the first extensively rock-dusted coal operation in this country.

In 1916, while in the Bureau of Mines service, I made an underground study and a report to the Bureau on this mine. There were then some 10 miles of entry in that mine which had been kept well rock dusted for at least four years. The dust used was "adobe" or surface soil screened from sweepings of the dry surface wagon roads through a screen with ⅛-in. openings, the dust giving about 20 per cent through 200 mesh and about 10 per cent of approximately ⅛ in. size. The material was collected during dry weather by contract at $1 per ton (sacked) and was accumulated in summer and stored for winter and spring use.

The dust was scattered through haulage entries by hand or by an electrically operated blower and was held on shelves along the ribs or between and on timber caps with from ¼ in. to 2 in. thickness of the rock dust. The cost of maintaining the 10 miles of entry well dusted was about $1,500 per year or $150 per mile per year. Total cost of the rock dusting over a four-year period was about $6,000, about 2,500 tons of dust being used and 2,000,000 tons of coal produced. The cost included about 1,200 days labor dusting at $2.50 per day, 2,500 tons of rock dust at $1 per ton and miscellaneous labor, material, repairs, power cost, etc. amounting to about $500. The cost per ton of coal produced for keeping 10 miles of entry rock dusted was about 0.3c.

### Sprinkled Interior of Mine

In addition to the rock dusting, some sprinkling was done chiefly in the interior of the mine costing about 0.4c. per ton; and, due to spilling of coal and sifting of coal dust through loose cars on the entry floors, the floors of haulage roads were kept sprinkled between and just outside the rails. Total cost of sprinkling and rock dusting was about 0.7c. per ton, much less, of course, than the same work would now cost.

The Dolomite explosion near Burmingham, Ala., in November, 1922, and the Dawson No. 1 Mine explosion at Dawson, N. M., in February, 1923 (at both of which I made underground inspections and reports) both starting on main intake haulage road and both in mines which had fairly elaborate watering systems, convinced me that at least as far as freezing can occur on main intake air courses which also act as main haulageways, rock dusting is likely to be much more dependable than sprinkling.

In making up the report on the Dawson explosion to the Bureau of Mines (copy of which also went to the owners of the Dawson properties) I strongly urged the rock dusting of main intake-main haulage roads (of which there were many miles being operated at Dawson) at least as far as freezing extended in coldest weather together with extension of watering methods in the interior mine workings placing water lines, and water hose at every working face,, and keeping thoroughly wet all open interior workings. The use of water on cutting chains on all mining machines and also the sprinkling of loaded car tops at the faces and on partings was recommended. It was strongly recommended that each section of all mines be protected by rock-dust barriers.

### Most Modern Practices at Dawson

By January, 1924, or about a year after the Dawson No. 1 explosion, the Dawson mines were by all odds the most up-to-date mines I had ever seen from the standpoint of health and safety; both rock dusting and watering methods were being used to an extent which I had never before encountered. The Dawson mines quickly became the mecca of western coal mining people and almost immediately modifications of the Dawson practice were being adopted in mines of New Mexico, Colorado, Utah and Wyoming.

The now famous Utah regulations adopted after the Castle Gate explosion in March, 1924, involving compulsory rock dusting "at least into the most distant points where freezing takes place in coldest weather," use of rock dust barriers, use of water on coal-cutting machines, compulsory sprinkling of faces by miners and of all other interior open workings by the company, exclusive use of permissible explosives and of electric blasting and exclusive use of closed lights, are all Dawson practice though some of these practices had their origin in Utah and some were in at least partial use previously in Utah mines as well as in mines of New Mexico, Colorado and Wyoming.

While all of the Utah coal operators agreed to the new regulations before they were issued some have been somewhat doubtful as to the efficiency of rock dusting, yet practically all are in some degree complying with the law. Some of those at first frankly skeptical now are rock dusting far beyond the amount specified in the new regulations; some are rock dusting as specified by the new regulations or even beyond the demand of the regulations and are simultaneously sprinkling intensively the floor of the places where ribs, roof and floor are rock dusted and are *soaking* the interior mine workings. On the other hand, there are a few whose rock dusting is evidently done only to "get by" when the state inspector comes around.

One of the most extensively adopted adjuncts to rock dusting in western mines is the spreading on the floor of intake haulage entries of surface soil or adobe which usually becomes dry and dusty and, in addition to greatly aiding in track ballasting, also sends into the air by movement of animals, trips, etc., considerable quantities of finely divided incombustible dust which

---

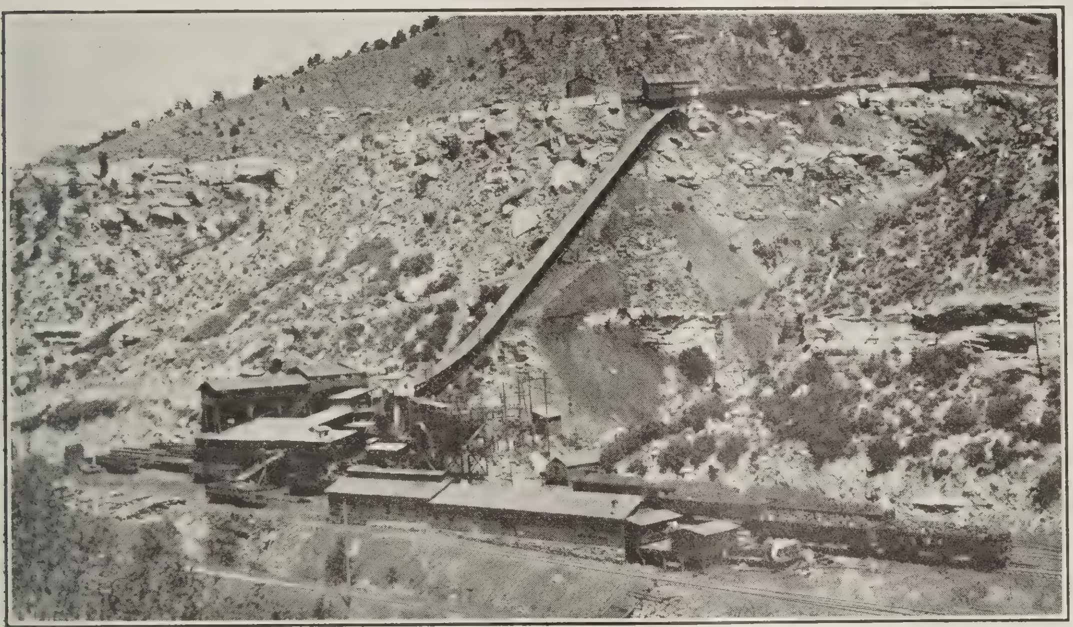
This article is from a paper read by Mr. Harrington at the Price meeting of the Rocky Mountain Coal Mining Institute, Aug. 24, 1925.

ultimately settles on ribs, timbers, roof, etc., and aids in keeping percentage of combustible low.

During the past year or year and a half much over a hundred miles of haulage entry floor in western coal mines have been covered with from a few inches to as much as a foot of soil or adobe at a cost of from 10c. per foot of entry to 25c. or even more, depending upon thickness of the covering, amount of preparatory cleaning done and whether the adobe can be found readily available to the mine, whether it can be loaded in pit cars by steam shovel or by horse scraper and trap or by hand, etc.

Suitable material for the floor covering is almost anything which pulverizes upon becoming dry, and has a combustible content of less than 10 per cent. In many instances the material has over 50 per cent free silica but no alarm is felt since little of this material gets into the air breathed by workers and up to date no complaints have been made nor has there been any evidence of trouble. While placed in mines in lumps as large as a man's head this material dries and disintegrates to such an extent that when sampled on entry floors after a few months of service it runs 25 to 50 per cent through a 200-mesh screen.

For ordinary rock dusting purposes the material most in use in the West is crushed limestone obtained from cement mills or smelters at a cost of $3 to $5 per ton sacked at the mill or smelter. Fineness is 40 to 60 per cent through 200 mesh. Freight brings the cost, f.o.b. mine, to $5 or $5.50 and in at least one instance to $8 per ton. A few mines in Utah have used crushed leucite which is silvery white in color and glistens brilliantly when crushed to 100-mesh or less, is almost entirely incombustible, costs about the same as the crushed limestone and is placed on the ribs, roof, etc., almost as readily as limestone.



**Typical Utah Incline**

The seam mined by the Carbon Fuel Co. at Rains outcrops high on the face of the hill, making necessary this long conveyor to the tipple and loading plant. R. P. Fitch is superintendent of this mine. His top plant, as well as several others in Utah, is capable of applying most of the refinements now known in coal preparation. Some Utah operators deplore this recent development of sizeing though it makes the coal of that state even more marketable.

Both the crushed limestone and the crushed leucite absorb moisture in humid air. A few mines are preparing to crush their own local material and at least one company in Colorado has a combined crusher and rock duster which converts shale underground to dust and immediately deposits it. This company rock dusts all open parts of the mine up to and including the faces. A few mines are converting local shale oil to a watery mud of about 20 per cent solids and "muditing" or covering roof, ribs, and floor with the watery mud which has some decided advantages in protecting and covering exposed surfaces. With certain kinds of soil and after successive coatings in places which dry out rapidly, the dried "mudite" acts largely as ordinary rock dusting.

Some smaller mines apply rock dust by hand but most of the companies have made their own rock dusters and, curiously enough, most of the rock dusting machines are essentially modelled after the one used by the Victor-American Fuel Co. at Delagua, Colo., in 1912 to 1916. These machines consist of a small, electrically-driven, belt-connected blower (heater gage 2 to 5 in.) and a dust hopper with an outgoing pipe. Locally-made machines of this type cost somewhat less than $1,000 and some of them dust 25 to 35 lin.ft. of entry per minute. One such machine recently redusted 17,000 ft. of entry averaging 10x12 ft. in cross-section in eight shifts.

Cost of rock dusting by these blower units, using crushed limestone or crushed leucite, runs from 2 to 4c. per foot of entry; about 60 per cent is labor, 30 per cent rock dust and about 10 per cent miscellaneous items such as power and materials used. The amount of dust deposited on ribs and roof runs 2 lb. or less per foot of entry. Many of the Utah mines have used compressed air on an injector principle forcing rock dust against ribs or roof with a high velocity propelled by compressed air at 40 to 70 lb. per square inch. This so-called high-pressure dusting dislodges coal dust from crevices, ledges and other projections and leaves a plaster of $\frac{1}{3}$ to $\frac{1}{2}$ in. of rock dust upon ribs, roof, timbers, etc.

The mining companies of Utah practically all have air compressors, stationary or portable, and water lines (now universal in Utah mines) can be used for carrying compressed air and as a result the high pressure dusting is popular because it leaves a heavier coating of dust than other methods (3 to 6 lb. per foot of entry) and costs but little more than with the low-pressure methods. Costs run from 4 to 6c. per lineal foot of entry.

Many Utah operators now believe the first coating of rock dust should be made by the high-pressure method with subsequent or redusting coats, which require but 1 to 2 lb. per foot of entry, to be done with low-pressure machines which are somewhat the quicker. One Utah mine now figures on placing rock-dust boxes along mine workings about every 500 ft. and using the compressed air through water lines to force the rock dust into the air to be later deposited by the air on roof, ribs and floor and it is expected to be able to rock dust practically all intake air courses of a fairly large mine (capacity 2,000 tons per day) in about two shifts. Another mine now has an effective dusting machine of the usual blower type but taking its power from the wheels of a pit car which may be hauled by a mule. It is now felt by many Utah coal mining men that where air velocity is as high as 500 ft. per minute, redusting can be done readily by using the air currents as distributors. The dust is thrown into the air by blower at points 500 to 1,000 ft. apart. However, other operators say that using air currents to distribute rock dust bears the same relationship to *efficient* rock dusting as do frozen water lines to efficient sprinkling methods.

Rock dust barriers used in the West are largely of the V-trough type using 16 to 20 troughs in a barrier, though some mines with high coal use 30 or more troughs per barrier. The volume of rock dust per barrier runs from 2,500 to 5,000 lb. Various kinds of rock-dust material are used in these barriers, among them crushed limestone, crushed leucite, siliceous mill tailings, adobe, flue dust, etc. It is felt that almost any kind of fine incombustible material will serve provided its specific gravity is not too great and provided also that it will not pack or consolidate too much or that it will not absorb moisture to too great an extent.

It is found that in the extremely humid air of most of our Utah mines which use water freely in interior sprinkling, the limestone, leucite, flue dust, and some adobes absorb so much moisture as to become a paste or mud unless securely covered by some such impervious material as oil cloth. Highly siliceous material, however, absorbs little or no moisture and it now appears that crushed quartz would be admirable material for rock-dust barriers.

The usual 16- to 20-V-trough barrier constructed of timber costs $50 to $75 completely installed, while the same kind of barrier constructed of galvanized iron troughs and similar material, such as is now used to a considerable extent by one company, costs around $100. In my opinion the use of galvanized iron or similar material for permanent barriers is the wiser and in the long run the cheaper, as the wooden barriers soon become deformed, or they decay, or they swell due to moisture and can be relied upon to remain in good working condition but little over a year in most places and much less than a year in many places.

Some mines use a succession of comparatively loose shelves as barriers, the shelves extending practically across the opening, where there is no haulage, or along the rib where there is haulage; some properties use as barriers a supply of rock dust contained in a perpendicular box-like opening in the rib held in place by a door which is opened by a vane-like trigger extending into the mine opening. A few mines are preparing to use the concentrated type of barrier recommended by the Bureau of Mines. Some mines have well over 100 barriers installed, though in general not more than 15 to 25 barriers are found in any one mine and most mines have omitted the barriers wholly.

# Does Sprinkling Increase Spontaneous Combustion in Mines?

**By C. P. Crawford**
Combustion Engineer, Utah Fuel Co.,
Salt Lake City, Utah

BUREAU OF MINES Technical Paper 172, by S. H. Katz and H. C. Porter, entitled "Effects of Moisture on the Spontaneous Heating of Stored Coal" says at the outset, "Spontaneous fires in storage piles of bituminous coal have been the source of trouble and loss since the industrial utilization of coal began. In Europe the idea arose that spontaneous combustion is more liable to happen during wet weather than during dry. Statements favoring or opposing this idea have crept into the literature. Conflicting conclusions, based on experiment as well as opinions based on observations of various degrees of reliability, are given in most of the recorded discussions of the subject.

"Because of the uncertainty of the effect of moisture and its seeming importance among the conditions that effect spontaneous combustion in stored coal, the work described in this paper was undertaken by the Bureau of Mines. The experiments showed that a coal from Illinois oxidized faster when dry, whereas a sample of Pittsburgh coal oxidized faster when moist. These discordant results and similarly inconsistent results from the observations of different investigators may be coupled with the fact that under actual conditions of storing, both coal and air always contain a considerable amount of moisture."

The foregoing report of the investigations of the Bureau demonstrates that the mystery of spontaneous combustion has not yet been solved.

I became interested in the matter about ten years ago in observing what was probably one of the best exhibitions of this phenomenon. The old dump at Castle Gate No. 1 mine contained bony coal and track cleanings generally. In winter when snow fell upon this old dump, the snow was soon melted by the heat of the dump which was comparatively warm at all times. Within 48 hr. afterward little blue flames were in evidence on the surface of the pile. Few of the gas feeders were sufficiently constant to maintain a steady flame at any given point, but shifting emissions of gas were ignited one by another, resulting in a continuous popping and apparent running about of the flames.

Another interesting exhibition of spontaneous heating was to be seen a few years ago in the storage coal piles of the local sugar factories. This coal was piled in concrete lined pits filled with water. However, on this occasion the coal extended above the surface of the water. At every plant where this condition existed the coal was soon heating, and in each case the affected area was in a plane horizontal to and from 8 to 14 in. above the water level. The height of the hot area above the surface of the water appeared to be affected by the fineness of the coal.

---

This article is from a paper prepared by Mr. Crawford for the Price meeting of the Rocky Mountain Coal Mining Institute.

**"City Homes" At a Mine**

This apartment house at the Standardville mine in the hills of Utah houses 20 families and affords them almost every modern convenience, including a good many that city apartment dwellers do not get. The building has electric ranges, patent beds that fold into the walls, hot and cold running water and good bathrooms.

It is well known that oily rags have a tendency to heat when allowed to accumulate in some location protected from free air circulation. For some reason, as yet unknown, this does not apply to petroleum or its derivatives.

Now, the most common explanation of spontaneous combustion is that the combustible material oxidizes by being brought into contact with air in the presence of moisture, the theory being that the moisture acts as a catalytic agent.

My theory is that spontaneous combustion is due to oxidation of combustible matter by free oxygen carried in solution by a liquid, the oxidation taking place only as, when, and at the place where this oxygen is released from solution by the evaporation of the liquid.

The reason this oxygen released from solution in liquid is more active than the oxygen of the atmosphere is because of its concentration. Under a pressure of one atmosphere and at the freezing point water will hold in solution a maximum of 4.1 per cent of oxygen, by volume, whereas the maximum amount of nitrogen gas it will carry is 2 per cent of its own volume. This permits in extreme cases of a dissolved atmosphere having a content of 2 parts oxygen to 1 part nitrogen, as compared with a ratio of 1 to 4 in normal atmosphere. The activity of concentrated oxygen in promoting combustion is well known and is demonstrated in the oxy-acetylene torch.

Let us apply the commonly accepted theory of spontaneous combustion to the case of the old dump at Castle Gate. The melting snow would furnish the moisture as a catalyzer, but where would the air come from to furnish the oxygen? Surely all free oxygen contained in any air present in the interior of the dump would be exhausted after the first fire. Also, if the oxygen were furnished by free air in the affected area, why does the gas come to the surface to complete combustion?

Now, let us apply the newer theory. The melting snow carries its dissolved oxygen down into the pile. So long as the water remains in liquid form it holds the oxygen intact, but capillarity soon causes this water to spread out to an extent directly dependent upon the fineness of the material in which it reposes. Evaporation soon begins, and at this time and place the concentrated oxygen is released.

All solids absorb gases, and their ability to do so is increased in proportion to the area of their exposed surfaces. The oxygen is first absorbed by the solid, to be followed by chemical combination in case the solid is combustible matter. If the heat thus generated is not dissipated as fast as generated, the resultant rise in temperature speeds up the whole reaction until all available oxygen has been consumed. If the temperature of the combustible has not been raised to its ignition point in an atmosphere of free air before the exhaustion of water supplied the oxygen, all heating subsides until there is another storm.

This theory applies equally well to coal stored in concrete pits. So long as all coal is submerged in liquid no heating takes place, but if the top of the pile is permitted to project above the surface of the water, heating will take place at the line of evaporation, which is at the point where capillarity ends.

While coke apparently does not heat from spontaneous oxidation, it is not unreasonable to suppose that some oxidation takes place to a slight degree. A higher degree of concentration of oxygen coupled with a higher temperature undoubtedly would result in combustion.

In the experiments conducted by the Bureau of Mines, as mentioned before, it is my opinion that the faster oxidation of moist Pittsburgh coal was due to the moisture absorbing its maximum of oxygen before any oxidation of the coal took place.

Elaboration on this line of thought brings up a question pertinent to coal mine operators. If this theory of spontaneous combustion is correct, what are its effects on a coal mine which is being sprinkled daily with fresh water? Suppose a mine is sprinkled with 200,000 gal. of fresh water each day. If this water has been thoroughly aërated, and is carrying its maximum of 4 per cent oxygen and 2 per cent nitrogen, the mine is receiving daily 12,000 gal. of dissolved air of which 8,000 gal., or 1,000 cu.ft., is oxygen.

Is it not reasonable to suppose that a sudden blast of heat, such as is produced by a gas explosion, would evaporate almost instantly a large quantity of water, thus releasing a corresponding volume of this two-thirds pure oxygen? It seems to me this might account for the violence of any subsequent dust explosion under conditions which indicate that practically all normal atmosphere has been devitalized.

# Low-Voltage Current Proves Safest for Shooting

By A. C. Watts*
Salt Lake City, Utah

WHEN MINE dust or gas ignites from shots in coal the powder used and the method of loading holes are first to come under suspicion. How many such explosions and fires are due to excessive voltages used in electric shot firing nobody will ever know. However, Mr. Watts proved to his own satisfaction in Colorado that 500-volt current was responsible for a good deal of trouble in his mine, whereupon he introduced resistances of one kind or another to reduce his current to 100 volts at 45 amp. This he found to be adequate. Possibly many another mining engineer may profit by these experiments.

FOR SEVERAL YEARS, a mine in Colorado experienced considerable trouble from small fires caused by the blasting of coal. Although a well-known make of permissible powder was used, it was first thought that the powder ignited gas that might be present and that this, in turn, set fire to line brattices or to the coal. Experiments were, therefore, conducted with another make of powder, but the results convinced the superintendent of the mine, Robert Williams, Jr., that the fires were not caused by the powder but by the high-voltage electric current used for detonating the shots.

The mine "makes" gas freely, giving off from three-fourths to a million cu.ft. of methane per 24 hr. The coal is good grade bituminous of a free burning quality.

Electric shot-firing from the outside after all men and animals were outside had been practiced for a number of years. The shooting circuit was connected with the main power circuit at the mouth of each entry. Shooting circuit switches were mounted in boxes, which were kept locked with the handle of the switch, in open position, showing through the bottom of the box. The door of the box could not be shut and locked when the shooting switch was closed.

At the entrance to each room, or working place, a small switch, called the miner's switch, was placed on the shooting line. It was the duty of the miner, when entering his place at the beginning of the shift, to see that this switch was open and that it was kept open until he left the place at the end of the shift to go out of the mine. Grounded return was used for main power lines. The current was 500 volts, direct current, with 100 to 300 amp.

The nearest working face was 9,600 ft. from the shot-firers' switch outside the mine and the most remote working face was 2½ miles. The various working faces were scattered over a wide area between these two points.

A description of the main power line would be valueless; the conductors were of sufficient size, the drop in voltage being not more than 15 per cent. The shooting circuits were No. 8 wires in entries and No. 12 wires in rooms—double lines.

After first experiencing trouble with fires, the shot-firers were required to make an inspection immediately after detonating the shots; and, to expedite their work, rope trips were run. But until current was reduced, as a result of the experiments, a fire would start about every week or ten days, and at least one local explosion occurred which blew out concrete overcasts and stoppings and extended 2,000 ft. from the point of origin. A more extensive explosion was prevented by the wet condition of the mine caused by efficient sprinkling.

On idle days, the superintendent and other observers experimented with other powders and shot with full current and with a hand battery. With the full current of 500 volts and 100 to 300 amp., flame invariably accompanied the detonation of shots. The flame of one shot was estimated to be at least 19 ft. long. Another shot acted like a roman candle and threw sparks of fire for 20 ft., one spark lighting on some brattice cloth and burning a hole in it. When the hand battery was used no flame could be seen, hence it was decided to experiment further with reduced current.

### CURRENT OF 100 VOLTS AND 95 AMP. USED

A water resistance 14 ft. long with copper terminals was constructed. Experiments showed the proper length between terminals to use for the mine but, as this varies for each mine, the figures would be of no value. This was used until one night a shot-firer decided not to use it because he had missed several shots the previous day, which led him to believe the current was not strong enough, so he used the full current with the result that a fire was started. To remove the possibility of such tampering, a resistance was made out of an old rheostat and adjusted until it was found that a current of 100 volts and 45 amp. was sufficient to detonate all shots without fires resulting.

Tests were made with Form CC-500 ohms resistors. Because no recording instruments were available no current readings could be made with instruments used, but visual observation indicated that the flame from detonators, when resistors were used, was about the same as when the current was cut down with water resistance—a small blue flame hardly discernible and shown on a photographic plate as a pin point of light. Although it was determined that resistors could be used, they were deemed impracticable.

When testing with detonators, it was found that with full 500-volt current the paraffine covering on the lead wires of detonators was often set on fire and sparks thrown off, which could easily ignite methane or dry brattice cloth; this did not occur when a resistor or resistance was used.

When installing a shot-firing system, resistors can be used on the outside of each working place, or by placing suitable resistance for each district or by placing full resistance outside of the mine. This was adopted for sake of economy and greater insurance.

# Dangerous "Fireworks" from High-Voltage Shot Firing Stopped by Resistance

Upper pictures show shots fired with 500-volt current. Water boxes and 500-ohm resistors cut it down to 100 volts at 45 amp. The photographs are as follows: (1) Blown-out shot, one stick of permissible; current full strength. (2) Detonator wrapped in gasoline-soaked waste; current full strength. (3) Two detonators in parallel; current through 8 in. of water. (4) Twenty-five detonators in parallel; current through 8 in. of water. (5) Short circuit in cap wire; current full strength. (6) Interior of shooting cabin with switches locked in shooting position. (7) One detonator; current full strength. (8) Detonator wrapped in gasoline-soaked waste; current through water. (9) Detonator wrapped in gasoline-soaked waste; current through water. (10) Three detonators in series; current through water. (11) Four detonators in parallel; current through two 500-ohm resistors in parallel. (12) Six detonators in parallel; current through three 500-ohm resistors in parallel.

# Easily Installed Power Lines and Controls Aid Work of Equipment in "V" System

By C. O. Gallaher and G. B. Southward*
Elkins, W. Va.

THE "V" SYSTEM of mining, originated and developed in the Norton mine of the West Virginia Coal & Coke Co. in many respects departs radically from the usual coal mining methods. This made it necessary for the mine engineers to work out a special plan for the installation of electric equipment and the transmission of power such as is described in this article. However, it may be desirable first to explain the operation of the mining system so that the power requirements may be more clearly understood.

In Fig. 1 is illustrated a standard 10-face panel which has a normal daily capacity of 1,250 tons of coal. Conveyors are laid along the faces and in cross and lateral entries, two face conveyors on each block meet in a V and discharge onto a cross conveyor while the five cross conveyors disharge onto the lateral conveyor. In this way all the coal produced from the ten faces in the panel is conveyed to a common point on the haulway where it is loaded into a trip of mine cars.

Because mining is done by machine undercuts along the faces, they always retain a fixed length and the same relative position to each other while advancing abreast toward the lateral entry. When the Vs of the faces have reached the lateral entry, as shown by the dotted lines in Fig. 1, the lateral conveyor is separated into its units and carried ahead 200 ft. to the next lateral entry where it is re-assembled. As the mining of the blocks progresses, the cross conveyors are shortened and one after another of the conveyor sections removed and reset in the advance cross entries.

The conveyor used is of a sectional type which is easily transported and assembled. It is equipped with self-contained drive units that can be placed at any of one or more points in one conveyor unit, as the length of the latter may require. Only one drive unit is used on each face conveyor, but each cross conveyor requires three drives when at its maximum length of 225 ft. and one drive at its minimum length of 25 ft. The lateral conveyor is equipped with seven drives which at times are increased to eight.

### Induction Motors Drive Conveyors

The conveyors are driven by 220-volt induction motors with high resistance rotors to provide ample starting torque. The face-conveyor motors have a capacity of 7½ hp. while the motors which drive the cross and lateral conveyors are rated at 5 hp. Alternating current at 230 volts is used for the conveyor motors, electric drills on the faces, blower fans in the advance entries and for the electric lights. Direct current at 550 volts drives the locomotives and the undercutting machines.

Since all the coal mined in this panel is brought by the conveyor system to one discharge point, it is essential that the system be controlled from this point. Also, since it may be desired at times to stop one or more of the conveyors, the control is so arranged that each may be operated independently of the others. Furthermore, because of the periodic advancement of the lateral conveyor, the wiring as well as all switches and controls must be designed to permit of rapid installation and removal, and also must be rugged enough to withstand frequent shifting.

C. O. Gallaher developed the wiring and control system for a standard 10-face panel as shown in Figure 2. The 2,300-volt, alternating current lines (not shown on the map) are carried on the surface to the top of the borehole, and at this point disconnecting switches, choke coils and lightning arresters are installed. The drill holes vary in depth from 120 to 200 ft., and are cased with 3-in. pipe which extends to the floor of the mine and is provided with a suitable outlet near the roof for leading out the cables. These cables are suspended from the surface and consist of three No. 2 wires which are insulated with varnish and cambric for 2,300 volts.

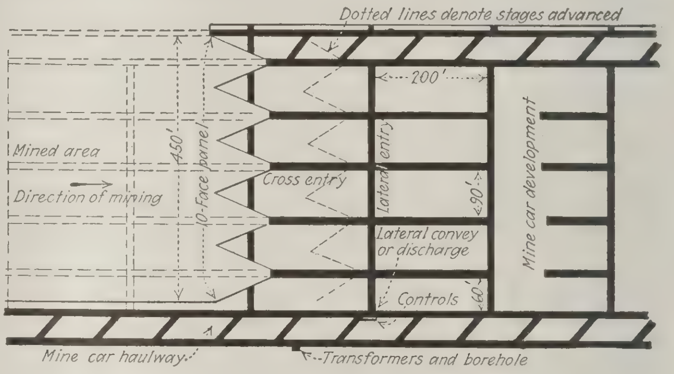

**Fig. 1—Standard 10-Face Panel at Norton**

This illustrates the celebrated V-system of mining in which conveyors transport coal from workings through face and lateral entries to car-loading points on the haulways. The wiring and control system for this panel layout is shown in Fig. 2.

From the bottom of the drill hole, *A*, 2,300 volts are transmitted through the primary cutouts, *B*, to a bank of three 75-kva. transformers, *C*. These step down the potential to 230 volts and are also connected to supply 115 volts for lighting purposes. The transformer bank is equipped with low-voltage lightning arresters, *D*, connected on the secondary side of the circuit, with the air gap set slightly above the potential of the circuit.

The ground wire from these arresters is not shown. It is led to the transformer casings and thence to the borehole where it is connected to the casing which is also grounded on the surface. A three-pole knife switch, *E*, is located just beyond the transformers for disconnecting the main feeder lines. As a safety measure a lattice fence is placed around the transformers to keep any employee from coming in contact with the high voltage.

The 230-volt feeder line, *E*, is 1,000 ft. long and located in the heading, thus allowing a 2,000-ft. panel to be mined before the transformers are moved to another borehole. From this main feeder, short cables, ***F***,

FIG. 2

*Wiring and Control System for Standard 10-Face Panel in "V" Mining at Norton, W. Va. It Was Designed by C. O. Gallaher, Chief Electrician of the West Virginia Coal & Coke Co., and Has Been Used Successfully for a Long Period.*

are carried through a crosscut to the main 800-amp., double-pole reversing switch, *G*, and the main oil switch which are installed at the conveyor control point. The circuits which operate the conveyors lead out from this main oil switch, *H*, which is equipped with overload relays to trip at 600 amp.

The lateral conveyor circuit, *I*, is strung with three-conductor cable which varies in size from No. 00 to No. 6. This circuit ties in the eight lateral motors and is controlled from a three-pole, enclosed switch, *J*. Three-pole polarity receptacles, *K*, are placed in this line connecting with polarity attached to the motor cables. These are quickly attached and detached when the lateral conveyor is moved ahead.

All cross, and face-conveyor motors are operated through the circuit, *L*, which consists of three single-conductor, rubber-covered cables leading off from the main oil switch, *H*, with 500,000-cir.mil cable and ending with cable of No. 00 size. These cables are strung along the entire length of the lateral heading and are provided with a separate branch circuit, *M*, which is led along each cross entry to the "V" of the faces. Magnetic switches, *N*, are located at the junction points of the cross lines, and are operated through the control circuit, *O*, by remote control, *P*, at the mine car loading point. Motor junction boxes, *Q*, are attached to the cables at each motor location on the cross line; face conveyor switches, *R*, are connected at the end of this line, which is at the throat of the "V."

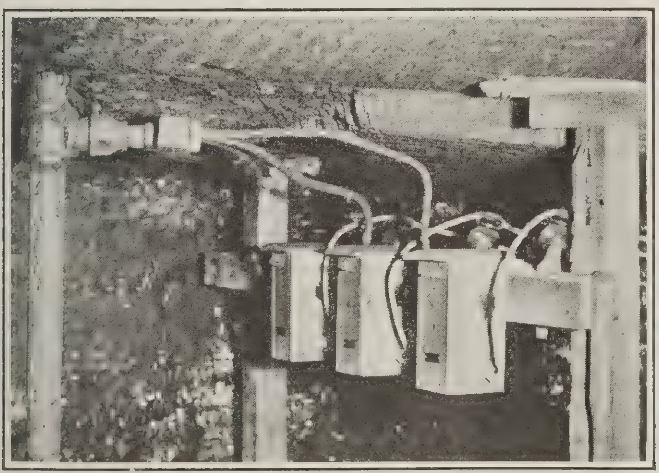

**Fig. 3—Where Power Enters the Mine**

Here is shown the beginning of the underground transmission system. The vertical pipe on the left is part of a borehole casing in which a 2,300-volt circuit is conducted from the surface to the primary cutouts suspended from the timber crossbar.

The motor junction boxes are of metal and in size measure 6x6x4 in. They are constructed with hinged top covers and all terminal blocks are mounted on ebony. Round-socket terminals are installed on the main cable connections leading into the box and split-end terminals lead out for the motor connections. All of these terminals are phased out and marked, 1, 2 and 3, to correspond with similar markings on the cable connections so that it is easy in reconnecting motors to obtain the proper direction of rotation. The face conveyor switches, *R*, are equipped with polarity receptacles for plugging in the short cables leading to the face conveyor motors.

While the face conveyors are being moved forward, the cable is withdrawn from the receptacle and rests on the conveyor. The cross conveyor cables are made up in 66-ft. lengths, the ends of which are connected at the motor junction boxes. As the cross conveyor is shortened, one of these lengths is coiled and eventually removed along with the junction box and drive unit in the process of the retreat. Because of the frequent adjustments made in the wiring to conform with the advances made in mining, all cables on the cross line are laid out on the floor where it is dry and held by

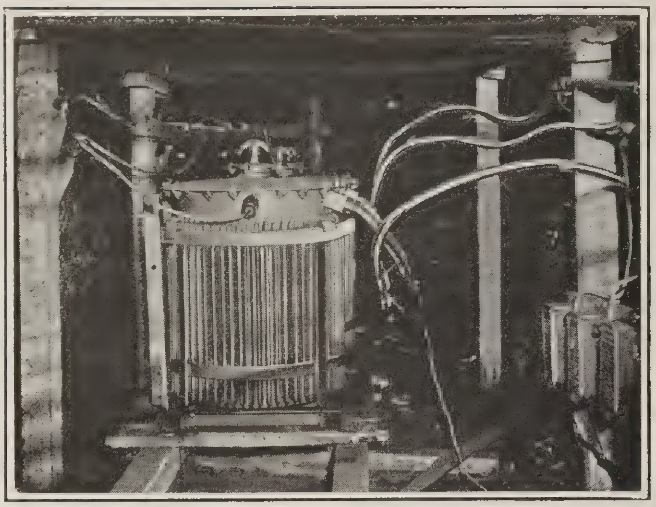

**Fig. 4—Transformers and Lightning Arresters**

This bank of three 75-kva. transformers step down the potential from 2,300 volts to 230 volts. The boxes on the right are low-voltage lightning arresters. These are connected on the secondary side of the circuit, with the air gap set slightly above the potential of the circuit.

insulator pins which are set along the ribs in wet places.

Alternating current for the electric drills on the faces is transmitted through a portable Tirex cable which is connected by polarity plugs on the metal case of the magnetic switches, *N*, at the junction point of the cross circuits. For lighting purposes, separate alternating current lines, *S*, of 115 volts lead from the transformers to all working faces. For the cutting machines a 550-volt direct current circuit, *T*, is led from the trolley circuit, *U*, to a plug, *V*, at the working faces.

All conveyors are controlled from the mine-car loading point. The main oil switch, *H*, closes the conveyor circuit which starts the lateral conveyor, but the cross conveyors are started separately through the magnetic switches, *N*, with the remote control, *P*, at the loading point. This remote control has a start-and-stop station for each cross conveyor and, therefore, any of them may be operated independently.

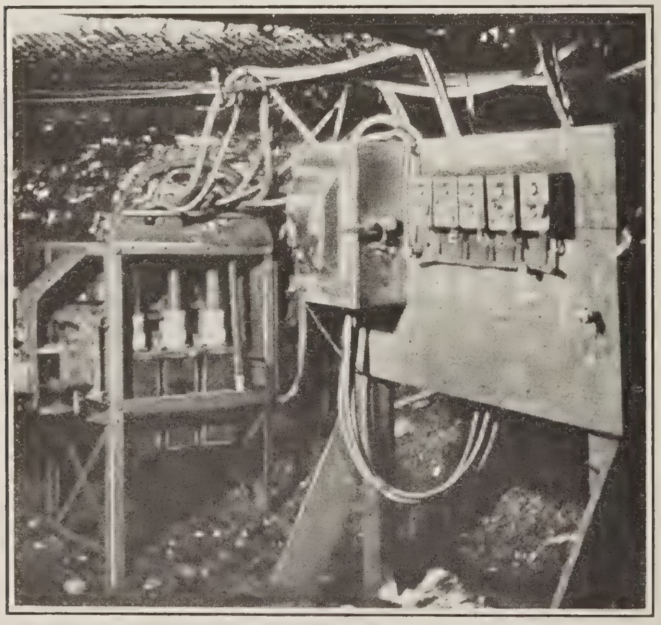

**Fig. 5—Main Switching Equipment**

These controls are located at the point where the lateral conveyor discharges into mine cars. From left to right the equipment consists of an oil switch, a lateral conveyor switch and remote control pushbuttons operating five cross conveyors in a battery.

In addition to the main control switches, each face conveyor, through its separate switch, *R*, can be stopped at any time at the face and may be started from this point providing its main control switch is still closed. The reversing switches for the face conveyors are used when starting the face conveyors under overload conditions, which sometimes occur at the beginning of a shift when the conveyors are thickly covered with coal rolled out in shooting. By running the face conveyor for a few inches in a reverse direction enough slack is provided to enable the conveyor to pull forward from under the coal without difficulty. The main reversing switch is used for reversing all motors in the entire battery when timbers and supplies are conveyed from the mine cars to the working faces.

As the conveyors frequently are stopped under full load while trips of mine cars are being changed, the motors are connected directly across the line in order to get full starting torque. The motors are started in groups. The main-line conveyor with a group of eight motors is started first. The cross-line conveyors, one at a time, are next started through the agency of the remote control switch and in groups of three or five motors depending upon whether the face conveyor switches are open or closed. The time required to start the entire battery of conveyors is 5 to 10 sec.

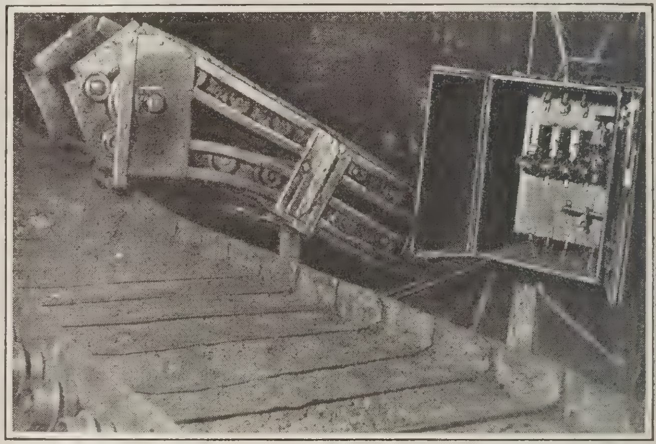

**Fig. 6—Magnetic Switch for Cross Conveyor**

This switch is located at the intersection of one of the cross conveyors and the lateral conveyor and controls the cross conveyors indirectly through a remote control arrangement on the main switchboard.

Because a high starting current is built up the motors are not fused independently; a fuse heavy enough for starting would offer no protection whatever from overload while the conveyors are running. Since the use of starting and running switches would complicate the wiring to a prohibitive extent, eliminating all fusing and protecting the entire battery with overload relays has proved satisfactory. These are located on the main oil switch, *H*, which is set at 600 amp., the tripping point of the entire battery of conveyor motors.

These wiring and control arrangements at first glance may seem rather complicated. The installation not only insures satisfactory electrical operation but also is designed to facilitate rapid connecting and disconnecting, which the mining system requires. Much time for experiment was spent before the system was developed to its present state. It is now considered satisfactory in every respect. When it is remembered that this wiring provides for an output of 1,250 tons per day, the mechanical and electrical work involved does not appear excessive.

# Unstable Dollar Causes Coal's Wage Troubles

**By Prof. Irving Fisher**
Yale University, New Haven, Conn.

THERE ARE TWO outstanding industries in the country which seem to have more than their share of "labor trouble"—the railroads and the coal mines. Not only are they constantly faced with the possibilities of a strike, but when the situation becomes acute, they are not allowed to settle the thing quietly.

A strike in a foundry or factory is heard of by the public and then at once forgotten, but a strike in the coal fields arouses public discussion, talk of nationalization and government interference in its settlement.

There is danger to the present organization of the coal mining industry that comes from public dissatisfaction with the way it is managed. But there is another disadvantage arising from labor troubles that is more imminent and is at the same time the basis of public criticism, and that is the loss in production during a strike. This loss is harmful to all. The miners lose their wages, the operators lose their profits and the public loses the chance of low prices. It is estimated* that in a recent strike in the Pittston field lasting from Nov. 24, 1924, to Jan. 26, 1925, the miners lost $3,827,750 in wages while the operators lost $840,000 and the world's supply of coal was decreased by 850,000 tons or about 1.7 times as much as New York City uses for the making of electricity. (The Pittston field produces about 9 per cent of the anthracite total of the country.)

It is not necessary to go further into detail to illustrate this axiomatic fact: strikes do much harm to all concerned, and frequently do no ultimate good even to the strikers. The important thing is to examine the reason for strikes.

### WAGES IS FUNDAMENTAL QUESTION

There is no doubt that the fundamental question is almost *always* one of wages. Yet is is not an underlying dissatisfaction with more wages but rather a dissatisfaction, due to the decrease of "real wages" (purchasing power of money wages). This decrease, in turn, is often due to the increase in the cost of living.

From 1916 to 1924 there were 24,834 strikes and lockouts. In 38 per cent of these the whole dispute concerned wages, and in 15 per cent more wages were a factor. It is significant that the greater number of disputes about wages occurred in 1917 during the first steep rise in prices, while the next greatest number occurred in 1920, the year of sudden price decline. The fewest strikes occurred in 1924, a period of stable prices. Eight per cent of all strikes are in the mining industry and 7 per cent of all strikers are coal miners. In 1917 there were 449 strikes of miners. From 1916 to 1924 a total of 280,585 coal miners struck.†

Before the war the miner had used a certain standard of living. Then came 1915 and 1916 with the sharp rise of prices. On the same money wages he found that he could not buy his accustomed quantity and quality of food, clothing and shelter for himself and his family. Moreover, the report came back to him that the operators were getting higher prices from their coal and were making more profits. Unable to gage the situation exactly, he assumed that he must demand higher wages, and, in order to be on the safe side, he doubtless often overstepped the mark and demanded increases out of all proportion to the rise in price (the falling value of the dollar).

Then prices began to go down and the miner changed his logic. He had been getting a certain number of dollars a day, why should the operator want to give him less? The answer that coal prices had fallen, and that profits had decreased did not satisfy him. It seemed to him that it was up to "the company" and not to the workers to make good the losses. Strikes resulted.

### BLAMES FLUCTUATION OF PRICES

It is clear all through that the real trouble lay in the fluctuation of prices. If the cost of living had not increased the miner would have lost an argument for an increase in wages. If the prices had not then fallen again the operator would not have found it necessary to reduce wages. It is not, then, as some of the miners think, "profiteering by the operator," or as some of the operators think, "greed of the miner" that is really at the root of the trouble. The real culprit is often our unstable dollar. That keeps the purchasing power of both wages and profits constantly fluctuating so that gains to one party are always being snatched away to the temporary disadvantage of one and advantage of the other.

It is possible to argue that since each one gains, and then loses, he comes out the same in the end. Even though this were true, it cannot help but cause dissatisfaction to the loser. And so one party is always desiring a change which the other will necessarily oppose. The result is the tremendous social and individual loss caused by the ensuing strikes or lockouts.

When the blame has been found to rest on neither party, but rather on our unstable dollar, it should be easy to correct the trouble.

One question then becomes important; how to combat unstable money. The Philadelphia Rapid Transit Co. is struggling with this problem and is about to offer a solution more accurate than any previously attempted. In England millions of laborers have had their wages automatically adjusted by an index number of the cost of living, and during the war several firms adopted this system in the United States.

There are today, various other plans which have been devised to solve this problem. Some attempt to stabilize the dollar itself.

Money, our measure of *value*, is our most frequently used *measure*. Others, less important, such as the yard, the peck, the pint, the pound, etc., were "fixed" a long time ago. A yardstick that constantly changed its length is inconceivable to us today, and yet we put up with a "yardstick" of commerce that is almost never the same two weeks in succession. How long will we let our dollar have a varying amount of purchasing power? How long will we put up with a situation where one person is constantly losing when another gains; where there results friction, strikes and ultimate loss to all?

## Anthracite Men Lay Down Tools with No Prospect of Peace

### Wild Last-Minute No-Strike Efforts Fail—Operators Hope Next Settlement Will Provide Adjustable Wage Scale—Miners Like Maintenance Plan

**By Sydney A. Hale**
Special Contributor, *Coal Age*,
New York City

The anthracite strike is on.

Both sides are digging in for a long struggle, if necessary.

The suspension, predicted by pessimistic observers following the first clash of the operators and officials of the United Mine Workers at Atlantic City, N. J., on July 9, officially became effective at midnight Monday. Many workers, anticipating the formal order issued from the temporary headquarters of the union chiefs at the Bellevue-Stratford Hotel, Philadelphia, Pa., Aug. 27, began to clean up and remove their tools the latter part of last week. By Monday night the army of anthracite union workers, estimated at from 145,000 to 158,000 men and boys, had dwindled down to a few thousand maintenance men.

For a time it looked as if even this group would be called out because the operators and miners wrangled through three conferences at the offices of the Philadelphia & Reading Coal & Iron Corporation, Philadelphia, before reaching an agreement on the status of those men. As a matter of fact, the first suspension order was mailed before this agreement had been reached and was supplemented by a second order dated Aug. 28.

This second order, covering the agreement on maintenance men, contained these paragraphs:

> The agreement in substance permits the continuance of necessary maintenance occupations. Maintenance men in such occupations are not to be replaced by others. Otherwise normal conditions that prevailed during idle periods in the past are to be the basis for this agreement. Any general settlement made will be retroactive to Sept. 1 affecting maintenance men. Copy of the agreement is herewith inclosed.
>
> We consider this agreement an advanced step over similar agreements and fully protects our every interest.
>
> Concerning the manner of handling maintenance work, we would state that all work necessary to preserve the normal conditions of the colliery, regarding ventilation, drainage and protection of property, is permitted. This involves such work as necessary engineers, boiler house employees, pump men, fuel men, electricians and those necessary to keep operating units in order.
>
> If the operators desire that maintenance work be done not in keeping with these instructions, the mine committees are advised to take such matters up with the district officials in their respective districts before taking final action.

These strike orders were not promulgated, however, until after last minute efforts to prevent the shutdown had gone out in a burst of melodramatic cross-country chases and pre-dawn conferences. These efforts began with the creation of a Citizens' No-Strike Committee composed of business men in the anthracite region. Sneered at and frowned upon at the outset by President Lewis of the United Mine Workers, who tartly served notice on the body headed by John H. Uhl, of Wilkes-Barre, to keep its hands off, the committee persisted in its efforts. Mr. Lewis, however, finally met the committee at the Altamont Hotel at Hazleton on Aug. 25 and in an address which lasted nearly three hours, delivered a justification of the miners' position and an attack upon the operators. He said:

"If they (the operators) will withdraw their statement on record in the conference (at Atlantic City) that they will yield nothing and reject everything that disturbs the factor of mine costs, then there can be negotiations."

With this statement as its thread of hope, the citizens' committee met the operators in the Hotel Sterling, Wilkes-Barre, the following day.

Major W. W. Inglis, replying for the operators, reviewed very briefly the breaking off in the Atlantic City negotiations and stated frankly that the producers were unwilling to abandon their position on increased wages, the check-off and other demands. "Our minds are not closed to meritorous demands of any kind," said the major, "and we are prepared to discuss fully such demands, but we are not willing to withdraw opposition to demands which we regard as being without reason or substantial merit.

"As to the needs of the immediate situation, we are thoroughly in accord with your desire to avoid a suspension. To that end we renew our proposal that, pending the results of further effort to draw up a new contract, the operators and miners agree that there shall be no cessation of operations. We see no good reason why there should be a strike or suspension while efforts are being made to negotiate a new agreement."

### *Hard-Coal Miners Off For Europe*

On Aug. 24 no less than 50 miners of the anthracite fields, apparently confident the mines were to shut down Sept. 1, booked passage for Italy and other Central European countries. Most of them were happy and bore full pocketbooks. Some of them said they would take as much $50,000 with them to invest in home-country real estate. "Can buy about my whole home town," said one. This sort of exodus to Europe occurs just before every strike. About 75 per cent of the men return.

#### Inglis Interprets Answer

The committee was plainly disappointed at the answer. After a recess of an hour Major Inglis made the following statement:

"You wish further interpretation of our answer to your questions presented by you today. We hoped that you would understand our reply to mean this: In order to avoid a suspension on Sept. 1, 1925, we are willing to renew the negotiations with the representatives of the mine workers looking toward a new agreement, provided you can arrange a conference and provided further it is distinctly understood that we have not agreed to abandon our opposition to the check-off and wage increases, both of which we are willing to consider fully, but both of which we now believe to be unsound and unwarranted."

Still hoping against hope, Chairman Uhl, accompanied by Ralph A. Ammerman, another member of the committee, started out to carry this message to John L. Lewis. Mr. Lewis and a number of his associates had been attending a picnic in the vicinity of Wilkes-Barre. As soon as they learned the results of the meeting they had commenced the return trip by automobile to Philadelphia. Mr. Lewis and Vice-President Philip A. Murray led the caravan in a high-powered roadster; Secretary-Treasurer Thomas Kennedy and James L. McAndrew, secretary of District No. 9, U. M. W., followed in a smaller car.

"Half a league, half a league, half a league" more or less behind came the pursuers, Messrs. Uhl and Ammerman, in a new straight-eight roadster (name not furnished on request) with an enterprising news hound perched peril-

## *Anthracite Strike Chronology*

The demands of the miners, which resulted in the present suspension, were framed at a convention of Districts 1, 7 and 9 of the United Mine Workers, held at Scranton, Pa., June 29 to July 3. These demands include a two-year contract, the check-off, a 10 per cent increase to tonnage men and $1 per day to day men, equalization of rates for the same labor in individual collieries and the fixing of certain minimums, punitive overtime and payment by weight.

The chronology since July 3 has been as follows:

July 9: Joint meeting of operators and miners at Atlantic City, N. J., where President Lewis presents miners' demands and S. D. Warriner, spokesman for the operators, replies that competition makes further increases impossible; offers arbitration.

July 10: Subcommittee of general scale committee organized; committee adjourns to July 14.

July 14-17: Subcommittee meets at Atlantic City to discuss demands; operators refuse to join with miners in petition to Interstate Commerce Commission to investigate freight rates.

July 21-24: Subcommittee continues discussion of demands.

July 28-31: Subcommittee concludes consideration of first six demands.

July 31: Lewis writes Warriner demanding that he and W. J. Richards take part in negotiations.

Aug. 3: Warriner declines Lewis request; renews offer to arbitrate.

Aug. 4: Subcommittee adjourns *sine die* after operators refuse to bind themselves to wage increases and miners again reject arbitration.

Aug. 8: Warriner writes Lewis, suggesting resumption of conferences.

Aug. 9: Lewis declines to reopen negotiations unless operators change position on wage demands and check-off.

Aug. 20: Business men in anthracite region organize committee to bring operators and miners together.

Aug. 25: Lewis meets committee at Hazleton; insists operators must recede.

Aug. 26: Operators in meeting with committee at Wilkes-Barre refuse to abandon position on wage increases and check-off.

Aug. 27: Suspension order issued at Philadelphia.

Aug. 28: Status of maintenance men fixed.

Sept. 1: Strike begins.

ously in the rumble seat. It was some time before the union leaders learned that they were being pursued. By that time, a breakdown had set them out of the current of traffic and the pursuing car had thundered by unknown. The midnight hour had passed before Mr. Lewis and his friends stumbled into the lobby of the Bellevue-Stratford, tired, bedraggled and begrimed, to find a hungry twain from the Citizens' Committee waiting for them.

But even the wild ride did not persuade Mr. Lewis to recede from his position that no resumption of negotiations was possible until the operators had withdrawn the statements to which the union objected. Defeated, the members of the committee started back for Wilkes-Barre as dawn was breaking over the Susquehanna. At a meeting at Scranton, Friday night, the committee disbanded.

The issuance of the formal suspension order was met with a statement by Major Inglis denouncing the union action as subversive to the prosperity of the anthracite industry. The order, he declared, would cost the workers $1,000,000 in wages.

"There are stronger influences at work than a desire to protect the anthracite industry and the anthracite region from the calamity of a strike," he continued. "The feeling is growing that union policy is dominated by its greater concern in soft coal affairs. This was admitted to be the case in the long strike of 1922, and it looks as though it was true today.

"Naturally, this does not lessen resentment in the anthracite region that this calamity should come upon it. The idea that miners cannot work unless they have a contract that satisfies them in all respects is a relic of the dark ages of unionism. It must yield to reason in the end. So must the strike habit. These recurring suspensions are a curse and a reproach. They must be ended by the acceptance of a sane and reasonable method of settling differences by some form of arbitration rather than by resort to force."

The desire for arbitration was again emphasized by Mr. Inglis in reviewing the situation before a meeting of the producers held at Philadelphia on Friday. "In view of the present situation," he concluded, "your committee strongly recommends that the operators maintain a firm stand for arbitration of the present differences, to prevent a recurrence of interruptions such as the one about to start. It believes that any settlement effected should be of a permanent nature, providing for a readjustment of the wage scale from time to time, to allow of prices for our product that will enable it to move freely in competition with other fuels."

Neither statement narrowed the breach between the operators and the miners. The latter withheld any formal answer to the charges made by Major Inglis, but ridiculed the idea that the anthracite strike was undertaken to bolster up the position of the organization in the bituminous fields. The fact that the 1922 hard-coal strike outlasted the soft-coal suspension that year and the differences in the predominating sources of consumption of the two fields were offered to disprove the charge.

## Pittsburgh Coal Co. Miners Form New Union

Pittsburgh, Pa., Sept. 1.—A movement that may result in highly important developments in the coal industry, particularly in the Pittsburgh district, has been inaugurated here with the formation of a new miners' union. The initial step was taken by the men employed at Banning No. 2 mine of the Pittsburgh Coal Co., at Whitset Junction. This mine was opened recently under the 1917 scale, the first union mine in the Pittsburgh district to step into the lower wage payers.

At a meeting of the men in the Banning school house officers were elected for the local, which is designated as No. 1. Of the officers are John Mills (negro), president; M. E. Miller, vice-president, and Daniel Jefferson (negro), secretary. Albert Hillman, Morris Perkins, Blanchard McFely and Marsh Hilloman were appointed to the pit committee. Charles Hill was elected doorkeeper and Andrew Wilson check weighman. E. S. McCullough, industrial aid of the Pittsburgh Chamber of Commerce, was asked to draw up a constitution and by laws for the union.

### Will Movement Spread?

The big interest in the movement here is how far it will spread. The Pittsburgh Coal Co. on Monday morning had 155 men working in the Banning mine, it is announced. This is the highest number so far. There were 206 pickets on duty, of whom 52 were women and children. The company loaded 493 tons at the mine Saturday and expected to do as well each day the early part of this week. Up to Monday 1,600 tons of coal had been produced.

While resumption of mines in the Pittsburgh district is generally discussed, independents have thus far been unable to establish a foothold with the 1917 scale. The Pittsburgh Coal Co.'s Banning No. 2 mine at Whitsett Junction, Pa., is the only mine that has been converted. An operation near Imperial lasted two days, then quit.

## Illinois-Wisconsin Retailers Elect N. H. Kendall

Reorganization of the Illinois and Wisconsin Retail Coal Dealers' Association, one of the pioneer organizations in the field, has been effected within the last few days. I. L. Runyan, secretary of the association for the past 15 years, has retired. N. H. Kendall, for a decade commissioner of the Chicago Coal Merchants' Association and more recently with C. M. Moderwell & Co., has been named as his successor with the title of managing director. Another veteran to retire is C. S. Dodge, Monroe, Wis., who relinquishes the office of treasurer to Peter Beck, Harvey, Ill. Mr. Beck has taken an active part in association work for a number of years. Ex-President Russell H. Jones, Kenosha, Wis., has been elected to the newly created position of secretary of the board of directors. R. C. Wagner, Champaign, Ill., is president. Headquarters will be continued at Chicago.

# Soft-Coal Mines 24 per Cent Safer than In 1924—Did Rock Dust Help?

Bituminous coal mines in this country are getting safer. During the first seven months of this year fatalities were 24 per cent less than in the same period of 1924, thanks largely to a great reduction in dust and gas explosions. It is possible rock dusting and the present-day safety drive are responsible. Accident records covering the seven months show a loss of 1,262 lives in the coal-mining industry, which is 225 less than the number reported for the corresponding months last year. Of the 1,262 fatalities, 929 were at bituminous mines and 333 at anthracite mines. The gross fatality rate for the seven-month period was 3.85 per million tons, as compared with 4.64 for the same period in 1924. The rate for bituminous mines alone was 3.38 as compared with 4.43 during the first seven months of 1924, a reduction of about 24 per cent. The anthracite rate for the seven months was 6.21 compared with 5.71 in the same months last year.

An analysis of the causes of the 1,262 soft-coal mine fatalities in 1925 shows a very marked reduction in the per-million-tons death rate from explosions of gas or coal dust, the rate being 0.72 for 1925 and 1.41 for the seven-month period in 1924. A slight reduction in the fatality rate from falls of roof or coal is also shown by the reports. The rates for haulage and explosives are slightly higher than in 1924. A comparison of the rates for the first seven months of the two years is shown by the figures in the following table:

| | Jan.-July 1924 | Jan.-July 1925 |
|---|---|---|
| All causes | 4.636 | 3.847 |
| Falls of roof and coal | 1.883 | 1.722 |
| Haulage | 0.608 | 0.655 |
| Gas or dust explosions | 1.406 | 0.722 |
| Explosives | 0.168 | 0.195 |
| Electricity | 0.125 | 0.128 |

The July fatality rate in bituminous coal mines this year was 23 per cent below the average for 10 years and 17 per cent below July of last year, according to information received from state mine inspectors by the Bureau of Mines, Department of Commerce. The anthracite rate also was less than the 10-year average so that the total rate per million tons for the month was drawn down to 3.45 deaths per million tons of production. A total of 166 lives were lost producing 48,126,000 tons of coal.

Of the 166 fatal accidents in July, 51 were at anthracite mines in Pennsylvania, and 115 were at bituminous coal mines throughout the United States. The fatality rate for bituminous mines was 2.91 per million tons, based on the month's production of 39,582,000 tons; in July last year the corresponding rate was 3.51, while over a 10-year period (1915-1924) the July rate averaged 3.79. The anthracite rate for July, based on a production of 8,544,000 tons, was 5.97 deaths per million tons, as compared with 5.54 for July last year and 6.32 for July during the ten-years 1915-1924.

### *Logan Tells Bittner To Get Out*

Van A. Bittner, international organizer for the United Mine Workers in northern West Virginia, and his party of other mine union officials left Logan County, Aug. 25. without indicating their destination after having been served with notices of a permanent injunction restraining their organization from attempting unionization of the miners in the Logan coal fields. After the injunction notice was served the union officials received a special committee from the Logan chamber of commerce, whose spokesman told Bittner and his party that "your presence is not desired." The injunction for which notices were served was granted in 1923 to sixty-five coal companies in the Logan field and made permanent in January, 1924.

---

The Louisville & Nashville R. R., of Louisville, Ky., one of the largest systems operating in the south, and also a big coal producing road, used a total of 4,111,963.35 net tons of soft coal in locomotives during the twelve months period ending June 30, 1925.

## Coal-Mine Fatalities During July, 1925, by Causes and States

(Compiled by Bureau of Mines and Published by *Coal Age*)

| State | Underground | | | | | | | | | | | | Shaft | | | | | Surface | | | | | | | Total by States | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Falls of roof (coal, rock, etc.). | Falls of face or pillar coal. | Mine cars and locomotives. | Gas or dust explosions combined. | Explosives. | Suffocation from mine gases. | Electricity. | Animals. | Mining machines. | Mine fires (burned, suffocated, etc.). | Other causes. | Total. | Falling down shafts or slopes. | Objects falling down shafts or slopes. | Cage, skip or bucket. | Other causes. | Total. | Mine cars and mine locomotives. | Electricity. | Machinery. | Boiler explosions or bursting steam pipes | Railway cars and locomotives. | Other causes. | Total. | 1925 | 1924 |

## Northern Producers Plan to Combat Rate Advantage Won By Southern Coal Shippers

Philadelphia, Pa., Sept. 2—Operators representing the northern bituminous coal fields will meet at the Hotel Bellevue-Stratford this afternoon to determine what action, if any, should be taken with respect to the recent decision of the Interstate Commerce Commission opening up New England and the Middle Atlantic states to all-rail prepared sizes from the low-volatile fields of southern West Virginia. The conference, to be participated in by representatives from the northern West Virginia, Maryland, central Pennsylvania and Pittsburgh districts, will also take up the question of promoting an educational campaign to acquaint the domestic consumers of the East with the virtues of bituminous coal for household consumption.

The meeting this afternoon follows an all-day conference held here last Friday at which the Interstate Commerce Commission decision was discussed, first, by the operators, and then between the producers and officials of the Trunk Line carriers. Although no official statement of progress was issued at the conclusion of this meeting, the opinion is held by many of the coal men interested that the decision favoring the Southern fields is part of a government policy to smooth the competitive path of the non-union producers. This policy is traced back to the message of President Harding in which he declared that, except for the output from the unorganized fields, the United Mine Workers had the country by the throat, and the subsequent recommendations of the United States Coal Commission that the use of substitute fuels in anthracite - consuming territory should be encouraged.

### No Emergency Exists

The Northern operators, particularly those in the low-volatile areas, feel that the decision fails to give proper recognition to the case presented by them. While they might not object to the publication of joint through all-rail rates from West Virginia as an emergency proposition, they insist that such an emergency does not exist. Against the 500,000 tons monthly that the Commission estimated the Southern fields might add to the domestic coal supply of the Northeast, the Northern fields assert that they can produce and ship 2,000,000 tons. Routes and rates for this latter movement are already available. On the other hand, the rates ordered from West Virginia apply via the Potomac Yard and Hagerstown gateways. To throw such a movement through those gateways, they declare, would mean congestion and delay that would dilute the car supply of all mines shipping to Eastern consuming points. The differentials of 61c. to $1.10 over Clearfield rates for distances 225 to 465 miles greater also are attacked as preferential to the Southern producers.

Three possible courses of action have been suggested, viz., to apply to the Interstate Commerce Commission either for a modification of its order, a rehearing, or a reargument of the case. The meetings with the railroads have been held with the hope of persuading the carriers to join with the Northern fields in whatever action may be decided upon, but the outlook in that direction did not appear bright at the adjournment of the Friday conference.

**James E. Black**

Who, in the absence of F. G. Tryon, who is on furlough for a brief period from the Bureau of Mines to make a study of statistics of fuel and power for the Institute of Economics of Washington, is in charge of the coal unit of the Division of Mineral Resources. Mr. Black has had long experience in coal accounting and was associated with David L. Wing in the service of the U. S. Coal Commission. Prior to his service with the Coal Commission Mr. Black was an examiner with the Federal Trade Commission.

## New England Has More Coal Now than Last Year

The Aug. 25 report of Eugene Hultman, chairman of the Massachusetts special commission on the necessaries of life, showed that his state on Aug. 1 had 2,625,690 tons of domestic anthracite on hand in retailers' yards or already delivered to householders, as compared with 2,576,191 Aug. 1 last year. Thus in the face of an anthracite miners' strike, Massachusetts, which sets the pace for all New England in coal consumption, was in possession of little more than an average quantity of hard coal.

### *Industrial Coal Stocks Increase in July*

Industries increased their coal stocks by more than six million tons in July, according to the National Association of Purchasing Agents. Larger supplies of both anthracite and bituminous coal were laid in, probably in anticipation of possible trouble in both fields. The amount of coal on hand in industries Aug. 1 is estimated by the association at 46,373,000 tons of anthracite and bituminous combined. This is sufficient to last 48 days based on the amount of coal consumed in July. Consumption in July exceeded that of June by approximately one million tons.

## Hard Coal Strike Scares Country Little This Time; Miners' Outlook Not Good

By Paul Wooton

Washington Correspondent of *Coal Age*

The anthracite agreement came to an end this year in an entirely different setting than did that of 1902 when President Roosevelt intervened. Then there frequently was real misery among the mine workers. Their standard of living was below that in many other industries. Then there was a great body of consumers to whom substitutes were unfamiliar and to a considerable extent unobtainable.

As the agreement wound up this year and the strike started, the mine workers were enjoying a standard of living that exceeds that of many other American industries and is so far ahead of that of any group in Europe as to be incomparable. There is no poverty or genuine grievance among them. They are prosperous and are saving money.

The mine workers have forced up the wage rate until their product has become a luxury. Incidentally they opened the way for the entry of oil, coke and high grade soft coal into what could have been kept an exclusive market. A situation has been brought about where adjustments could be made quickly were anthracite to disappear from the earth. The second winter it hardly would be missed.

Instead of finding desperate consumers pleading with federal officials for protection as was the case in 1902, the expiration of this year's agreement found the consumers in a very different state of mind. They were bending their efforts to free themselves of dependence on a single fuel. They did not want the federal government to interfere. The strike would have to last twelve months, it is believed, before any great pressure would be developed for federal intervention. When a former fuel administrator of New England—a man noted for the vigorous way in which he has championed the cause of the consumer—comes out and urges the use of substitutes, it would seem that the public will take the matter more seriously than ever before.

The mine workers also faced a different situation than ever before as the agreement expired. They had to decide between holding the high wage scale they had attained and embarking on a desperate adventure involving the possible destruction of their union and the loss of half their market. Loss of half the market would mean the reduction of the working force by 75,000 men. It would mean lowering of prices to win back what had been lost.

The anthracite situation has served to emphasize that the main objective of organized labor in this country now should be holding what it has. If an effort is made to force wages to higher levels the existing structure is likely to be wrecked. Our resources are such and the capacity of our managers and our workers is such that we may be able to maintain present standards, but it is going to be a tremendous task—one that calls for full co-operation between employer and employee.

## Stealthy Union Effort In Logan County May Be "Grandstand Play"

Is the publicity stir about organizing the Logan and Mingo Counties coal fields in southern West Virginia a "grandstand play" to appease the coal operators of the Central Competitive Field or is it business? This question is being asked generally in the coal fields of the "Little Mountain State."

Coal operators in the northern field of West Virginia who had their tussle with the union and seem to have its shoulders on the mat, say that it is a grandstand play to placate the 100 per cent organized Central Competitive Field and to make men there feel good over another attempt to organize "the citadel of non-unionism" in bituminous coal fields or what the miners sometimes call "hard-boiled non-union."

Visitation of Van A. Bittner, chief international representative of the United Mine Workers in northern West Virginia, and members of the international executive board members to Logan and Williamson two weeks in succession has naturaly caused a stir. These impregnable non-union strongholds have been unmolested since Keeney's armed march on Logan. Mr. Bittner and his party were requested by a committee of Logan citizens to leave there.

An effort is being made by the United Mine Workers to have John L. Lewis, international president, visit the northern West Virginia and Panhandle sections on Labor Day or soon afterward, but it is believed that he will be unable to come because of the pressure of business. If a strike is called in the West Virginia bituminous coal fields it is believed that it will not be staged until the middle of October.

### No Settlement Reached

Several conferences were held recently with John H. Jones, president of the Bertha-Consumers Co., in Pittsburgh, but no settlement has been reached. It is believed that the company is awaiting the action of the miners incident to the expected strikes in the anthracite and bituminous fields. The Rachel mine at Downs, W. Va., continues to work non-union and the Bertha mine, near Morgantown, in northern West Virginia, continues to work with union miners, pending a settlement at Rachel.

Recently a great deal of trouble has been started in Monongah, where the municipal officials are either members or closely identified with the United Mine Workers. After being criticised in a public meeting Mayor Harry Bennett conferred with the sheriff and claims that the non-union forces were as bad offenders and law-breakers as the union miners. The sheriff agreed to post two deputies there daily. Charges were made that the town officials were not enforcing the law.

A rumor afloat that Italian miners were deserting the union was quickly denied by Nick Aiello, a former president of Sub-District No. 4, District No. 17, who is of Italian extraction. The miners claim that the story is operators' propaganda.

## *Klansmen Pallbearers Bury Negro Miner*

Roderfield, W. Va., witnessed the peculiar spectacle, Aug. 23, of a group of Ku Klux Klan members serving as pallbearers at the funeral of a negro miner. Samuel Obrey, the negro, was killed in a mine in Fall River and the body was sent to a Roderfield undertaker for burial. As the coffin was placed in the hearse to be taken to the cemetery a Ku Klux Klan meeting, held in rooms over the undertaking establishment, was dismissed. Noting the absence of mourners, several Klansmen boarded the hearse, while others fell in behind and marched to the cemetery, where they lifted the coffin from the hearse and lowered it into the ground.

## Soft-Coal Strike Threatens; Southwest Miners Quit

Government officials are on the anxious seat lest trouble in the soft-coal fields follow in the wake of the anthracite strike. Since John L. Lewis delivered his threat of a general bituminous strike at the tri-district convention of anthracite miners, at Scranton, last June, many local unions have notified him that they will support such action. Agents of the U. S. Department of Labor are understood to have been ordered to look into this situation.

William Dalrymple, president of district 21, comprising Oklahoma, Arkansas and part of Texas, issued a strike call at a mass meeting of miners at Hartshorne, Okla., Aug. 30, urging all union men working in mines of companies that "have repudiated their contracts," and others working at wages less than the 1924-25 scale, to cease work the following day. Three-fourths of the union miners of the district were expected by union officials to go on strike at midnight.

Dalrymple's order expressed confidence that the union would be able to win its strike and restore the 1924-25 scale.

---

## North American Co. to Distil Pulverized Coal

The International Combustion Engineering Corporation has contracted with the North American Co. to construct plants for low temperature distillation of coal which will greatly reduce, it is said, the fuel cost of the North American's electric power stations. The initial plant will have a capacity of 210 tons a day and will be erected at the Lakeside plant of the Milwaukee Electric Railway and Power Co., a North American Company subsidiary. Construction of this plant will begin at once. The new system distils the pulverized coal now used and the pulverized coke obtained will be burned under the boilers. The other byproducts will be motor spirits, tar and gas.

## Two Tipple Fires Blamed on West Virginia Strikers

A reign of terror broke out in the northern West Virginia strike zone late last week, when two tipples were destroyed. Fire of undetermined origin burned the tipple of Junior mine of the Harry C. Coal Co., in Keen's Run, near Everson, Marion County, between 2 and 3 a.m., Aug. 28, with a loss estimated at from $20,000 to $30,000. The mine owners allege that the tipple was fired by persons who did not want the mine put into operation on a non-union basis. The mine was idle for two years, but recently the mine cars were put into repair and plans were made to reopen the mine soon.

The tipple at mine No. 55 of the Consolidation Coal Co., at Meadow Brook, Harrison County, was burned down Saturday morning, Aug. 29, entailing a loss of $40,000. In addition to the tipple the box-car loading shed and the blacksmith and machine shops fell an easy prey to the flames. The mine was not in operation and no mine guards were on duty at the plant. According to reports three men fled from the tipple soon after the fire was discovered. It was reported that the company was getting ready to reopen the mine, but this was denied by officials, according to reports.

A new daily non-union coal loading record was attained Tuesday Aug. 25, when 1,697 cars were produced. The heaviest daily loading on the Monongah Division, B. & O., was reached the same day at 965 cars.

Thirty-seven striking union miners are charged with contempt of court at Grafton by officials of the Maryland Coal Co., of West Virginia. It is recalled in statements being forwarded to Judge Warren B. Knittle at Philippi, that the men solicited non-union miners working at its Wendel mine to join the United Mine Workers and leave the company's employ. The injunction granted to the company specifically restrains union officials, members or agents from doing such acts.

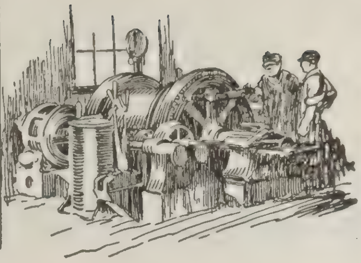
The Consolidation Coal Co. is dismantling mine No. 37, at Berryburg, near Philippi, and the steel is being shipped to other company mines. The reason for closing down the mine, it is reported, is that the operation cannot be worked profitably because of long hauls. The mine has been operated since 1900.

---

## Russians Visit Mine Fields

The Birmingham district was visited Aug. 20 by three members of the Soviet Russian Coal Commission, representing the Donugal Trust, which controls and operates the Russian coal mines. In the party were N. T. Schibaieff, N. I. Levfcheko and Z. E. Zorin, of Ukraine, South Russia. They were shown over the district and visited both coal and ore mines. The visitors were tendered a dinner during their stay in Birmingham. From Alabama they went to the Colorado coal fields. The commission in the United States consists of nine members divided into three groups in order that the coal producing centers might be visited and inspected as quickly as possible.

# Practical Pointers For Electrical And Mechanical Men



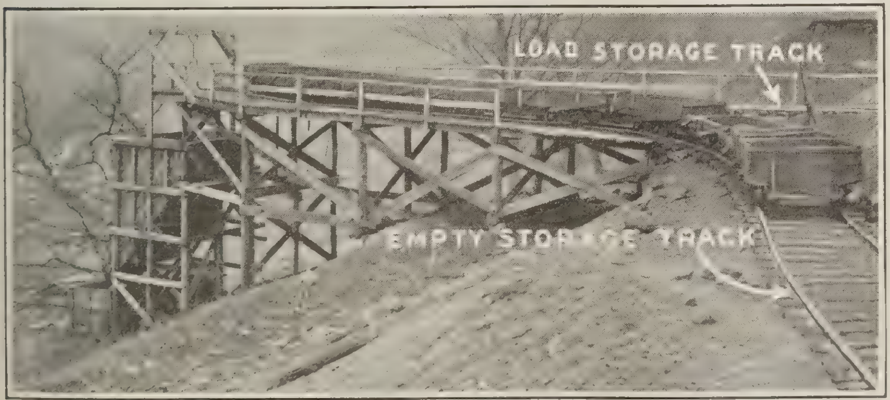
## Gravity Switching of Mine Cars Aids This One-Man Dump

At our old Detmold mine the force of gravity is being used to the utmost in handling and dumping mine cars containing slate. The mine mouth lies several hundred feet above the valley so that unlimited space for rock disposal is available. Cars of slate are switched by gravity from the trip and then allowed to drift down the rock storage track which is long enough to take 25 cars. One loaded car at a time is drifted into the dead-end type dump by one man who also disposes of the slate. After each car is emptied it is pushed from the dump and thence by gravity passes through a spring switch and onto an empty storage track.

Beneath the dump is a bin which holds about 15 mine cars of slate. This dump is equipped with an electric undercut gate. After the attendant has dumped enough slate to fill the bin, he goes below and by means of an electric larry distributes the slate on the bank of the dump. The layout is shown in the accompanying illustration.

The Detmold mine is quite old and at present is producing only about 500 tons of coal per day. At this rate of coal production about 40 cars, or about 150 tons, of slate must be handled daily. The one man will easily dispose of this quantity in about four hours; often he has handled 80 cars of slate in one 8-hr. shift. In fact, this scheme is so ideally arranged that after the rock is switched out of the trips, we hardly realize that we have a rock dump because it gives us so little trouble.

ELKINS READ,
General Supt.
Maryland Coal Co., Lonaconing, Md.



**One Man Can Dump 80 Cars a Day Here**

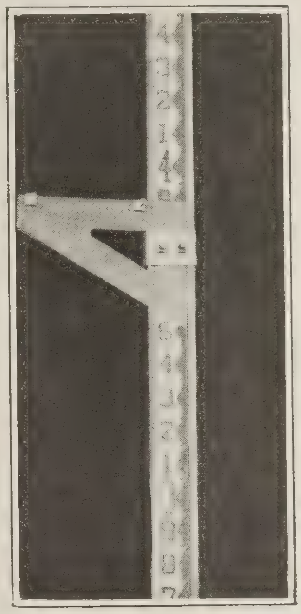
This layout increases efficiency in the handling of slate. Mine cars are switched from the trips coming from the mine and are dropped by gravity through the load storage track to a dead-end dump. After being emptied the cars are pushed off the dump and thence by gravity pass through a spring switch and descend the empty storage track.

---

### Home-Made Instrument Aids In Measuring Coal Berm

For ascertaining the height of a coal berm in a strip pit or that of other objects to which direct access cannot be gained so that they may be measured with a rule or tape, the device shown in the accompanying illustration has been devised by Otis Bledsoe, engineer of the Sunlight Coal Co., of Boonville, Ind. This contrivance is extremely simple and was evolved from materials partaking largely of the nature of "odds and ends" found in the coal-mine office. While it will not give results that are absolutely accurate they are sufficiently exact for all practical purposes.

The firm with which Mr. Bledsoe is connected does much coal stripping. As the beds worked vary more or less in thickness and it is difficult if not impossible to obtain a direct measurement on the height of the berm from the footwall to the top of the coal he hit upon this scheme.



**The Height Finder**

To determine the height of the berm in a strip pit with this instrument it is only necessary to set the rod on the footwall, hold it vertical, sight across the two bolts projecting from the triangle, raising or lowering it until the line of sight coincides with the top of the berm. The reading of the triangle on the rod is then the thickness of the coal at that point.

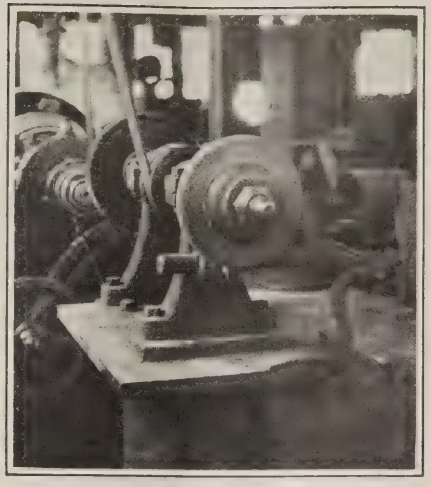
This device consists of an old level rod, an ancient zylonite drawing triangle, a plumb bob and a metal clamp holding the triangle to the leveling rod in such a way that it may be slid up or down like a target. Two small bolts are also provided. These project from the side of the triangle close to its upper edge and serve as sights.

In use the level rod is set up on the footwall as close to the toe of the berm as possible, the plumb bob indicating when it is in a perpendicular position. The triangle is then moved up or down until the line of sight across the two bolts strikes the top of the berm. The reading of the top of the triangle on the level rod then gives the thickness of the coal.

## Scrap Heap Yielded Most of This Grinder's Parts

In the ordinary mine shop few machines are used more frequently by everybody than is the grinder. This is utilized not only for shaping edged tools of all kinds but for smoothing rough surfaces or ends, for cutting hard steel bars and the like. The grinder thus forms one of the tools that is almost indispensable in shop operation, and not a few shops use several such machines.

In the accompanying illustration may be seen a grinder employed in the No. 4 shops of the Kingston Coal Co., at Kingston, Pa. Although this machine was built up from odds and ends picked up around the shop and from the scrap heap it serves excellently the purpose for which it was intended. Briefly the mandrel for this grinder, together with the flanges that hold the two wheels, was forged and turned up in the shop. The two bearings and the pulley originally formed part of the governor of a large engine. The stand upon which the wheels are mounted is a piece of heavy pipe embedded in the concrete floor and having a rectangular piece of heavy plate cap screwed to the flange upon its upper end. The adjustable rests were made in the shop.



**Largely Salvaged**

The two bearings and pulley were reclaimed from the scrap heap and the mandrel rest and stand made in the shop. This grinder, while not very graceful of outline, is nevertheless a sturdy and effective tool.

## Change of Foot Valve Remedies Pump Trouble

At one of the mines belonging to the company by which I am employed the power plant draws its water supply from a pumping station located about a mile away. Originally this station contained one 250-gal. pump designed for a 160-ft. head. This discharged to the power plant through a 4-in. line of cast iron pipe. When more boilers were added another pump was installed, the two machines being piped in parallel.

These pumps would not operate successfully under this arrangement so they were piped in series making virtually one 6-stage machine. The load, however, kept on increasing, the boilers were forced in order to furnish the necessary steam and more water had to be supplied. To complicate matters the water contained impurities that began encrusting the inside of the pipe until the clear bore did not exceed 2½ to 3 in. so that it became necessary to lay a 6-in. discharge line.

When this line was completed the original pump was attached to it and supplied more than enough water. The 4-in. line was then relaid to one of the other mine power plants. The second pump was connected to this line but was also piped in parallel to the 6-in. line so that either or both pumps could discharge to the power plant, thus giving it the benefit of both machines in case of emergency. It also could be supplied by either pump if necessary.

In due time an emergency arose and both pumps were turned onto the 6-in. line. After a few minutes of operation, however, the size of the stream delivered indicated that the machines were sucking air, but careful examination failed to reveal any air leaks. Finally the second pump was throttled down, whereupon its current consumption rose. Now ordinarily throttling a centrifugal pump lowers the reading of its ammeter, but with this machine, the reading increased.

This was somewhat bewildering. It looked as if the machine was not getting enough water. Accordingly the suction line was pulled up and it was found that the 3-in. foot valve lifted only about ¼ in. and inasmuch as this pump was operating under a head far less than that for which it was designed its suction was thus throttled. A new 4-in. flap check valve rectified this trouble and today the pumps work together without difficulty when discharging to a common delivery line.

GRADY H. EMERSON.

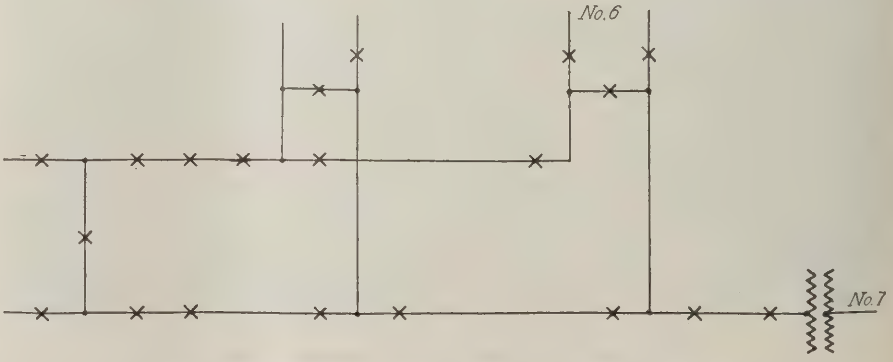
Acmar, Ala.

## Board Visualizes Circuits

The accompanying sketch shows how the electric power circuits of the Susquehanna Collieries Co. are indicated on a wooden board to assist the workmen in visualizing their arrangement. At each point marked by a cross a hole has been made in the board to show the position of a switch. Whenever a switch is closed a plug is placed in the hole, indicating a particular switch, thus designating the fact that the circuit is closed at that point.

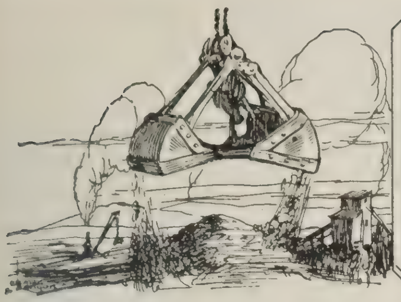
It is always an easy matter to trace the power supply from its source to the place where it is used. In many instances there are two or more ways of supplying energy to a given point but unless other switches are properly set serious troubles may arise.

With such a diagram in front of him a substation attendant can be directed to open or close any particular switch without great liability of making a mistake; each switch is numbered and the corresponding number is marked on the board. By referring to the diagram load dispatching and repair work can be directed over the telephone with accuracy and with safety to workmen.

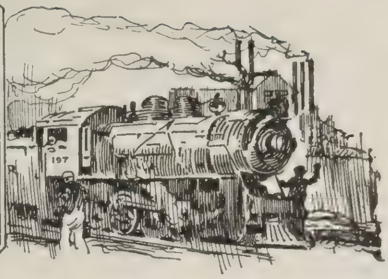


**Power Circuit Map Shows How Loads Are Supplied**

The cross marks on the diagram represent places where switches are located. Plugs inserted into these holes, which are drilled into a wooden board, indicate a closed switch.



# Production And the Market



## Soft-Coal Markets Develop Increased Strength As Anthracite Strike Begins

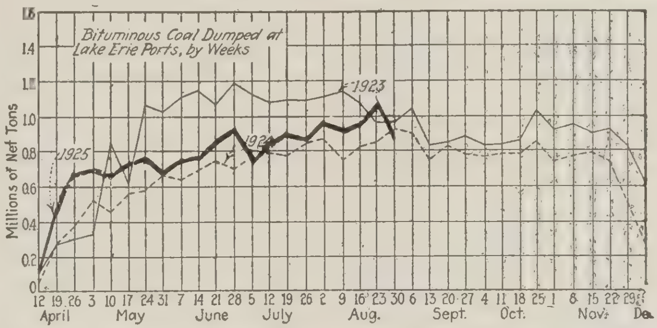
The long threatened anthracite strike became an actuality Sept. 1, the only uncertainty now being as to its probable duration. As a natural corollary the bituminous coal trade continues to improve, prices showing increasing firmness. Demand is especially strong, of course, for domestic varieties, but railroads, utilities and industrial consumers have not been slow to realize the importance of building up reserves and are taking larger shipments on existing contracts lest their sources of supply be menaced by nervous Eastern anthracite consumers. While the pick-up is in boldest relief in hard-coal consuming territory the betterment is not confined to any particular locality, being practically nationwide. At Cincinnati the August supply of smokeless was sold up early last week and orders were accepted only for September delivery.

Perhaps the best feature of the upward trend in business is the fact that it is not entirely attributable to the anthracite strike as the usual seasonal pick-up has the groundwork of sound basic conditions and rather well depleted stock piles. The export situation at Baltimore also shows signs of revival, and the trade, long dormant, bears a more hopeful aspect. Lake business made a comeback when buyers showed a willingness to pay better prices for good quality coals which had been diverted to better markets for a time.

### Hard-Coal Calm as Strike Descends

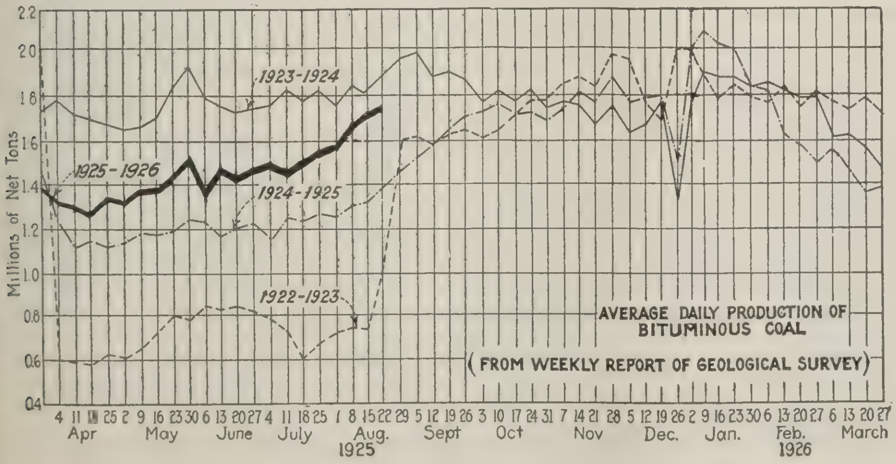
Although the promised suspension went into effect on Tuesday, as scheduled, the anthracite market has shown an unwonted absence of "runaway" characteristics. Business was brisk last week, of course, but there was a gratifying lack of soaring prices on independent coals, these operators having in many instances withdrawn from the market so far as new business was concerned, as they were already rushed with orders. Egg and stove were in strongest demand, though orders for chestnut and pea were plentiful. Steam sizes also moved briskly with all sizes strong and prices firm, independent quotations having climbed above company schedules.

Production of bituminous coal in the week ended Aug. 22 is estimated by the Geological Survey at 10,527,000 net tons, as compared with 10,260,000 tons in the preceding week, as shown by revised figures. Anthracite output in the week ended Aug. 22 totaled 2,209,000 net tons, the largest weekly output since Dec. 16, 1922, as against 1,904,000 in the previous week.



*Coal Age* Index of spot prices of bituminous coal again advanced last week, standing on Aug. 31 at 174, the corresponding price for which is $2.10.

Dumpings at Lake Erie ports during the week ended Aug. 30, according to the Ore & Coal Exchange, were: Cargo, 859,218 net tons; steamship fuel, 50,225 tons—a total of 909,443 net tons, compared with 1,028,492 in the previous week. Hampton Roads dumpings during the week ended Aug. 27 totaled 411,814 net tons compared with 513,780 tons in the preceding week.



### Estimates of Production

### Midwest Is Active

As viewed from Chicago the general condition during the past week in the Midwestern coal markets seems greatly improved. The demand is increasing for Illinois, Indiana and west Kentucky domestic sizes. Prices on these coals are firm, and there is a general feeling they will advance 25c. a ton at once. On west Kentucky prepared sizes, prices have reached a new high level. Operators in west Kentucky were forced to increase prices due to a drop in the price for their fine coal, which has about reached the year's lowest level. While the prepared sizes are in fairly good demand, the production of fine coal in all fields is above the present requirements. Some of the large consumers are buying heavily, while others are still holding back awaiting developments in the anthracite field. This holding off may be the cause of the prices being so extremely low on all fine coal from the western coal fields. Last week screenings, especially from Fifth Vein Indiana, sold as low as $1.10.

The greater percentage of the operators in eastern Kentucky and West Virginia also seem to have plenty of orders on hand, owing to the fact that when buying started about three weeks ago they received more orders than they could handle. The bulk of the orders, however, will be completed between Sept. 1 and 10. Coal may then be easier to obtain. From all indications, prices on practically all grades of eastern Kentucky and West Virginia coal will advance 25c. a ton after Sept. 1, high grade eastern Kentucky coals 50c. a ton.

The Pocahontas situation is serious. The same condition exists in the Pocahontas field as in the eastern Kentucky and West Virginia fields. Few Pocahontas operators are quoting prices, accepting orders only on the basis of price current at time of shipment, as it is their desire to clean up all the old orders first. Lump and egg, when car numbers can be given, have sold as high as $4.50 in Chicago.

Business is good in southern Illinois. The mines are beginning to work five days a week and all sizes are moving excepting small nut and screenings. These are lagging just a little. Mines that have been idle are getting ready to start up again. Railroad tonnage is unusually good both from the strip mines and shaft mines. The strip mines are working full and crushing has practically stopped everywhere. In the Duquoin field business is picking up and there is better working time—three and four days a week—and a demand for everything excepting screenings. Duquoin prices are about 25c. to 50c. under the prices of the association members in the Franklin County field. The Carterville independents range anywhere from 25c. to 50c. under the association prices.

In the Mt. Olive field there is a crying demand for domestic sizes. Mines are working three and four days a week and even the steam sizes are finding a market. Railroad

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Aug. 31 | Aug. 24 | Aug. 17 | Aug. 30 |
| Index .................. | 174 | 172 | 167 | 164 |
| Weighted average price.. | $2.10 | $2.08 | $2.02 | $1.99 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

---

tonnage is good. The Standard district is lagging just a little. New mines are starting up and increased working time at those in operation keeps the tonnage just a little ahead of the demand, but prices are not good—just about the cost of production. Steam is slow and hard to move. Railroad tonnage is fair. Mines are working three to five days a week.

Domestic business in St. Louis is good, especially on Illinois high-grade. Anthracite, smokeless and coke are moving slowly but Mt. Olive and Standard are beginning to pick up. Wagonload steam is quiet and carload steam is just a little under the supply. Country domestic business is unusually good on all sizes and is turning from high grade to middle grade on account of the high prices. A lot of eastern Kentucky coal is moving into central Illinois and Iowa territory and a lot of western Kentucky into the Missouri territory. Retail prices will be advanced Sept. 5.

### Kentucky's Trend Is Upward

The eastern Kentucky coal market remained unchanged over the week as the operators had poked it up to a point where production was meeting with plenty of competition from the big union mines north of the Ohio River. It has been contended that when eastern Kentucky hit a peak of $3 a ton, the advance would stop. However, the anthracite strike may raise this maximum a little.

During the week the western Kentucky market, which has been advancing slowly but surely for several weeks, took another spurt, prepared prices advancing, along with mine run, while screenings are a shade weaker in that field, due to strong production. Although the strike of 1924 was never officially adjusted, the miners returned to work in most plants, and are too busy to become troublesome.

Eastern Kentucky is still quoting some 4-in. block at $2.50, principally in the Hazard field, but most coal of this size is selling at $2.75@$3, with specialty fuels at $3.25. Egg and lump are $2.25@$2.50; nut, $2@$2.25; mine run, $1.50@$1.75; screenings, $1.10@$1.25. Western Kentucky 6-in. block is as high as $2.50, general quotations being $2@$2.25; egg and lump, $1.85@$2; nut, $1.40@$1.75; mine run, $1.25@$1.50 and screenings, 65@85c., the bulk of screenings moving at 75c. or better.

### Northwest Trade Brisks Up

Dock operators at Duluth and Superior experienced better all-round interest in the market during the last few days. Cooler evenings after a long heated term are stimulating domestic demand. The near approach of the threatened strike of anthracite miners served to bring in more orders for hard coal from dealers over the Northwest.

From present indications, strike or no strike, there will be a greatly increased turnover of Pocahontas and other smokeless coals on the Head-of-the-Lakes market during the fall and winter months. Retail yards already have batches of orders for those coals booked from consumers who had up to the present never taken anything else than anthracite. Some dock officials think they are likely to run short of Pocahontas coal and they have been pressing their mines connections for further shipments. Two price advances in lump, egg and stove sizes of Pocahontas totaling $1 during the last three weeks, brings the dock figure up to $8. Mine run and screenings are unchanged at $5.25 and $4.25 respectively. Slightly better ordering of bituminous coals was reported from industrial quarters.

Allowing for a final 10c. advance, anthracite prices as of Sept. 1 are: Egg, $13.10; stove, $13.50; nut, $13.35; pea, $10.10, and buckwheat, $8.50. Receipts of anthracite have been from one to two cargoes weekly. Hard coal on the docks has been cut down to around 375,000 tons.

The movement of coal from the East is continuing in good volume to this market. Forty-one cargoes, including two of anthracite, were unloaded at the docks during the last week and ten cargoes, all anthracite, were en route.

Managers of coal docks and retail dealers at Milwaukee report a brisk demand for fuel—not particularly for anthracite, as might be expected as a result of apprehension over labor conditions at the mines, but for bituminous coal, which is going out freely to consumers in the Northwest. Beginning this week, retail dealers advanced Pocahontas, making egg $11.75 shoveled and $12.50 carried to bins; nut, $10.75 and $11.50 respectively, and mine-run, $8.50 and $9.25. Hocking egg and nut were marked to $8 and $8.75, and splint to the same figures. Receipts by cargo for the season to Aug. 27 total 2,104,048 tons. Receipts of anthracite are 7,378 tons short of the receipts up to the same date last year, but the receipts of bituminous coal are 368,793 tons greater than in the corresponding period in 1924.

### Southwest Trade Improves as Fall Nears

The approach of fall is improving the Southwestern market, but only Kansas of the Southwestern states is prepared for full production. Few mines are operating in Missouri. The McAlester (Okla.) district is more or less stable with a 1917 wage scale, but in the Henryetta field union opposition to the 1917 scale, which has not completely stopped production, is preventing profitable operation. In Arkansas, where some pay the 1917 scale and others operate under that of 1924, some of the largest operating companies of the Southwest have made no move to reopen their mines.

The Colorado coal market continues to show considerable improvement. Many large shippers are working to full capacity and orders are being booked for late October and November delivery, which is unusual for this time of the year. August production was the heaviest in years. Inquiries are coming from sections that this field has never been able to reach before. Prices were revised Sept. 1 as follows: Walsenburg fancy domestic lump was advanced 25c. to $5.50; washed nut is $4.75; washed pea, $3.25; high-grade Crested Butte anthracite Nos. 1 and 2, $7.25, and Nos. 3 and 5 (base burner size), $7.75.

The winter storage business in Utah seems to have really commenced at last. It is not heavy, however. There might not have been any appreciable winter storage business for heating purposes yet had not the fall weather been a little early this year. Prices remain as steady as ever. It is almost a year since the last major change.

### Trade Notably Active at Cincinnati

In the Cincinnati market the supply of smokeless coals was practically sold up for August early last week and standard operators were accepting business for September delivery at a contract price of $2.25 for mine-run and $3.75 for lump and egg. Little if any smokeless domestic was sold on the domestic market.

Steam and byproduct coals have been much more active on this market and it is apparent that considerable buying is being done for reserves, influenced by the threatened tie-up of anthracite production in the East. Buyers are operating cautiously but are steadily increasing their orders.

The demand for high-volatile domestic coals was not so keen during the last week, perhaps because of the warmer weather. There was no trouble in selling the entire production, however, the feverish call alone being missing. Prices held firm all along the line.

There was an increase of production for the week in all the districts. The C. & O. carried in excess of 24,000 loads and other coal roads broke records. Approximately fifteen thousand coal loads passed through the Cincinnati gateway last week for the North and West, which was a gain of about 1,100 over the preceding week.

Lake shipments, which had fallen off for a few weeks because coal production was diverted to better markets, showed a disposition to come back, due to the willingness of lake buyers to pay a better price for coals of satisfactory quality. There were 3,831 lake loads through the Cincinnati gateway, a gain of 479 over the previous week.

Tidewater demands for smokeless mine-run are getting better all the time and the low stocks in the face of this call are helping the price. A considerable tonnage sold at $4.85 during the last week.

Cincinnati retail dealers are getting $8.50 for smokeless lump and egg, an advance of $1. Some dealers have added 50c. to the price of high-volatile block, but this is not general as yet.

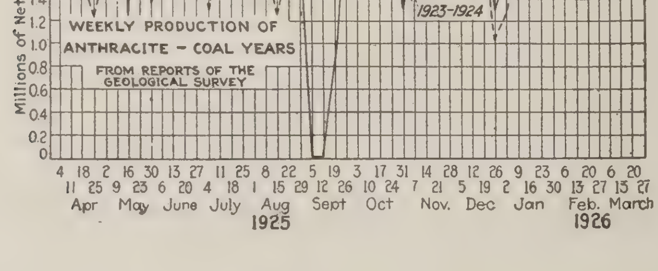
Domestic trade at Columbus continues active. More mines are opening. Retailers are buying fast and requesting immediate shipment. Producers and distributors from West Virginia and Kentucky are taking new orders only for delivery after Sept. 15 as all of the output has been disposed of up to that time. Advancing prices are noted in all fields.

Up to Aug. 15 there was only about 20 per cent of the fuel required for householders delivered in Columbus and many other cities and towns in Ohio. This, of its own accord, would naturally stimulate the domestic trade. Retailers are advancing prices in sympathy with the higher levels at the mines. Smokeless is selling from $8.25 to $8.75 and splints from $7.25 to $7.75 and in some cases even higher. Hocking lump has not shared much in the general advance but sells for $6@$6.75 depending on preparation.

Steam trade has not shared in the general strength of domestic sizes. Buying is still rather haphazard and much of it is from hand to mouth.

Production in the southern Ohio field is increasing, especially in the Pomeroy Bend section, where more mines are being put into operation, mostly on the 1917 wage basis.

The anthracite trouble has greatly stimulated operations and the market in eastern Ohio. Smokeless has stiffened sharply and mine prices both on Pocahontas and West Virginia splint are now $1 to $1.50 above those of a month ago. Steam inquiries are more numerous and railroads, public utilities and manufacturers are increasing their supplies. Output in eastern Ohio during the week ended Aug. 22 totaled 261,000 tons, or about 37.3 per cent of potential capacity. This is 11,000 tons over the preceding week but 35,000 tons under the corresponding week a year ago.



### Pittsburgh Prices Firmer

Coal prices at Pittsburgh have made no definite advances of importance but they show a firmer tone. Coal moves readily now whereas until recently it was either difficult or impossible. The increase in buying is wholly within the normal market area for Pittsburgh district coal. Former buyers probably are consuming a little more and are now stocking in a moderate way. The anthracite situation stimulates this. Buying of domestic coal by retail dealers is fully as heavy as would be expected at this time of year.

There are no further developments in wage and labor matters. The coal trade at large considers the starting of the Banning mine by the Pittsburgh Coal Co. a small event. It is almost on the fringe of the district and is near the Washington Coal & Coke Co.'s operations—always non-union—and near the Bethlehem Steel Corporation mines, which recently became open-shop.

In spite of the anthracite situation soft coal shows no local disturbance at Buffalo. None is anticipated unless a hard-coal strike runs a month or more. West Virginia is still trying to advance its bituminous prices, especially on lump, but Buffalo shippers say they cannot get any more for it. Gas slack is still scarce and lump is not plentiful, but the consumers object strongly to paying any increase for them.

Bituminous quotations are still $1.60@$1.75 for Fairmant lump, $1.40@$1.50 for mine run and $1.25@$1.40 for slack, on the $2.39 rate; $2.25@$2.50 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, $1.30@$1.60 for slack, on the $2.24 rate; $1.75@$2 for Allegheny Valley mine run, on the $2.09 rate. No. 8 is scarce because so many mines are closed.

### Firmness to Last in New England

Now that the anthracite suspension is a fact the New England trade feels the present firmness in bituminous is likely to continue. Prices on prepared coal in the West have advanced sharply as anthracite shipments have diminished, and while there is as yet no material increase in demand here for mine-run for steam purposes the Hampton Roads basis is decidedly up from quotations of a week ago. It is understood that $4.75 was paid several days ago by large interests, and that $4.85@$4.90 is the current level, with occasional sales at $5. Several of the larger distributors as well as certain of the agencies have been obliged to buy small tonnages to complete cargoes, and on these lots the price has been quite as firm as any in the open market.

On cars Boston and Providence both Pocahontas and New River are in reasonably good request at $5.90@$6, an advance of more than 50c. within a few weeks. This has induced many consumers to put in coal where otherwise they would have waited until fall. Receipts are not large and all factors are moving their summer accumulations with little or no difficulty.

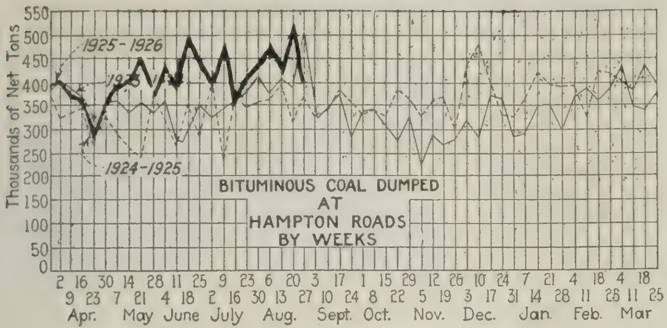
In the quality grades from central Pennsylvania there are signs of renewed interest, but at this writing what demand there is has arisen west of the Connecticut River. The on-car level of Pocahontas and New River at New Haven, Providence and Boston is not yet high enough or hard enough to warrant purchases all-rail in tidewater territory. Even on the low basis quoted per net ton f.o.b. mines the superior coals in Pennsylvania are still out of line with those from the smokeless districts.

The trade is awaiting with considerable interest whatever developments may follow with respect to prepared Pocahontas and New River all-rail as a substitute for anthracite. There is a feeling that unless there is an acute shortage of the latter the delivered cost will be too high to make the West Virginia screened coal attractive.

### Market "Looks Up" in New York

The bituminous coal market at New York is "looking up." Demand continues to grow slowly but surely and local houses believe the industry has turned the corner. There is not so much free coal around because of the heavy Western demand. Some operators have been able to get a slightly higher price for the better grades.

High-volatile coals are in a better position due to lake demand. Advances of from 10c. to 15c. over last week's quotations are asked by local shippers.



Coal at the piers is commanding a better position. Demand is better and an occasional higher price is reported.

The Philadelphia soft coal market gathers strength. Producers of better grades report themselves well sold up. Some of them refused a week ago to take any more business for August and were also unwilling to quote a price beyond the end of the month. They are trying for the anthracite market with only moderate success thus far. This is also true of those in the coke trade who specialize in sized coke for home use. Contract customers are calling for their coal. Shippers are not contracting any more tonnage.

Bituminous coal at Baltimore after many weeks of almost continuous quotations at the same low rate, is now advancing. Practically all grades of steam and gas coals are 10c. higher at the mines. Production is still more than abreast of demand, but surplus stocks in the East are lessening rapidly. The export situation is reviving. During the last week of August there were three clearances, principally for Italian ports, with 21,246 tons cargo and 1,940 tons in bunkers.

### Birmingham Market Strengthens

The Birmingham market is improving steadily. Buying of domestic coal has begun in a small way and quite a few orders are being taken from the smaller towns and communities in the territory for spot shipments. Dealers in Texas also are buying in Alabama. Shipments to dealers on contract have improved, though restrictions to some extent are still effective. The retail trade, however, is still far from satisfactory. Little household coal has been stored as yet.

Steam power plants throughout this and adjoining states are now operating full time. The severe, prolonged drought has badly crippled the operation of hydro-electric plants. Large consumers are expected to begin the stocking of a reserve supply in the near future. The bunker trade is normal.

Quotations on steam coal have firmed up during the week. The better grades of washed coal are in strong demand. Domestic sizes showed the customary Sept. 1 increase. The district output for the week of Aug. 15 was 389,000 net tons, an increase of about 42,000 tons over the same week a year ago.

Demand for foundry coke is stronger at $4.50@$5 per ton ovens. Nut and egg coke also are moving very well.

### Anthracite in Sharp Demand

Considerable activity existed in the anthracite market at New York last week. Buyers were everywhere in evidence and retail dealers willingly stored all shipments. A few hundred loaded boats were in the harbor but they belonged to retail dealers who anticipated a shortage after Sept. 1.

The larger companies continued to take care of their regular customers as best they could. Independent operators were rushed with orders, many of them having already withdrawn from the market so far as new business was concerned.

Egg and stove sizes were most in demand, although there was a heavy sprinkling of chestnut orders. Pea coal was in heavy call, wanted mostly by inland dealers.

Firmness marked the steam coals. All sizes were strong and quotations for independent product higher than company schedules.

In spite of the strike the Philadelphia market still has a spirit of calmness. Business is active, however. Dealers have all received a little bit more coal than they had anticipated. There is an inclination in some quarters to quietly complain of preparation. Possibly most of this is due to the increased quantity of washery coal that is coming to market, and in addition it is felt that breakers are also running through a bit of bank coal.

Retail prices have not changed. Of course there will be no announcement of September prices by the companies inasmuch as they will have no fresh-mined coal for sale. However, a few of the larger concerns with a light tonnage of egg, stove and nut in storage, and a good stock of pea, will ship these sizes until they are exhausted. All steam sizes are moving briskly, with the independents all sold up. There are no premium prices of moment.

The Baltimore anthracite situation is naturally made interesting by the hard coal strike. While coal is still coming through on delayed shipments, nobody is taking orders at the rates offered at the mines a week ago, and no one is guaranteeing deliveries. Independents raised prices all the way from 50c. to $1.25. Meanwhile, the retail dealers in Baltimore are not excited. Between 60,000 and 70,000 tons are on hand. September prices have not been set.

The anthracite situation at Buffalo is of course much strained, for the demand is strong. Distributors say that they could sell several times as much old line company coal as they can get. The independent trade is booming, but the volume is not great. The premium is from $2 up. Sales are made when a consumer or dealer gets tired of waiting for company coal.

Lake shipments have dropped down to a single dock and that is not running fast. Clearances for the week were 26,100 tons, of which 16,400 tons went to Milwaukee and 9,700 tons to Duluth.

### Connellsville Coke Active Again

Week before last Connellsville furnace coke had its sudden spurt, spot coke going from $3 to $3.25, while two fourth-quarter contracts were made at $3.50 and $3.75 respectively. Last week the market was dull, with no change in prices. This week the market has been active again, as to spot and early shipment.

Buying has been almost entirely by Eastern consumers, some of them not regular patrons of the region. The turnover has not been large compared with the volume moved sometimes when blast furnaces are buying, but it is a distinct improvement over the low production rate the region has had for months past. The production lately has been well balanced by contracts with furnaces, either for the current quarter or for the half year, leaving little coke to spare, while operators are indisposed to blow in ovens except as they see clear prospects of being able to dispose of their coke for some time.

The buying, therefore, has sent prices upward. Sales in the past few days have ranged from $3.35 to $3.65, last week's price of $3.25 being out of the question. Price has varied in individual transactions according to tonnage, period and keenness of buyers. Spot lots brought the lower prices; deliveries over a week or two the higher prices. The market is $3.35@$3.65, but this should be designated as spot and prompt rather than as merely spot.

There is nothing new in fourth-quarter contract furnace coke. Foundry coke is scarcely more active than it has been lately. It would take a good deal of activity to make foundry coke follow furnace coke. The spot foundry coke market is still $3.75@$4.25, but is firmer.

The coke trade at Buffalo is not active. It will probably wait till the furnaces start up. There is much preparation for turning out a larger supply anticipatory of a heavy household trade. Most of the local byproduct oven companies have appointed special salesmen for their surplus. It is said that a good part of the increased bituminous output is going into coke.

---

# Foreign Market And Export News

## Britons Want Prices Cut Because Of Government Subvention

The Welsh coal trade is in a difficult and unsettled state following the wages negotiations. Operators are short of orders and constantly exposed to the "bearing" tactics of prospective buyers, who are trying to take advantage of the government subvention to obtain a substantial cut in prices.

Consumers both at home and abroad had previously laid in stocks of coal against a stoppage and they are in no need of purchasing immediate supplies. Some of the pits previously closed down have been reopened and more pits are working longer hours than before the negotiations.

Business at Newcastle for August and early September shipment is bad, home business is slow and export trade is difficult to obtain. The entire trade is purely from hand to mouth and at the moment there is little prospect of any fresh business. The Finnish State Railways have contracted for 16,000 tons of D.C.B. steams at 21s. per ton, c.i.f. Helsingfors. Beyond this there is no contract to report.

Output in Great Britain executed a poor come-back after the week of the August bank holiday, attaining a total of but 4,370,000 tons, according to *Coal Age's* special cable. Cardiff coals last week declined in price from 6d. to a shilling, but Newcastle maintained the levels of the week before.

### The French Coal Market Prices Advance Steadily

In spite of the fact that British collieries resumed work Aug. 3, coal business in the Sarre is lively enough. Sarre collieries had to raise their prices Aug. 1 and will probably have to increase them again so as to offset the 5 per cent wage increase which has been granted the miners. So it is to be expected that competition, from that side, will be less fierce in France.

Industrial fuels show a slight improvement. However, consumption of industrial grades does not absorb the total French output. August brought with it symptoms of a rally in domestic business but normal business activity will not be resumed before mid-September. Semi-bituminous sized fuels are extremely firm, and bituminous screened rather neglected.

Shipments have been hampered by the lack of cars. Freight on the waterways, in consequence, has seen an increase.

During July the Office des Houillères Sinistrées received from the Ruhr 671,500 tons of indemnity fuels, including 378,100 tons coal, 264,500 tons coke and 28,900 tons lignite briquets, making a daily average of around 21,600 tons.

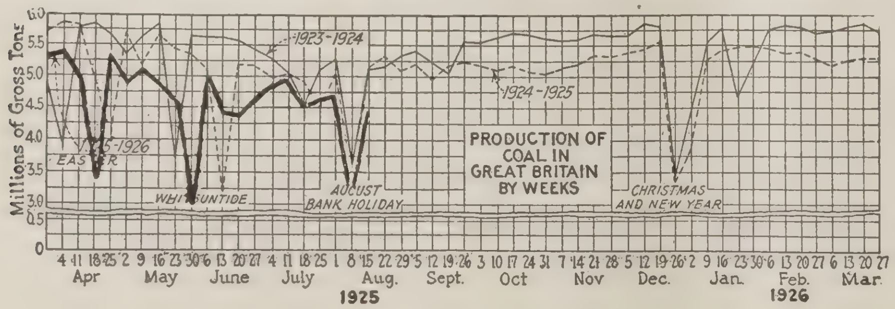
### U. S. Coal Exports Increase Heavily in July

Total exports of bituminous coal from the United States during July, 1925, amounted to 1,648,395 long tons, the heaviest exports of any month since September, 1923, according to the Coal Division, Department of Commerce. This figure compares favorably with the 1,435,973 tons exported in June and the 1,356,933 tons in May. Exports to Canada totaling 1,310,052 tons were the highest monthly shipments to that destination since September, 1923, and are largely responsible for the heavier total exports.

Total exports of anthracite totaled 462,676 tons compared with 313,535 in June. The July exports were the heaviest monthly shipments since June, 1921, and the second highest since August, 1920. This large increase is due mainly to heavier exports to Canada, 442,906 tons being shipped against 303,000 in June.

### No Strength Yet in Belgian Industrial Coal Market

The Belgian market for industrial fuels continues weak. Rebates are conceded nearly everywhere; in the Borinage, for instance, one shipper has applied decrease rate of 3 fr. on the greater part of industrials destined to the glass-making industry; and even greater rebates than this have been noticed. Coke reductions are noted also. Importers of British coals are disposed to cut prices to compete with German fuels. This has an unfavorable influence on the Belgian market. Home-fuels, however, remain relatively firm.



### Havana Imports More Coal

Coal and coke imported through Havana, Cuba, during the first half of the current year, as compared with the same period of the two previous years by months, was as follows:

| | 1923 Long tons | 1924 Long tons | 1925 Long tons |
|---|---|---|---|
| Jan. | 43,447 | 53,596 | 46,381 |
| Feb. | 60,968 | 35,863 | 37,462 |
| March | 49,335 | 34,215 | 39,125 |
| April | 41,800 | 38,751 | 53,062 |
| May | 38,759 | 21,514 | 43,046 |
| June | 46,000 | 34,908 | 36,935 |
| Total | 280,309 | 218,847 | 256,011 |

# News Items From Field and Trade

## ALABAMA

James W. Whatley has resigned as manager of sales for the DeBardeleben Coal Corporation after a service of about two years. Prior to going with the DeBardeleben corporation, Mr. Whatley was in charge of coal and coke sales for the Tennessee Coal, Iron & Railroad Co. for the greater part of his twenty years service with that company, and is regarded as an authority on questions of fuel salesmanship. Mr. Whatley has not announced his future plans.

The Sloss-Sheffield Steel & Iron Co. will soon complete the connecting links at each end of the Praco branch of the Louisville & Nashville R.R. which will enable the company to handle the output of its Flat Top mines direct from the operation to its large byproduct plant at North Birmingham, with its own equipment and crews, effecting an enormous saving in freights. Trackage rights were obtained from the Louisville & Nashville R.R. by an agreement effected some months ago.

The Roden Coal Co., with mines at Marvel, Bibb County, has adopted a novel and effective plan of placing the good qualities of its domestic coal in the public eye and mind by the erection of a large electric sign on the Roden Building, Second Ave. at Twentieth St., Birmingham, the most strategic point in the business section. This sign is 33 ft. wide and 26½ feet high and intermittently flashes an advertisement of the merits of the celebrated Marvel product, which is extensively used throughout southern territory.

## COLORADO

Carl De Lockte has been appointed by Governor Morley to serve on the Industrial Commission to fill the vacancy created by the death of Mr. Saunders.

## ILLINOIS

Franco No. 3 mine, employing 300 men, has resumed hoisting coal, after having been idle all summer. It was announced that the reopening was made possible by increased orders from mail-order houses in Chicago. An agreement has been reached whereby the miners will be equipped with electric lamps.

A petition asking authority to dispose by public sale of all the properties of the Southern Gem Coal Corporation and the Southern Gem Coal Co. was filed in United States court at East St. Louis, Aug. 22, by W. S. Wilson of Pinckneyville, and N. C. McLean of East St. Louis, Mo., as receivers. Judge George W. English set Sept. 2 as the date for the hearing. The receivers point out that all negotiations and conferences to rectify the concern's affairs have proven futile. They also state that in spite of the appointment Jan. 26 of receivers that the company's debts, which had been estimated at three million dollars, have continued to increase. The companies own coal mines in Franklin and Perry Counties.

Two mines, A of the Central Illinois Coal Mining Co. and Woodside Mine No. 53, at Springfield, Ill., have resumed work after having been closed for several months. Three hundred miners are on the job in the two.

The construction of a steel tipple and the setting of two boilers is in progress at the new coal mine opened on the Santa Fe Ry. north of Knoxville, and east of Galesburg, by the Galesburg Coal Co.

Glen Young, mine boss at one of the Taylorville mines, and a group of associates have leased the mine of the Assumption Coal and Mining Co., at Assumption, seven miles north of Pana, and plan to reopen it employing 100 men.

The Macon County Coal Co. of Decatur, and the Decatur Coal Co. have been merged into one corporation each company retaining its identity and continuing under its own name. The capital stock of the Macon County company formerly $200,000 will be increased to $500,000 after the $100,000 capital stock of the other company is included. Stockholders in the Decatur company will receive Macon County Coal Co. stock for their interests. W. J. Grady will head the new company as president, with C. F. Mattes, vice-president and J. N. Baker, secretary-treasurer. John Armstrong, former president of the Macon company becomes a director of the consolidation, as does David W. Beggs, who was president and general manager of the Decatur company. Other directors are: W. J. Grady, C. F. Mattes, W. S. Ridgley, E. D. Mattes, S. D. May, Forrest File, F. A. Tuttle and John Diller.

Owen M. Fox has left the Black Diamond to become executive vice-president of the Chicago Coal Merchants' Association.

William Mauch, of Danville, a veteran coal operator in the Danville district for many years, has been appointed mine inspector for the eastern district of Illinois to succeed Daniel Reese, who died recently. Mr. Reese had held the office 26 out of the last 31 years.

## INDIANA

The Eagle Coal and Mining Co. and the J. K. Dering Coal Co. have been made defendants in a suit brought in Superior court in Terre Haute by Mary A. Collins, Clifford Collins, Clarence Collins and Clara House who claim $10,000 damages, alleging that the defendants have mined coal too near the surface of their land so that the foundations of a house, a barn and other buildings have been undermined and a well was drained.

The tipple at the Thomas mine, near Brazil, recently was destroyed. The Brazil fire department tried to save the structure, but the entire top plant is virtually a total loss.

Trial of Bruce Rogers, superintendent of the Kings mine, near Princeton, operated by the Deep Vein Coal Co., charged with firing shots in the mine in an unlawful manner, has been set for Oct. 1 in the Gibson County Circuit Court. The case is attracting considerable attention in Indiana mining circles as it is being prosecuted under the recently passed "shotfirers' law." One hundred and twenty indictments were originally returned against Rogers, but 60 of these have been quashed by Circuit Judge C. A. Smith, who will sit in the case.

## KANSAS

The Bureau of Mines safety department will conduct an intensive drive in safety work in the coal mines of southeastern Kansas during the next three or four months. Vernon Allison, associate chemist of the department reached Pittsburg, Aug. 26, to give lectures and demonstrations to the miners in advance of J. J. Forbes, of the safety extension service of the Bureau of Mines, who directs the campaign.

Not only the team from Western Coal & Mining Co. mine No. 20, which won the Kansas State first-aid and rescue meet, but also the Jackson-Walker Coal & Mining Co. team which won second place, will attend the international meet in Springfield, Ill., Sept. 10 to 12. A fund was raised in advance of the state meet to send the winning team and since then a purse has been made up to defray the expenses of the second team, which will motor to Springfield.

An attempt to wreck the steam shovel of the Dunkirk Coal Co. near Mulberry early in the morning Aug. 23 was frustrated when an employee noticed the odor of smoke and upon investigating found that it came from two burning fuses leading to a box containing

125 sticks of dynamite. He rushed from the pit and called an officer. When they reconnoitered a little later the fuses had ceased to burn before reaching the dynamite. Bloodhounds unhesitatingly picked up a trail to the house of Walter B. Greek, who was employed at the mine. A fingerprint expert from the Pittsburg police department asserted that prints made from Greek's hands corresponded with those found on one of the sticks of dynamite. A few days before, Greek was reprimanded for being slow.

## KENTUCKY

Lonnie Jackson, Mayor of Central City, who resigned as president of District 19, United Mine Workers, in 1924, because he was not in sympathy with the Jacksonville-agreement strike in western Kentucky, has resigned as mayor of his city, effective Aug. 21, in order to give his entire attention to his real estate and other ventures.

A deal is pending by which the Harlan Coal Co., of Louisville, may take over the mines and equipment of the Letcher Coal Mining Co., at Elsiecoal, on the Louisville & Nashville R.R., nine miles from Whitesburg. The Letcher operation has been in litigation for some time, and was to have been sold at court house door some weeks ago, but the sale was postponed.

Although there has never been any agreed settlement of the strike in western Kentucky, which was called on April 15, 1924, the field is running freely, with plenty of labor available, and majority of miners back at work, the strike having been a losing proposition for the union. While it cost operators a good deal of money, the situation in the field today is better than for a long time past.

The West Kentucky Coal Bureau, composed of the western Kentucky operators, and principally interested in handling traffic matters, will meet at the Seelbach Hotel, Louisville, Sept. 8, this being the first meeting since spring. There was a suspension of meetings over the hot weather.

Philip C. Watson, who has been with his father, R. A. Watson, in the R. A. Watson Coal Co., jobbers and retailers, of Louisville, has gone with the Blue Diamond Coal Sales Co., as resident sales agent in Michigan. His headquarters are at Grand Rapids.

A. H. Stepp, formerly manager at Louisville for the Southern Coal Co., has joined the Hawley McIsaacs Co., at Madisonville, to help in that company's big stripping project.

## MONTANA

The Montana miners are taking a hand in a buy-Montana-coal campaign of publicity now going on. The United Mine Workers district organization estimates that 500,000 tons of coal are imported into Montana every year, enough to represent the full-time output of the Red Lodge group of mines for 190 days.

**Barthell, or No. 1, Mine, Stearns Coal & Lumber Co., Barthell, Ky.**

Coal is brought to the tipple from both sides of this picturesque hollow. Note how the hills are capped with many feet of solid sandstone.

## OHIO

The Blackstone Coal Co., at Rutland which took over the former No. 4 Maynard Coal Co. mine, the tipple and power houses which were recently burned, has reopened the property after an idleness of two weeks. Only mine run is loaded. The company has purchased complete equipment for its tipple including shaker screens, picking tables and loading booms which will be installed soon.

Work has been resumed at the mine of the Central West Coal & Lumber Co., located at Jacksonville. The mine has been idle for about six months following the burning of the tipple. At the time of the destruction the company had installed loading machines which had been operated successfully. The machines are again in use.

## PENNSYLVANIA

The Duquesne Light Co., subsidiary of the Philadelphia Co., has awarded a contract to the Dravo Construction Co. for the sinking of a new mine shaft at the Harwick mine, Rural Ridge.

The possibility of a strike in the hard coal regions had the effect of stimulating buying from central Pennsylvania hence the production there increased. The loading for the week ending Aug. 22, were 15,825 cars as compared with 13,519 cars for the week ending Aug. 15. The August loadings to and including Aug. 22 were 42,001 cars, compared with 37,054 cars for the same period in July.

Cambria County coal operators somewhat ironically thank the Interstate Commerce Commission for doing so much as to mention bituminous coal, especially low-volatile coals, as a "substitute" for anthracite fuel. Operators declare: "Bituminous coal runs the workshop of the world. It runs nearly everything west of New York. It runs New York, too, railroads, ships, electric light and power plants. About the only thing it doesn't do is supply heat for residences through cellar heaters." They claim that Cambria County coal goes in a steady stream to Edison Electric and other big New York plants. It keeps freight moving. It is not a substitute for anything, though there may be some substitutes for bituminous coal.

Men at the Kinloch mine of the Valley Camp Coal Co. at Parnassus, who six weeks ago, entered an agreement with officials of the company to forego wages for that period, have been paid, and all is happy. The mine continues in operation.

The Carnegie Steel Co. is offering, through outside selling agents, 1,000 tons of Clairton byproduct nut coke daily, which it expects to sell largely in the east where buying is expected to be stimulated because of the anthracite tie-up. These selling agencies are offering the coke to dealers in the east at $4.50 f.o.b. Clairton. The coke is all one size, ⅞ x 2 in., and is sold because it is too small to be used in the blast furnaces.

The No. 4 mine of the Stineman Coal Co. at South Fork which was closed down on July 1 resumed work Aug. 24, but is not being operated to capacity. It is also reported that the company may soon reopen its No. 1 mine.

The Saxman Coal & Coke Co., Derry township, near Greensburg, has purchased approximately 125 acres of coal adjoining the Peanut plant of the company from the Latrobe-Connellsville Coal & Coke Co.

Through stock purchase, the Pennsylvania R.R. has acquired the Western Allegheny R.R., a coal line 47.8 miles long which runs from West Pittsburgh, near New Castle, to the North Penn Coal Co. mines at Kaylor, Pa., near the Allegheny River. The railroad was owned by interests identical with the North Penn Coal Co., and it is understood the stockholders benefited by the transaction.

The United States Engineer's office at Pittsburgh in issuing a report on tonnage for July showed that there were moved on the Monongahela River, 1,384,368 tons of coal and 101,502 tons of coke; on the Ohio River in the Pittsburgh district, 302,940 tons of coal and 37,800 tons of coke, and on the Allegheny River, 16,400 tons of coke.

## SOUTH DAKOTA

The Dakota Feldspar Co., of Rapid City, is opening a new coal mine 17 miles northeast of Hot Springs. This mine is in connection with a mine of berylmica, the lode of the latter mineral having furnished the incentive for previous coal development when feldspar had intrinsic value.

## UTAH

The Carbon County coal mining officials and others accused of lynching a negro miner in June who brutally murdered the Castle Gate town marshall, have not been indicted by the grand jury which examined 120 witnesses. It was declared no satisfactory evidence connecting the men with the lynching of the murderer could be obtained. The district attorney announces that he will prosecute the men in another way later. In the meantime, the defendants are heros throughout the coal mining camps of Carbon County.

F. N. Cameron, vice-president of the Utah Fuel Co., of Salt Lake City, has returned from a three months tour of Europe, accompanied by his wife and daughter, Myra.

Twenty-nine persons were killed in Utah coal mines during the year ending June 30, according to the report of the State Industrial Commission. All but two of the accidents occurred underground, eleven of them being due to falling coal. There were twenty-seven permanent partial injuries during the same period, falling coal being the cause of one-third of them.

A bulletin just issued by the U. S. Bureau of Mines says that during the decade ending Aug. 31, 1923, 1,078 net tons of coal was mined in Utah per man, basing the figures on all employees engaged in coal mining. The average for the nation during the same period was only 743, according to the report. The daily output per man in Utah was stated to be 6.7 net tons of coal, compared with but 4.3 tons for the national average.

Moroni Heiner, vice-president and, until a short time ago, also general manager of the United States Fuel Co., says Utah has 46,000,000,000 tons of recoverable coal, and that there are nearly 15,000 square miles of workable coal in the state. He said that about one-half of the coal produced in the state is used for domestic purposes. There were said to be 5,353 men employed in coal mining in the state on an average for the year ending June 30, 1924, with a payroll of $9,160,937, $1,711.36 being the earnings of an average miner for the year. The average price of coal per ton at the mines was given at $2.89 in 1923, the entire output being worth $13,657,000.

## WEST VIRGINIA

With the mines along the Monongah Division of the Baltimore & Ohio R.R., loading 1,034 cars of coal in the week ended Aug. 22, a new weekly figure for the 1925 lake shipping season was reached. The previous peak loading of the season was in the week ended Aug. 8, when 991 cars were produced.

Due to the heavy movement of anthracite the eastern railroads obtained more bituminous coal for use on their roads from the Fairmont region. In the six weeks preceding Aug. 22, the mines along the Monongah Division of the Baltimore & Ohio R.R. loaded 7,939 cars or 396,950 net tons of railroad fuel. Approximately 60 per cent of this coal was obtained by the foreign carriers.

In the Monongalia circuit court recently Judge I. Grant Lazelle of Morgantown, issued a temporary injunction restraining the Connellsville By-Products Coal Co. (J. A. Paisley interests) and the Cochran Coal & Coke Co. from mining coal in their Pittsburgh seam lying under the main headway of the Sewickley seam of the Continental Coal Co. in Scott's Run. The first application for a restraining order was made Aug. 11.

**First Car of 1917-Scale Coal from Pittsburgh District**

This car was loaded at Banning No. 2 mine of the Pittsburgh Coal Co. at Whitsett Junction, Pa., on the Pittsburgh & Lake Erie R.R., 43 miles from Pittsburgh. The car holds 70 tons and was loaded Saturday, Aug. 22. Standing on the track beside the car is William Lauder, division manager, Pittsburgh Coal Co., in charge at Banning. The mine had opened at the request of the men on Aug. 20 with 36 men. The next day 89 were on the job. On Aug. 24 another mine in the Pittsburgh district opened on the same basis and the movement was spreading.

The following West Virginia coal companies have gone out of business through a surrender of their charters to the secretary of state: Blue Flame Fuel Co., Raleigh Smokeless Coal Land Co., Logan Mining Co., Main Island Coal Corporation, Block and Gas Coal Mining Co., Eastern Utilities Coal Co. The North American Coal Co. and the Beckley Pocahontas Coal Co. have been dissolved by a decree of court.

The Hillman Coal & Coke Co., a Pennsylvania corporation has been authorized to do business in West Virginia.

Preparations are being made for the annual first-aid meet of the New River Co. which is to be held Sept. 26. The New River company was the first in West Virginia to adopt the "Hundred per cent mine safety" slogan. The meet will follow the general plan of the first-aid meet at Holden held by the employees of the Island Creek Coal Co. last month. D. J. Parger, of Pittsburgh, chief engineer, mine safety service, Bureau of Mines and several other officials of the Bureau of Mines will attend the meet.

After working on an open shop basis one year, miners employed at Eagle mine of the Clark Coal & Coke Co. near Hepzibah, Harrison County, celebrated the event by holding an outing on Aug. 22. A program was rendered. The mine worked 309 days and loaded 5,607 steel hoppers. There were 28 acres of coal or 280,552 tons of coal mined. The company claims that no other mine in the state worked that many days in a year.

John F. Phillips, president of the Delmar Coal Co., of Fairmont, has signed contracts with the Metropolitan Life Insurance Co. which provide for his employees group life insurance totaling approximately $115,000, in addition to health and non-occupational accident benefits. The policies were written on a co-operative basis, the employees sharing the cost.

W. M. Rowan, of Grafton, who was vice-president of sub-district 3 of District 17, United Mine Workers, was recently elected as commissioner by the miners employed by the Consolidation Coal Co. under the company contract plan and the 1917 wage scale. Another commissioner is to be chosen to represent the company. The name of Tom Lewis, who was once international president of the United Mine Workers of America, is mentioned, although no selection was made from last reports.

The Hardy Coal Co., with plants in the Thacker district of West Virginia on the Norfolk & Western Ry., is soon to issue $750,000 in 10-year 7 per cent notes redeemable in whole or in part any time at 101. It is announced that with each $1,000 note, five shares of stock will be given, the price of both to be $800. That will mean $600,000 for the $750,000 notes, plus 3,700 shares of stock. The proceeds from the sale of notes will be used to liquidate all floating debts and to purchase additional equipment to enable the company to increase its production. This company hopes soon to reach a monthly production of 60,000 tons. In July, the Hardy Coal company produced 45,000 tons that proving to be a record month. The issue of $750,000 notes has been subscribed.

Coal operators interested in the $100,000,000 Flint merger were called to New York City last week for conferences, which were conducted by Bickmore & Co. and A. H. Flint & Co. with individual companies. The general belief is that the merger will be consummated soon. There are twenty-four coal companies included in setup No. 1.

Thomas W. Arnette, president of the Antker Coal Co., has returned from a two months' trip to Colorado and the Pacific Coast. Mr. Arnette attended the triennial session of the Grand Encampment of the Knights Templars of the United States in Spokane, Wash., recently.

The Bethlehem Mines Corporation, operating mines at Barrackville and Dakota, has ordered a large number of roller bearing mine cars, which constitute somewhat of an innovation in northern West Virginia territory. Other large orders for cars have been placed by the New England Fuel & Transportation Co. The Everettsville mine of the New England company has broken all its own records recently for the production of coal. This mine has exceeded 800-mine cars output per day.

A survey being made by engineers of the Chesapeake & Ohio Ry., up Glade Creek is thought to presage the development of coal and timber land in Richmond district of Raleigh County.

The mines of West Virginia took a toll of 37 lives in the month of July, twenty deaths being due to fall of roof, coal and slate. Mine car accidents were responsible for six fatalities, motor accidents, three, mining machines, five and electrical shock three. All of the fatal accidents occurred inside the mines. McDowell County mines led in the number of accidents, seven occurring in that county. In Logan there were five fatalities and in Fayette four. Three fatal accidents occurred in Monongalia and two each in Marion and Mingo Counties. One death occurred in each of these Counties: Barbour, Brooke, Boone, Grant, Greenbrier, Harrison, Kanawha, Marshall, Mercer, Preston, Raleigh, Taylor, Upshur and Wyoming.

The Costanzo Coal Mining Co. of Wheeling has leased a part of the old Nichols farm from Albert Schenk and others of Wheeling for the purpose of mining coal. Royalties on the coal mined will be paid as consideration for the lease.

It is the intention of the purchasers of the Smith Pocahontas Coal Co. to reopen the mine of that company in about a month. The property and assets of the company including a plant near Mullens in Wyoming County on the main line of the Virginian were recently sold at public sale and bid in by J. C. Pack, of Bramwell. In preparation for the reopening of the mine, prospectors are making tests for new entries. Before closing down last January the company encountered rock in such abundance that profitable mining of the seam was out of the question.

Justus Collins, president of the Smokeless Fuel Co. of Charleston and also head of a number of large coal producing properties in West Virginia and Kentucky, has completely recovered from a protracted illness of several months and is able to be at his desk again.

## CANADA

The government of Nova Scotia has requested the British government to appoint a chairman to head the commission which will soon be established to inquire into the coal industry of the province, in accordance with the terms under which the Cape Briton strike was settled.

The strike of coal miners in the Edmonton field was terminated on Aug. 23 when a meeting of miners held at Beverly voted by a small majority of the 125 men voting to return to work on the terms of the operators. The reduction in wages amounts to 13 per cent for contract rates and 5 and 10 per cent for company and day men. Work was to be resumed on Aug. 26.

Prof. W. C. Worcester, of the University of Saskatchewan, who was in charge of carbonizing and briquetting tests of Canadian lignite coal in Germany, has returned to Canada and reports that the tests have been technically successful. The work was carried on for two summers at two of the largest briquetting plants in Germany. Fifty-two tons of lignite from the Western Dominion Collieries at Taylorton, Sask., were used in the tests.

With a full cargo of 2,200 tons of Welsh coal for the Welsh Anthracite Coal Co., of Toronto, the steamer *Knut* docked in Toronto a few days ago, having come direct from Swansea, Wales. This is the fifth vessel that has come overseas this season with coal for this company.

The Public Utilities Committee of Winnipeg, Man., has accepted the tender of the Harstone Coal Co. for the supply of 15,000 tons of Greenhill, Alberta slack coal at $7.67 per ton, required for the central heating plant at Winnipeg.

Shipments of Alberta coal to Toronto over the Canadian National Rys. at a special reduced rate have been discontinued for the present to give the right of way to the movement of grain. When this is over they will be resumed until the full amount of 25,000 tons of coal has been hauled.

The output of the Cape Breton mines is steadily increasing. On Aug. 18 the production of coal amounted to 11,266 tons. On Aug. 19 the number of men at work was 6,195, of whom 4,695 were underground. Mine No. 21 at Birch Grove is permanently closed down and is being dismantled. The bank-head structure and machinery are being removed to No. 11 where a fire took place during the strike. The troops, with the exception of about 150 soldiers, have been removed from the district.

Production of coke in Canada during the month of July amounted to 89,221 tons, the lowest tonnage yet recorded for any month this year, and a drop of 19 per cent from the output of 109,694 tons in June. This decline was largely due to the strike among the coal miners in Nova Scotia. Ontario ovens produced 51,903 tons or 58 per cent of the total production in Canada. Imports of coke in July totaled 55,542 tons as compared with 55,836 tons in June while exports dropped to 1,683 tons from 3,567 tons in the preceding month. For the seven months ending July, 325,470 tons of Canadian coal and 900,579 tons of imported coal were converted into 803,068 tons of coke. During the same period Canada imported 396,598 tons of coke making a total supply of 1,199,666 tons of which 27,735 tons was exported leaving 1,171,931 tons available for consumption in Canada.

# Traffic

### To Hear Carriers Next Week

The Interstate Commerce Commission has announced that at the Sept. 8 hearing in Chicago, Ill. on ex-parte 87 and Docket No. 17,000 which provides for a general freight rate adjustment in the Midwest including an increase of 15c. on coal, the time will be too limited for the presentation of direct evidence by shippers and the public. Instead there will be a further hearing for them at a later date. Carriers and associations of security holders will be heard only.

Dismissal of the complaint of the Fifth and Ninth Districts coal traffic bureau attaching rates on coal from mines in the Belleville district of Illinois to Kansas City, Mo., and other western points is recommended in a report submitted to the I.C.C. by the examiner.

A new regulation of the New York Central R.R., approved by the New York Public Service Commission, provides that switching charges of connecting lines at Buffalo, N. Y., will be absorbed on coke, carload, having road haul via New York Central, but not to exceed 38c. per ton (net or gross as rated). Effective Sept. 15, 1925.

# Obituary

**David T. Evans**, at one time a coal operator in the Kanawha field, died suddenly late in August at Huntington, W. Va. For a number of years Mr. Evans was one of the operators of the Mount Carbon Co., Ltd., Powellton, W. Va. Several years ago, however, he disposed of his interests in the Mount Carbon company and in the Cabin Creek Consolidated Coal Co., in which he was a director, and entered the oil refining business at Kenova. Funeral services were held in Huntington, where Mr. Evans was buried.

## New Companies

**The Putnam Coal Co.**, of Peoria, Ill., has been incorporated with capital of $10,000 to mine and ship coal. The incorporators are Charles M. Putnam, Charles M. Putnam, Jr., and John Evers, Jr.

**The Fairfax Collieries Co.**, of Dorfee, W. Va., has been incorporated by C. H. Schafer and D. C. Prichard, both of McMechen, with a capital of $500,000. The chief operations of the company are in the Henry district of West Virginia.

**The Carter Coal Co.** was incorporated in Madisonville, Ky., the first week of August, with a capital stock of $30,000, by Jewel Avis, Coleman L. Jones and others.

**The College Hill Coal Co.**, of Jacksonville, O., has been chartered with a capital of $22,000 to mine and sell coal in the Hocking Valley field. Incorporators are L. E. Holmes, C. D. Williams, William C. Hilt, James Mackie and Albert Cannon.

**The New North Coal Mining Co.**, Springfield, Ill., has been incorporated with capital of $50,000 to engage in the business of mining and selling coal. The incorporators are B. Schreiber, Charles H. Sutton and C. I. Schreiber.

**The Chelsea Coal Co.** has been organized and incorporated by L. E. Compton, W. O. Meyers and J. F. Dowis of Pittsburg, Kan., and J. A. Holland of Mulberry, Kan., to operate a steam shovel mine on a 600-acre lease near Chelsea, Okla. The sale of coal will be handled by the Security Fuel Co. which Mr. Holland and associates conduct with a sales office in Kansas City.

Organization of the **Ohio Valley Coal Co.**, with $100.000 capital stock to engage in coal mining has been completed with several Indianapolis men as directors. The list includes Frederick M. Ayres, Clarence Stanley, Victor C. Kendall, Samuel Ashby, O. H. Stout, Sidney A. Stout and Thomas C. Mullins. Mr. Ashby, an Indianapolis attorney, said the company had not obtained coal properties at this time, but intended acquiring mines in the Ohio valley states within a few months.

**The Jefferson Block Coal Co.** has been incorporated at Jasonville, Ind., with a capital stock of $6,000 to do a mining business. The incorporators are W. Russell Johnson, Joseph Rogers and Henry Neal.

## Coming Meetings

**Oklahoma Coal Operators' Association.** Annual meeting, Sept. 10 at McAlester, Okla. Secretary, A. C. Casey, McAlester, Okla.

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

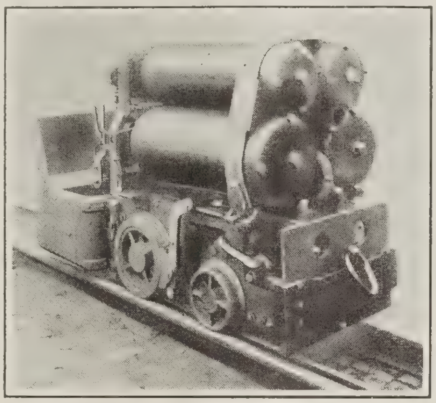
**Fourth National Exposition of Power and Mechanical Engineering,** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

# New Equipment

## Compressed Air Locomotive Is a Midget

For certain uses or under certain conditions the compressed air locomotive is still employed. Where conditions in the mine dictate the use of this type of machine two varieties or weights have been in general use—the haulage motor and the gatherer. A third type or midget machine has recently been developed and placed on the market by Messrs. Demag, of Duisburg, Germany. This is about comparable in size and weight as well as in the service it is intended to render to the electric shuttler recently placed on the market in this country.



**Four Tanks Store the Energy**

This machine is charged with air at the etreme pressure of 2,600 lb. It is intended for light work only, such as moving only a few cars at a time over comparatively short distances. It is safe in any mine atmosphere and can move over any track that will support a mine car.

Chief dimensions of this German machine are as follows: Weight, empty, 2 tons; speed, 5 to 6.2 m.p.h.; capacity of air tanks, 7 to 9 cu.ft.; charging pressure, 2,200 to 2,600 lb. per square inch; pressure of air entering cylinders, 206 to 235 lb. per square inch; useful performance about $7\frac{1}{2}$ ton miles per hour overall width $31\frac{1}{2}$ in.; length, 79 in.; height 59 in.; length of wheelbase $20\frac{3}{8}$ in.; distance traveled per charge of 2,200 lb., about 6,900 ft. or 1.13 miles; with 2,570 lb. of a charge this distance can be increased to about 8,500 ft. or 1.6 miles; normal power output, 4 h.p.; maximum power output, 6 hp.; normal drawbar pull, 339 lb.; maximum drawbar pull, 550 lb.

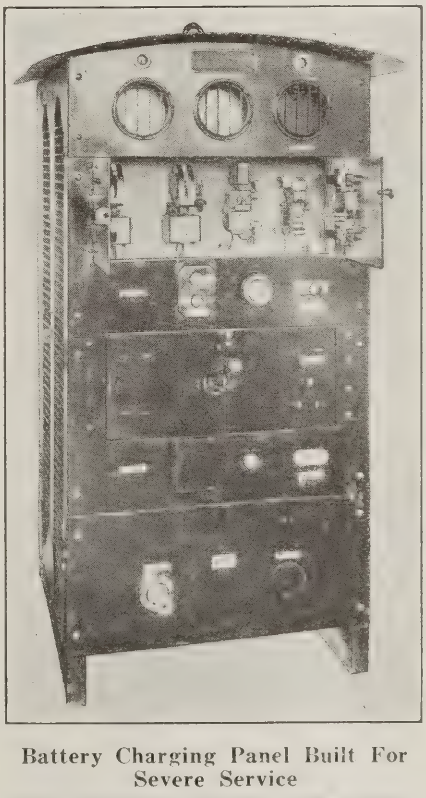
In the design of this locomotive it was the constant aim to keep all dimensions to a minimum. As a result this machine can be run onto the hoisting cage and moved up or down in the shaft with no more dismantling than the removal of the driver's seat. This is a light sheet-iron casing that may be easily attached or removed without interfering in the least with pipe connections operating levers or the like.

Because of this light and compact construction this machine may be employed on several different levels being transferred from one to the other by the regular mine cage. Again, in the event that heavy repairs become necessary it may be run onto the cage and hoisted to the surface where these repairs may be performed in the light of day. Furthermore, the machine is so light that it may be run to any part of the mine over any rail that is heavy enough to carry a loaded mine car. Even with its light weight, however, its drawbar pull is sufficient to haul eight to ten cars each weighing about 2 tons.

## Strongly Inclosed Battery Charging Panel

A specially designed and completely self-contained battery charging outfit is now in operation in one of the large anthracite mines in Pennsylvania to withstand the rough treatment to which underground equipment is often subjected. The outfit was built in the form of a switchboard panel by the General Electric Co.

The housing framework is made of machine steel, welded, with a missile-proof covering on back and sides of $\frac{3}{4}$ in. expanded metal grill, No. 13 standard gage. The roof is formed of a heavy plate of 0.156-in., stretcher-leveled steel, having the customary gentle roll for shedding water. An extra heavy I-belt is fastened through the roof to the framework to provide for



**Battery Charging Panel Built For Severe Service**

Only authorized persons have access to the equipment in this inclosed cabinet. Even the meters are protected against tampering yet are visible at all times.

easy shifting of the equipment, by crane or handles, from one part of the mine to another.

A strong clip, suitable for a padlock, on the doors provides protection against meddling by unauthorized persons. The meters at the top of the panel are viewed through three portholes, protected by bars.

The doors of the upper section when opened expose the relays and contactors. The right-hand door carries a reset handle for the overload relay thus allowing the operator to reset the relay without unlocking the door.

A handwheel for the dial switch, a push-button station and a voltmeter switch are all mounted on the solid portion of the panel directly below the swinging doors of the upper middle section.

The electrical equipment, consisting of standard battery charging apparatus, is especially finished to prevent corrosion.

## Simple Priming Device Aids Centrifugal Pumps

To meet the demand for a vacuum pump suitable for use in priming the smaller sizes of centrifugal pumps, Barrett, Haentjens & Co., of Hazleton, Pa., has brought out the device shown in the accompanying illustrations. In outward appearance this much resembles the machines of a similar character previously developed by this firm. It is, however, small and simpler in its construction.

This pump is intended for use in conjunction with a vacuum breaker and, consequently, is of the dry type. As a result, water does not enter this machine, it requires little power, operating stresses are reduced to a minimum and the working parts are not subject to rust or corrosion. Its simple construction is of marked advantage when making inspections or repairs to any of the internal working parts. The drive chain, as may be seen, is carefully guarded.

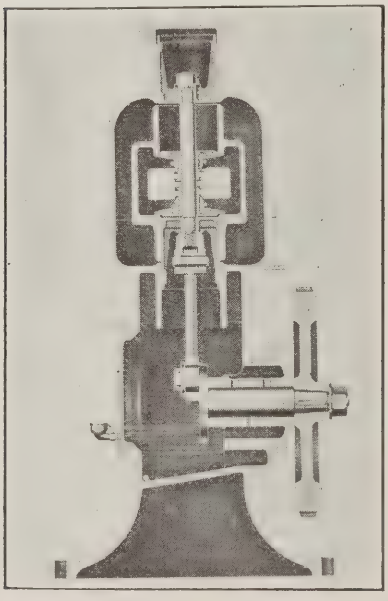


Fig. 1—Cross-Section of Priming Pump

This machine is intended for operation in conjunction with a vacuum breaker. Thus no water can find its way into the working parts, which consequently, are not subject to rust or corrosion. Lubrication is automatic.

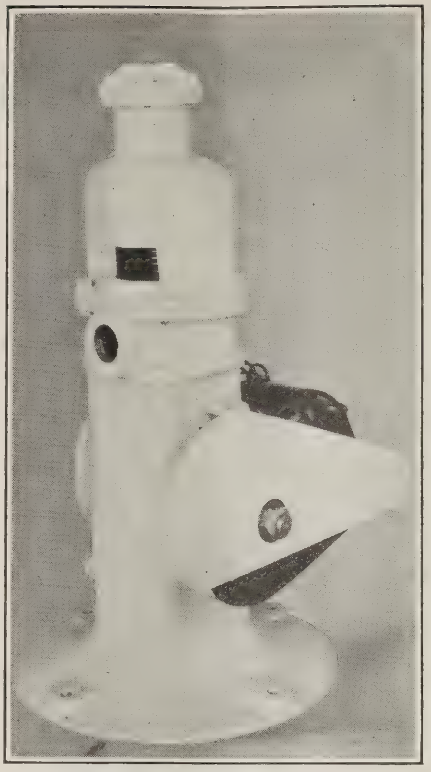

Fig. 2—Ready for Installation

This shows the self-contained priming unit ready to be set up and connected to the pump it is to serve. As may be judged from this illustration the floor space is small as is also the necessary head room.

The manufacturer claims the following advantages for this new machine: The pump is a compact unit requiring little floor space or head room. Automatic lubrication of all moving parts conserves oil and reduces the amount of necessary attendance. The machine is built without inlet valves, air enters it through parts that are alternately covered and uncovered by the piston. Both exhaust valves are located at the ends of the cylinder, are seated by a single spring and are always visible. Such simplicity of construction makes for easy running and long life.

## Industrial Notes

**The Cutler-Hammer Mfg. Co.**, Milwaukee, Wis., has purchased the business and patents of Payne Dean, Ltd. The Dean valve-control apparatus has always been manufactured by the Cutler-Hammer Mfg. Co., and they have recently also manufactured much of the other equipment sold by Payne Dean, Ltd., such as the auxiliary power plant apparatus. Mr. Dean and many of his associates are now connected with the Cutler-Hammer Mfg. Co. and will actively assist in the promotion of this work.

A contract for the construction of shaker screens and tipple equipment for the **Dawson Daylight Co.**, Dawson, Ky., has been awarded the **Earlington Machine Works**, at Earlington, Ky. The Dawson concern operates a strip mine. Its tipple was destroyed by fire on July 21.

**The Westinghouse Electric and Manufacturing Co.** has received a $500,000 order for electrical equipment from the Comal Power Co. of San Antonio, Tex., through the U. G. I. Contracting Co. The new plant is designed to use powdered coal. This enables the power company to use the low grade coal or lignite mined in that vicinity at a big saving.

**The American Cable Co.** has appointed the firm of Bruntons, Musselburgh, to handle its general line, including Tru-lay wire rope and Tru-loc fittings, in Scotland. The Dominion Wire Rope Co., Montreal, is a new Canadian distributor. Other new distributors are: The Marion Machine, Foundry & Supply Co., Marion, Ind., J. Shuman Hower, 106 Foster Bldg., Utica, N. Y., The Contractors Equipment Co., 8 Steuben St., Albany, N. Y., and John C. Louis, 221 S. Eutaw St., Baltimore, Md.

**Clarence L. Cook** has joined the sales organization of the **Fairmont Mining Machinery Co.**, after having been with the Pittsburgh Coal Washer Co.

**J. V. N. Dorr**, president of the **Dorr Co.**, arrived on the Olympic, Aug. 26, after spending two and one-half months in Europe in connection with European business of the company.

## Trade Literature

**C-E Air Heater.** Combustion Engineering Corporation, New York City. Catalog A H-2. Pp. 14; 8¾x11 in.; illustrated. Describes the construction, operation, performance and applications of this heater.

**Reilly Oil Heater.** The Griscom-Russell Co., 90 West St., New York City. Form 402. Leaflet describing and illustrating how this apparatus uses live steam to provide the proper degree of preheating of oil for thorough atomization at the burners.

American Blower Co, Detroit, Mich., has issued Bulletin No. 3506 on **"ABC" Steel Plate Exhaust Fans.** The bulletin has 25 pp., 8½x11 in., with illustrations and tables. The company also has issued a 4x7-in. bulletin superseding Price Book 1129 and Price Book 1129-A, containing prices and information on electrically driven fans and blowers for exhausting, blowing, ventilating, drying and cooling.

Pennsylvania Pump & Compressor Co., Easton, Pa., recently issued Bulletin No. 122, describing its **Aftercoolers;** No. 123, describing its Class 3-A and 4-A **Air Compressors** and class 7-A and 8-A on **Vacuum Pumps;** Bulletin 124, describing its **Portable Air Compressors.** These bulletins are 8½x11 in., illustrated.

**The Venturafin Method of Heating** is the name of an 8½x11-in. book issued by the American Blower Co., Detroit, Mich. The book is well illustrated, showing the different installations where the Venturafin method has been installed.

The C. J. Tagliabue Mfg. Co., Brooklyn, N. Y., has issued a new and revised edition of its catalog on **Automatic Controllers** for temperature, pressure, humidity, liquid level, condensation, etc. It contains 84 pp. and is well illustrated.

**Anchor Rerailers.** T. H. Edelblute Co., Pittsburgh, Pa. A four-page folder describing and illustrating the installing of the rerailers at coal mines, metal mines, etc.

**The Air-Lift Method of Pumping Water by Compressed Air.** Pennsylvania Pump & Compresor Co., Easton, Pa. Bulletin No. 118. Pp. 12; 8½ x 11 in.; illustrated. A discussion of the air-lift method, with tables.

**Jeffrey Belt Conveyors.** The Jeffrey Mfg. Co., Columbus, Ohio. Catalog No. 409. Pp. 52; 7½ x 10½; illustrated. Contains descriptions of various types of standardized belt conveyors for use in practically every industry where loose materials or packages are handled.

**Uehling Vacuum Recorder, Type D.** Uehling Instrument Co., Paterson, N. J. Bulletin No. 140. Leaflet describing the construction and working of the recorder which operates on the mercury-column principle and employs no moving parts, springs or diaphragms.

The Westinghouse Electric & Mfg. Co., East Pittsburgh, Pa., recently issued its new 1925-27 catalog of electrical supplies containing 1,200 pp. and well illustrated. Includes all new apparatus designed and manufactured in the past two years, as well as all previous types, brief descriptions of the company's industrial motors and controllers, power and marine equipment, large switchboards and oil circuit breakers and railway supplies. The book contains a complete subject index, style number index for checking invoices, classified index and thumb index which enables the user to locate any section of the catalog.

S. Flory Mfg. Co., Bangor, Pa., recently published Catalog No. 31, containing 72 pp.; 6 x 9 in.; illustrated. The catalog is devoted exclusively to Flory **hoisting machinery** for construction and material handling operations.

COAL AGE

McGRAW-HILL COMPANY, INC.
JAMES H. McGRAW, *President*
E. J. MEHREN, *Vice-President*

Devoted to the Operating, Technical and Business Problems of the Coal-Mining Industry

R. DAWSON HALL
*Engineering Editor*

Volume 28 NEW YORK, SEPTEMBER 10, 1925 Number 11

## Island Creek

THIS IS THE ISLAND CREEK number of *Coal Age*. The story of how Island Creek Coal Co. has grown in technical, physical and economic importance in the world of coal is presented in the leading articles of this issue, not because that company is a paragon of coal operating virtue but because it has risen so strongly over faults and handicaps that have consigned many another such organization to mediocrity.

Vision, vigor and the application of keen intelligence have done much from 1902 forward to make Island Creek Coal Co. one of the most consistently profitable coal properties in the history of the industry. Favorable natural and labor conditions do not account wholly for this. Method is in part accountable. Coal men everywhere who are reaching out for management and operating ideas that will improve their own businesses and thus help in today's advance of the coal industry to a higher plane of efficiency will eagerly read the pages of this issue to learn Island Creek method.

## No Disagreement, but—

A FEW YEARS AGO the conservatives of the United Mine Workers saved that organization from the folly of an out-and-out declaration in favor of the nationalization scheme imported from Russia via England by referring the question to a special committee for further study and report. A few days ago the subject so dear to the radical dreamers and the addled-thinking "economists" whom Ellis Searles so aptly dubbed Greenwich Village coal diggers was again dragged forth by energetic newspaper reporters eager to brighten up a humdrum story of the anthracite deadlock.

John L. Lewis has been prompt to disclaim responsibility for the resurrection. The stories "reviving discussion of the theory of nationalization of the coal industry," he states, "do not originate with the mine workers." John Hays Hammond, declares the president of the United Mine Workers, must bear the onus because the chairman of the United States Coal Commission "has been haunting the lawns of White Court, pestering the President" to abandon the traditional government policy of non-interference with business and establish a semi-regulation of the anthracite industry. "It is obvious," Mr. Lewis sagely remarks, "that any legislation enacted by Congress dealing with anthracite must similarly be superimposed upon the bituminous industry." Such regulation, Mr. Lewis has indicated both publicly and privately, is not advocated by the United Mine Workers.

With the federal operation of railroads still a vivid memory and the Shipping Board mess a constant reminder of what happens when the government undertakes to step out of its natural sphere, only a minority would favor regulation of either branch of the coal industry except as a last alternative. It is cheering, therefore, to find such an influential ally as Mr. Lewis lifting his voice in protest against renewing consideration of the perpetration of that economic crime. It would be more encouraging, however, if Mr. Lewis was not exercising his control over the coal industry in such a way that many otherwise sober-minded citizens are driven to believe that what he denounces offers them their only relief from his tyranny.

Mr. Lewis breathes brave words against regulation, but his actions are the strongest support of the school he condemns.

## Maintenance and Success

WHEREVER WE FIND coal properties which stand out as efficient profit-making producers, such as the Island Creek mines described in this issue, we invariably soon observe that unusually good supervision and care is given the mining equipment. In these days one hardly need argue that low-cost operation should go hand in hand with the use of labor-saving equipment. But, strangely enough, although most men admit that the success of a mine depends largely upon the amount of equipment it uses, they forget that poor maintenance and careless operation limits the usefulness of apparatus and profit it can make.

If it is worth while to invest a large amount of money in a machine, why isn't it also worth while to insure its continued operation and success by providing adequate repair facilities?

Breakdowns and delays to haulage systems often tie up production in a section of a mine employing many men who must remain idle until service is restored. A main hoist or power substation failure may shut down a whole mine for a day or more. Only by regular inspection to avoid such accidents and by providing sufficient repair parts can a mine hope to be able to pay its overhead for every day it is in operation.

## Consumers and the Safety Problem

SUCH A MODERATE USE of rock dust as does not invade the rooms probably will not greatly affect the sale of coal. The public, however, will view with disapproval any dustiness of product where the dust does not resemble fuel and some difficulty may be experienced in disposing of the ribs and stumps of entries, where they still retain a heavy coating of rock dust. However, this coating could be washed off with a hose before shots are fired. Where extensive sprinkling is done and fine coal adheres to the large lumps the retailer complains, for he finds he has more screenings. The consumers find that they have a dusty coal. Thus the public is offering some resistance to modern safety methods.

The coal might be washed down after being prepared. After all, such a washing of the lumps, six or eight inches in diameter or larger will not add much moisture to the coal for what water is applied will speedily run off; but with the smaller sizes, or with run-of-mine it will result in shortage of weight, the railroad weight of coal and water not coinciding with that of the dry coal when it is received. Fortunately in these cases there is less objection to adhering fine coal and consequently washing down fine sizes will not be necessary.

## From the Courthouse Steps

DAY-BY-DAY SALES of coal mining property in sheriffs' hands during the summer was not a healthy thing for the coal industry. The effect that this sort of thing is bound to have on certain coal markets during the next year or so while margins on coal are slim cannot be overlooked. In sections of Kentucky sales from courthouse steps have put some bargains into the hands of buyers. A property valued at $600,000 sold for a mere $32,000. Another which sold less than two years ago for $250,000 went off the auction block at exactly one-tenth its value. There are others. The list is long.

The buyers probably can afford to operate these properties successfully even though the previous owners went broke trying to do it. The new holders' investment is so small that their depletion charge, interest on bonded indebtedness and other capital charges are practically nothing. The advantage this gives these companies in the market may be enough to completely undermine nearby markets upon which other and more regularly financed mines depend for their outlet. Thus the much heralded law of the survival of fittest which is supposed to be operative with especial effect in the coal industry, produces strange results.

## Score: Yellow Cab, 67; Coal, 23

MEN HONESTLY striving to overcome natural obstacles to efficiency in coal mining are irked by the high marks set up in certain other industries whose problems are not comparable to coal's. Take Eugene McAuliffe for instance. Mr. McAuliffe stands at any hour on the curb of almost any busy city street in America and witnesses the ant-like industry of the ubiquitous Yellow Cab. It never seems to quit work. Mr. McAuliffe ponders. Then, with his customary mental vigor he gathers up statistics on the Yellow Cab, compares them with statistics of coal mining, and, in his *Union Pacific Coal Company Employees' Magazine*, deals coal another black eye.

He says that John Hertz, the founder and, for 10 years, the actuating spirit of the Yellow Cab does what he does in the city streets of the land "by efficient organization expressed in good equipment, well maintained, and thereafter used. Before the recent collapse of the coal mining industry the average working year was 215 days out of 308, or on the basis of 8 hr. per day, 1,720 hr. per year. In Chicago the Yellow Cab Co. averages 16.2 hr. actual service per day, every day in the year, but eliminating holidays and assuming a year of 308 days, its cabs would operate 4,990 hours, or 290 per cent of the average mine year. Ninety per cent of the cabs are always ready for service, the peak demand coming at 1:00 a.m. Sunday (Saturday night); 70 per cent are double shifted; the cabs average 50,000 miles a year and last on an average three years.

"Our mines and mine equipment are employed about 23 per cent of the year (excluding holidays), while John Hertz's cabs keep busy 67 per cent of the time. Naturally it is a far step from coal mining to wiggling a cab through the streets of New York or Chicago, but the Hertz performance was developed in 10 years. The mining industry is now about 750 years old and efficient mechanization is just coming in, while the work year has gone back. We want more of the John Hertz mental attitude in the coal industry; such would mean better earnings, safer employment, happier men and cheaper coal."

True enough. We certainly do want more dauntless men of mental keeness in coal. The industry needs their stimulus, the mining art their freshness of vision. However, Mr. McAuliffe surely recognizes that severe limitations which Nature has fixed inflexibly upon underground mining makes it essential that efficiency of the coal industry be measured on a different scale from that of the Yellow Cab. The cab does not run continually in a low and caving tunnel. Its roadways are maintained for it by others. It can travel where it pleases. So long as it runs at all its income is up to standard. Can coal do that?

## Raw-Material States Suffer

IN A RAW-MATERIAL country capital seems to drift almost inevitably to the industries producing that raw material. Manufacturing gets only a passing consideration, and, consequently, in a state like Pennsylvania or West Virginia we see coal and iron traveling away to be used at distant points and the products of those raw materials being brought back after having paid transportation both ways. This is neither economical nor desirable, but it seems almost inevitable, constituted as we are.

Part of the overdevelopment of mineral resources comes from that very fact. The genius of the inhabitants of raw-material states is directed solely to that development. No matter how greviously the industry may have suffered or may be suffering, somebody is looking for an opportunity to open new mines, usually some impecunious person who cannot hope to compete because he cannot equip his mines adequately.

Utah, for instance, is suffering just now from the obsession. It is said that the state is cursed with too much coal. In Carbon County everyone has his eye on a coal mine rather than on the one hundred and one other possibilities, that would make Utah a well-rounded state.

Resting on only two or three industries, all based on raw-material production, any community has an extremely uncertain existence. When the particular raw materials are not wanted, business is dull to utter stagnation. No other place of employment or investment is open, and the towns waste away. Even the railroads, having nothing to haul, lay off men or give them short time.

Diversified industry is needed as much as diversified farming. We rebuke the cotton farmer for hauling in oats, wheat, corn and hay that he could grow on his own acres. We chide him for excessive anxiety to increase his cotton acreage in the face of the weakness of the cotton market, but the coal industry is no better. It develops far too many properties that should remain untouched. Let capital go into coal mining without limit, so far as it increases efficiency, but let it not be wasted in cheap, inefficient equipment that gluts the market while not lowering the cost. And above all, let it visit no more grief upon regions already overdeveloped.

***Island Creek Number***

# Would You Increase Tonnage and Reduce Costs? Island Creek Has Done It

## Careful Division of Area Among Mines of Large but Not Phenomenal Size—More Inspection and Less Repair — No Substitution of Coals—Towns to Attract More Desirable Men — Houses, Mines and Offices Easy of Access

**By R. Dawson Hall**
Engineering Editor, *Coal Age*,
New York City

NOT WITHOUT some basically correct principles of management and operation could the Island Creek Coal Co. of Logan County, West Virginia, have arrived at its present large production. Its mines will possibly produce this year more coal than those of any independent bituminous coal company. There must be some reason for this rapid rise to leadership, and it will be my endeavor to set down the cause of the growth of this company since 1902, when it started mining on a small scale at Holden in the heart of Logan County.

One of its prime principles relates to selling. It sells direct to the consumer, and it confines its business to its own coal. In consequence, it is not subjected to the loss of reputation which a producer of a good product inevitably sustains when some other coal is substituted for its own. All its business is done with coal that it knows is good and dependable, from beds that it is sure are clean, mined by men under its own supervision, carefully prepared and picked on its own tipples. As a good reputation is the basis of all successful business, it is not well to have other persons substitute inferior coal for a standard product nor is it advisable to do as is the practice of some operators, to ship fuels of other companies and from other mines and seams in place of their own. In short, the Island Creek Coal Co. does not itself substitute nor give others an opportunity to do so.

An operating principle that the Island Creek Coal Co. has adopted to its great advantage has been to divide up its field in carefully planned areas so as to minimize haulage, electrification and ventilating costs. Each mine has its predetermined area and each area is of a size appropriate to the physical conditions. The division of the whole field has been made easy by the many narrow valleys which give ready access to every coal section, though in some of them the Island Creek seam does not outcrop.

The Island Creek Coal Co. is not seeking to make big records for single mines. It is willing to leave that honor to other operators. Large gross tonnage from a suitable number of mines at a correct mining and transporting cost may not make headlines but seems more likely to, and actually does, produce dividends, certainly under Logan County conditions. Do not believe, however, that the company favors the operation of small mines in large numbers. Its largest mine is now producing 65,000 tons a month, and its newest operations, Nos. 20 and 21, are designed for a maximum daily output of 4,000 tons, quite a sizeable production even in these present days. In fact, whereas in 1923 the Island Creek Coal Co. produced 3.1 million tons of coal from nineteen mines in the Island Creek seam, in 1924 it had concentrated its activities to twelve mines and yet produced nearly 5 million tons. It found that the efficiency in operation was correspondingly greater, and at present it is mining at the rate of over 6 million tons with greater ease and a

---

The tipple and slope at No. 1 mine are shown in the headpiece. The gallery and the slope shelter a belt conveyor 285 ft. long.

lower cost per ton than before. So the Island Creek company is an exponent of the value of the slogan "Better and fewer mines."

But such a practice of enlargement of operations reaches a limit, and the management of the Island Creek mines believes that a 4,000-ton-per-day mine is preferable for favorable conditions such as theirs. By keeping the size of its plants within limits such as these, it can avoid long hauls and simplify its ventilation problems.

Traveling from mine to mine one is impressed with the fact that the Island Creek Coal Co. is a believer in modernization and believes in it not alone in the restricted sense that when it starts a new mine it should make it the last word in mine construction. Shafts Nos. 20 and 21 are probably the most interesting installations of the company, and they are new, but all the plants are modern because they have been diligently modernized. A long series of reconstruction jobs have made available every new form of production help. Old tipples have been replaced by new, and right now two new tipples are being built to do the work more inexpensively and more effectively than those they replaced.

When the slopes at several of the mines were first driven they were timbered, but coal dust tended to collect on the collars and the management feared that this dust would create an explosion hazard. In consequence the slopes have been lined with concrete. Underground equipment is constantly being replaced and supplemented. Notable changes of this kind have been the recent installation of about 2,000 low-type steel mine cars equipped, like every car on the job, with roller bearings. The use of electric coal drills is another evidence that the Island Creek company is not behind-hand in its modernization program. These are only a few of the ways in which this company has brought its operations abreast of the times.

And we have here by no means a company without a past. It has had time and plenty of opportunity to grow moss-backed and time-worn but it lacked the disposition.

Since 1902 when ox teams laboriously hauled equipment over the mountains a distance of eight miles from the village of Dingness, W. Va., on the Norfolk and Western R.R. great changes have taken place. At that time a saw-mill was constructed which cut down the merchantable timber. It continued its operations till 1919. As one looks at the hills one hardly realizes that the work of lumbering is completed. They are still verdure-clad and as picturesque as ever.

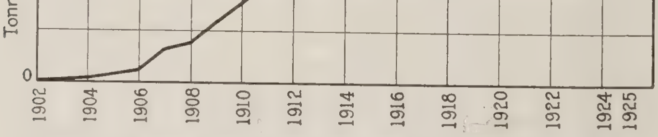

**Fig. 1—Production Curve of Island Creek Coal Co.**

The sag in the curve between 1916 and 1920 marks the period during the war and shortly thereafter when labor was scarce and car supply limited. The straight line between 1921 and 1923 marks the period during which markets were being readjusted. The rapid ascent between 1923 and the present day shows how the last readjustment of the market has increased the production of this company. At the beginning of 1923 the company had nineteen mines in operation; during 1924 and 1925 only twelve have been operating and yet the production has been growing rapidly. This sharp rise is a striking example of what modernization will do.

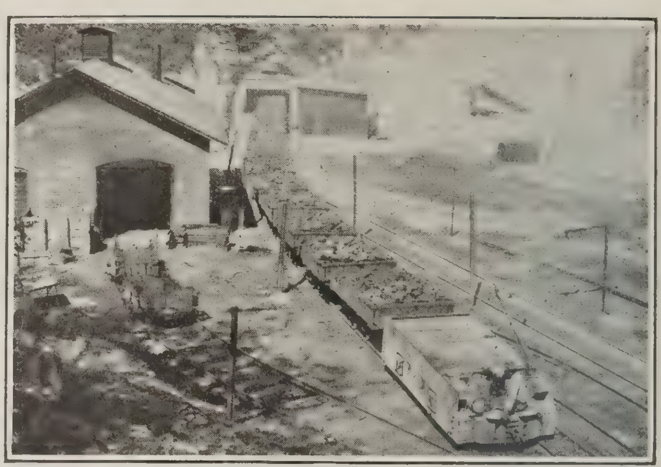

**Fig. 2—Out from the Cool of the Mine Into the Summer Sun**

Loaded trip leaving No. 18 mine. The train consists of twenty low-type mine cars of 2½-ton capacity hauled by a 15-ton locomotive. The seam at this mine lies 189 ft. above the level of the railroad track at the tipple. One of the few mines of the company where the cars come to the surface.

The company gradually acquired a large acreage and opened new mines, its growth being slow because of lack of railroad facilities, though by 1910 it had seven mines and an output exceeding 1½ million tons yearly. At the close of this present year the company will have mined altogether from all its nineteen mines, past and present, over 44 million tons.

At present, the company has in fee simple 27,000 acres of coal land, all in one large tract. It is estimated that under this property are about 215 million tons of coal in the Island Creek seam, 82 million tons of coal in the Draper seam and 60 million tons in the Eagle seam. To date mining has been confined entirely to the first-named bed.

A liberal policy with regard to labor has been characteristic of the Island Creek Coal Co. It has recognized that any company, that would expand, must have villages and living conditions that would attract the better kind of labor. Only trouble can be expected if the towns in which the men are housed are of the kind that men of orderly habits and high ideals shun. The Island Creek villages have not only scenic beauty but comfort and neatness. The man who lives in them can say "good-bye" to the pioneering life with its hardships.

With no less than 290 actual working days in the year; with a system of ten schools which have the highest rating in Logan County, the funds of which are augmented by the company, so that they run nine instead of eight months; in an almost urban community comprising 10,000 persons, all of whom dwell in and around Holden (a community for the welfare of which the company holds itself responsible) with good water supplied by four water filtration plants of a combined capacity of 324,000 gal. in 8 hr. the employee of the Island Creek Coal Co. rightly feels he has ideal conditions. The best men and the largest supply of men can be obtained by an operating policy such as this.

Reverting to the filtration plants it may be said that the largest is at Holden. It has a capacity of 200,000 gal. in 8 hr., the water being pumped from the Right Fork of the Main Island Creek. The water is treated by the use of chlorine, soda ash and alum and then filtered and piped to the houses. Fire plugs are distributed as needed to guard against fire, aided by a fire truck which gives a pressure of 350 lb. per square inch. The town of Holden also is provided with fire-alarm boxes.

In all the villages some means of sewage disposal has been provided. Wherever the practice is convenient and safe, the sewage is discharged into the creek. In other places it is piped to septic tanks. In Holden the streets are paved and in lesser communities hard roads or their equivalent have been provided. Sidewalks have been laid where needed and street lights are everywhere installed. All lots are fenced.

To make possible the quick delivery of lighter materials from storehouse to mine, to aid officials and doctors in making their rounds, to accommodate its mine workers and to prevent the tracking of dirt into their houses as well as to benefit the county at large, the company, in 1923 and 1924, graded and constructed ten miles of 16-ft. concrete roads at a cost of $675,000. Without good roads the mines, even though reasonably close to one another, are not readily accessible for the visits of officials, especially in rainy weather. How near the mines are to each other can be judged

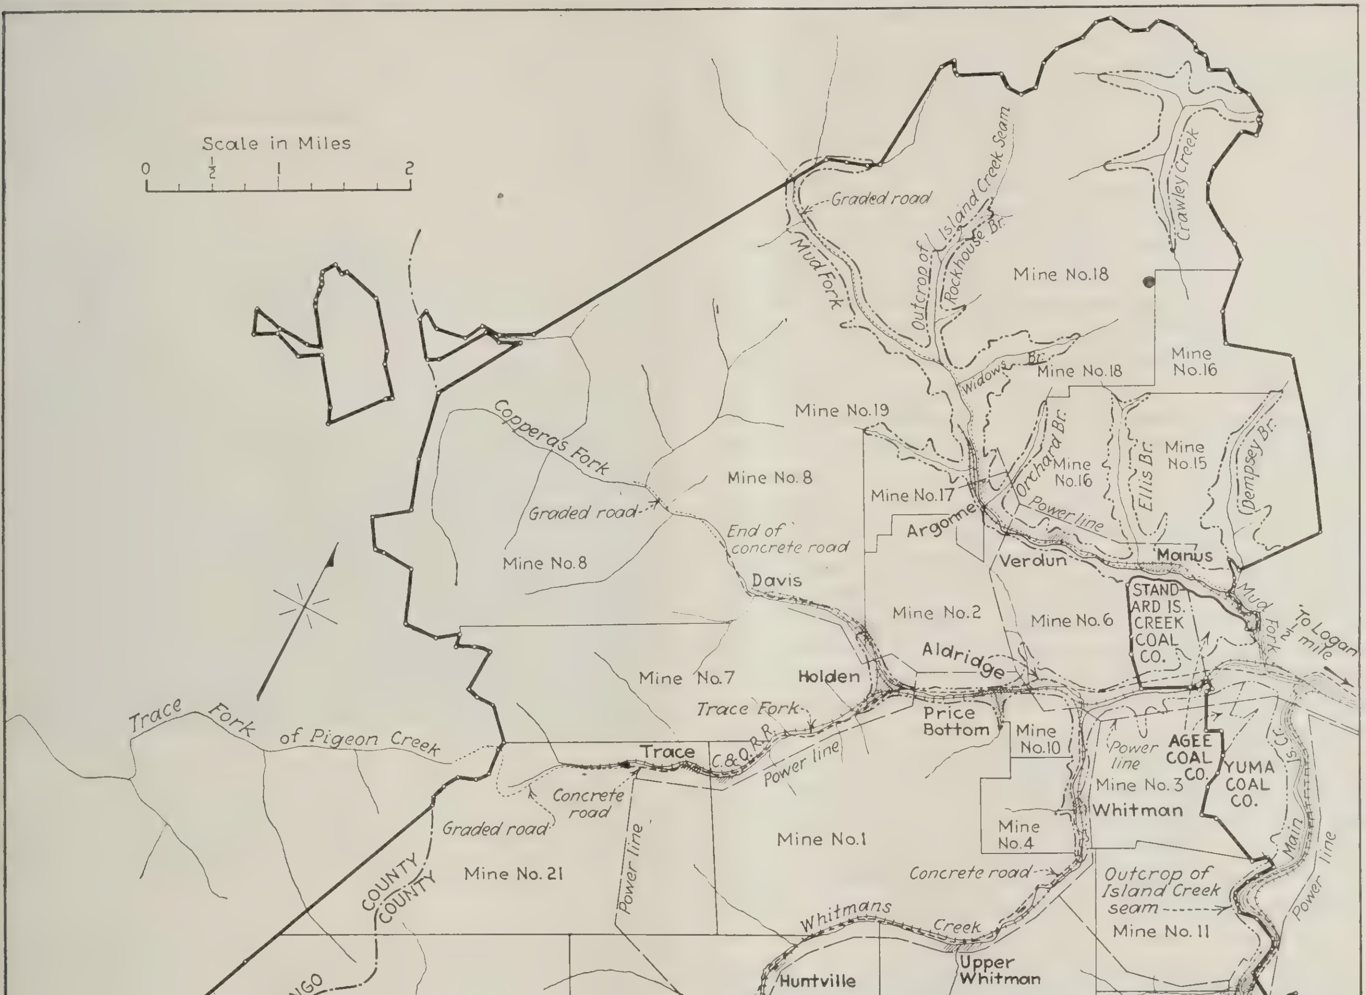

Fig. 3—Map Showing Holdings, Mines, Villages and Power Lines of the Island Creek Coal Co.

The outcropping areas on the right in time will give place to the deeper mines on the left. These mines have been apportioned larger areas because, where the coal is deep, fewer and larger mines are desirable and economical. Where the crop divides a coal field into small areas, it is useless to spend money in providing a huge output which could only be attained by the time the area readily available was about worked out. But in deep-lying fields, the cost of sinking slopes or shafts and the expenditure for conveyors or hoists make it profitable to put in fewer plants and these of large capacity.

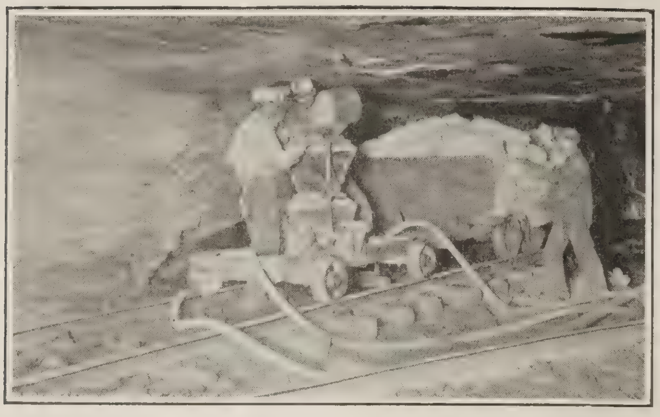

Fig. 4—Rock Dusting in No. 20 Shaft Mine

The Island Creek Coal Co. is not passing up anything new which is likely to make its mines more safe. Lately it has gone to rock dusting. It is now rock dusting the haulage entries in its shaft mines and will extend this activity to all of its operating mines. It will further guard against coal-dust explosions by erecting rock-dust barriers at the necks of room panels. Here is shown a cement gun being utilized for distributing rock dust.

from the general layout map of the property (Fig. 3).

With good roads, frequent, even daily, visits by the general manager and his operating and engineering assistants are possible. Radiating from Holden and leaving the main thoroughfare between that town and Logan, the county seat, are a number of branch roads which reduce to a minimum the distance by automobile from any settlement on the property to either of these towns. Most of the miners employed by the Island Creek Coal Co. own automobiles, so that they may enjoy the activities of the larger towns.

Repair men from the mechanical and electrical departments making headquarters at Holden all travel to and from their work in automobiles, the roads having made feasible the erection of a large central shops building where repairs can be made uniformly under the watchful eyes of the departments. Speedy transportation of supplies by trucks has enabled the company to operate efficiently with only a small stock of repair parts at any one mine.

Like all successful companies the Island Creek Coal Co. lays more stress on inspection than on repair. With any other plan there can be no continuity of operation. And for that inspection the company vests the authority in the equipment-maintenance department and not in the mine officials. Let us consider a few examples of the way in which this plan functions.

As far as condition is concerned, there is no difference at the Island Creek mines between an old and a new machine. As a result, cutting crews are not anxious to get a machine newly arrived from the factory and are not allowed to make such a choice, for there is no difference in operating efficiency between it and any other machine. Frequent inspections and prompt attention to defects keep equipment up to standard, and the cutting operations are closely watched by the equipment-maintenance department, the cuts themselves being inspected to ascertain whether the machine runner has been using dull bits.

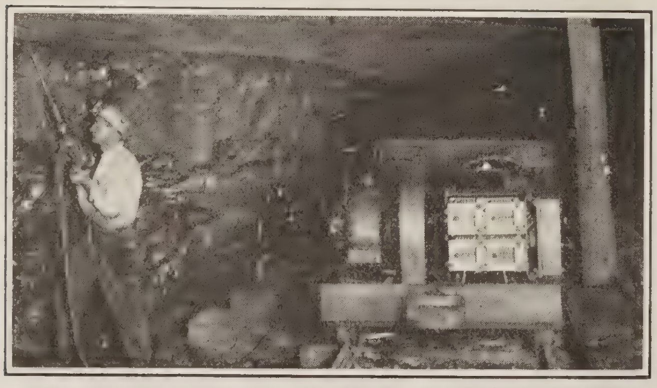

Fig. 5—Air Drill Breaking Roof for Overcast

Directly over the coal seam in these mines is a bed of hard massive slate which is broken only with the greatest difficulty. Consequently for the building of overcasts a portable compressor is hauled to the job and thereby a difficult task is made comparatively easy.

The electrician at each mine thoroughly inspects every cutting machine on the job at least once a week, the inspection being made in the motor barn where facilities are provided for the making of all necessary adjustments. In addition, the machine runner inspects and adjusts the machine daily and each day makes out a daily report with a copy as to the condition of the machine. These he hands to the night boss, who in turn passes the report to the mine electrician and gives the copy to the mine superintendent. If the machine needs repair it is taken immediately to the motor barn. Electric coal drills are stored during the off-shifts in the same place, where they are inspected each day and the necessary repairs made.

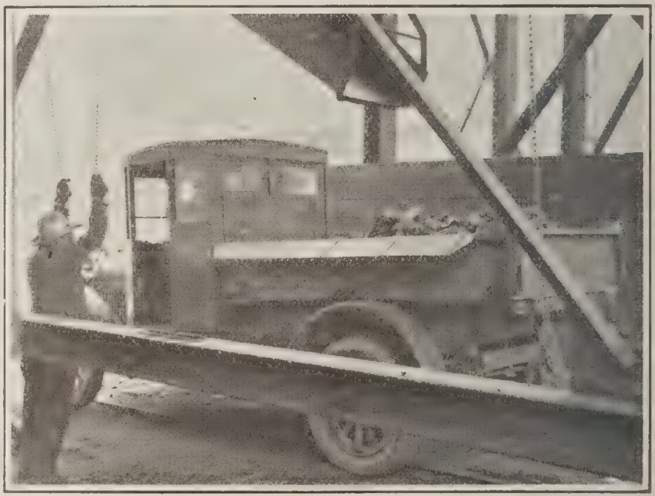

Fig. 6—Automobile Truck Disposes of Mine Refuse

What little mine refuse is brought to the outside from the interior of the Island Creek Coal Co. mines is hauled away in automobile trucks, introducing a novel use for this type of vehicle at the mines. This scheme is the least complicated and the most economical for the disposal of small quantities of rock which are dumped over the banks of the roads.

Only once, and only at one mine, in a period of twelve years during which many mines have been operating, has a day been lost by reason of fan trouble. This continuity of fan operation can be attributed solely to the care with which the fans are inspected for defects and the promptness with which any fault is corrected. Each fan is inspected once a week by the alternating-current electrical department.

*Coal Age* has already outlined the scheme of tipple inspection which provides comparative freedom from breakdowns of tipple equipment. For full details the reader is referred to the May 7 issue, p. 678.

The authority of the mine superintendent or mine foreman does not extend to the mine electrician. The latter reports to the head of the direct-current electrical department by whom all of his orders are given.

The company insists that all rooms and entries be driven uniformly wide and straight and in adherence to its standard plan of mining. The work of every eighteen or twenty loaders is directed by a straw boss. As the rooms and headings advance, center lines are painted on the roof, the lines being extended by a center boss and helper with each advance of one cut. Surveying corps report the finding of all off-center places to the superintendent and the general superintendent. A mine inspector is employed; he reports directly, and only, to the general superintendent, who promptly acts upon the inspector's suggestions.

The Island Creek Coal Co. prepares its coal with great care, as is instanced by the fact that it requires that each railroad car shall be carefully swept before it is loaded. It is anxious to maintain the appearance as well as the quality of its coal, and any lump which has a luster inferior to that of the bulk of the coal is rejected, even though its analysis may measure up to that of the average. At the Island Creek mines all the coal is screened, even the run-of-mine, because only by screening is it possible to pick out the impurities in the coal of larger size. When run-of-mine is shipped it is made up of the assembling of the sizes after the impurities have been removed on the picking table.

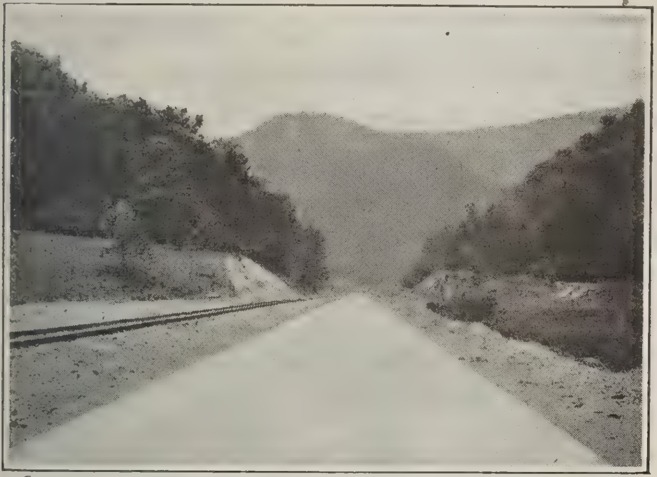

**Fig. 7—How Island Creek Builds Roads**

Without easy communication no business can be conducted profitably. A primary need of efficiency is good roads. How many companies never achieve success because they fail to provide road facilities and become buried in the ruts and mud holes that inevitably form in dirt roads? Island Creek has spent $675,000 in highways like this.

Though it is a fact that the Island Creek mines have had a good record for safety, the company is making a concerted effort to increase the safety of its workers. It is acting as far as it can through its employees in the work it is doing in and about the mines and throughout the property. That part of the program of safety in which the employees have not, as yet, concerned themselves is shouldered by the company. But by continual education, example and training the company is extending the control of employees in the safety campaign.

Perhaps the strongest link in the chain of safety at these mines is the safety clubs. Mention of their method of functioning was made on p. 873 of the June 11 issue of this magazine. A few additional remarks relative to their purpose and practice are appropriate at this point. The safety clubs were organized, as indicated by an excerpt from the rules and regulations governing them, "to protect the employees of the Island Creek Coal Co. from accidents in and around the mines and to promote a system of first-aid training that will enable the employees to look properly after the health and comfort of their fellow workers."

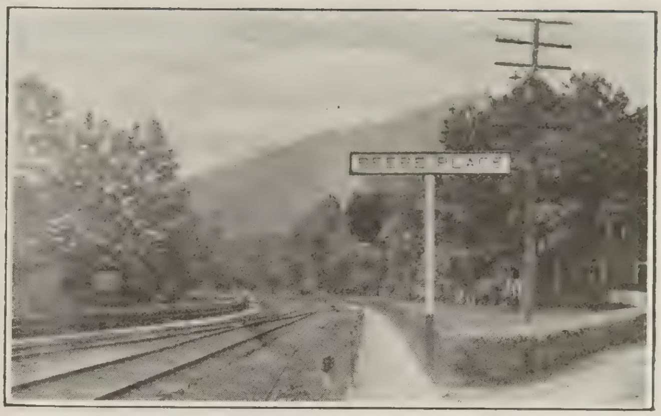

**Fig. 8—Even the Railroad Is Attractive at Holden**

By laying a sidewalk and erecting an iron fence on either side of the railroad tracks this thoroughfare for travel on foot has been made safe. The scene is enhanced in beauty by the hedges and trees.

Obviously it is an organization of employees, over which the company assumes no control. Each mine has its own club presided over by the superintendent as president and the mine foreman as vice-president. Meetings are held every two weeks by the several clubs to discuss accidents and means to prevent them. Failure of any employee to attend at least one meeting a month subjects him to a fine. Any employee who violates the company rules or state mining laws is fined 50c. for each such act by the club and is further open to prosecution by law.

Safety police are elected by the club for one month. Their duty is to detect unsafe practices. They present their cases at the meetings of the club, and the members collectively pass judgment. So wide flung is the authority of this club that if an employee is caught speeding his automobile on the property he is convicted for that act by his associates.

Every man on the payroll has received a 15-hr. course in first-aid training given by the U. S. Bureau of Mines. In addition a first-aid team of six men is maintained, and at least ten men have been trained in mine-rescue work at each mine.

Another company with the same executive officers and many of the same directors is the Pond Creek Pocahontas Co. which owns the entire stock of the

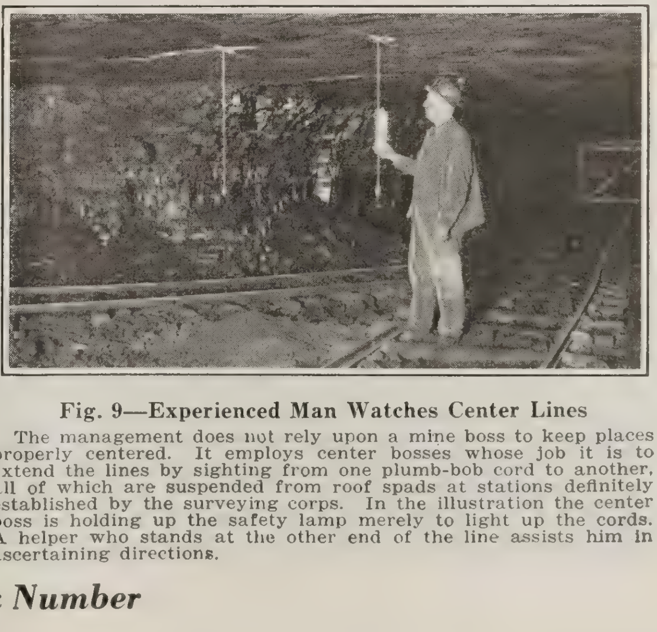

**Fig. 9—Experienced Man Watches Center Lines**

The management does not rely upon a mine boss to keep places properly centered. It employs center bosses whose job it is to extend the lines by sighting from one plumb-bob cord to another, all of which are suspended from roof spads at stations definitely established by the surveying corps. In the illustration the center boss is holding up the safety lamp merely to light up the cords. A helper who stands at the other end of the line assists him in ascertaining directions.

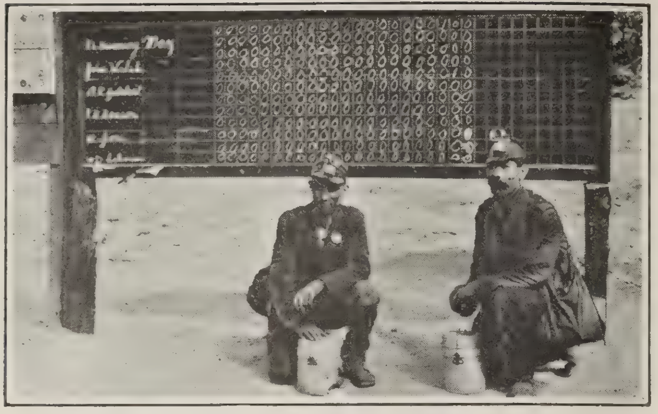

Fig. 10—Score Board Where Naughts Are Popular

Here are listed the names of the assistant mine foremen and the number of accidents in No. 1 mine day by day in the sections over which they have control. Opposite each name are two lines or squares. In the upper are listed minor accidents and in the lower, those that are serious.

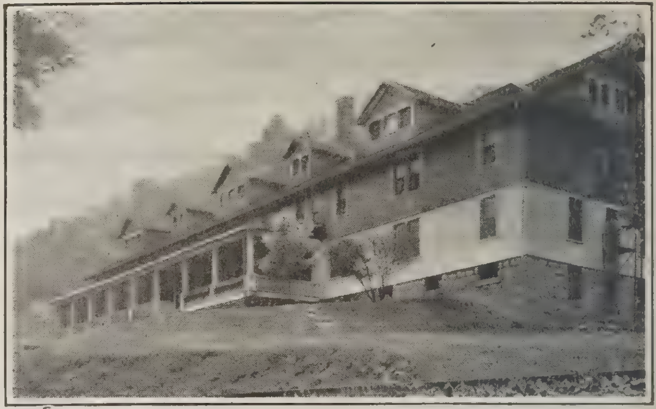

Fig. 11—Holden "Club" Is Well Worthy of Name

A cheerful, restful spirit pervades this club house. Such places are built not so much of lumber and stone as of human lives, and the Holden building has not only good structural material but good human material also, to make the club a real home. The Holdenites are quite proud of this building.

By-Products Pocahontas Co., its coal being sold by the Island Creek Coal Co. The Island Creek and Pond Creek Pocahontas coals are of a different character, the former having more volatile matter than the latter. The Bartley shaft at the Pond Creek Pocahontas Co. is only starting operations but is expected to produce 400,000 tons during the current year. By-Products Pocahontas Co. will ship about 225,000 to 250,000 tons this year, so that the two properties will provide a tonnage of from 625,000 to 650,000 tons, which will bring the production of the entire aggregation of companies up almost to 7 million tons. When complete the yearly tonnage of the two Pocahontas companies will be over a million tons a year.

---

Another Case Where Roads Pay Dividends

Fire truck and men at Holden. It is good practice to house the fire truck close to the shops and to pick a crew of fire fighters from the men who work there. With this arrangement no time is lost in getting to the fire. This apparatus develops a water pressure of 325 lb. per square inch.

Charity For "Unsafe" Men

Such a scene as this is enacted every pay day at almost any mine office. These unfortunates are victims of mine accidents resulting from the carelessness of themselves or others. Most of the miners, as they file from the cage, pay envelope in hand, contribute to the cripples waiting in line outside of the door.

**Headed for Market**

This is the day's output from Island Creek Mine 17 halted for purposes of photography only and not because this bull of an engine is stalled. The production of the 12 Island Creek mines in Logan County, W. Va. has been mounting steadily since the company made its 85,000-ton start in 1902, until this year it is expected that the total from the 12 will reach 6,000,000 tons.

# "System Without Red Tape" Keeps Costs Down

## Rigid, Regular Inspection and Reports Point Out the "Stitch in Time"—Central Metering Cuts Power Bills—Standardization Holds Repair Stocks Low but Ample

**By J. H. Edwards**
Associate Editor, *Coal Age*
Huntington, W. Va.

AT A GROUP OF MINES so completely electrified as that of the Island Creek Coal Co. of Holden, W. Va., the work of installing, supervising, and maintaining electrical and mechanical equipment holds an important place among factors essential to low-cost production. The use of equipment best adapted to the conditions, and the proper maintenance of that equipment are important, not only because of the direct relation to operating cost, but also because, indirectly, they help to increase coal production.

The group consists of twelve operating mines—five drift, five slope, and two shaft—all in the Island Creek seam. The coal which is a high grade bituminous of hard character, averages about 76 in. in thickness and contains a parting of 1 in. to 2 in. of slate. Generally speaking the bottom and top are good and there is a comparatively small amount of water to be pumped from the mines. Very little gas is encountered, open lights being used even in the two shaft operations. The seam lies practically horizontal, and there are no natural grades of sufficient steepness to limit in any way the use of electric locomotives for gathering and hauling.

All coal is undercut with electric machines, loaded by hand into 2½-ton mine cars, and gathered by cable-reel locomotives. Excepting the hand loading, the mines are completely electrified for hoisting, for driving pumps and for ventilating.

The most outlying mine of the group is only 4 miles by good road from operating headquarters at Holden where the warehouse, and repair shop are located, and 5 miles from the point of central metering of power. This power is purchased at 6,600 volts from the Kentucky-West Virginia Power Co. and transmitted at that voltage to the various mines over pole lines owned and operated by the coal company. There is a total of 18 miles of this line in use.

In order to provide further insight into the general conditions, a few figures on power consumption and production are given in Table I. The kilowatt-hour data includes all power used not excepting that for house lighting and other outside-of-mine purposes.

**Table I—Relation of Electrical Energy and Tonnage at Island Creek Mines**

| Period | Kw.-Hr. | Tons Mined | Kw.-Hr. per Ton |
|---|---|---|---|
| All of 1924 | 16,300,000 | 5,000,000 | 3.26 |
| Oct., 1924 | 1,460,000 | 520,000 | 2.81 |
| First 5 months of 1925 | 7,100,000 | 2,300,000 | 3.08 |
| Average for 21 mines of over 10,000 tons per month capacity, all 100 per cent electrified and in the same general territory as the Island Creek mines | | | 4.66 |
| Highest of the above | | | 7.91 |
| Lowest of the above | | | 2.36 |

Here it may be well to explain that company houses are provided for practically all employees. It will be noted that the kilowatt-hour-per-ton figures in the table are considerably less for the Island Creek mines than is the average for a number of other West Virginia mines of about the same capacities.

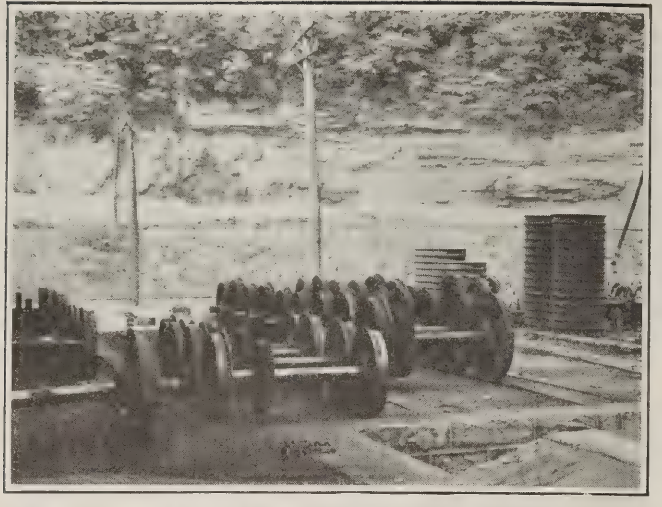
The Island Creek mines vary in capacity from 1,000 to 2,700 tons per day, and the total consecutive daily production is approximately 22,000 tons. This latter figure divided by 3,890 (the maximum average 5-min. demand) gives 5.65 tons per day per kilowatt. As a comparison, a 2,200-ton mine in the same coal field gets only 3.255 tons per day per kilowatt of 5-min. demand. This indicates the advantage that a group of mines such as the Island Creek properties gains by central metering of purchased power.

For a company which has been operating and developing mines for over twenty years, the equipment of the Island Creek is highly standardized. The desirability for standardization is given important consideration whenever anything new is to be purchased, but must naturally take second place when improvements are offered which are of distinct advantage.

On the outside equipment, alternating-current motors are used exclusively, these being of a few standard sizes, so that a small stock of bearings gives protection against the only trouble common with this type. The direct-

---

The headpiece shows the top works of Mine 21, one of the two Island Creek shaft mines. It was completed in 1923 and may attain a daily production of 4,000 tons. At the left is shown an inspector examining an electric drill which has been left by the operator in such a position that one man can give it a test without aid. At the right H. L. Bradshaw, chief electrician of the alternating current department checks the voltage at a mine substation.



Orderly Storage of Wheels, Axles and Tires Is Noticeable Around All Island Creek Mines

current substations, which in every case are located outside of the mines, are equipped with synchronous converters of 200- and 300-kw. sizes and of two makes. The standard direct-current voltage is 250; however, four of the older mines are still using 500-volt pressure. Squirrel-cage motors of both the one-speed and two-speed types are used for driving the mine fans. No synchronous motors are in use, yet the power factor at the central metering point averages 80 per cent. Inasmuch as there is no power factor clause in the rate schedule there is no need for correction.

Assuming that all locomotives and mining machines are in use each day, the efficiency measure is 1,100 tons per haulage locomotive, 256 tons per gathering locomotive, and 286 tons per mining machine. Roughly 10 per cent of these locomotives and machines are not in use but are serving as spares. This makes the actual tonnage per working unit higher than the figures here given. None of the equipment is double-shifted. The length of the shift is 8 hr.

In order to get large tonnages the Island Creek company keeps on hand a complete supply of repair parts so that only in unusual instances is it necessary to shut down a piece of machinery to await the shipment of repair parts from the factory. Table II lists the totals of the five principal classes of repair parts kept in stock in the central warehouse.

The value of stock on hand at the warehouse is $82,612. Adding $15,000 which it is estimated will cover the small repair parts kept in stock by electricians at the twelve mines, makes a grand total of $97,612 invested in repair parts exclusive of armatures and other items which circulate back and forth between the mines and the repair shop. This figure divided by

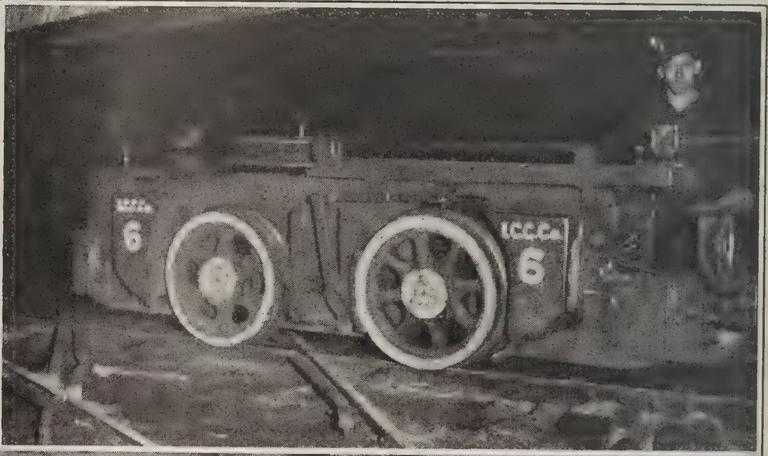
Table II—Repair Parts of the Five Principal Classes Kept in Stock at the Central Warehouse

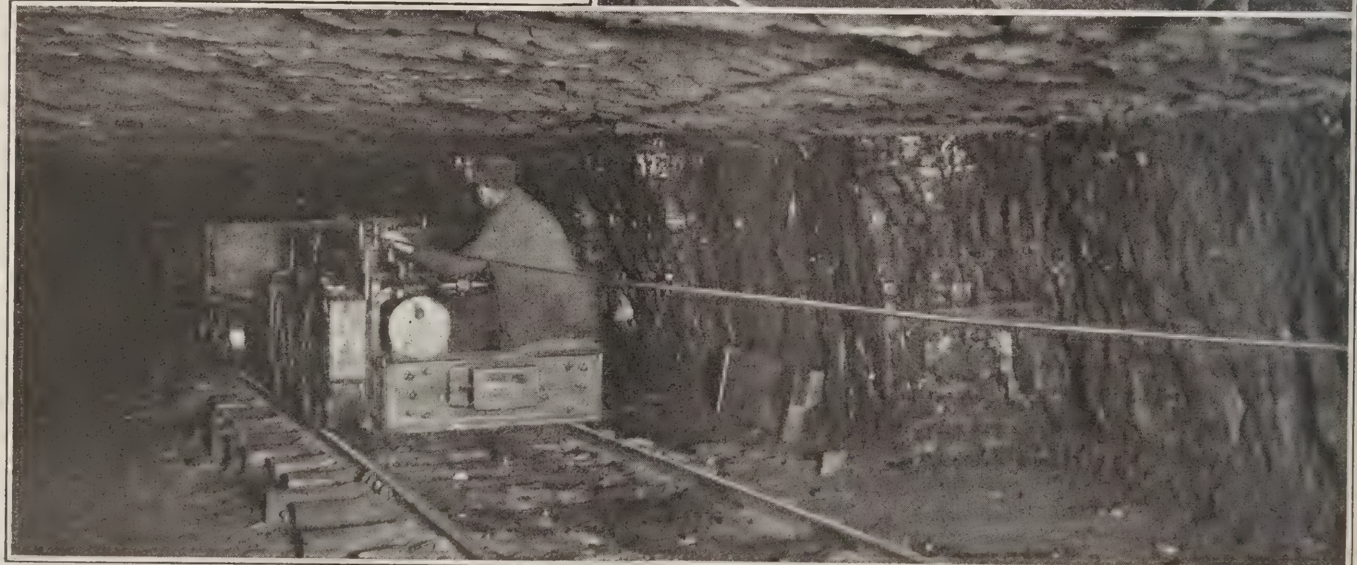
| | |
|---|---|
| For mining machines | $26,036 |
| For locomotives | 36,654 |
| For tipples | 11,813 |
| For pumps | 4,763 |
| For drills | 3,346 |
| Total | $82,612 |

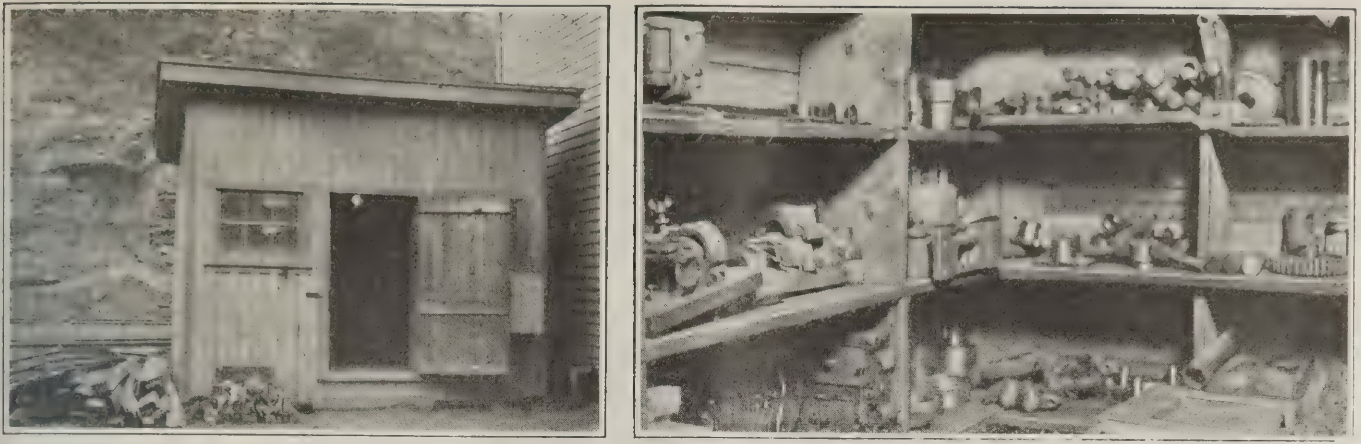
### Gatherers in Mine 12

At the bottom is shown a 6-ton cable-reel locomotive of the type commonly used for this service in Island Creek mines. This machine undergoes the most rigid inspections periodically which is one of the reasons why Island Creek haulage difficulties do not include many locomotive breakdowns. Such careful inspection usually reveals mechanical weaknesses before they cause trouble. Also, the system of management at these mines calls for intelligent treatment of equipment by operators. If inspection shows a motor has received unnecessary abuse, something is done to correct careless handling before it becomes habitual.

Each man is given some personal responsibility for his own motor, however. He is expected to repair controllers and keep brakes adjusted. At the upper right is a thirteen-year-old locomotive, fresh from the shops, which is still giving good service.







Group Storage of Supplies and Orderly Handling of Them Cuts Down Costs

At the left is the supply building for Mines 11 and 12. These mines are close together, so, instead of carrying a set of supplies inside each mine, one set is kept on the outside at a point halfway between the two.

At the right is an interior corner of the supply building. In order to avoid loss of time in getting supplies from the central warehouse, the mine electricians keep at the respective mines a small supply of such parts as are needed frequently.

22,000—the daily tonnage—gives $4.43 for spare and repair parts per ton. This favorable figure indicates the advantage gained by standardization, and by centralized operation. As a comparison it is safe to say that the average West Virginia mining company carries $9 or more for spare and repair parts per ton. To substantiate this estimate there is cited the following actual figures of six mines: $14.57, $8.34, $9.52, $10.72, $7.58 and $8.34.

Responsibility for inspection, supervision, and maintenance of electrical and mechanical equipment of the Island Creek mines is not centered upon one man but instead is divided among four men, who report individually to the general superintendent. One of these men—the chief electrician of direct-current equipment —has charge of all underground machinery, except the alternating-current mine pumps. The chief electrician of alternating-current equipment has charge of substations, fans, hoists, transmission lines, house lighting, etc. The master mechanic is in charge of the machine tool, electric welding, and blacksmith departments of the central shop. A general inspector has among his duties the complete inspection of tipples and tipple equipment.

The division of the electrical work between two men is unusual, however, at the Island Creek mines it apears to work satisfactorily. It amounts practically to the equivalent of having one man in charge of underground equipment and another in charge of outside equipment. This arrangement enables each man to concentrate on his particular branch of the work, and gives each an opportunity to go into detail in investigating trouble and devising means of avoiding recurrences of it.

Six men and the chief, H. L. Bradshaw, compose the average force of the alternating-current department. A large room in the main shop building serves as headquarters. Here the chief has a desk, and in addition the room is used for the storage of tools, small repair parts, portable test meters, and small equipment. Benches along the wall provide a place for miscellaneous repair work. No winding equipment is provided for the reason that burn-outs of alternating-current motors are rare. The few jobs of this class of winding are transferred to the winding room of the direct-current department.

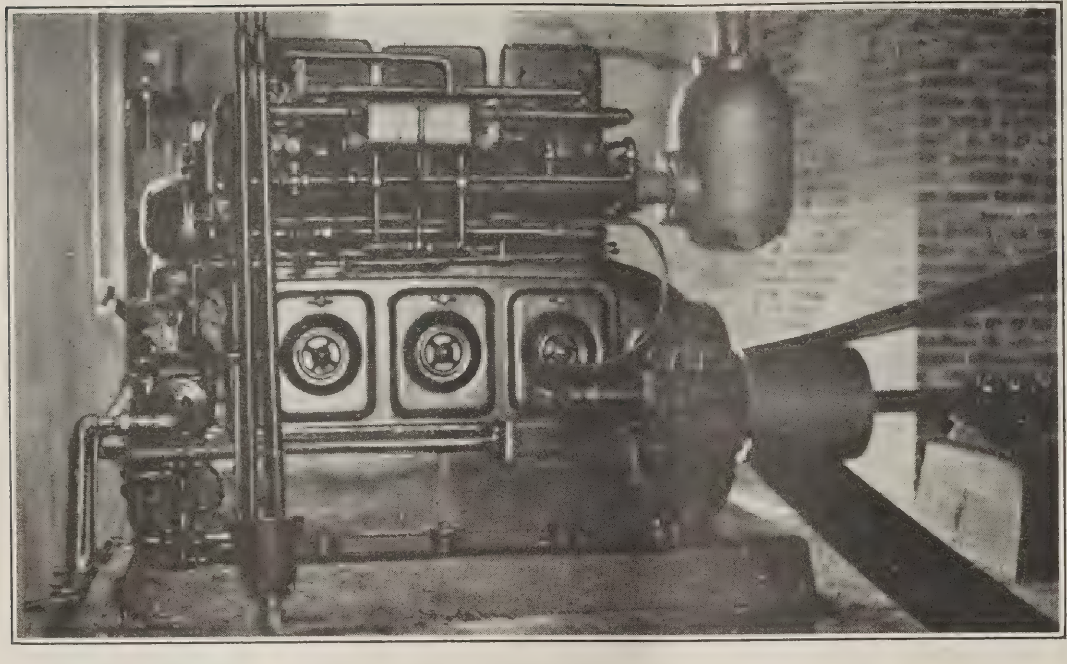
Cleaning and inspection are two important phases of the work of the alternating-current department. It is a company policy to do everything possible to prevent breakdowns. The prevention of trouble leaves more time for inspection and cleaning. This, in turn, further reduces trouble.

All synchronous converters, motors, and other electrical apparatus are regularly cleaned out with compressed air. For this purpose there is used a 17.5-cu.ft., motor-driven air compressor mounted on a Ford chassis. This machine is parked alongside a tipple, substation, or other building where electrical equipment is installed, the motor cable is plugged into a power receptacle and the compressor is operated until the blowing out of the machinery is completed. This one compressor serves all of the mines.

Another interesting purpose of this portable compressor is to act as a spare for the air brakes and control of the hoists at the two shaft mines. If any trouble should occur with one of the motor-driven compressors, hoisting would be stopped only for the short time necessary to get the portable unit on the job, plug in the electric cable and connect the air hose. Cleaning equipment of the portable type costs far less than equipping with stationary compressors every building where electrical equipment is in use.

Although electrical equipment is inspected when it is blown out, the chief of the department makes it a point personally to inspect all important items such as substations, mine fans and hoists. He sees each fan at least once each week and sends a weekly report of the condition of each to the general superintendent.. The substations and hoists are inspected as often as the fans but no reports are made out covering these. The chief electrician decides how often such inspection is necessary.

Other work coming under the alternating-current department is the care and reading of meters. Besides the distribution meters in substations and hoist houses, coal company meters are installed at the power company's transformer substation. This installation consists of a graphic voltmeter, graphic power-factor meter, graphic wattmeter, and a plain watthour meter. These furnish a complete check on the watthour and demand-meter readings of the power company, and are read by the chief electrician at the same time that the representative of the power company reads his meters. In the several years of use of purchased power no discrepancies have arisen in these readings.



**Ready for an Emergency**

This three-cylinder gasoline engine serves as an auxiliary to the motor drive of the ventilating fan at No. 21 mine. Squarejaw clutches on either side of the fan are manipulated when it is desired to change from one drive to another. The engine is equipped with dual ignition and with an electric starting system.

It is with the direct-current equipment that the greatest opportunities exist for improvement in the continuity of service, and in the reduction of repair cost. There are several reasons for this condition. In the first place a direct-current motor is normally less rugged than one of the alternating-current type. In the second place, especially at the Island Creek mines where all of the direct-current equipment is on the inside, this equipment is subjected to less favorable conditions and to the likelihood of greater abuse.

The chief of the direct-current department, L. D. Thompson, has made the most of the opportunities. With the full backing of the management he practically has eliminated loss of time due to breakdowns and has cut the repair costs per ton to a figure which is worthy of the envy of any company. It would be a joy to any progressive chief electrician to see how well "set up" and well "lubricated" is this department.

The principal features, in their order of importance, which contribute apparently to the success of the department, are:

(1) The mine electricians report to the chief electrician instead of to the mine foremen.

(2) So far as possible the mine electricians are freed from all repair work which can be done in the central shop and which requires special care, special skill, or special tools.

(3) The department has the understanding, confidence and backing of the management.

(4) A system without red tape is used.

(5) Control over the operators of the equipment. As an example, the motormen must do their own repair work on the locomotive controllers, and must keep the brakes properly adjusted.

The organization of the thirty-two men composing the direct-current department is shown in Table III. Opposite each mine the daily tonnage is given to indicate how few men are needed in proportion to the size of the mine. In several instances one head electrician serves two mines. This is possible because the mines are located close together. At those mines where the electrician has no helper, a man from the central shop lends assistance whenever necessary.

At first thought it may seem peculiar that a foreman is needed for the two bonding crews of two men each. The foreman's principal duties are to find out where bonding is necessary, plan the work, and to see that material is on hand so that the men will not be delayed. Pin-driven bonds are used exclusively. Care is taken to have the holes reamed out clean before the bonds are applied.

The practice of having the mine equipment assembly work at the central shop segregated and under the chief electrician instead of under the master mechanic of the shop is an unusual arrangement, but it gives the chief electrician entire control over an important branch of the repair of inside equipment. The arrangement leaves no opportunity to shift responsibility in case of failure due to poor workmanship.

**Table III—Organization and Number of Men in the Direct-Current Maintenance Department, and Daily Tonnage of Each Mine**

| | | |
|---|---|---|
| Chief Electrician of Direct-Current Equipment (A total of 32 men in the department) | Electrician and helper, Mine 1—2,000 tons | |
| | Head electrician, Mines 7 & 8 | Electrician, No. 7—2,000 tons |
| | | Electrician, No. 8—1,700 tons |
| | Head electrician, Mines 11 & 12 | Electrician, No. 11—1,600 tons |
| | | Electrician, No. 12—1,800 tons |
| | Electrician and helper, Mine 14—2,450 tons | |
| | Head electrician, Mines 15 & 16 | Electrician, No. 15—1,350 tons |
| | | Electrician, No. 16—1,300 tons |
| | Head electrician, Mines 17 & 18 | Electrician, No. 17—1,000 tons |
| | | Electrician, No. 18—1,250 tons |
| | Electrician, Mine No. 20—1,900 tons | |
| | Electrician, Mine No. 21—1,900 tons | |
| | Foreman of bonding crews, two crews of two men each. | |
| | Foremen of winding department of central shop, four winders | |
| | Foreman of mine equipment assembly work in central shop, two men. | |

The work of the assembly department is one of the most important features connected with the maintenance of underground equipment. It is this department which relieves the mine electrician of work which can better be accomplished in a central shop. A few of the jobs done in this department will be described.

The mining machine parts repaired and assembled are the cutter chain, cutter bar, cutter head, main gear assembly, intermediate gear assembly, main frame, and bottom plate. These repaired and assembled units are kept in stock at the shop ready to send to any mine that has need of them. With cutter chains it is the practice to have the mine electrician put on a complete new chain whenever as many as three bad lugs are found. The removed chain is then taken to the shop and entirely rebuilt. Instead of putting the rivets in cold as is the usual practice when making repairs inside of a mine, the rivets are put in hot and the worn straps which are good enough to use over again are carefully paired as to length. For the riveting, an electric heater is used. This provides a quick, clean, and certain means of bringing the rivets to the desired heat.

An important feature of the work on the main gear assembly is the use of the electric arc welder to lock the cap screws of the drive sprocket. Such practice, which eliminates a former source of trouble, would not be practical if the mine electricians were allowed to renew parts of the assembly. Instead, if a main gear, drive sprocket, or other part requires renewal, he sends the entire assembly to the central shop and instals a repaired unit in its place, thus saving time and doing a better job.

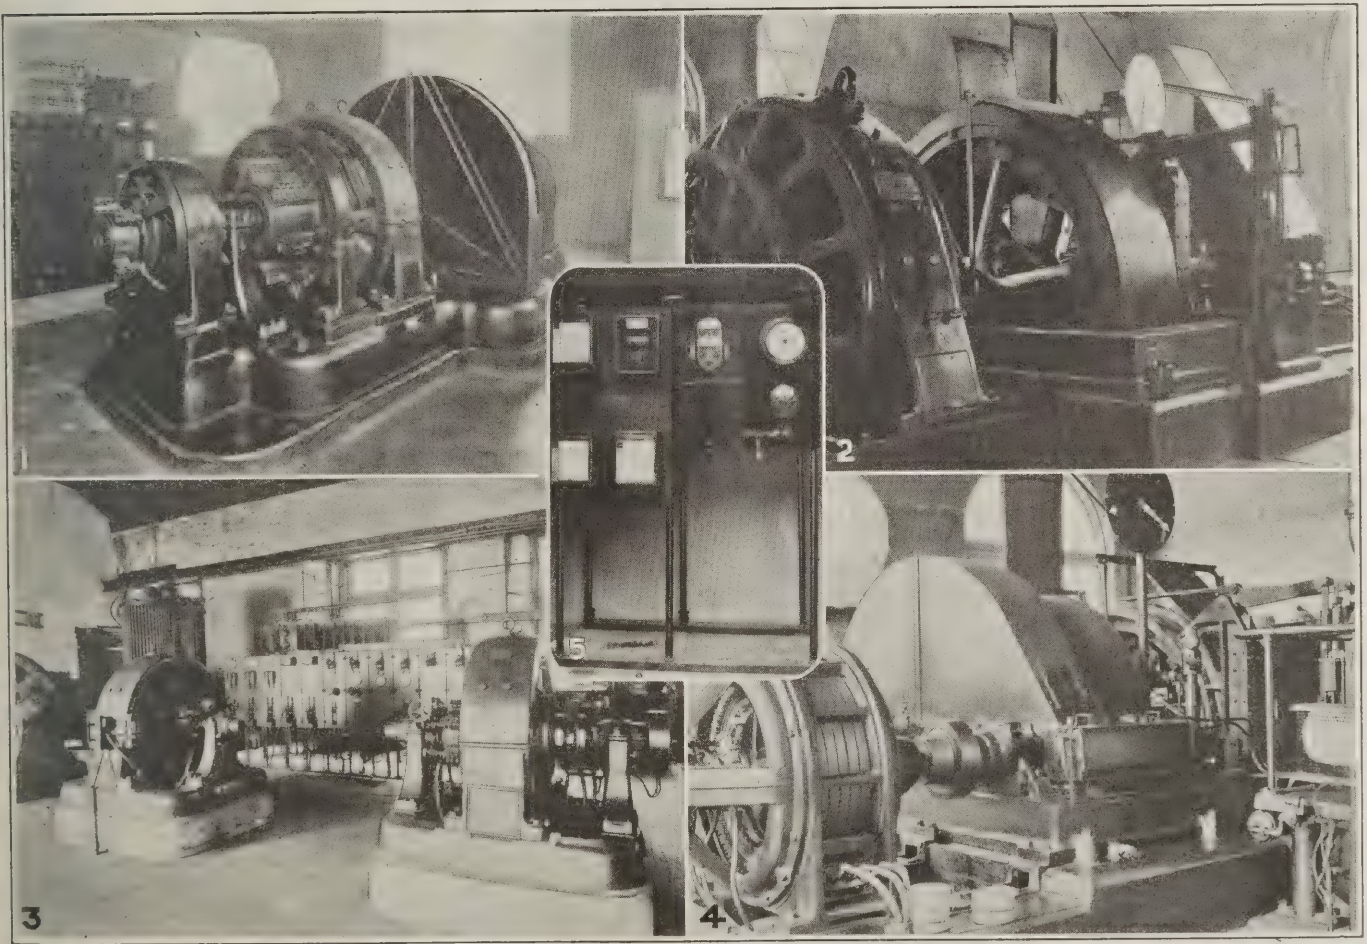
Another example of the work that can be done in the central shop, is the reinforcement of the cast-steel step plate of the bottom-plate assembly. As a result of several cases of breaking the intermediate shaft bearing housing of the step plate, these housings are now reinforced by shrinking on a ½x1¼-in. forged steel band. This is done on every bottom plate that comes to the shop for repair.

Some of the locomotive parts which are repaired and assembled at the central shop are trucks complete with tires and split gears, bumpers complete with draw pockets, and armatures complete with bearings, bearing housings and pinions.

The use of split gears is favored by the Island Creek Coal Co. because it eliminates the necessity of pressing wheels off the axles, consequently decreasing the liklihood of loose-wheel trouble. When split gears are applied in the central shop instead of at the mines, a perfect fit is assured so that there is little chance of a gear loosening. The practice is to use abrasive brake shoes interchanged with the plain type, as the condition demands, so as to wear the tire uniformly. In many cases tires serve their full life without once having to be trued in a lathe.

It is the practice not to change any locomotive draw pockets at the mine, but rather to put on complete new bumpers. The bumper is applied by setting twelve rivets. Another important locomotive practice is that of not allowing the mine electrician to change bearings and pinions on locomotive armatures. In case of trouble he puts in a spare armature which is complete with these parts. This saves time and insures the use of parts that are assembled in the best possible manner.

It was mentioned in a foregoing paragraph that sys-



**The Island Creek Coal Co. Tries to Be Economical in the Purchase and Application of Power**

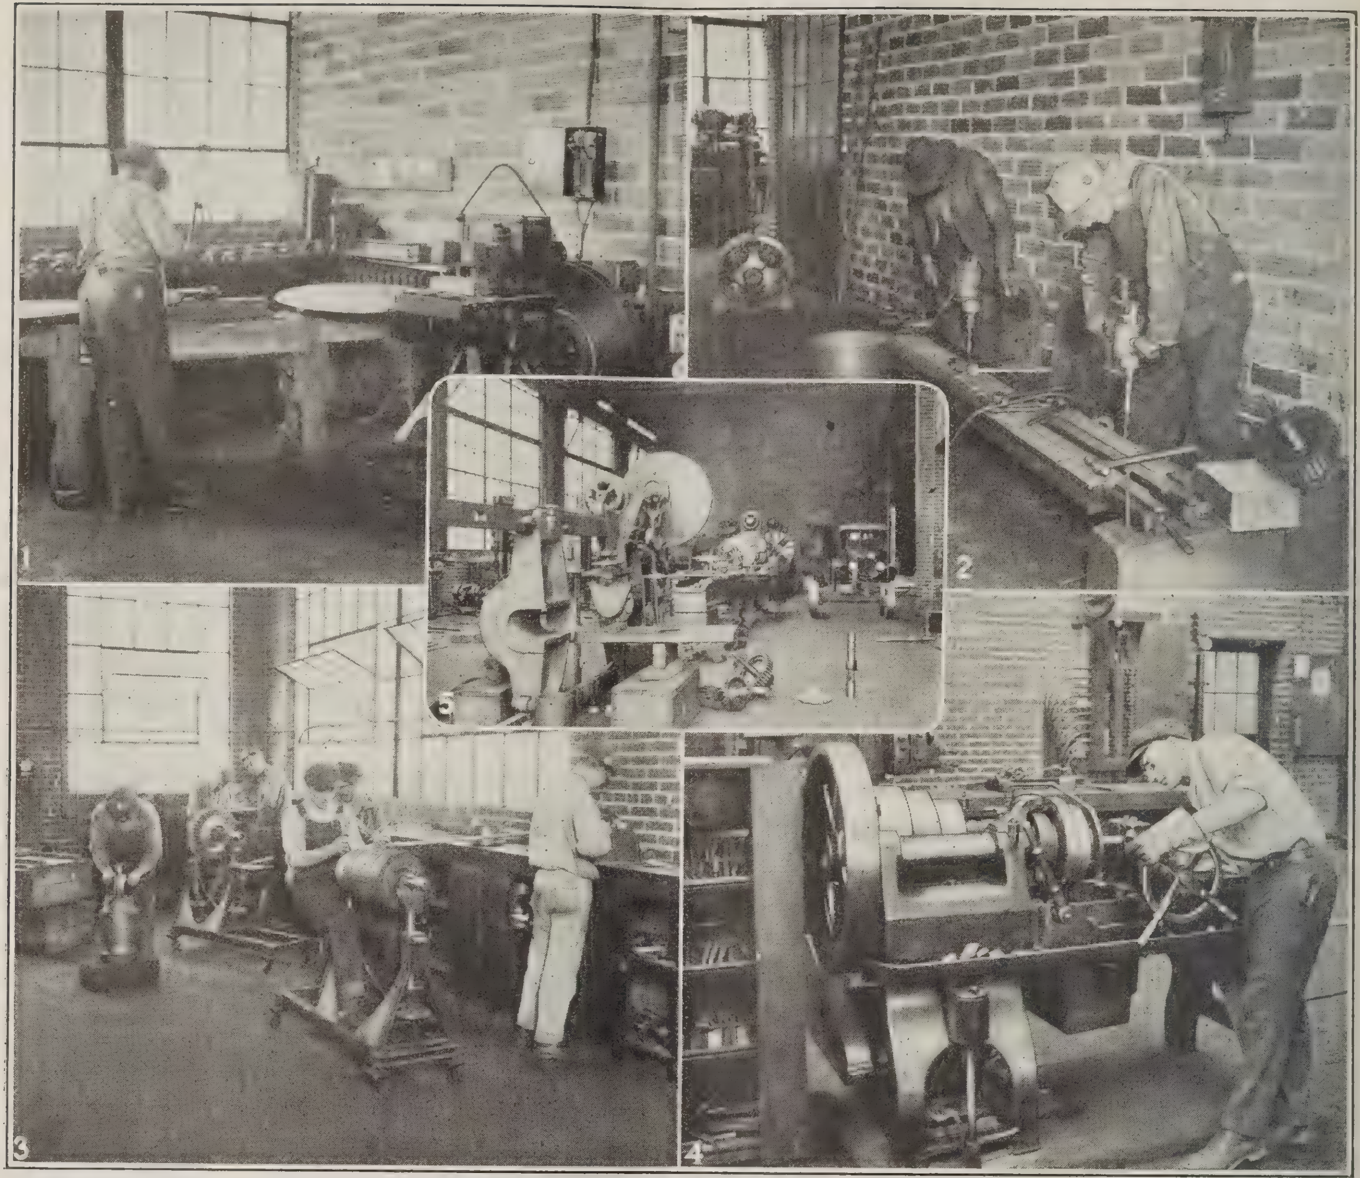
1—This is the flywheel motor-generator set of the Ilgner-Ward-Leonard hoist at Mine 21. The motor is 350-hp., the generator 400-kw., and the exciter 19-kw. During the regular hoisting of coal the demand of this motor-generator set fluctuates between 175 kw. and 275 kw. and drops to a steady value of approximately 40 kw. when the hoist is not in operation.

2—The main hoist at Mine 21, is driven by a 475-hp. direct-current motor.

3—An Island Creek substation from which alternating current is distributed to light the town of Holden, and direct current is supplied to operate Mine 1. Converters rather than motor-generator sets are used in all mine substations. No synchronous motor drives are used, yet the power factor at the central metering point averages 80 per cent.

4—An auxiliary hoist at Mine 21 which has a 200-hp. induction motor and cylindrical drums.

5—Power is checked by these electrical instruments of the power company and coal company at the central metering point. On the coal company's panel at the left are mounted, in addition to a watt-hour meter, a graphic voltmeter, graphic power-factor meter, and a graphic wattmeter. With an annual power bill of somewhat over a quarter of a million dollars, there is, naturally, considerable satisfaction in having a check on the meters of the power company because there is always a chance of error that can be corrected.



**The Island Creek Coal Co. Has a Central Machine Shop of Which It Is Proud**

1—Rebuilding a cutter chain. If a mine electrician finds as many as three bad lugs in a chain he puts on a new one and sends the old chain to this shop. Here it is entirely rebuilt. The worn straps which are found good for further use are carefully matched as to length and the rivets are put in hot. The electric rivet heater is at the right.

2—Rebuilding the cutter bar of a shortwall mining machine. The mechanical work on direct-current equipment is under the chief electrician instead of under the machine shop foreman. This centers the responsibility.

3—In the winding room plenty of space, good light, good ventilation, and steam heat for cold weather make things pleasant. Factory-made coils are used, and bad commutators are sent to the factory for repair or refilling. All armatures are dipped and then baked in an electric oven.

4—The bolt-threading machine has a motor in its base. All other machine tools are also of the individual motor-driven type.

5—Interior view of the central machine shop at Holden.

tem without red tape is responsible in part for the successful maintenance and operation of the direct-current equipment in these mines. This system involves only three employees: The motorman or machine operator, the mine electrician, and the chief of the direct-current department.

The plan begins to operate when the motorman checks in at the end of each shift, signing his name to a report, indicating the number of the locomotive which he used and its condition, detailing what sort of trouble, if any, developed during the shift. On this same kind of report sheet, the chief electrician notes any trouble encountered with the mining machines. He keeps on file one copy and sends the other to the chief electrician.

This report impresses on the equipment operators their responsibility in the proper handling of equipment; it is for reference in case of argument, and for checking the past record of a former operator who again applies for a position.

The next report in the system—the one of most concrete value—is that made up each night and morning by the chief electrician as a result of telephone conversations with the mine electricians. In making out this type of report, the chief uses no prepared form but instead a plain sheet of paper on which he notes the number of the mine and opposite it an O.K., if the mine electrician reported no trouble during that shift, and a short description of trouble if any occurred. When making up the same type report the next day, he notes whether items of trouble formerly reported have been repaired, and also what was the reason for the breakdown.

Receiving these reports each night and morning by phone keeps the chief electrician in touch with every case of trouble and affords him an opportunity to investigate before machine difficulties become "ancient history." By referring to his file of these telephone reports he can check the frequency of certain failures and be guided thereby in a decision as to what expense would be justified in improving that part of the equipment which was affected.

No cases of repeating trouble "get by" very long at the Island Creek mines. Many improvements which were first put into use at these mines have later become standard with the manufacturers of the equipment involved. Instead of accepting equipment failures as a matter of course, the Island Creek organization considers them indications of weakness in the machine, or indications of unnecessary abuse. Abuses are stopped if it is practicable to remedy the abusing condition. If the machine shows weakness, a concentrated effort is made to find a way to strengthen it.

### Inspection Cuts Maintenance Cost

The regular inspection of mining machines, locomotives and electric coal drills cuts down delays and reduces maintenance cost by revealing where the "stitch in time" is needed. The mine locomotives and coal drills are inspected each day at the end of the shift, and the mining machines once a week. Each machine has its day to be brought to the pit for this weekly inspection. Since the average is about six machines per mine, the electricians must inspect one machine each day.

To facilitate inspection, electric coal drills are placed on wooden horses by the crews at the end of the shift. These drills are set so that any stray oil will drain from the armatures back into the gear cases. Their position is such that the one mine electrician can, without help, give them a running test. An extra drill is kept on hand at each mine in order that there may be but a short delay to the crew in case of a breakdown, and to avoid the necessity of calling an electrician to the mine at night.

The handling of repair parts for the direct-current equipment is another work which is done systematically but without red tape. The main supply house, where a large and complete stock of parts is kept, is located near the central shop at Holden. To avoid delays in getting material from the main supply house to the mines, a small stock of the more commonly used parts is kept at each mine. These parts have been charged out against the mine, so that no formalities are necessary when the repairman wants to use some of this material. The stock is replenished each day, the chief electrician making out the order after finding out by phone from the mine electrician what parts have been used. The Island Creek practice is in sharp contrast to that of some large companies which seem to let the formalities of accounting interfere with the speedy repair of equipment.

As is indicated in Table III, the winding department of the central shop is under the chief electrician of the direct-current department. This is because practically all of the rewinding is for direct-current equipment. Several of the practices in the rewinding shop differ from those of some of the larger coal companies, but agree with the present trend among the majority of these organizations.

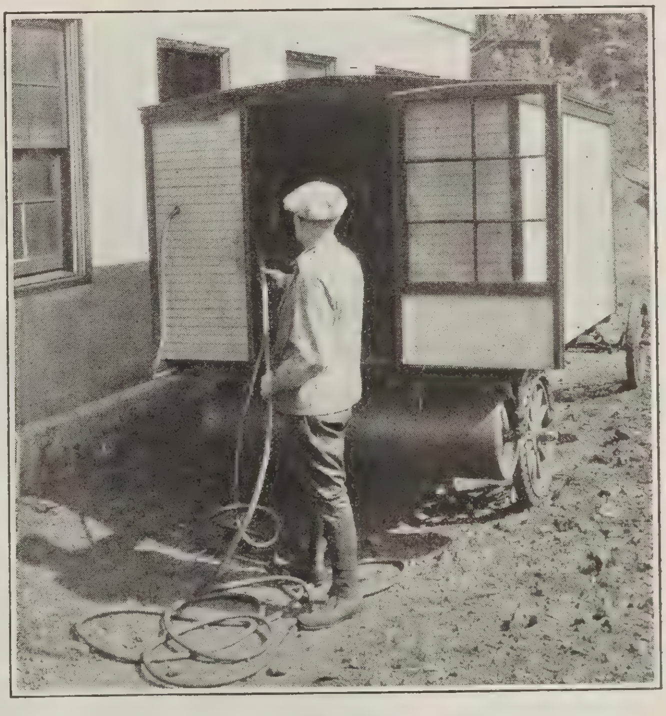
Two of the practices referred to are those followed in making armature coils and in repairing commutators. Only in cases of emergency are coils made at the Island Creek shop. Instead they are purchased from the motor manufacturer, for the reason that such coils fit better and also are more thoroughly insulated. The use of hot presses in the manufacture of coils is apparently the deciding factor in favor of the factory product.

Only the lesser repair jobs are undertaken on commutators. If one is received which requires the renewal of a large number of the mica segments, the insertion of several new bars or the replacing of all the mica V rings, then the whole commutator is returned for repair or refilling to a reliable manufacturer who is equipped with all of the special tools and presses for putting the commutator in good-as-new condition.

In the Island Creek shop, armatures are dipped and then baked in an electric oven. Special tools for speeding up the work and for improving the jobs are made for every operation which is a frequent repeater. Costs of the work are kept by distributing the material and labor charges against the specific mine and under one of the headings: "gathering motors," "mining machines," "drills," "pumps," "ventilating equipment," "tipples," or "substations." Costs are not kept of the individual jobs. The expense of clerical work for doing this is considered to exceed the value of the data obtained.

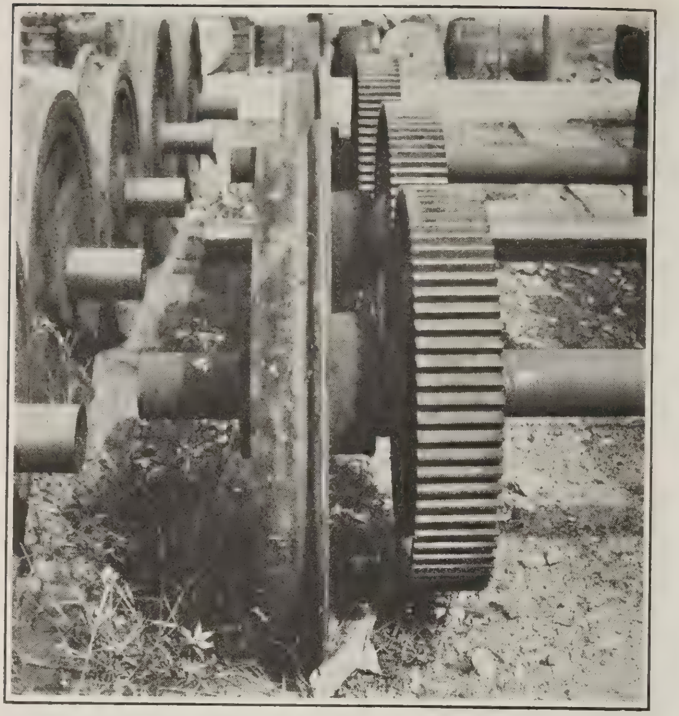
The foreman of the winding shop makes up each day for his own use and for file a list of the jobs on hand, indicating opposite each the mine to which the work is to be charged, and which of the jobs is of first importance. Any of those completed on the day the list is made up are so noted for record. The current list hangs on the wall so that the winders, upon completing a job, know what to do next even though the foreman is not there to tell them.

Little mention has been made of the machine tool, blacksmith, and autogenous welding departments. These are under a master mechanic who, like the two chief electricians, reports directly to the general superintendent. The equipment in the machine tool department



**This Portable Outfit Saves Money**

A 17.5-cu.ft. motor-driven air compressor mounted on a Ford chassis is used for air cleaning of all electrical apparatus located outside of the mines. When photographed the compressor had just been parked alongside a fan house and the operator was unreeling the hose preparatory to blowing out the fan motor. This compressor is the same size as those used in conjunction with the hoists at the two shaft mines and, therefore, acts as a spare for these installations.



**Rust Has Little Chance Here**

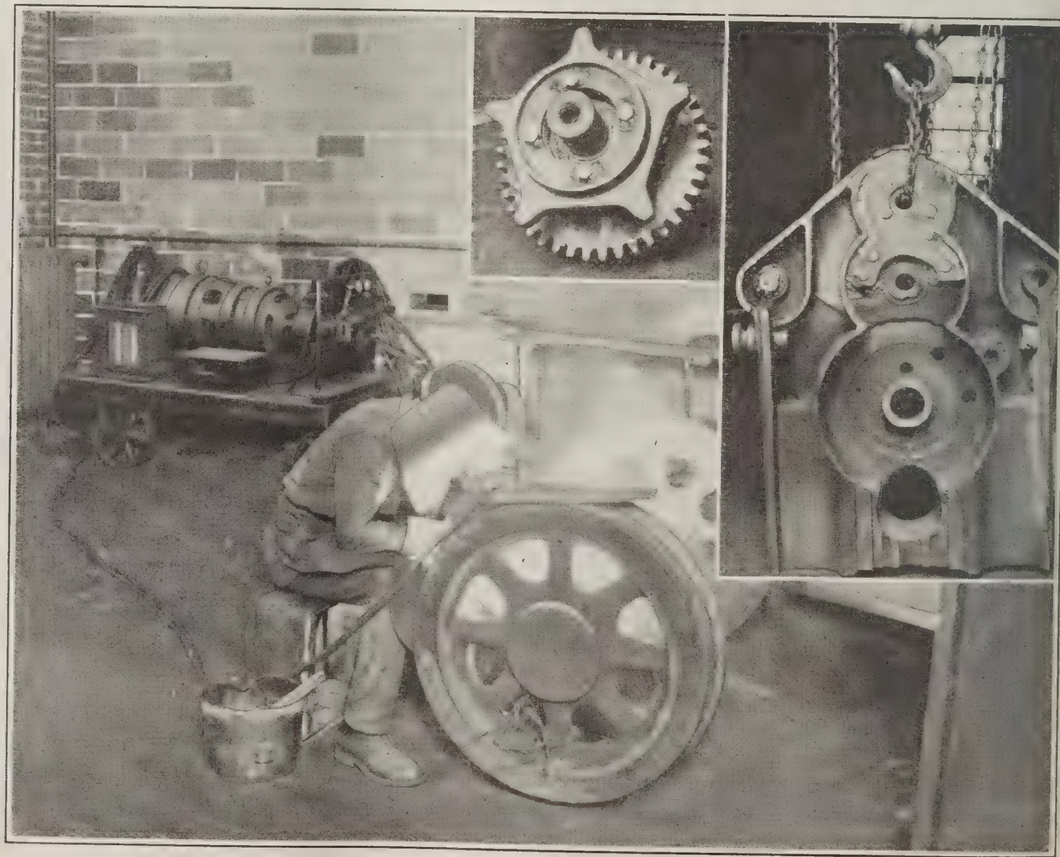
Locomotive axles should be painted before being stored; otherwise, whether the storage space is sheltered or not, the axles will rust. The Island Creek Coal Co. believes in the use of paint for this purpose and, consequently, all these axles are thus protected.

is complete but not elaborate. It consists of a planer, 30 in. x 30 in. x 9 ft.; a bolt machine which can take bolts in sizes up to 2-in. and pipe up to 1½-in.; a pipe machine, up to 6-in.; an engine lathe, 42 in. x 12 ft. (maximum chuck diameter and distance between centers) used almost exclusively for tire work; a second engine lathe, 27 in. x 12 ft.; a third engine lathe, 21 in. x 7 ft.; a 2-hp. motor-driven emery grinder; a radial drill of 24 in. radius; a radial drill of 36 in. radius; a plain, horizontal milling machine with a 28-in. feed; a power hacksaw, 9x9 in.; a shaper of 24-in. stroke; and a 100-ton wheel press.

One of the busiest machines in the shop is the 200-amp. arc welder. Roscoe Garret, the master mechanic, states that he does not see how they got along at all without this welder. All such parts as are electrically welded by other mining companies are also welded by Island Creek, except locomotive tires and armature shafts. The filling of tires was tried several years ago but was given up because the added metal did not wear as well as the original tire steel. Special manganese-steel electrodes such as are now being used by some coal companies were not tried, however. The building up of the ends of armature shafts is done with oxyacetylene. This gas torch is also used for cutting, and for the welding of cast iron.

In contrast to many mines which operated through the boom period, there is no unused machinery lying around Island Creek properties. This in itself indicates that care has been exercised in buying new equipment, and that obsolete material is disposed of promptly as second-hand material or junk.

Back of all is the management. It is true that the mining conditions under which equipment operates at the Island Creek mines are almost ideal but by no means are all of the operating conditions natural. Many were created by good management. A specific example is the arrangement whereby the mine electricians report to the chief electrician instead of to the mine foreman. Many mining men say that this is impractical, but what others say does not bother the Island Creek management. Men, methods and equipments are judged by the results they get. Results at the Holden group of twelve mines are satisfactory.



**The Arc Welder Is Busy**

Island Creek men can't understand how they ever got along without this equipment. Today they do every welding job possible at mines except filling locomotive tires and building up armature shaft ends. Two jobs are shown at the right: The cap screws on a mining machine drive sprocket have been locked in place and a $\frac{3}{4}$-in. plate riveted and welded onto the main frame of a mining machine. The casting around the rear stud hole had been broken away.

# Proper Handling Helps Make Mine Output Clean

## Pan and Belt Conveyors in Slopes and on the Inclines Transport Coal to Tipples—At Two Mines Self-Dumping Cages Are Used—Various Sizes Picked Separately

**By Alphonse F. Brosky**
Assistant Editor, *Coal Age*
Pittsburgh, Pa.

VARIATIONS IN ELEVATION of the Island Creek seam with respect to tipple levels at the twelve mines of the Island Creek Coal Co. grouped near Holden, W. Va., have necessitated the employment of several schemes for transporting the coal to the respective tipples. Thus at six of the mines the seam lies below the tipples and coal is raised on concreted slopes by pan conveyors—in one instance by a belt conveyor. At four mines the seam lies above tipple level, requiring pan conveyors to lower the coal from the headhouses to the preparators. However, at one of the four, the difference in the elevations of the discharge feeder in the headhouse and the shaker screen in the tipple is so little as to make the conveyor gallery practically level.

At the two mines most recently opened—Mines 20 and 21—the seam lies so far below the surface that shafts are needed to hoist coal to the tipples. Self-dumping cages are used. Further information covering variations in plant layout at these mines is condensed in Table 1.

Depending upon the capacity of the respective mines, double track in lengths of 600 to 1,200 ft. constitutes the trip landings adjacent to each dumping point. Cross-over dumps are employed at eight mines, kick-back dumps are in use at two, and the self-dumping cages serve the two shaft mines. Although dumping equipment is of these three different types, only three men are required for their operation at each mine, so carefully planned are the arrangements for handling cars. The equipment is so designed that in no phase of the dumping operation do two cars come together violently. This reduces mine-car wear and tear.

The arrangement of the trip-handling and dumping equipment in No. 8 mine, which is representative of seven other installations, is shown in Fig. 1. This mine is now producing about 2,100 tons a day. The double-track trip landing on the load side of the dump is 1,000 ft. long. The trips are moved forward by a feeder. Between the feeder and the dump is a 1½-per cent down-grade which causes each loaded mine car (roller-bearing equipped) to gravitate freely to the dump immediately after it is uncoupled.

The dump itself is inclined sufficiently to cause each empty car to clear the dump before the next car enters. Leaving the dump, the car rolls to a kick-back from which it is shunted to the empty storage track where it is picked up and joined with other cars by a trip maker. One man handles the two car hauls and uncouples the cars; a second man operates the dump and the third couples up the empties.

More space in this article will be devoted to Mine No. 20 than to others because it is one of two of the newest mines in the group. Mine No. 21 is a duplicate of Mine No. 20 in respect to layout and equipment, except for slight differences which conditions required. To reach Mine 20 from Holden one travels south and west about 4½ miles on a stretch of concrete road built by the company along Whitman Creek.

Here has been erected a modern mine plant of concrete, steel and stone, equipped to produce 4,000 tons of coal a day. No. 20 hoisting shaft is 285 ft. deep. It is semi-elliptical in cross section, with extreme dimensions of 12x27½ ft. It is lined with 12 in. to 18 in. of concrete and equipped with self-dumping cages in balance. A solid block of coal measuring 1,151x1,518 ft. surrounds this shaft. The shaft bottom layout is of especial interest because of the ease with which it enables three men to handle coal in 40-car trips at the rate of 4,000 tons in 8 hr.

The shaft bottom proper is supported by a brick arch resting on sandstone piers. The width of this arch is 22 ft., its length 100 ft. and its rise, 3 ft. Its minimum thickness is equivalent to four courses of standard size bricks set edgewise. The thickness of the masonry piers is 2 ft. From the inby end of the arch extends an 1,100-ft. trip landing of two tracks. A portion of the landing adjacent to the arch is permanently supported by steel sets of 15-in., I-section beams on 6-in., H-section legs. The sets are on 4-ft. centers. Already fifty-two such sets have been erected

---

In the headpiece are three views at Mine No. 20. Looking at these views one in realty also sees No. 21 mine for the design, layout and equipment in both are duplicates. The desire of the company for permanence of construction in these two plants is illustrated by its use of sandstone in the piers under the big bottom arch and in the walls of the hoist house on the surface. These two mines are built to run for 50 years or more.

**Slope Bottom Arrangement at No. 8 Mine**

The layout of this bottom and the choice of equipment for it are worth particular notice. First, the grades are such as to cause a mine car to gravitate freely from the trip feeder onto the cross-over dump and off again after dumping. These grades are not excessive; it is the roller-bearing wheels that do the trick. One car leaves the dump slightly before another enters, avoiding destructive forces of impact between them.

and 100 more are being erected so that after this work is completed the approach to the shaft will be permanently supported through a distance of about 700 ft.

Loaded cars in trips of 40 are delivered on the storage track by a 15-ton locomotive to a trip feeder which passes the cars, one at a time, over a favorable grade to the shaft. As each car gravitates toward either of two cage landings it passes over an antomatic switch which is thus set to guide the car following to the opposite cage landing.

The car is stopped and held by a friction car-check at the landing. The car-check is manually operated but the cager, to which the car moves on being released from the car-check, is automatic. When a cage reaches the landing level, the stop holding an empty mine car on the cage is automatically depressed; at the same time the cager horns are swung away from the front wheels of a loaded mine car and thus both cars are simultaneously let free to move.

The loaded car moves into the cage, pushing out the empty. As the loaded car clears the cager, a front wheel trips a lever which automatically sets the cager horns in a position to hold the loaded car following. Upon leaving the cage the empty car is delivered by a kick-back to a trip maker which joints it with other cars on the empty-car storage track. The simplicity of this equipment, requiring only three men for its operation, is notable.

An excellent feature of the layout at the bottom of the auxiliary shaft is worthy of mention. Unlike the customary track arrangement at the foot of a man-and-supply shaft, that in No. 20 mine provides a 300-ft. double track. The second track is for the storage and for the assembly of a trip of supplies. By its use the latter job is greatly simplified.

No less important than efficient mining is the handling and preparation of coal on its way from the mine car to the railroad hopper. In Island Creek properties preparation really starts at the face where the miners are required to remove as much as they can see of the one band of slate which divides the seam into two benches and whatever other refuse might be mixed with the coal during shooting. This gob is stowed between the double tracks in the working place. All coal is screened, after which it is customary to pick it on its way to the loading booms.

By following the path of travel of coal through the tipple at No. 20 mine, a fair conception of preparation facilities at all of the mines of this company is gained. This tipple is spread over four railroad tracks, is of all-steel construction and has a capacity of 500 tons an hour. On leaving the mine cars on the self-dumping cages, the coal is guided by a chute into an 8-ton, steel-plate, receiving hopper, from which it is fed by a reciprocating feeder to the shaking screen. A fly gate installed in the receiving chute can be set to divert either mine rock or emergency mine-run coal from the receiving bin, and by means of a second fly gate each of these is directed to its respective destination, the

**Washing Down No. 14 Conveyor Gallery**

Coal dust on an inclined walkway is a menace to those who travel there because it makes treacherous footing. The Island Creek Coal Co. avoids this by removing the dust with a stream of water. This scheme also is employed in cleaning the interior of the tipple.

**Table I—Detail On Island Creek Coal Co.'s Twelve Mines**

| Mine Number | Class | Means of Transporting Coal to Tipple | Conveyor Details Width (in.) | Conveyor Details Length (ft.) | Slope (deg.) | Elev. of Coal with Respect to R.R. Track | Tipple Capacity (tons) | Present Mine Output (tons) |
|---|---|---|---|---|---|---|---|---|
| 1 | Slope | Belt conveyor | 48 | 285 | 18 | 37 (below) | 3,500 | 2,800 |
| 7 | Slope | Apron conveyor | 60 | 260 | 20 | 20 (below) | 2,500 | 2,100 |
| 8 | Slope | Apron conveyor | 60 | 260 | 20 | 20 (below) | 2,500 | 2,000 |
| 11 | Slope | Apron conveyor | 60 | 172 | 35 | 27 (below) | 2,500 | 1,600 |
| 12 | Slope | Apron conveyor | 60 | 172 | 35 | 27 (below) | 2,500 | 1,700 |
| 14 | Slope | Apron conveyor | 48 | 300 | 23 | 90 (below) | 3,500 | 2,600 |

| 20 | Shaft | Self-dump. cages | .. | ... | .. | 285 (below) | 4,000 | 1,700 |
| 21 | Shaft | Self-dump. cages | .. | ... | .. | 228 (below) | 4,000 | 1,700 |

ISLAND CREEK TIPPLES

*Upper left—Mine 18 tipple on Mud Fork. The coal seam lies 189 ft. above the railroad track. Coal is lowered on a 42-in. retarding, pan conveyor 400 ft. long on a 30-deg. incline. This structure, like all others owned by the Island Creek Coal Co., is carefully maintained.*

*Upper right—At Mine 12. This tipple has a capacity of 2,500 tons in 8 hr. The slope is 172 ft. long and has an inclination of 35 deg. It is provided with an apron conveyor 60 in. wide.*

*Lower—Conveyor gallery and tipple at mine 14. The coal lies 90 ft. below the surface at this point. A 48-in. apron conveyor 300 ft. long and on a slope of 23 deg. is used for lifting it to the tipple. This mine is producing about 2,600 tons a day.*

former to the rock bin and the latter to a railroad car on No. 1 track.

The screening rig is double-decked and perforated to separate run-of-mine coal into lump, egg, nut and slack sizes. The upper deck is provided first with a 7x15-ft. area of stepped screen with slotted perforations which separate the lump and egg from the under sizes. The coal next flows over an 8x7-ft. area of stepped screen with slotted perforations which separates the egg from the lump size. On the lower deck the slack is separated from the nut by a 7½x15-ft. stepped and slatted screen.

From the screen the lump is discharged onto one of two picking tables and either egg or nut or both are discharged onto the other. Thence by loading booms the picked sizes are lowered with a minimum of breakage to railroad cars on the two middle tracks. A cross flight-conveyor extending from the nut-and-egg picking table to the lump picking table enables the prepared sizes to be mixed for loading on the lump track. The slack is chuted directly to a railroad car on No. 1 track. Refuse from the picking tables is carried by a conveyor to a 20-ton rock bin. This conveyor also can carry egg coal to a 20-ton, house-coal bin.

In the Island Creek seam is a 4-in. bed of soft coal at the top and a 10-in. thick bed at the bottom. These softer beds of coal are separated from the remainder of the coal on the picking tables and are loaded on No. 4 tracks as a separate product. The transfer of the soft coal is accomplished by a cross conveyor.

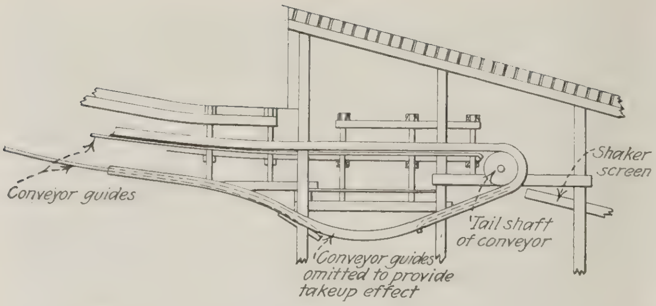
At No. 18 mine on Mud Fork the seam lies 189 ft. above the elevation of the railroad track under the tipple. In the headhouse at this mine, coal is dumped by a crossover dump and is conducted by a receiving chute to an apron feeder, by which the coal is fed to a retarding conveyor. In the receiving chute is a short, screen section which separates slack and drops it onto the conveyor behind the feeder. Thus is formed a soft bed which cushions the fall of the larger sizes as they drop from the feeder to the conveyor.

The conveyor is 42 in. wide and 400 ft. long on a slope of 30 deg. The pans are provided with 1-in. high beads which, together with the fine coal on the bottom of the conveyor, prevent the lump coal from rolling down the slope. This conveyor is driven at a speed of 60 ft. per minute by a 25-hp. alternating-current motor and is equipped with a magnetic brake and also a hand brake for emergency use. It has a capacity of about 1,500 tons in 8 hr.

An interesting feature in the design of this steep and long retarding conveyor line is the absence of a screw take-up. Slack in the conveyor is automatically gathered as shown in Fig. 7, by troughing and gapping the conveyor guides under the return strand adjacent to the tail sheaves. By reason of the "hang" of the return strand from the drive sheaves at the head of the conveyor, the slack in the conveyor sags down in the gap between the guides. This keeps the load strand of the conveyor taut.

Shaking screens, picking tables and loading booms are used in the preparation of coal at all the mines including No. 18 mine.

At Huntington, W. Va., the company is erecting a



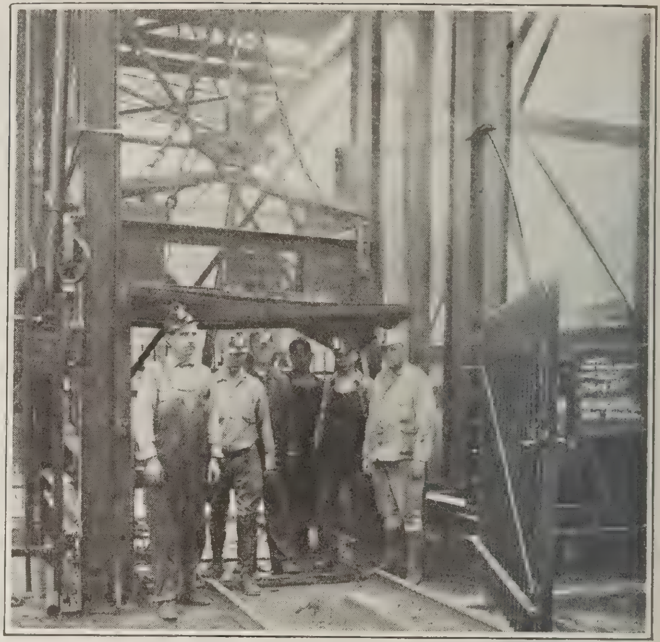
**Automatic Conveyor Take-up at Mud Fork Mines**

The coal here lies above the tipple and consequently retarding conveyors are used. Being of the retarding type the drives are at the head or top so that the load strand of the conveyor stays taut. But this design allows the return strand to hang loose. It is common practice to use a take-up screw to eliminate this slack. At these mines, however (Mines 15, 16, 17 and 18), slack is automatically taken care of by allowing the strand to sag down in a gap in the line of conveyor guides.

reloading station on the Ohio River, to which each day 6,000 tons of run-of-mine coal for steam and domestic use will be shipped by rail from the mines and reloaded into barges for reshipment to ports on the river, chiefly to Cincinnati where a rescreening plant is located. This is not a new venture of the Island Creek Coal Co. The new Huntington plant merely replaces an older plant from which coal has been shipped on the Ohio River for a number of years.

At the new Huntington reloading plant, railroad cars will be delivered one at a time by a steam locomotive to a cradle dump. After being dumped they will drift by gravity out of the dump. From the receiving hopper under the dump the coal will be fed to a belt conveyor and transported without further transfer to the river barges. This belt is 48 in. wide and the conveyor is 400 ft. long. The conveyor is arranged so that coal can be lowered to the barges with a minimum of breakage at any practicable stage of the river.

The rescreening plant at Cincinnati has a capacity of 3,000 tons per day. It is arranged so that the run-of-mine coal shipped from Huntington can be unloaded at any practicable stage of the river and reloaded as run-of-mine; or, after passing over a shaking screen, it can be lowered by loading booms into railroad cars as lump and egg. If desired, run-of-mine, lump or egg can be carried to individual storage bins from which they are withdrawn and loaded into trucks serving local trade. This plant is electrically operated throughout.

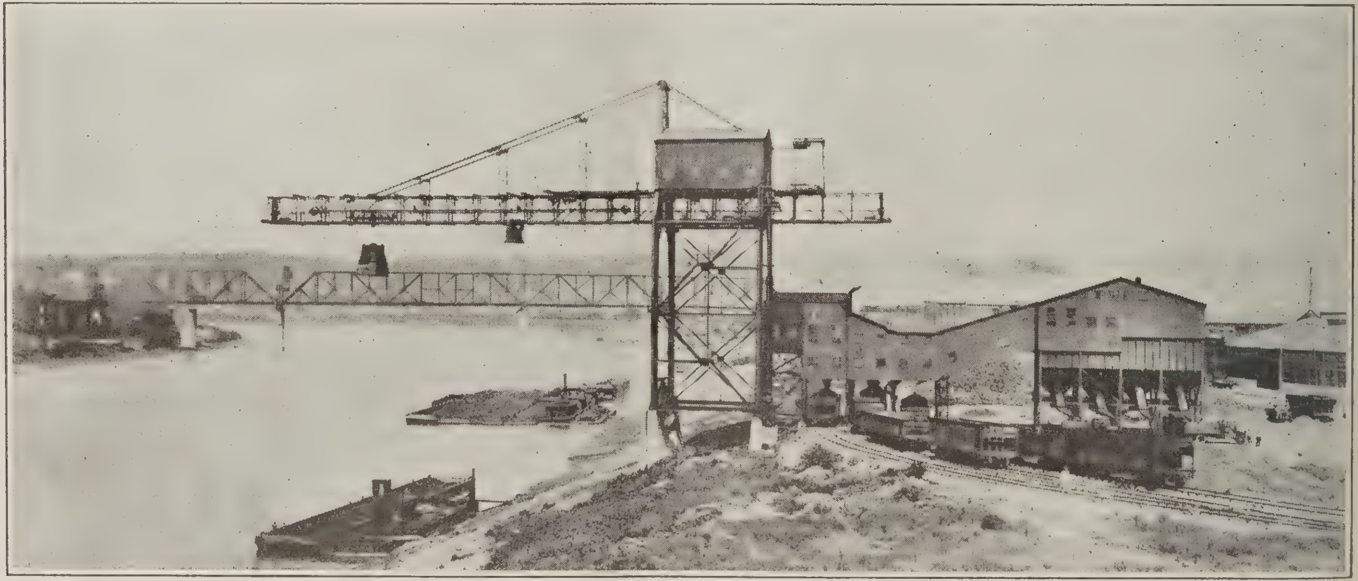


**The Top of One of Island Creek's New Mines**

This is at Mine 20. The company has only one other shaft operation: Mine 21 nearby. These two mines are just now getting into their production stride. At the right in this picture stands Supt. J. H. Madison, in almost spotless togs. He is the big boss of this mine.

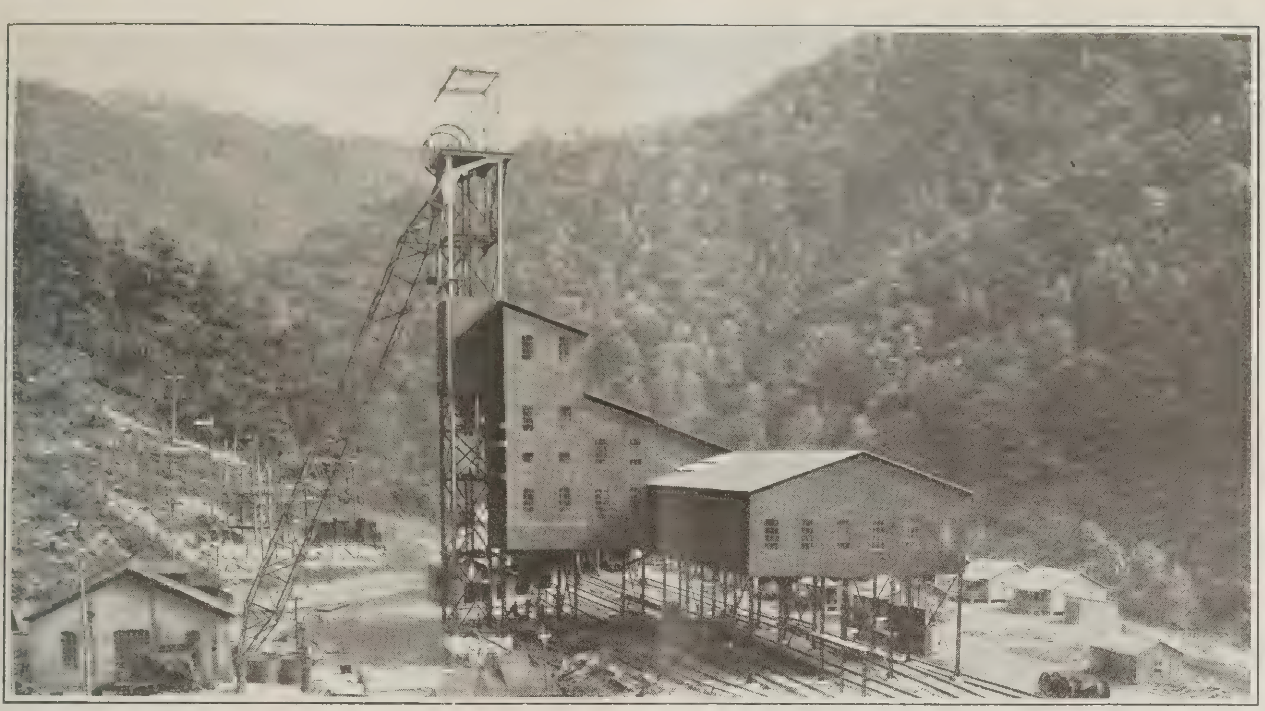
## Island Creek Mines Use Rock Dust

The company operating Island Creek properties believes thoroughly in rock dusting for protection. A good deal of experimental work has been done in the recent past and two dusting machines are on the job. A new campaign starts this fall before the approach of cold weather when moisture in the air will not be excessive as it has been in southern West Virginia all summer.



**Rescreening Plant at Cincinnati Helps Handle Island Creek River Coal Business**

About 3,000 tons of run-of-mine coal is shipped daily by rail from the mines to Huntington where it is reloaded into barges on the Ohio River and transported to this plant at Cincinnati for resizing. The plant has all the facilities of a modern mine tipple except picking tables which are not needed because refuse is removed at the mine.



# "Wireless Mine" at Bartley Strives for Safety

### New Operation of Pond Creek Pocahontas Coal Co. Has No Power Lines Underground Yet It Is 100 per Cent Electrified — Hoists 4,000 Tons Daily in 8-Ton Skips

**By J. H. Edwards**
Associate Editor, *Coal Age*,
Huntington, W. Va.

ON DRY FORK in McDowell County, W. Va., there is located a new mine, which, because of the high quality of the coal, the plans for large production, and a revolutionary step in safety, stands out prominently among the new operations of the country. The revolutionary step in safety puts the mine 100 per cent on a battery system of operation thus removing all power wires from underground. This mine is owned by the Pond Creek Pocahontas Co., which is controlled by the same interests as the Island Creek Coal Co. However, it is operated by its own local management.

The coal mined is the Pocahontas No. 4 seam. A 585-ft. shaft, recently sunk at Bartley, taps the 2,600-acre tract which is owned in fee. Judging from the present showing in the mine, and from a number of core-drill test holes, the coal will average 6 to 6½ ft. over the entire tract. Except for a 1- to 2-in. streak of bone coal located about 2 ft. from the top, the seam is free of partings. In many places this thin streak of bone disappears entirely. Generally speaking, the roof is sandstone. The coal is of a friable nature, has a columnar structure, and is of exceptionally high quality. The latter characteristic is indicated by the following general analysis: Moisture, 1.06; volatile matter, 14.90; fixed carbon, 79.58; ash, 5.52; sulphur, 0.60; B.t.u., 15,000. The high purity makes the coal one of many uses and consequently of constant demand.

Considering the conditions, and the number of problems to be worked out, rapid progress has been made in developing the Bartley mine. Although the main skip shaft was not put into use until June 16, the mine had shipped 150,000 tons of coal by Aug. 1. The equipment is designed for a capacity of 4,000 tons per day. The supply shaft was sunk to the coal, Aug. 1, 1924. From that date until Dec. 1 the coal was hoisted by bucket, then in mine cars on the single cage of the supply shaft until the starting of the skip hoist at the main shaft. The first cutting machine was put into use in December, 1924, and the first locomotive in January, 1925.

Mention of the inside equipment brings up one of the main features of Bartley shaft. It is a "wireless mine," yet the electrification is 100 per cent. Storage batteries are used exclusively for cutting, gathering and hauling. No trolley wires are in the mine and none of the tracks are bonded. This progressive step was taken in the interest of safety. The battery compartments, mining machines, and locomotives are all of the type approved by the U. S. Bureau of Mines as permissible for use in gaseous mines. A more complete description of this equipment will follow later in this article.

Both the main and supply shafts are concrete-lined through their entire depth of 585 ft. The supply shaft is 14 ft. x 27 ft. 6 in. and is divided by a concrete partition, one side being used for air and the other as a compartment for the single cage of the men-and-material hoist. A water ring, sump, and pumping station are located 230 ft. from the top. The water from this

---

In the headpiece are shown the headframe and four-track steel tipple. The shaft is 585 ft. deep to the coal with an additional 65 ft. below to accommodate the car-dumping and skip-loading machinery. The rated capacity of the hoisting equipment and of the tipple is 4,000 tons per day.

**Gathering Locomotive in the "Wireless" Mine**

In this mine there are no trolley wires or machine-feeding lines, and none of the tracks are bonded. The battery in this locomotive consists of forty-eight 33-plate, lead cells and is rated at 480 amp.-hr. and 46 kw.-hr. The single motor of this locomotive is connected to both axles by worm gearing.

ring furnishes the domestic supply for the town. It is pumped from the sump to a high tank by a 60-hp. 4-stage centrifugal pump.

The main or skipshaft is 9 ft. x 26 ft. and is excavated to a depth of 65 ft. below the coal. Bottom-discharge skips of 8-tons capacity are used. The equipment at the bottom of the shaft consists of a one-car rotary dump, a 5-ton weigh hopper, and a skip-loading hopper with air-operated gates. A motor-driven car spotter feeds the trip through the rotary dump, and "hikers" located at points on the entry about 300 ft. in each direction from the dump provide added facilities for handling cars. The controls of the dump and of the other bottom equipment are grouped and interlocked so that but two men are required on the bottom.

Both the skip and supply hoists are of the geared type with plain cylindrical drums. The brakes which are set by gravity, are released and controlled by oil pressure. Weighted accumulators operating in connection with automatic pumps keep the pressure at a constant value. Wound-rotor, 2,300-volt, induction motors are used on both hoists, that on the supply hoist being rated at 250-hp., and the one on the skiphoist, 500-hp. Controllers geared to the drum shafts provide complete protection against all conditions of failure of the engineer to operate the hoist properly, and against other conditions such as overspeed due to a broken motor shaft. The duty cycle of the large hoist is as follows:

| | |
|---|---|
| Weight of skip, lb. | 21,800 |
| Maximum weight, material per skip, lb. | 17,000 |
| Total lift, ft. | 690 |
| Maximum rope speed, ft. per min. | 688 |
| Number of trips per hour (max.) | 42.4 |
| Time to accelerate, sec. | 10 |
| Time at full speed, sec. | 50 |
| Time to retard, sec. | 10 |
| Time to dump and load, sec. | 15 |

In actual operation it was noted that when hoisting a skip containing three cars of coal (about 10 tons), the motor takes a peak of 250 amp. at starting, an average of 125 amp. during the first part of the hoist, and drops to around 90 amp. near the end of the run. The full load rating of the motor is 132 amp. Power for operating this and other equipment is purchased.

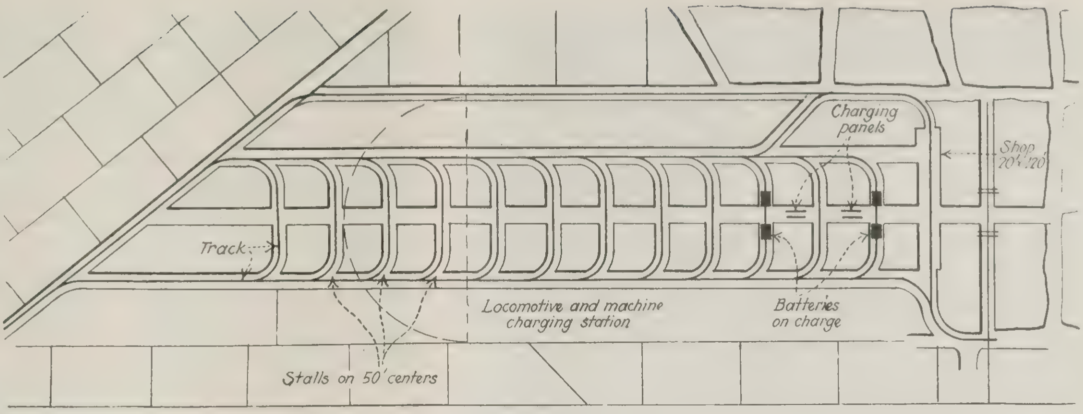
The four-track steel tipple at the Bartley mine is a model among those of its class. The floors and walkways are of concrete, and all shafting, gears, and other dangerous parts are inclosed by guards of sheet metal or wire screen. The tipple is equipped to load four sizes, three of these passing over picking tables and loading booms. By a simple arrangement of cross-conveyors the three sizes of picked coal and the slack can be reassembled when it is desired to load run-of-mine. The refuse from the picking tables is conveyed to a bin from which it is disposed of by a motor-driven, self-dumping larry.

**On the Move**

Arcwall machine traveling to the next place. The electrical equipment of this machine is approved by the Bureau of Mines as permissible for use in gassy mines. Power at 250 volts to operate the machine is supplied by a battery mounted on a self-propelling truck. The coal in the Bartley mine averages 6 to 6½ ft. in thickness, and the only impurity is a 1- to 2-in. streak of bone in which this machine cuts about 2 ft. from the top. In many places this parting disappears entirely.

**Shop Plan**

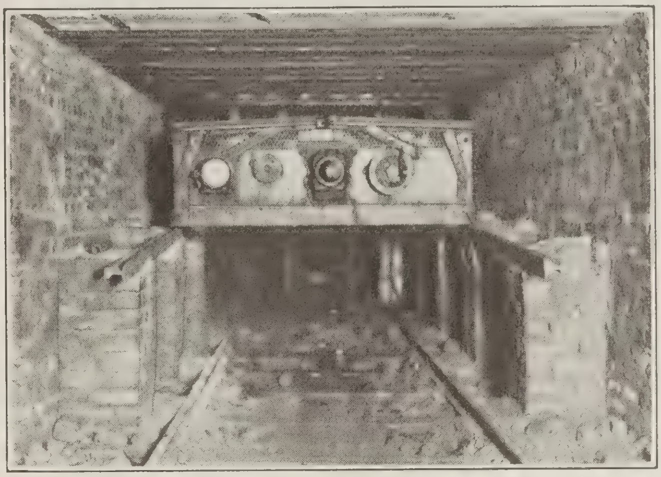
Here all batteries are charged. The compartment containing a discharged battery is deposited in one stall and a compartment containing a charged battery picked up in the adjoining stall. Power for moving the chassis from one stall to the other is furnished from the battery through a portable transfer cable.



The driving equipment of the tipple consists of seven alternating-current motors aggregating 122 hp. All of these, except the three of 5-hp. size on the boom hoists, are of the wound-rotor type. One of 30-hp. drives the three picking tables and the three loading booms. Another of the same size drives the cross-feed and mixing conveyors, and a third, the shaker screens. The remaining motor, of 7½-hp. rating, operates the feed hopper. Drum controllers in combination with magnetic line contractors are used on the one 7½-hp., and on the three 30-hp. motors.

The 12-x5-ft. mine fan is belt-driven from a 150-hp., 585-r.p.m., wound-rotor induction motor. It is the intention to install later a 300-hp. motor on this fan. Because of lack of room this will have a chain drive. The 150-hp. motor will be left in place to serve as a spare. Auxiliary power, operating the fan in case of failure of purchased power, is provided by an 8-cylinder, 1,200-r.p.m., 300-hp. gasoline engine directly connected to a 125-kw. alternator. This emergency power unit can be used for operating the men-and-material hoist at a reduced speed.

Direct current for charging batteries and for operating the slate larry is supplied by a 275-volt, 300-kw., synchronous converter located in a room adjoining the supply hoist. Positive and negative feeders, each of 500,000 circ.mil carry the direct current through the supply shaft to the battery-charging stations. For this duty, single-conductor, standard borehole cable is used. This is insulated with varnished cambric, is lead covered, and armored. The cables, each 585 ft. in length, are suspended at the top of the shaft by clamps.



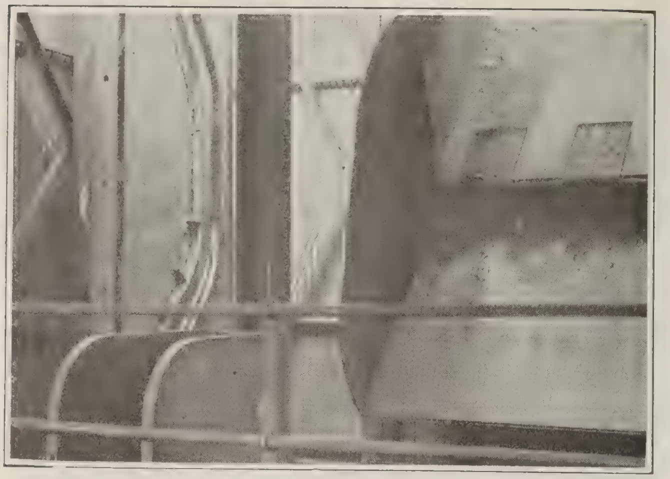
**A Locomotive Battery on Charge**

One of the temporary charging stalls is shown. It was used before the permanent stations were completed. More room is provided in the permanent stations. In order to load this battery compartment, the chassis of the locomotive is run under it, then backed out pulling the compartment along. As the compartment runs down the sloping side rails it settles down into operating position on the chassis.

The same type of cable—except that it is three-conductor—and the same method of support are used for carrying the three-phase, 440-volt power to the pumps

**"Canned" Energy for Cutting**

Each mining machine is followed by one of these power trucks. The battery consists of 110, 31-plate lead cells and is rated at 450 amp.-hr. and 99 kw.hr. This is sufficient energy to operate a mining machine during a full shift. The chassis of this power truck is worm-driven from a single motor. The unit, including the battery compartment, is approved by the Bureau of Mines as permissible.



**The Skip Dumps Its Load**

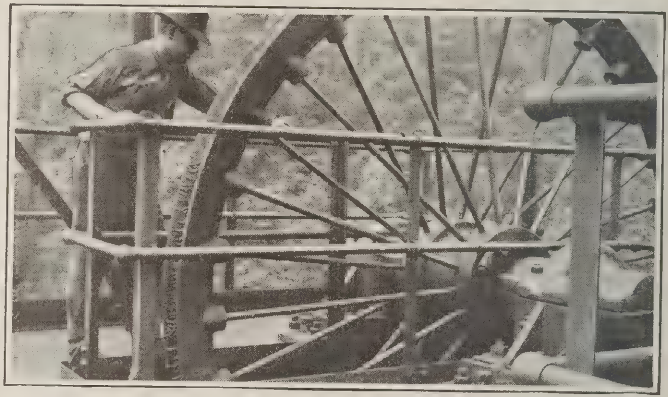
The open gate of the bottom-dumping skip is shown. One of the advantages of this type of skip is that the entire weight is available for counterbalancing the loaded skip as it leaves the bottom. This reduces the power required at starting. To the left can be seen the curved, gate-opening guide of the other skip compartment.

at the water ring and at the shaft bottom. A similar three-phase cable installed in the skip shaft conducts power to the bottom for operating there the seven 440-volt motors capable of developing 262 hp. These motors consist of the following: A 25-hp., wound-rotor driving the rotary dump; a 20-hp., wound-rotor driving the car spotter; two 25-hp., wound-rotor driving the "hikers"; a 7½-hp., wound-rotor operating the weigh; a 150-hp., squirrel-cage driving a centrifugal pump; and a 10-hp. vertical, squirrel-cage driving a centrifugal deep-well pump. This pump raises the water from the pit in the bottom of the shaft to the mine-level sump. The motor is located on a level with the coal and so is above danger in case of flooding of the pit.

Since there are no trolley wires in the Bartley mine the electrical energy for operating the locomotives and mining machines is carried "on wheels" rather than on wires. A storage battery forms a part of each locomotive and coal-cutting unit.

At present, because of the comparatively short hauls, no main-line locomotives are used in the mine. The gathering locomotives deliver the loads directly to the shaft bottom. On this service there are in use five 7½-ton, single-motor, worm-driven locomotives, geared for a speed of 3½ m.p.h. The battery compartments are of the quick-demountable type. Ten of these compartments, complete with batteries and fixtures, make up the power equipment for the five locomotives. This arrangement necessitates no shutdown of the locomotives for charging. One battery is at the charging station while the other is in use. After a locomotive arrives at the station, but a minute or so is required to change batteries.

The coal-cutting equipment consists of two arcwall plates each. The ampere-hour rating is 480 and the kilowatt-hour rating 46. This capacity is sufficient for a full shift. The normal size of trips is five cars, but a locomotive can pull ten or twelve cars. The cars are of 3½ tons capacity and the empty weight of each is approximately 2 tons. They are of the steel-body, wood-bottom type, equipped with open-end roller bearings.



**Inspecting the Sheave Wheels**

These bicycle-type head sheaves are 10 ft. in diameter. The bearings are of the ring-oiled type with large oil cellars, so they need little attention.

The coal cutting equipment consists of two arcwall mining machines and two complete, self-propelling power trucks. A power truck is made up of two main

**Well Lighted Tipple**

Picking tables in the foreground and loading booms leading down through the concrete floors to the tracks are intended to handle nut, egg, and 4-in. lump. The photograph from which this illustration was made was taken just before the tipple went into service. The numerous windows directly above the picking tables and around the walls of the tipple give ample light to aid men to load clean coal.

parts, a chassis and a quick-demountable battery compartment. The chassis is worm-driven from a single motor. The truck carries a 110-cell, 31-plate battery having an ampere-hour rating of 450 and a kilowatt-hour rating of 99. This capacity is sufficient to operate the mining machine while cutting at least thirty places —which means a full shift—and to propel the power truck to and from the charging station, and the truck and machine from place to place.

The accompanying sketch indicates the permanent arrangement of the underground shop and of battery charging stations which is now being worked out at the Bartley mine. At the end of a shift a locomotive power truck will unload its battery onto the charging rails in one stall, then pick up a charged battery in the adjoining stall. A heavily insulated transfer cable will be used as a conductor from a battery while the chassis is moving to an adjoining stall.

**Part of the Mining Town**

This view was taken from the top of the headframe showing one group of the new houses of the Pond Creek Pocahontas Co. Level ground is scarce in the mountains of West Virginia, so every available space has to be utilized for buildings. Note that on the other side of Dry Fork creek there is room only for the highway.

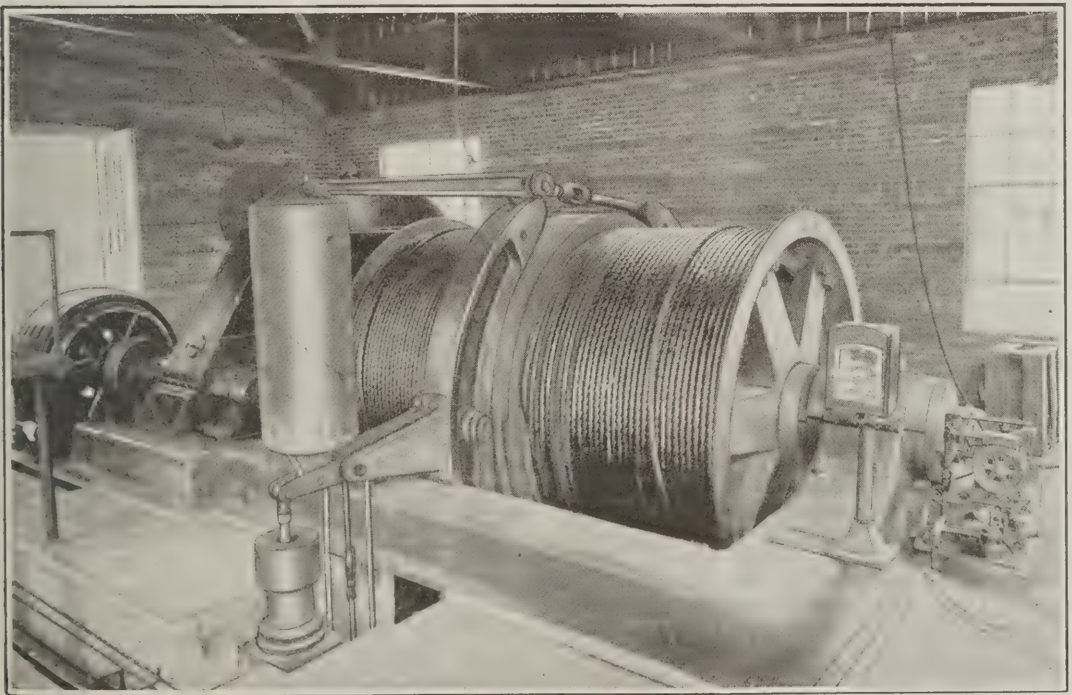
Although the primary object in using storage-battery power for cutting is to eliminate the danger of the ignition of gas or coal dust by open wiring, there are several other advantages afforded by battery operation. The most important are: More places can be cut per shift because of constant voltage because power is continuous and no time is lost in making and repairing electrical connections, there is a saving in the elimination of wires and bonds, and the peak load on the power system is reduced.

**Where the Power Goes Down**

The two 500,000-circ. mil, 250-volt, armoured cables each 600 ft. long are suspended by clamps at the top of the supply shaft. These cables carry current to the battery-charging stations inside the mine.

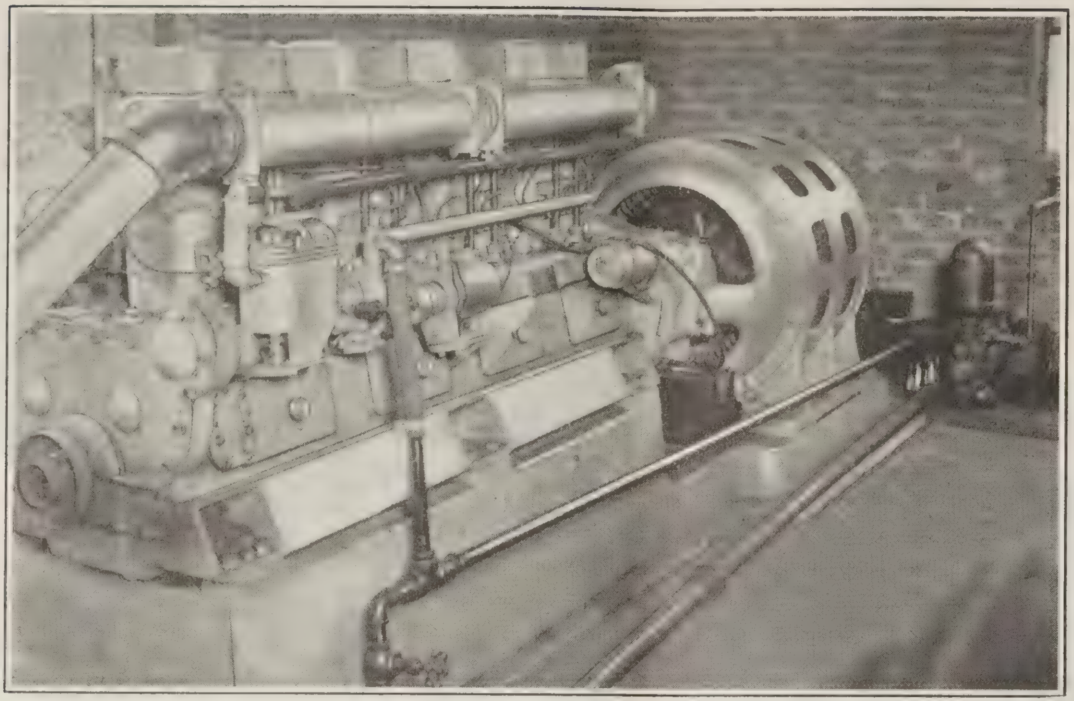
Mining methods at Bartley are not out of the ordinary. No mechanical loading has been attempted, and there is no intention of adopting longwall methods. The coal is cut at a point about 2 ft. from the top and is loaded out in two benches. Shot firers are employed to load and shoot the holes which are drilled by hand by the miners. One shot firer serves ten or twelve miners.

The firing is done by electricity from permissible



**Main Hoist**

Although the total lift is 690 ft. and 8-ton skips are used, a motor of only 500 hp. is required for hoisting the rated capacity of 4,000 tons per day. The hoist brake is set by the large weight in the foreground and is released by oil pressure. At the right is a controller geared to the drum shaft.

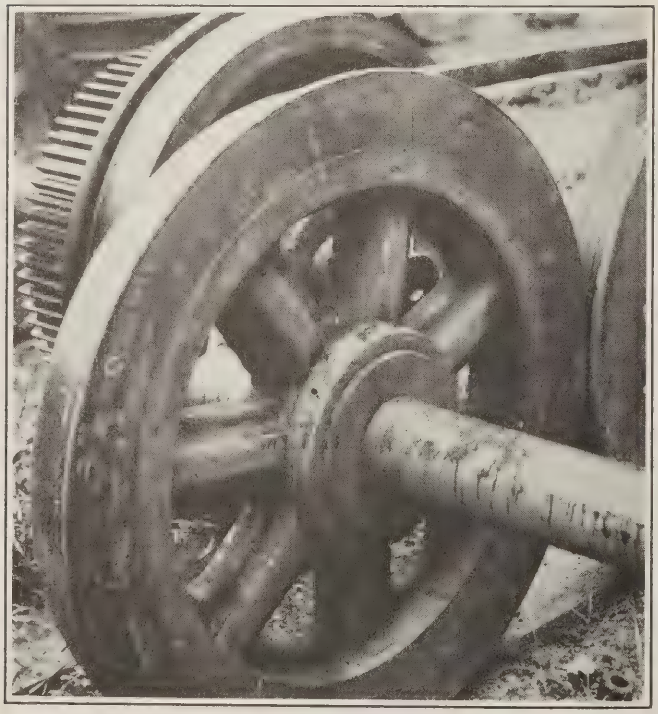


**Standby Power**

In case of failure of purchased power, this 300-hp. gasoline engine directly connected to a 125-kw. alternator generates power at 2,300 volts to drive the mine fan and supply hoist. At the right is a 2¾x 2½-in. single-cylinder pump driven by a 2-hp. motor. This pump supplies cooling water to the engine.

attachments on lamps. The two benches of the 12-ft. face are brought down by four rib shots. Ordinarily one stick of permissible is used in each of the top holes but in many places as little as half a stick suffices. In the bottom bench three sticks are used for the breaker shot, and two sticks on the other side. The shots are fired one at a time and the coal from the first shot in each bench is loaded before the next shot is fired.

With its excellent coal, up-to-date equipment, safe but efficient methods, and good management, the Bartley mine bids fair to be one of the prize operations of the Pocahontas field.



**Collar Holds Fractured Hub**

When wheels turn on their axles the axles are built up and then turned down to a snug fit. In applying the wheel under heavy pressure the hub is sometimes strained. To overcome this defect the Island Creek Coal Co. shrinks a collar on the hub.

## These Men Made Island Creek Mines Important

The Island Creek Coal Co. dates back to 1902 when the organization of Boston and Cleveland capital was effected. The company was started in order to develop certain Logan County, W. Va., coal land which formed the nucleus of the great holdings of today centering at Holden. A. F. Holden of Cleveland, engineer and financier, was made president of the company and held this office until his death in 1913. In 1907 T. B. Davis had become vice-president in charge of operations and he it was who succeeded Mr. Holden. He has been in active charge of affairs for the company ever since.

The same group of men organized the Pond Creek Coal Co. in 1911 and operated the property owned by that company until December, 1922 when it was sold to the Fordson Coal Co. Almost immediately thereafter, substantially the same men formed the Pond Creek Pocahontas Coal Co. to build and operate the so-called "Wireless Mine" at Bartley which is described in the last leading article beginning on page 359 of this issue of *Coal Age*.

The local management of the Island Creek properties is in the hands of James D. Francis, vice-president, and A. R. Beisel, general manager, at Huntington, W. Va., where are the head offices of the company. Both these men have been with the company for a number of years. Vice-President R. S. McVeigh of Cincinnati, Ohio, is in charge of sales.

The steady growth of the Island Creek Coal Co. is reflected in the mounting annual output of the mines since 1905 as shown in this table:

| Year | Tons | Year | Tons |
|---|---|---|---|
| 1905 | 147,703 | 1916 | 2,280,661 |
| 1906 | 351,541 | 1917 | 1,933,805 |
| 1907 | 691,547 | 1918 | 1,891,375 |
| 1908 | 941,036 | 1919 | 1,781,413 |
| 1909 | 1,220,326 | 1920 | 1,795,077 |
| 1910 | 1,665,668 | 1921 | 3,240,993 |
| 1911 | 1,876,446 | 1922 | 3,144,423 |
| 1912 | 2,039,887 | 1923 | 3,152,919 |
| 1913 | 1,916,100 | 1924 | 4,951,403 |
| 1914 | 2,207,444 | | |
| 1915 | 2,213,616 | Total | 39,443,383 |

## Second Week of Anthracite Strike Finds Both Sides Standing Firm; Union Bitterly Opposes Arbitration

The first week of the anthracite strike has passed with neither operators nor miners showing the slightest intention of receding from the positions that deadlocked the wage negotiations at Atlantic City, N. J., last month. On the eve of the suspension Major W. W. Inglis reiterated his conviction that the strike was wholly unnecessary and that the contention that the miners could not continue work without a contract was a relic of the dark ages of trade unionism. Union leaders interpreted this as another demand that they submit to arbitration and made no concealment of their purpose to oppose to the limit of their resources the successful termination of a "strike to end future strikes," as the operators' attitude has been defined.

No comment was forthcoming from union headquarters at the Bellevue-Stratford Hotel, Philadelphia, Pa., on the action of certain of the operators in the region in canceling the credit privilege to strikers trading at company stores. Nor did President Lewis and his aids express any concern over reports of friction between some of the local unions and the operators over the employment of maintenance men. All such difficulties, it was stated, would be amicably ironed out under the terms of the agreement entered into at Philadelphia on Aug. 28.

### Strike 100 per Cent Effective

Both sides agreed that the suspension was 100 per cent effective. On behalf of the operators it was pointed out that the wording of the Pennsylvania mining statutes requiring two years' experience before certification made the employment of strike-breakers impossible. Moreover, they denied entertaining any intentions of attempting to operate open-shop. On its side, the union also declared itself against separate agreements with individual operators. District No. 1 reported to Philadelphia that one company had offered to sign up a contract embodying the demands in the Scranton tri-district convention platform, but the offer was declined.

Newspaper stories that the miners might again push the nationalization program, quietly sidetracked as soon as John Lewis came into power in the United Mine Works, were met with a prompt denial. In a statement made public Sept. 3 Mr. Lewis denied that the revival of the discussion had originated with the miners. "It is John Hays Hammond and not the mine workers who proposes that the federal administration shall cast overboard its policy of non-interference with business. It is Mr. Hammond who proposes that the Republican majority in Congress shall depart from its traditional policy and through legislation establish a semi-regulation of the anthracite industry.

### Lewis Points Out Hammond

"Surely the astute Mr. Hammond should appreciate that the investment bankers of New York and Philadelphia who control the anthracite industry do not desire the prying hand of Congress to bare to a scornful public gaze the amazing profits which they are taking from a natural monopoly of a public necessity. Mr. Hammond should also know that the federal Congress cannot differentiate between anthracite and bituminous mines when dealing with the basic necessity of coal. It is obvious that any legislation enacted by Congress dealing with anthracite must similarly be superimposed upon the bituminous industry. Such a contingency would be decidedly embarrassing to such friends of Mr. Hammond as the Pittsburgh Coal Co., the Consolidation Coal Co., the Bethlehem Mines Corporation and the B. R. & P. Coal interests, all of whom have torn up their agreements with the United Mine Workers."

The reference to these bituminous companies marked the limits of official comment upon the rumors that the union planned to call a soft coal strike in sympathy with the anthracite miners and to force the government to get behind the Jacksonville agreement. A direct statement on this contingency was refused. To questions whether the anthracite strike could be made fully effective without the co-operation of the bituminous miners, union spokesmen returned the enigmatic response: "Well, we seem to be going on the belief that it can, don't we?"

Neither side made any predictions as to the duration of the tie-up. The operators have been pounding upon the demand that the next agreement should contain provisions that would make future suspensions impossible. They have also launched a daily advertising campaign in the regions showing the markets and the money lost by the suspension. Union leaders express themselves so bitterly against arbitration that they convey the impression that they are willing to hold out to the last ditch on that question.

### *Governor Pinchot Silent On Strike Mediation*

Governor Pinchot of Pennsylvania has not intimated what, if any action, he intends to take regarding the anthracite strike. He is now touring the state, making an inspection of the state and semi-state institutions, and during his absence state officials are powerless to act.

Secretary of Mines Walsh has not communicated with the Governor since his return as one of the Governor's official observers at the Atlantic City conference of the operators and miners. Secretary of Labor and Industry Lansburgh has not heard from the Governor, either, since his recent return from a month's vacation.

"The Bureau of Industrial Relations of the Department of Labor and Industry," said Secretary Lansburgh, "has in effect offered its services as a mediator by being represented by David Williams at the Atlantic City conference. The bureau has no authority in law to force itself upon the contending sides. It cannot go before them unless mediation is desired."

---

## Burns Brothers Absorbs Four Coal Firms

Directors of Burns Brothers, New York, approved plans Sept. 2 for the acquisition of one wholesale and three retail distributing coal companies. The properties to be acquired are the Wyoming Coal Co., the Steamship Fuel Corporation, the Schuylkill Coal Co. and the Temple Coal Co. The consolidation extends the sphere of operations throughout the metropolitan district and into New England, as well as other sections, it was said.

The Wyoming and the Steamship Fuel Corporation are the largest of the four companies in the acquisition. Both are owned by the S. A. Wertheim and affiliated interests. The Steamship Fuel Corporation is a wholesale company, selling to retailers in all North Atlantic States, with piers at Norfolk and New York. The other companies are retail distributors.

Payment will be made from the Burns A and B stock, heretofore unissued. No financing will be required.

## Central Pennsylvania Output Gains During Strike

It is too soon yet to determine the full extent of the effect of the strike in the anthracite field on production in the central Pennsylvania bituminous field, as figures for August only are available. The loadings for last month were 60,350 carloads, as compared with 54,606 for July. The seasonal increase accounts for a portion of this but the strike has had its effect as is reflected in the number of idle mines being put into operation and the fact that operators are advertising for miners.

On the present basis, the field is producing 60 per cent of its normal capacity. The district can supply 40,000 carloads, or 2,000,000 tons, additional per month.

Mine No. 1 of the Stineman Coal Co. resumed operations on Sept. 1 with 100 men. The mine had been idle two months. The same company's No. 4 mine resumed a week earlier and is now working at 50 per cent of capacity. Increased output is reported at the Ehrenfeld operations of the Pennsylvania Coal & Coke Corporation. These mines are working three and four days a week after having worked only one and two days for several months. The Barnes-Tucker Coal Co., at Barnesboro, has increased its output during the past two weeks.

The Thermal mines of the Cosgrove-Meehan Mining Co., located at Acosta, Somerset County, recently purchased by a New York firm, have been placed in operation. It is reported that a large contract has been signed with one of the largest public utilities companies in New York, providing for a large tonnage over a period of three years. The daily capacity of the two mines, which are equipped with modern screening devices, is 1,000 tons daily. At the Foustwell mine of the Cosgrove-Meehan company the output has been doubled. This is said to be one of the best substitute coals produced to replace anthracite.

At Nant-y-Glo and Vintondale production is back almost to normal.

## Fire in Omar Mine Sealed; May Burn for Year

After a week of ceaseless work directed by Chief Mine Inspector Lambie and District Inspector J. F. White, employees of the West Virginia Coal & Coke Co. succeeded on Aug. 27, in sealing off the fire in the No. 4 mine of the company, at Omar, W. Va. Sixty concrete block brattices were built around the three hundred acres of pillar territory affected by the fire, which was caused by the wrecking of a loaded trip and the consequent short-circuiting of power wires.

It is thought by engineers that at least a year will be necessary to completely smother the fire. In the meanwhile the mine will be operated by routing the coal around the fire area.

No. 4 mine was the largest of the mines recently acquired by the West Virginia Coal & Coke Co. from the Main Island Creek Coal Co., having a daily capacity of 2,000 tons. Much valuable equipment was lost.

## *Name Commission to Probe British Coal Industry*

Appointment of the Royal Commission of Inquiry which will investigate the coal situation in Great Britain was announced by the government Sept. 3. The commission consists of Sir Herbert Louis Samuel, former Home Secretary, as chairman; Sir William Henry Beveridge, an authority on economics and employment; General Sir Herbert Alexander Lawrence and Kenneth Lee, who has held many important posts having to do with trade and commerce. They will be assisted by several expert assessors, including William Brace, chief labor adviser to the Mines Department, while the secretary of the commission will be C. S. Hurst, Assistant Under Secretary of the Mines Department.

The commission will, according to the announcement, "inquire into and report upon the economic position of the coal industry and conditions affecting it, and make any recommendations for the improvement thereof," as promised by the government when it granted a subsidy in order that the mines might continue to pay current wages. This action prevented a general strike on Aug. 1. The subsidy cost the government about £860,000 in the first month, although coal output was somewhat less than normal. The subsidy will continue in effect until next May, when the commission is expected to be ready to make its report.

## Carbonized Coal Rates Stand

The Interstate Commerce Commission has declined to suspend tariffs of the Illinois Central and other railroads serving the southern Illinois district, naming the same carload minima and rates as apply on lump coal to the movement of carbonized coal, effective Sept. 1. The rates on this product were established at the solicitation of the Old Ben Coal Corporation, which has been experimenting with low temperature distillation for several years and hopes to develop a market for the new fuel. The establishment of the rates was opposed by coke producers and coal operators in other parts of Illinois, in Arkansas and Oklahoma.

As a part of a campaign launched recently to take every possible advantage of an opportunity offered by reduction of freight rates from southern West Virginia to New England on low-volatile coals and to create new markets in New England for West Virginia bituminous grades, the services of the committee on mines and mining of the Chamber of Commerce of Huntington have been tendered Governor Gore of West Virginia and the secretaries of five coal operators associations in southern West Virginia. John E. Norvell, chairman of the committee, suggested that the state Department of Mines might be able to assist in the campaign of education in New England.

## Murray Charges Conspiracy Against Miners' Union

Pittsburgh, Pa., Sept. 8.—A Labor Day audience at Bridgeville, Pa., listened impassively to Philip Murray, of Pittsburgh, international vice-president of the United Mine Workers, declare that the Pittsburgh Coal Co. had joined a conspiracy with three of the largest coal producers of the United States to destroy the union and not to seek economical production. Murray named the Bethelhem Mines Co., the Rochester & Pittsburgh Coal & Iron Co. and the Consolidation Coal Co. as the other members of the "combination."

The Pittsburgh Coal Co. had announced but a day before that, in order to provide accommodations for the increasing number of workers at Banning No. 2 mine, where the 1917 scale is being paid, the company would move idle miners' families to houses of the company at other mines free of charge. On Saturday the mine had 202 men working and produced 563 tons of coal.

The Pittsburgh Coal Co., Mr. Murray maintained, was producing coal at a cost of $22.50 a ton and was employing men picked up in a drunken condition in Pittsburgh streets. Mr. Murray said in part:

"If the Pittsburgh Coal Co. succeeds in its policy of wage depreciation, its effect will be felt most keenly in the business centres of mining communities. Go down to Banning and you will find twenty-five deputies, each armed with a gun, driving union men away."

## No Decision on Rate Fight

No decision as to final action to be taken in combating the recent order of the Interstate Commerce Commission establishing joint through rates from the low-volatile districts of West Virginia to New England and Middle Atlantic states was reached at the second conference of northern operators and railroads held at the Bellevue-Stratford Hotel, Philadelphia, Pa., Sept. 2. There was, however, further consideration of the three lines of possible procedure outlined in the preceding issue of *Coal Age*.

Interested operators from the central Pennsylvania, Pittsburgh, Somerset and Upper Potomac fields are still hopeful that they can persuade the carriers to join with them in their protest to the Commission. To that end a committee of eleven operators, headed by J. W. Searles, president, Pennsylvania Coal & Coke Corporation, met with the coal traffic executives of the New York Central, Pennsylvania, Baltimore & Ohio, Western Maryland and Reading Railroads and also plans to hold another conference with the same officials early this week.

The Northern producers declare that they are in a position to ship 3,500,000 tons of low-volatile and 1,500,000 tons of high-volatile coal suitable for domestic purposes into the New England and Middle Atlantic territory every month. Some discussion was had as to the best way in which to bring this before the coal-consuming public. Formulation of a definite publicity campaign, however, has been held in abeyance.

# Prompt Recourse to Substitutes Urged as Surest Means to Avert Hard-Coal Panic and End Strike

**By Paul Wooton**
Washington Correspondent of *Coal Age*

Now that the opposing forces in the anthracite industry have dug in for what promises to be a long-drawn out struggle, officials and others in a position to serve the public in this crisis are much concerned because of the failure of anthracite-consuming regions to stock up with substitutes. Despite the fact that every day is precious, the movement of substitutes is slow.

When it is considered that anthracite is consumed in the winter at the rate of 7,000,000 tons a week, it means that large tonnages of bituminous coal and coke even now should be moving and orders should be rolling in at a much faster rate than the producers of substitutes report. This attitude is just what John Hays Hammond warned against in his interview when he advised consumers to take the middle ground between panic and lethargy. They have avoided panic, but have fallen into lethargy.

### Consumers Have Responsibility

It is quite apparent that consumers have not been made to realize that they have a responsibility in this situation. Moreover, dangerous doctrine is being spread broadcast. Some of it is being attributed to the President, thereby assuring its publication everywhere. From the accurate knowledge here of the President's views on the coal question it is regarded as practically certain that he has said nothing to justify such an interpretation of his utterances as the following, which appeared in a Washington newspaper:

"A word of caution from President Coolidge to the people who use hard coal:

"Don't rush into the market and buy a big supply of coal. By doing so you will be contributing to a shortage and thereby provide conditions which operators and miners likely seek.

"The President's attitude on the coal strike was stated for him at White Court yesterday. There is plenty of hard coal in sight, he understands. The public can stand a long strike. He will start the necessary wheels of the government moving to provide a continuous supply. When Congress convenes he will ask for the passage of legislation to deal with the situation, if it is then acute. But he hopes the people will not be run off their feet and make the situation serious by heavy buying."

This is typical of what the people are hearing. It encourages them to think that they will be taken care of. In meeting this strike the one great need and the thing most difficult to bring about is to start buying of substitutes. No one will buy substitutes if convinced that "there is plenty of hard coal in sight" or that "the public can stand a long strike" or when assured that the President "will start the necessary wheels of the government moving to provide a continuous supply." It is natural for the consumer who is unacquainted with the inner workings of coal distribution to be influenced by the advice he receives on every hand.

On paper, nothing is simpler than to set forth the availability of adequate supplies of substitutes. This can be done even in New England—that ear of the country which sticks out to the northward and always is the first to feel the frost. With large available surpluses of byproduct coke, of low volatile coal, of medium volatile coal, and of high volatile lump, it would seem simple to provide substitutes indefinitely. The trouble is that the potential supply of bituminous coal and coke is powerless to affect the situation until it is in the consumer's bin.

The great problem that faces the fuel committees in New England, in the Northwest and elsewhere is to induce the consumer to buy substitutes before it is too late. Those who understand the situation thoroughly agree that this buying must begin at once. If the total movement of substitutes needed can be spread over seven months, they can be provided relatively easily, but if buying is delayed until winter sets in and then a sudden call goes forth for 15,000,000 tons or 20,000,000 tons of substitutes in one month, it will be found that they cannot be delivered and prices will be pushed to the anthracite level or even higher.

The duty of the New England fuel committee is plian. They should make a budget of the normal rate at which anthracite is delivered to consumers. If, for instance, that rate for Massachusetts is 100,000 tons a week, then the committee should see to it that 100,000 tons of substitute move into cellars of that state each week.

### Time Required for Preparation

There is another reason for placing orders for substitutes at once. The mines in the territory tributary to New England will have to make special preparations to size and clean their coal in a form suitable for house use. The smokeless and medium volatile coals of central Pennsylvania, Somerset, Georges Creek and southern West Virginia make a fine domestic fuel when specially prepared, but ordinarily the demand for that purpose is too small to justify the equipment necessary. More than 90 per cent of the coal from these districts normally moves as run-of-mine.

The facilities developed by the producers in the Pocahontas and New River districts are absorbed largely in supplying Western trade. It is true that a number of producers in the region on which New England must rely equipped themselves with screens and picking tables after the strike of 1922, but their total capacity for preparation of suitably sized domestic fuel is comparatively small. If put to work now they can go a long way toward meeting the demand, but there are no reserve facilities with which to handle any peak in the demand.

### *Canada Gets Welsh Anthracite*

"The threat of a strike in the anthracite fields of the United States has already brought about large imports of coal from the United Kingdom," says the Canadian Pacific Railway's weekly trade review. "In fact the imports of British anthracite for the present season already exceed the total purchases of these fuels by Canada for last year. The figure for the current season is 246,316 tons of Welsh and Scotch anthracite, as compared with a total of 219,327 tons last year. In addition there has also been received a small shipment of British coke."

To ship mine-run for domestic use would be disastrous to the hopes of the bituminous producers who seek to build a permanent market for their fuel. One season's experience with mine-run coal will confirm the anthracite habit.

### Substitutes Would Hasten Peace

There is still another major reason why buying of substitutes should begin now. If the anthracite belligerents were to see that as much as 2,000,000 tons of substitutes actually are going into the bins of consumers each week, with the consumers pledged to receive a similar amount as long as the anthracite mines are closed, it would do more to hasten the settlement of the strike than would all the suggestions for arbitration or threats of investigation by congressional committees.

It is suggested that the local fuel committees can help the situation materially if they will urge producers and dealers in substitutes to co-operate so that full-time fuel experts are provided in each community to go from house to house where substitutes are to be used to demonstrate how they should be burned.

The committees also should arrange, fuel specialists in Washington point out, to have a consulting service to which the consumer could apply for advice as to the form of substitute best adapted for use in his furnace.

It also is regarded as imperative that fuel committees understand that in this emergency they are simply to supplement the regular machinery of supply and distribution. Their rôle is to arouse the consumer's interest to the point where he will commit himself at the earliest possible date to a definite order for substitutes.

In all this a great opportunity is knocking at the door of the bituminous coal trade. If it contributes constructively to the solution of this emergency, it can add materially to its market and can checkmate the demand for regulation of the coal industry.

## Strike Order in Southwest Has Little Effect

In response to the strike call to all union miners in District 21, United Mine Workers (Oklahoma and Arkansas), employed in mines paying less than the 1924 wage scale issued by William Dalrymple, president of the district, four hundred of the nine hundred men employed in the Rock Island mines near Hartshorne, Okla., walked out Sept. 1. Late in the afternoon, however, the superintendent of the mine announced many had indicated their intention to resume work. None of the mines at Carbon, Colgate, McAlester, Wilburton, Red Oak, Lutie or eastern Oklahoma was affected. Isolated instances of a few men quitting work were reported, but the number was not sufficient to affect production. The same condition was reported from Greenwood, Denning, Russellville and Coal Hill, Ark., where all production is under the 1917 scale, and from Spadra and Paris, Ark., where half of the twelve mines are paying the 1917 scale, while the remainder are operating on a 1924 basis.

Conditions in Oklahoma have been such throughout the summer that a strike order now could be little more than a gesture. McAlester, Hartshorne and Wilburton began early to operate under a lower scale than that signed in Kansas City in May, 1924. There was union opposition and an occasional clash between the workers and union men opposed to accepting a lower wage, but they were infrequent, and production was more or less stable when, a couple of months ago, mines in Henryetta began to follow suit. This precipitated union activities. Mass meetings were held and Oklahoma National Guardsmen were sent into the district to preserve order. Under their restraining influence, picketing has since been conducted. It has been more or less peaceable, but effective to such a degree that most workers to be influenced by union opposition had quit work long before the formal strike order was issued.

*Wide World Photo*

**They Are Counseling New England Against Anthracite**

This is Gov. Fuller's conference of New England governors and their representatives called to suggest ways for the northeast states to meet a shortage of hard coal due to a strike. John Hays Hammond was made permanent chairman. They are, from left to right, seated: James J. Storrow, Gov. Fuller, Massachusetts; Gov. Brewster, Maine; Mr. Hammond; standing, left to right: John F. O'Connell, Boston Chamber of Commerce; Representative Henry L. Shattuck; Congressman Allen T. Treadway; Edward Coss representing Gov. Trumbull of Connecticut; Ernest D. Sprague, Rhode Island; John C. Sherbourne, representing Gov. Billings of Vermont; Mortimer Silverman, Massachusetts coal purchasing agent; James J. Phelan, former coal administrator; Senator Charles P. Howard of Reading, Mass.; Congressman Louis A. Frothingham, and Eugene C. Hultman, Massachusetts, commissioner of necessities of life.

## Coal Mining Consumes Large Percentage of Timber

The coal mining industry consumed 87.3 per cent of the round timber and 58.5 per cent of the sawed timber used underground in 1923 by mining establishments in this country, according to data collected by the Department of Commerce in co-operation with the Departments of Agriculture and the Interior.

Bituminous coal mines consumed 63.6 per cent of the 174,389,004 cubic ft. of round timber and 44.8 per cent of the 507,359,000 board ft. of sawed timber which, according to the report, were used underground by 6,384 mining establishments in 1923. Anthracite mining was the second largest consumer with 23.7 per cent of the round and 13.7 per cent of the sawed timber. Pennsylvania, the leading state, reported 43.6 per cent of the round and 28.7 per cent of the sawed timber, as against 28.8 per cent of the round and 36.1 per cent of the sawed timber used in 1905, in which year 5,163, mines consumed 165,535,900 cubic ft. of round timber and 435,944,000 board ft. of sawed timber.

Summary statistics are presented in the accompanying tables. The figures for 1923 are preliminary and subject to such changes as may be found necessary upon further examination of the reports.

**Table I—Quantity of Mine Timber Used Underground, by Classes of Mines: 1923 and 1905[1]**

| Class of mines | No. of Establishments[2] | | Round Timber (Cubic Ft.) | | Sawed Timber (Board Ft.) | |
|---|---|---|---|---|---|---|
| | 1923 | 1905 | 1923 | 1905 | 1923 | 1905 |
| Total | 6,384 | 5,163 | 174,389,004 | 165,535,900 | 507,359,000 | 435,944,000 |
| Bituminous | 5,149 | 2,940 | 110,983,610 | 91,309,700 | 227,340,000 | 140,790,000 |
| Anthracite | 156 | 216 | 41,358,607 | 43,676,000 | 69,301,000 | 101,201,000 |
| Iron | 165 | 143 | 13,123,228 | 13,484,000 | 16,685,000 | 13,929,000 |
| Other metal | 879 | 1,718 | 8,780,092 | 15,282,500 | 193,333,000 | 164,956,000 |
| Fire clay | 35 | ..... | 143,467 | .......... | 700,000 | .......... |
| Miscellaneous | ..... | 146 | .......... | 1,783,700 | .......... | 15,059,000 |

**Table II—Quantity of Mine Timber Used Underground, by States: 1923 and 1905[1]**

| State | No. of Establishments[2] | | Round Timber (Cubic Ft.) | | Sawed Timber (Board Ft.) | |
|---|---|---|---|---|---|---|
| | 1923 | 1905 | 1923 | 1905 | 1923 | 1905 |
| United States | 6,384 | 5,163 | 174,389,004 | 165,535,900 | 507,359,000 | 435,944,000 |

| Colorado | 227 | 487 | 5,404,933 | 4,340,900 | 6,743,000 | 13,518,000 |
| All other states | 1,606 | 2,845 | 29,612,182 | 78,873,700 | 102,155,000 | 123,595,000 |

[1] Statistics for 1905 compiled by the Forest Service, Department of Agriculture.

[2] Reported as number of mines for 1905 and number of mining establishments for 1923. An establishment in some cases comprises a group of mines.

[3] Included in "All other States."

## Utah to Have New Coal Road In Carbon County

The Interstate Commerce Commission on Aug. 24 issued a certificate of public convenience and necessity authorizing the National Coal Railroad Co. to construct and operate eight and one-half miles of railroad in Carbon County, Utah. The line will serve the Union, Gordon Creek, Great Western and Consumers' Mutual coal companies. The road will be constructed with a stock issue, to be subscribed by the coal companies, and a bond issue of $150,000. It will connect with the Utah Railway Co.'s line, and it is understood that it will be later sold to that company at cost.

At first the program was more ambitious, but it was finally decided to construct the line mentioned only, for the present, anyway. From 7,000 to 10,000 acres of coal land will be grouped around the western end of the new line, which is at present without rail transportation facilities. It is estimated that the first section of road will in the first year handle 250,000 tons of coal, increasing to 750,000 tons by the end of the fifth year. The commission was told that the building of the road would lead to the opening of other coal mines. Present estimates are that the road will cost $437,400 to construct.

# Eureka Mine Goes on Non-Union Basis Despite Threat to Close Jones' Plants In Western Pennsylvania and Ohio

Last week the Eureka mine of the Bertha Consumers Co. started to work open shop under the 1917 wage scale. Since the announcement made recently that the Bertha-Consumers Co. of Pittsburgh, Pa., had formally broken off negotiations with the United Mine Workers in northern West Virginia, union officials and John H. Jones, president of the company, have had almost weekly conferences in Pittsburgh over the situation.

To bridge over the trouble the union agreed to put miners at work in the Eureka mine, at Maidsville, near Morgantown, for several weeks. Upon the abrogation of working conditions with the union, the miners were called out of the pits. Strikers are alleged to have attacked non-union workers since the walkout. The Rachel mines of the company, at Downs, near Mannington, has been operating non-union for several months.

One phase of the controversy that will be watched will be in connection with the union's threat to tie up the Jones plants in more firmly entrenched union districts of western Pennsylvania and Ohio. Nothing has come of it thus far. In the past the Jones concern has been an ardent believer in the miner's union and, if reports are correct, the United Mine Workers lent the firm money from the District No. 5 treasury, in the Pittsburgh district. However, union officials refuse to herald this, saying that it was strictly a personal financial transaction and not a matter of public discussion.

### Bittner Stages "Comeback"

As a "comeback" to the salutation extended to Van A. Bittner, chief international representative of the United Mine Workers in northern West Virginia, on a recent visit to Logan County, that official released for publication in Fairmont recently a letter addressed to J. P. Wright, spokesman of the Logan Chamber of Commerce. After charging that the chamber failed to give him an opportunity to reply to the statements made to him, Mr. Bittner says in part: "Your conduct in inviting representatives of our union to appear before your body and then insulting them as you did without giving anyone an opportunity to reply to your untruthful remarks, was the grossest exhibition of ignorance I have come across anywhere in the United States. However, as I say, I have no feeling against you or any other member of the Chamber of Commerce for your un-American actions because I realize that, living in an atmosphere of ignorance, suspicion and prejudice, as you do, under the domination of the king of bootleggers and thugs, you are simply a creature of environment."

After taking a series of personal slings at Mr. Wright and the commerce body, Mr. Bittner continues: "You can no more stop the organization of the miners of Logan County than you can stop the sun from shining or the rain from falling."

Former Judge Emmett M. Showalter, of Fairmont, general counsel of the Continental Coal Co. of Fairmont, which operates mines in the Scott's Run section of Monongalia County, appeared before the West Virginia Supreme Court in Charleston on Sept. 2 and asked that that tribunal act upon the writ of error granted to Bittner by one of the members of that body as soon as possible instead of waiting until the January term, because it arrived too late for the docket of the present term of court. In a mass meeting in Fairmont May 3, Bittner is alleged to have made attacks on Judge I. Grant Lazelle and his "infernal" injunctions, which were granted in Monongalia County, and personal attacks were made on Mr. Showalter, a former Fairmont banker. Bittner was fined $500 and sentenced to serve six months in the Monongalia County Jail, in Morgantown.

### Dynamite Fairmore Mine

Depredations in northern West Virginia have not halted. The pitmouth of the Fairmore mine of the Fairmont & Baltimore Coal Co., along the M. R. branch of the B. & O. R.R. at Adamstown, Harrison County, was badly damaged Sept. 1, when several sticks of dynamite are supposed to have been thrown in. The force of the explosion was so terrific that one of the rollers used in the rope haulage system was blown three blocks away and rails were broken in twain. The company began to work non-union about a week before the damage occurred. Fifteen outside men had been employed at the mine. A. Lisle White, of Clarksburg, is general manager of the mine.

While figures indicate that the union has the worst of the "go," the interest in the United Mine Workers continues. One of the largest miners' mass meetings ever held in the Fairmont region took place in a field near Monongah Aug. 30, when from 10,000 to 18,000 people were present to hear Bittner and others speak and at an ox roast held at Enterprise Sept. 1 there were 5,000 people present and three steers were slaughtered to feed the multitude.

### Miners Celebrate Labor Day

The United Mine Workers celebrated Labor Day with several large meetings. One was held at Watson and another at Pitcairn, near Clarksburg. John L. Lewis, international president, did not attend the Labor Day meeting in Fairmont, but may come for a Sunday gathering at a later date. The Knights of the Ku Klux Klan entertained the imperial wizard Labor Day and probably Mr. Lewis wanted no counter attraction. Some observers profess to see a connection between the Klan and the so-called American plan, which is opposed to employing foreigners and negroes in the mines.

### *Bryan Prepares to "Put Coal Business in Shape"*

Talk of a coal strike "is the usual show to raise the price of coal," said Charles W. Bryan, former Governor of Nebraska, in Kansas City, Aug. 30, as he rested before continuing his Chautauqua lecture tour. "I know there are fifty million cars of coal above ground now and there is no shortage. The mines are closing down because there is too much production. The operators are aided by the miners and they call the show a strike. The operators now say, 'We cannot mine coal.' After the coal is sold at a high price and the 'strike' is ended, they will say, 'We cannot supply the demand,' and raise the price."

Mr. Bryan reiterated his statement made in southern Kansas a few weeks ago that he will sell coal in Nebraska again this winter at a reduced price. "I will continue to sell coal at a low rate, as I promised the people," he said. "Excessive profits are cut out, and coal prices in Nebraska are forced low to meet my price. I started the coal business when Governor and promised when I left I would continue to help the people, just as their government should, but doesn't."

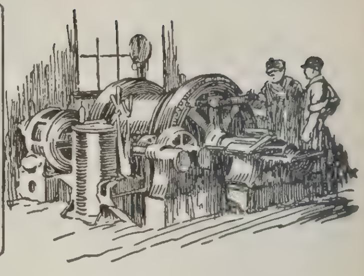
"After putting the coal business in shape," Mr. Bryan said, "Mrs. Bryan and I are going to Florida."

Local labor leaders have encountered the strictest injunction so far issued in the one handed down by Judge Warren B. Kittle of the Taylor-Barbour Circuit Court. By it union members are restrained from making any unlawful threats or suggestions of danger, are forbidden to gather in crowds, groups, single file or any other formation to intimidate employees or prospective employees of the Maryland Coal Co. of West Virginia, are prohibited from marching or staging demonstrations, useing vile, insulting language and especially the word, 'scab', and are restrained from circulating propaganda tending to intimidate employees of the plaintiff.

In the first four days of last week the non-union mines of northern West Virginia produced 5,847 cars of coal, a decrease of 581 cars from the corresponding period of the previous week. Union mines loaded 1,067 cars of coal, a decrease of 57 cars. Some of the non-union mines experienced labor trouble again last week, although it reached no alarming proportions.

Strike conditions are quiet in the Panhandle section. President Lee Hall of the Ohio miners had a conference at Wheeling on Sept. 2, with Andrew R. Watkins, international executive board member of Ohio, and a member of the international organization committee. Mr. Hall issued a statement to the effect that the union mines were working steadier in Ohio and that further improvement in working conditions was expected soon.

# Practical Pointers For Electrical And Mechanical Men



## Drying Sand by Electricity at Mines Cuts Outside Labor Cost

Heating by electricity as compared to heating by steam or heating directly from a stove or furnace is usually so much more expensive that it is entirely impractical. It is only in special cases that it pays to heat by electricity. An unusual application of electric heating is that of drying sand for mine locomotives. A number of the mines of the West Kentucky Coal Co. are equipped with dryers of this type.

Fig. 1 shows an end view of the dryer which is used at the No. 9 mine of the St. Bernard group at Earlington, Ky. Details of the inside of a similar dryer are shown in Fig. 2. The sand box, which is lined with sheet metal, has the following inside dimensions: Length, 6 ft. 6 in.; depth, 36 in.; width at top, 27 in.; width at bottom, 18 in. The resistance tubes or heating units are arranged in three horizontal rows located close to the bottom of the box. An extra-heavy galvanized screen of ⅜-in. mesh forms the bottom. The sand, when damp, will not pass through this screen by virtue of its own weight, but runs through readily when dried.

To provide for easy cleaning, the screen is mounted in a frame which is hinged at one side. When this screen becomes clogged with foreign matter, the dryer is allowed to empty. Then the screen frame is loosened at one side and dropped to a vertical position. The foreign matter falls down or is easily brushed off with a stiff broom.

The wire of the heating units is in direct contact with the sand. These units consist of grade "BB" size No. 12 B.w.g. galvanized telephone wire wrapped on 13/16-in. porcelain tubes which in turn are mounted on ⅜-in. steel rods. Each unit extends the length of the box. For single-phase, 220-volt alternating current, twenty units are used, these arranged in two parallel circuits of ten in series. At 2-ft. intervals the units are supported by large porcelain knobs mounted on cross rods.

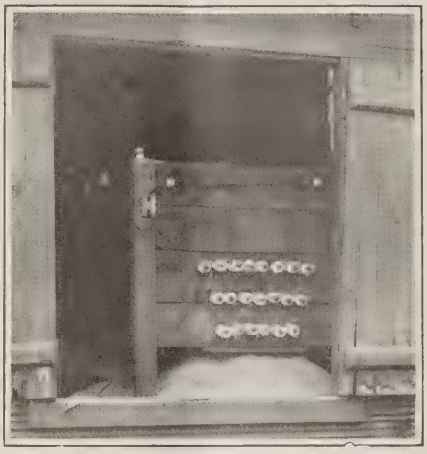


**Fig. 1—Drying Sand at No. 9 Mine**

The West Kentucky Coal Co. is using electric sand dryers at several of its mines. The power cost to operate one dryer is approximately 13c. per hour.

No data was available concerning the energy required by those sand dryers, but it was noted that standard 30-amp. fuses are used on a 220-volt single-phase supply circuit. Assuming that these fuses are carrying full load, the dryer requires 6.6 kw., which, at 2c. per kw-hr., makes the energy cost about 13c. per hour. The West Kentucky company uses the electric dryers where steam is not available. The advantages of the electric over the stove type of dryer is that much less attention is necessary, and there is a decreased fire hazard. After the electric dryer has been filled with sand it requires no more attention until the next filling. In some instances this saving in labor means the elimination of a special man.

This electric dryer was designed by N. W. Umstead, superintendent of equipment of the St. Bernard division. The several dryers in use were made in the shop at No. 9 mine at Earlington.

## Combined Level and Stadia Rod Can Be Read Easily

A new type of combined level and stadia rod or rather a new marking for such a rod intended to afford

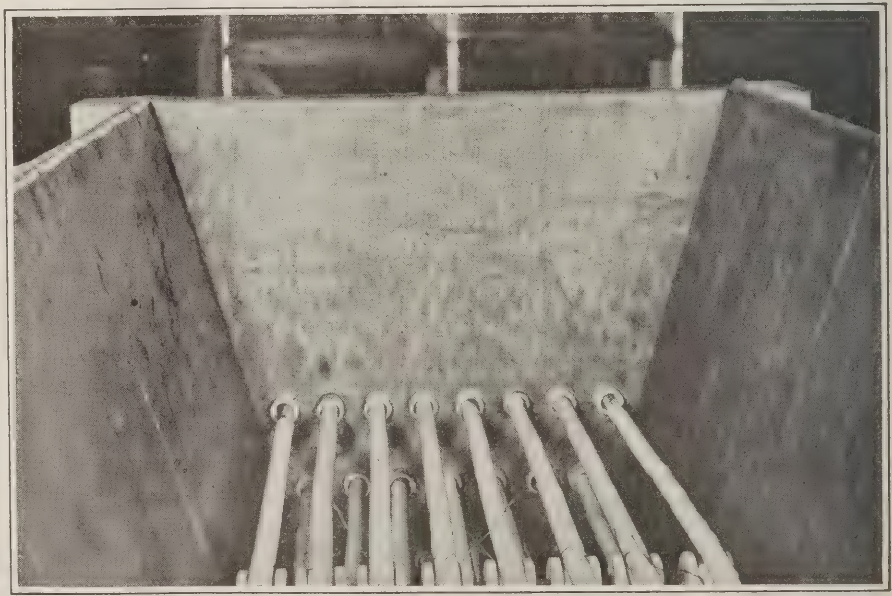

**Fig. 2—Showing the Inside Construction**

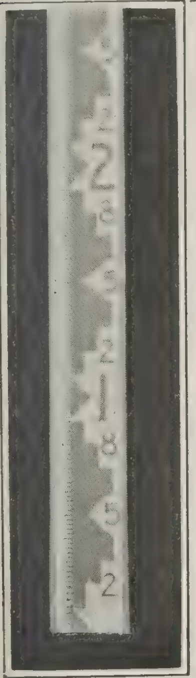
Sheet metal is used as a lining for the box. Note the tube cross-supports at the bottom of the illustration. The sand comes in direct contact with the resistance wire of the twenty heating units. The wire is wound on porcelain tubes which are mounted on ⅜-in. x 7-ft. steel rods.

great ease in reading has been devised by Otis Bledsoe, chief engineer of the Sunlight Coal Co., of Boonville, Ind. A portion of a rod bearing this new marking is shown in the accompanying illustration. Patent on this marking has been applied for by Mr. Bledsoe.

As may be seen, the marking of this rod is unusually large and legible. In actual practice this rod has been read with an ordinary transit at a distance of approximately 1,100 ft., this reading being accurate to "half a tenth." Naturally the 1/100 ft. markings were so small as to be indistinct and confusing at this extreme distance.



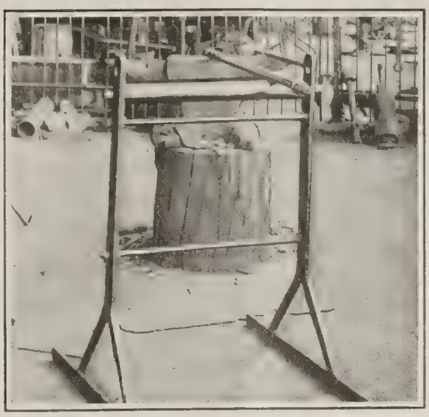
**Easily Legible Markings**

In this system of marking a black point facing the right indicates a foot; a white point facing the left indicates a half foot. The balance of the markings on this rod are so simple as to require little or no explanation. Their nature and clearness are such that they can be read at far greater distance than can any ordinary rod.

## Convenient "Old Woman" Is Effective Helper

Much of the work performed in both the mine blacksmith and machine shop, can be facilitated by the use of a suitable "old woman" to hold up the end of the work opposite that upon which actual operations are being performed. The accompanying illustration shows a device of this kind employed in the No. 4 shop of the Kingston Coal Co., Kingston, Pa. This was built up by the blacksmith and excellently answers the purpose for which it was designed.

It consists essentially of two standards fastened together by distance bolts or rods with a gudgeoned roller extending between them. This roller is made adjustable in height, its upper edge in the picture shown being at approximately the same elevation above the floor as the face of the anvil. Removal of two of the outer nuts on the distance rods will release one of the standards so that the elevation of the roller may be changed.



**This "Old Woman" Never Scolds**

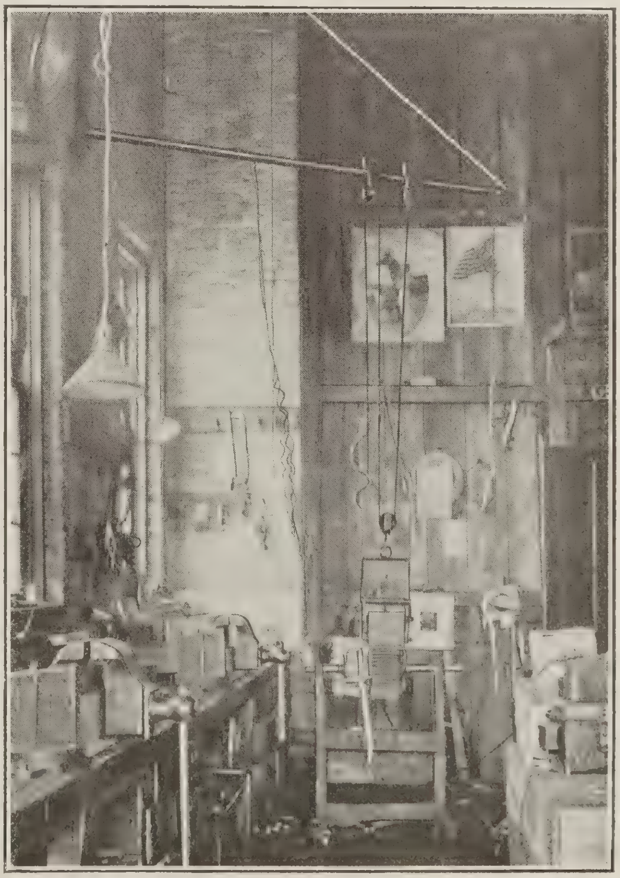
In many operations a suitable support for the dead end of the work is as convenient and effective as a helper. This stand or "old woman" is simply and easily constructed and may be adjusted readily as to height. Those who have built and used it consider it almost indispensable to their daily work.

The standard pieces are split for a certain distance from their lower ends and the two halves spread apart and fastened to horizontal foot pieces, which may be either straps or angles. In this case they are straps. The roller on this "old woman" is about 2¼ in. in diameter and made from a solid rod of metal, the two ends being turned down to form the gudgeons. It would be practical, however, to make this roller of a piece of pipe of suitable size with the ends plugged and the gudgeons driven into or attached to the plugs.

A device of this kind, as may be seen, is extremely simple to construct, yet it readily facilitates many of the operations that must be daily performed in the blacksmith shop of the mine.

## Swinging Jib Frame Aids in Motor Repairs

In the electric repair shop of the Consolidation Coal Co. at Frostburg, Md., the poles for testing armature windings are supported from a swinging jib frame of iron pipes. The apparatus is suspended from a wheel carriage which can be moved to any point on the horizontal member of the jib. By means of a simple pulley arrangement and a counterbalance the apparatus can be adjusted to the height of the armature to be tested. The carriage wheels and pulleys are old trolley wheels. The merit of this scheme is that the apparatus can be moved to any point within the radius of the swinging jib and can be raised or lowered without much effort on the part of the repairman; also it can be swung out of the way when there is no work requiring its use.



*This swinging jib frame supports poles for testing armature windings. The apparatus swung from the pipes is suspended by a wheel carriage and counter weights. The jib can be adjusted to the height of the armature to be tested, thus facilitating repairs.*

# Book Reviews

## Triumphs in Engineering

In interesting fashion with valuably reminiscent illustrations and charts of progress, Conrad Newton Lauer, general manager of Day & Zimmerman, engineers, has summed up 120 years of progress in industry in which story there is a little enough about coal or, indeed, other mining.

This publication entitled "Engineering in American Industry" is a republication of an address delivered on Dec. 12, 1923, before Princeton University under the Cyrus Fogg Brackett Lectureship in Applied Engineering Technology. It contains some 96 pp. measuring 9½x12 in., is printed on a fine grade of paper of *de luxe* character and bound in buckram.

It records what engineering has done to bring prosperity and comfort to the United States and does it in a way that makes it easy for reference. Among other charts are some showing the geographical distribution of industry in the United States by decades from 1849 to 1899 and thereafter by five-year periods, with dates of the principal developments, also maps showing centers of manufacture and of farm production. The book is published by the McGraw-Hill Book Co., 370 Seventh Ave., New York City, the price being $2.50. It has 61 charts and many illustrations.

## Facts Found by the Coal Commission

The average citizen, if he recalls at all the brief existence of the late and unlamented United States Coal Commission, remembers it as the body that spent $600,000 of the government's money without reducing his fuel bill. Not a few men who should know better give the currency of repetition to this flippancy. Disappointed because the Commission did not usher in a trade millenium which would guarantee fat profits and eliminate all worry as to the future, they ignore the cold truth of John Hays Hammond's declaration that "there is no easy panacea for this troubled industry." And many others who have been most glib in quoting the Commission as the authority for this statement and that speak, it is suspected, more from hearsay than from any intimate acquaintance with the reports of the federal fact-finding agency appointed by President Harding.

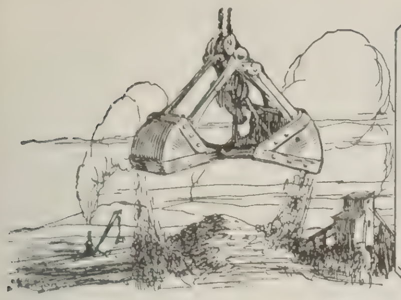
Possibly some of the blame for this state of mind should attach to the Commission, although circumstance was the major offender. The limited circulation necessarily given the mimeographed copies of the reports of the Commission cut down its audience. The highly technical, and sometimes confusing and heavy, character of the reports themselves frightened away many readers. Working against a far too early deadline, the federal fact-finding agency poured out a stream of inchoate facts which the public was in no condition to properly digest. What the Commission has needed has been a Boswell who would make its labors palatable to popular taste and time.

Such an attempt has been made in a volume just published (*What the Coal Commission Found*; The Williams & Wilkins Co., Baltimore, Md.; 416 pp. $5). Considering that it is the work of sixteen former members of the Commission staff, the fact that unevenness in style and in context is not more in evidence pays high tribute to Edward E. Hunt, F. G. Tryon and Joseph H. Willits, who acted both as editors and contributors. If some of the conclusions seem unacceptable, the answer is that whatever vice resides in those recommendations comes from the work of the Commission itself. That cannot be too strongly emphasized if the reader is to have a clear conception of the scope of the volume. The main purpose of the work is not the enunciation of any new theories, but to make available to the general reader those facts and conclusions which received the seal of the Commission's approval. Whatever quarrel there be must be with the Hammond commission, not with the scribes who wrote this book.

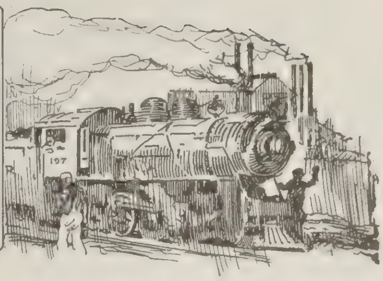
There is, naturally, practically no effort made to evaluate anew the work of the federal fact-finding agency. The direction is all in condensation, selection and digestion of the data put out by the Commission. In some respects, the results achieved represent a notable improvement over the original reports. This is particularly true of Anne Bezanson's studies of wage earnings, which discards many of the confusing and misleading tables incorporated in the Commission's report. The analysis of wage rate structures undertaken by W. E. Fisher will well repay reading in full: his summarizations in the volume under review form an intriguing and informative introduction to that work. Possibly the least readable portions of the book are the costs studies of David E. Wing; the mass of figures dealt with and the necessity for condensation were twin barriers over which the author stumbled on his way to claim the reader's attention.

The *Coal Age* family is so familiar with the reports on underground management, that a passing reference to Sanford Thompson's abstract of his work on that subject is all that is necessary. So, too, with the studies on wastes and better coordination between mining and transportation initiated by C. E. Lesher. More restraint is shown by J. W. Adams as he again wallows gleefully in the iniquities of the jobbers, and he confesses that "the total tonnage affected" by the activities he condemns was small and the practices assailed typical of the "coal bootlegger" rather than the legitimate jobber. There is real meat—not always tasty—in the sections of living conditions and the cost of living in the mining communities written by Bertha M. Neinburg and Marie L. Obenauer. Other features of the Commission's work are covered by H. Foster Bain, James E. Black, Horace B. Drury and Raymond A. Walter. The task of orienting the reader into the spirit of the book falls to Mr. Tryon and Sydney A. Hale.

The format is one of which the publisher may well be proud, and there are few typographical errors. It is all the more regrettable, therefore, that many of the charts in the book are crowded into such small space they are difficult to decipher. This is particularly unfortunate in a work intended for the lay reader who must receive his instruction with the irreducible minimum of personal exertion and inconvenience.



# Production And the Market



## Hard-Coal Strike Finds Country Well Prepared; Bituminous Market Stronger

Though the hard-coal "suspension" is in its second week both sides give every indication of maintaining their present positions indefinitely. Speculation now inclines more to the belief that there will be a protracted period of idleness than was the case at first. In order that an acute shortage may be deferred as long as possible, however, some companies—notably the D. L. & W.—have adopted regulations calculated to spread out the available supply as evenly as practicable, preference being given where necessary to the maintenance of health and comfort.

That the producers did a good job up to the last minute is indicated by an output during the week preceding the strike that exceeded that of the previous week, which was the largest since December, 1922. All in all, the country is unusually well prepared for a strike, as stocks in the hands of consumers are of goodly size and retailers' supplies are heavy.

Prices, too, are keeping within reasonable bounds, considering conditions. Company quotations are but little changed, 10c. having been added in a few instances to the quotations on egg, stove and chestnut, and 50c. on pea. Though independent schedules are considerably higher, some of these producers are out of the market, having been booked for their entire output in advance of the suspension.

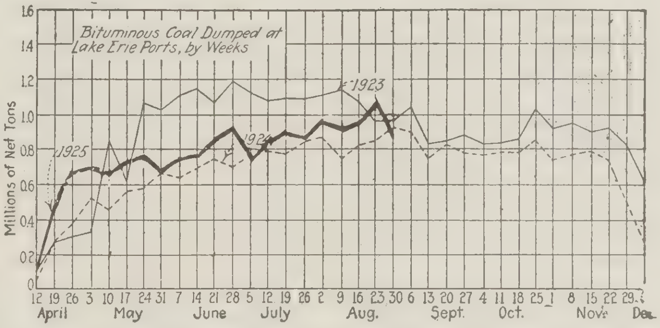
### Soft-Coal Market Maintains Strength

Despite an output exceeding consumption by more than 2,000,000 tons, the bituminous coal market continues to display marked strength. Steady accumulation of reserves by consumers, stimulated by the hard-coal suspension, has absorbed the tonnage unusually well, but how long this will continue will depend to a large extent on the duration of the halt in anthracite production.

Smokeless is easily the market feature, aided by the fear in some quarters that the rate cut by rail to New England on prepared sizes will divert considerable tonnage from other accustomed channels. Practically all grades are strong, however, and prices notably firm.

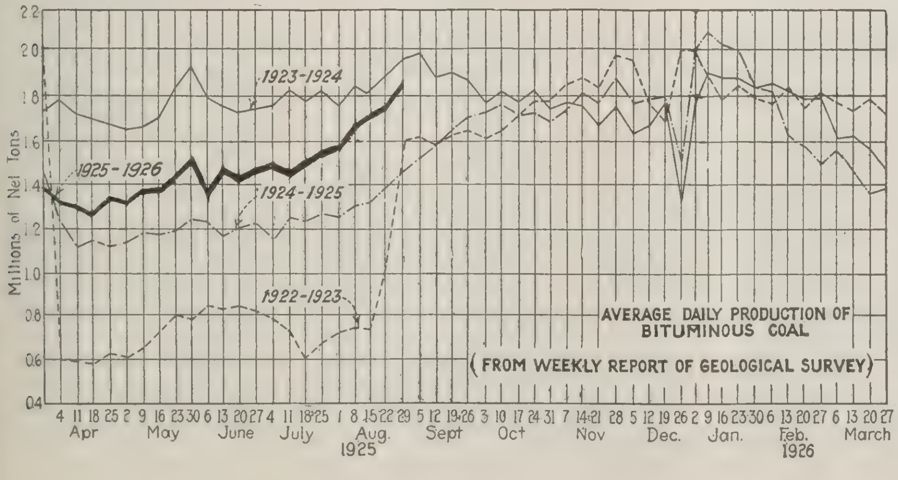
### Output Still Climbing

Output of bituminous coal in the week ended Aug. 29 is estimated by the Geological Survey at 1,218,000 net tons, compared with 10,523,000 tons in the preceding week, as shown by revised figures. Anthracite output in the week ended Aug. 29 totaled 2,319,000 net tons, as against 2,209,000 tons produced in the previous week.



*Coal Age* Index of spot prices of bituminous coal made a further advance last week, standing on Sept. 5 5 at 183, the corresponding price being $2.22.

Hampton Roads dumpings of coal at all piers during the week ended Sept. 3 totaled 421,390 net tons, compared with 411,814 tons in the previous week.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |
|---|---|---|
| BITUMINOUS | | |
| Aug. 15 (*a*) | 8,167,000 | 10,261,000 |
| Aug. 22 (*a*) | 8,582,000 | 10,523,000 |
| Aug. 29 (*b*) | 9,006,000 | 11,218,000 |
| Daily average | 1,501,000 | 1,870,000 |
| Cal. yr. to date | (*c*) 300,370,000 | 317,509,000 |
| Daily av. to dte | 1,473,000 | 1,555,000 |
| ANTHRACITE | | |
| Aug. 15 | 1,386,000 | 1,904,000 |
| Aug. 22 | 1,711,000 | 2,209,000 |
| Aug. 29 | 1,837,000 | 2,319,000 |
| Cal. yr. to date | (*c*) 60,307,000 | 62,417,000 |
| COKE | | |
| Aug. 22 (*a*) | 108,000 | 144,000 |
| Aug. 29 (*b*) | 110,000 | 165,000 |
| Cal. yr. to date | (*c*) 6,904,000 | 6,409,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minues two days' production to equalize number of days in the two years.

### Midwest Trade Is Brisk

In the Midwest market the demand for Illinois, Indiana and west Kentucky coals in the past week has been exceptionally good for this time of the year. There has been a general tendency again toward higher prices, especially on the best grades of west Kentucky coal.

Though the operators had quite a few cars of unbilled coal at the mines two weeks ago, this has been disposed of and they are now working on orders, which are coming in plentifully every day. Demand for prepared coal continues good, but operators have difficulty in disposing of fine coal, as large buyers are playing for prices to go lower. Fine coal is still at a low figure in the Illinois field, central Illinois bringing $1.30, and Franklin County screenings as low as $1.40. The prices on Indiana screenings have improved somewhat, Fourth Vein Indiana bringing $1.60@$1.70 and Fifth Vein Indiana $1.25@$1.40.

The market on Eastern coal continues to be very good. Prices have taken another jump of 25c. to 50c. on high grade eastern Kentucky and West Virginia coal and many jobbers have difficulty in covering orders taken on a speculative basis. The big-line yards in Iowa, who control about 70 to 80 per cent of all the retail coal yards in that state, are expected to place orders for five hundred to a thousand cars of eastern Kentucky coal for September and October shipment. Even the cheaper grades of West Virginia coal are bringing a premium, and at that it is difficult to obtain a large tonnage of this coal.

The situation in Pocahontas and New River is serious on account of the anthracite strike. Unheard of prices have already been quoted, the highest so far being $5 per ton, and dealers are willing to pay even that price. Large consumers are holding back, taking only what they have placed for shipment in the early part of August.

In the Carterville as well as the Harrisburg field domestic business has started in with a rush and all mines are oversold on lump and a few on egg. Nut is not moving well and the small sizes as well as screenings are in the way. This is the condition at the shaft mines. At the strip mines all sizes are moving fairly well with the exception of steam, and the prices of these sizes are so low that they move anyway, but in a general way the demand for steam is unusually good everything considered. Railroad tonnage is fair and car supply is good, with working time from four to five and six days a week. Mines that have been idle for many months are resuming and miners are slowly going back.

In the Duquoin field conditions are much better. Four and five days a week working time prevailed last week although steam and the smaller sizes are hard to move. Domestic is sold up for a couple of weeks ahead on lump with egg and nut about even. Prices are in line with the independent prices of Williamson County while strip prices

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Sept. 7 | Aug. 31 | Aug. 24 | Sept. 8 |
| Index | 183 | 174 | 172 | 166 |
| Weighted average price | $2.21 | $2.10 | $2.08 | $2.01 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

range anywhere from independent prices down for as much as a dollar.

In the Mt. Olive field there has been no increase in price and domestic is in good demand for lump and egg and steam is about equal to the demand. Railroad tonnage is fair. In the Standard field there has been an increase in movement but prices are low and just about cost of production is realized. A few mines are starting up over the field and working time is from three to five days a week.

Movement of domestic coal at St. Louis continues good and a drift is beginning from high grade to middle grade on account of the high prices. Duquoin and Mt. Olive coals are rapidly coming into favor. Standard is still slow excepting on apartment and similar contracts. The poorer elements have made no effort to place their coal orders and this will cause a fairly good demand when cold weather comes for cheaper coal. Anthracite is slow. The strike has caused no uneasiness here. The storage supply is ample to take care of requirements for the winter. Smokeless is not in demand and coke is moving slowly.

### Improvement Steady in Kentucky

Steady improvement in production is reported in Kentucky with more mines in operation and on better operating schedules. The eastern Kentucky fields are quite busy and western Kentucky is gradually increasing, with a few mines showing full time operations. A large number are running half to three quarters time, the average for the field on latest reports showing 47 per cent of potential time.

About the only price changes reported over the week were in eastern Kentucky, where it is said the cheapest of block coal is bringing $2.75, while some of the specialty coal producers are asking as high as $3.50, but $3.25 appears to be the sales top. Eastern Kentucky screenings also are higher, so-called "cat and dog stuff" going as low as $1.10, but good screenings are reported to be selling at $1.25@$1.40. Western Kentucky showed no change, still having plenty of room for more business.

Demand is strong for all grades, prepared moving well to retailers, while industrial concerns are taking some prepared, some mine-run, and keeping the market well cleaned up on screenings, especially screenings from gas coal. The Kentucky trade is feeling better over the general situation than at any previous time in many months, as conditions are pointing to good volume and good values.

### Northwest Business Improves Slowly

A spurt in anthracite was the outstanding feature at Duluth last week, but other coals, apart from Pocahontas, have not picked up to any extent. In spite of the wide spread between anthracite and bituminous prices, retailers report sales of hard coal so far this season larger than up to the same time last year. If the strike ends before the close of navigation it is thought that this market can easily absorb around 1,100,000 tons of anthracite during the present coal year.

Apprehension is felt lest there be insufficient supplies of Pocahontas in this market this season, due to the hard-coal strike and lower freight rates. The almost universal call for prepared sizes is embarrassing dealers and it is likely that domestic consumers will find it necessary to accept more mine-run. There has been difficulty in disposing of smokeless screenings, but demand is being created for them to mix with other screenings to heat public and commercial buildings owing to the campaign being inaugurated against the smoke nuisance.

While industrial demand for bituminous coal is still light, some improvement is being shown and orders are expected to reach a good aggregate this month. More utilities and municipal boards in northern Minnesota are expected to put out specifications in the near future for large tonnages of steam coal. Demand for steam coal from iron mining companies on the Minnesota ranges is limited and no substantial new bookings from the independent iron mining companies are looked for this fall.

With an advance of 10c. on Sept. 1, anthracite quotations are back to a winter basis. Prices now are: Egg, $13.10; stove, $13.50; nut, $13.35; pea, $10.50, and buckwheat, $6.50. Domestic coke is unchanged at $8.50 and briquets are $9.

Milwaukee coal dock managers report a heavy demand for all kinds and sizes of coal, with an increase of interest in anthracite, which local retailers advanced 10c. a ton Sept. 1. On the 10th 60c. is to be added to the price of coke, which was advanced 50c. a ton Aug. 1. There also was a sharp advance in Pocahontas last week. The inflow of coal by cargo continues steady.

### Southwest Busier but Cautious

As demand in the Southwest continues to improve with the approach of winter the price of Kansas lump is becoming firmer at $4.50, though some operators still quote it at $4.25. Mines in Kansas are working virtually full time and others are being opened. Kansas is the only state of the Southwest where stable conditions prevail, and even there operators show a tendency to limit production rather than gamble on the future by opening up in excess of present demand. In Arkansas conditions are unchanged from the last few weeks. A few mines are working under the 1917 scale, others under that of 1924, and others are closed pending the stabilization of wages at a reduced figure. In Oklahoma, union opposition to operation under the 1917 scale grows steadily more pronounced, exerting a psychological depression on the market that denies the open shop mines an opportunity to demonstrate how effectively they might be able to supply a normal demand.

Demand for domestic coal, both lump and nut, as well as slack, continues to increase in Colorado, and mines are speeding up production. Inquiries continue to come from territory heretofore unapproachable. Mines are operating without any labor difficulties.

Effective Sept. 1 the price of Walsenburg lump is $5.50; washed nut, $4.50; washed pea, $3; Trinidad coking coal over 6-in. screen, $4.25; over 3-in. screen $4; nut, $3.75; pea, $3; Trinidad Segundo coke, $7.50; Crested Butte high grade anthracite No. 1 and 2, (furnace size), $7.25; Nos. 3 and 5 (base burner size), $7.75.

The coal business in Utah is getting better. Dealers are placing larger orders, most of which are for immediate delivery rather than storage. Business, however, is not even now what it ought to be, and if the present car shortage develops to serious proportions many will go without coal this fall and early winter.

The industrial market for coal continues steady, though business is none too heavy. The mines and smelters, cement plants and railroads are among the largest consumers. The sugar companies are buying a little coal, but supplies held over from last year, on account of a short run, will prevent their taking as much coal this fall as they would otherwise have taken. The slack market is described as "fairly easy." A few weeks ago it was difficult to supply the demand on account of the shorter working time. Prices remain unchanged. There is practically no discussion now regarding prices. The labor situation is excellent.

### Bookings Lively at Cincinnati

With several northern Ohio cities practically down to bed rock on smokeless supplies the bidding for "car numbers" at Cincinnati sent the market to about $5 for lump, with egg in close pursuit. Indiana and northern Illinois dealers accustomed to low volatile tonnage at this time of year added their business and an uncommonly large tonnage was booked in the first few days of the month. Some of the wholesale houses and direct selling agencies, especially those of the New River field, soon were taking business at the market for what available coal they would have for the rest of the month. Stove and nut moved up to $3@$3.50, and while mine-run was stationary and strong at $2.50 it was an open secret that another step up could be expected there. Screenings were solid at $2, mostly because the heavy contracting to byproduct plants had left little free coal in the large make of domestic sizings.

Locally little credit is given to the anthracite troubles for the general advance in prices, dalliance of buyers who could have had coal weeks ago being stressed as the real reason.

The upward move in high volatiles has not been so pronounced. Harlans and Elkhorns lead the Kentucky list, with the best block at $2.75@$3.25. Egg trails a little while the best gas mine-run is strong around $1.75. Low grade steam mine-run may be had around $1.35—the biggest spread, top and bottom, in this make for nearly a year. Due to the action of certain of the Logan County (W. Va.) producers the spread on 4-in. lump is not so great with $2.50 as the low and $2.75@$3 the top. The rest of the list is about the same as the Kentucky offerings.

Local retailers are now attempting to follow the smokeless market with a quotation of $9 for smokeless lump, "good for one week only." On mine-run, where supplies are assured, the price is $6.50 and some asking 25c. more for hilltop delivery. No great change has been made in bituminous pricings with $6@$6.50 for lump and $4@$4.50 for slack.

With the anthracite strike a reality, demand for all kinds of domestic coal has increased at Columbus. Smokeless grades have been practically withdrawn from the market. Other grades of West Virginia coals, including the semi-smokeless varieties, also have strengthened to a large extent. Retail prices have advanced to a certain extent, especially in smokeless grades, which are selling at $8.50@$9.25 delivered. Splints are $7.25@$8 and Hocking and other Ohio mined grades are firm at $6.50@$6.75.

There is no corresponding demand for steam grades in the Ohio market, however. Some quiet buying is reported, but prices have not advanced to any extent. Large users, including utilities and large manufacturers, have placed some contracts recently. Practically all school coal has been delivered, but municipalities and public institutions will soon place orders. Railroad business is pretty well taken care of.

Some Ohio mines which have been idle for a year or two and even longer have been prepared for starting and quite a few are in operation. Production figures have increased to about 35 or 40 per cent of capacity in the southern Ohio field.

The eastern Ohio market, in both anthracite and bituminous, has been stimulated by the anthracite strike, causing consumers of both steam and domestic to enter the markets.

Prices, therefore, are holding firm at the higher levels, to say nothing of the further sharp advances in smokeless bituminous and anthracite for domestic use. Pocahontas is quoted at $5 per ton for lump, f.o.b. mines, while anthracite is $13.50@$14.

This situation in domestic has been reflected in steam market activity although prices have not been affected to the same extent. Most industrial concerns have or are now buying not only for current needs but also building up a small reserve.

All eastern Ohio mines which are operating are reported to be receiving orders almost to capacity, but as yet no additional mines have been reopened to take care of additional demand.

### Pittsburgh Trade More Cheerful

The turnover in Pittsburgh district coal continued to increase last week at a moderate rate and sellers are more cheerful. Domestic coal movement is now moderately heavy and prices have been hardening somewhat. The steam slack market must have more absorbing power, for the increased production due to shipment of domestic lump has not lowered prices, which are still quotable at $1.30@$1.35. Production in the Pittsburgh district as a whole probably is above 25 per cent now, is against 20 per cent or less in July.

The strike is on, but has not affected the Buffalo coal trade much. The bituminous trade is just the same. A few shippers are trying to get a better price with a trifle of success, but as a rule the old bottom prices hold very much as they did. All the mines are asking more. As a rule they are not getting it in this market. Still everybody is hopeful. Prices are unchanged.

### New England Market Stiffens Further

The steam coal market in New England is responding to the pressure exerted by volume shipments west from the West Virginia smokeless districts. A shortage of anthracite is relied upon to provide a ready market for Pocahontas and New River lump, egg and nut in territory north and west of the Ohio River and every effort is being made to crowd these coals in that direction. Mine-run also is being shipped west in quantities at $2.60@$2.75 per net ton at the mines, a price level that would mean $5.43@$5.60 per gross ton f.o.b. vessel at Hampton Roads. Receipts at the tidewater terminals are relatively light in consequence, and to help out in loading boats spot coal is in strong request. Coastwise coal has already brought $5.25, and unless the Western market cracks wide open under the strain of heavy consignments it is likely the Hampton Roads price will continue on its upward trend.

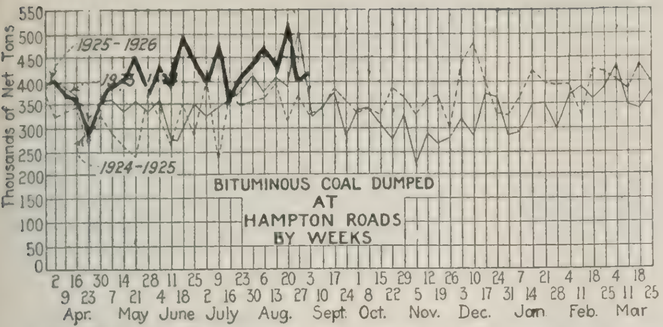
Prices on cars Boston and Providence also are mounting from day to day; $6@$6.25 as a market level has given way to $6.25@$6.50, and there is more buying in evidence than a week ago. The larger storage piles begin to show inroads, and factors who were pressing coal on their trade are now conservative in deliveries and are showing some anxiety over diminished receipts from Norfolk and Newport News. As yet there cannot be said to be anything approaching a broad market in this territory, but buyers are showing keener interest, and if the further course of prices is at all convincing there should be a really active market.

Quotations on coals from central Pennsylvania also are advancing. This is particularly true of the harder textured coals that are suitable for sizing and will carry well in shipment as substitutes for anthracite. Steam coals as such also are beginning to react.

### Strength Appears in New York Market

Considerable strength developed in the bituminous coal market at New York in the latter half of last week. Low volatile coals advanced an average of about 25c. for some grades and there was a heavier demand for low volatile domestic coals. There was no increase in demand noted for high volatile coals, however. Operators complain of the labor shortage at the mines due to the hunting season and the shift of many miners to other fields of industry.

Heavier demand has resulted in many operators being sold up for the better grades of coal for some weeks, and buyers are now willing to consider the cheaper grades in making purchases. So far there have been but few inquiries for screened bituminous coals from hard coal users but coke is gaining strength rapidly.



There was an added demand for coal at Philadelphia last week, but it is believed that after the first effects of the anthracite suspension wear off there will be a slight moderation in the soft coal market, as the usual consumers of anthracite steam grades are well stocked and continue to get good supplies from the storage yards. With so much strike talk in the air, however, the usual buyers of soft coal have been ordering more.

All prices are given now subject to acceptance on a given date. Contract customers are coming in for their share of fuel better than for some weeks.

There is considerable activity in gas grades, especially screened coal, although the largest users of this size are slow to accept coal at any increase in price. The railroads seem more interested in mine-run and are laying by more than usual and at a higher price.

Influenced by a seasonal demand for coal and the call resulting from a desire to protect industries against any sudden rise in the market due to strike complications, the price of all classes of bituminous coals advanced steadily in Baltimore last week. The increases were 20c. to 25c. Despite increased inquiry and closings on contracts, there is plenty of fuel to meet all needs, and some further change in the relationship of supply and demand probably will be necessary before there is a really sharp rise in the market. A gradual increase in price, however, is predicted. Exports of coal from Baltimore during August were larger than the foreign shipments from local terminals during any month since July, 1924.

At Birmingham consumers are now buying steam coal fairly well, the demand for high-grade washed and mine-run showing the greatest strength, with supply and requirements under present operating conditions about equal. Well prepared product from the Cahaba, Black Creek and Corona seams is fairly well sold ahead and such mines are operating on greatly improved schedules over a few weeks ago. There is also some improvement in demand for medium and lower quality commercial coal.

Domestic trade is picking up some. Car lots are being bought in greater number for shipment to individual consumers and community centers, while dealers who have not stocked any coal of consequence are beginning to make inquiry and place some business.

Quotable prices on steam coal are in line with figures last given. Domestic sizes advanced Sept. 1, Big Seam lump ranging $2@$2.50; Carbon Hill, $3.25; Cahaba, $4.25@$5; Black Creek, $4.50; Corona, $3.50; Montevallo-Straven, $5.25; Montevallo, $5.50 f.o.b. mines. Egg and nut sizes are about 25c. and 75c. respectively under lump schedules. Production is on a basis of 385,000 net tons per week.

Foundry coke is active at $4.50@$5 ovens, with egg and nut sizes moving at $3.75@$4 and $3.25 respectively, demand being sufficient to move present output readily.

## All Sizes of Hard Coal in Demand

Anthracite of any size is in good demand at New York. As soon as the suspension became a reality buyers appeared from every direction and most of the the coal lying about the harbor was quickly picked up.

Company coals are being carefully pro-rated among regular buyers and the independent producers are swamped with orders. The old line companies are drawing heavily on their storage places for chestnut and pea coals while some of the independents are sold out.

Stove and egg are on everybody's order and there is a heavy demand for chestnut and pea. Although independent domestic coals were quoted as high as $14 for inland buyers they were not willing to pay the price, and it was said not many sales were recorded at that figure. The same coals at tidewater were quoted at about $1 or more lower. Stock chestnut coal was quoted around $11.

The steam coals are stronger and in good demand.

Philadelphia consumers have finally awakened to the necessity of buying coal and when news of the suspension was broadcast they came with a rush, and many yards are now sold up on as much tonnage as they expect to get. The supply of stove was quickly exhausted, and buyers are taking nut instead. Pea is not in much demand, but it is bound to come into its own when the other sizes run down.

One company shipper has added 10c. a ton to prepared sizes for September and 50c. for pea, stating the latter expense is for the cost of storage. Inasmuch as the dealers have absorbed the monthly raises since spring, the general tendency now is to increase retail prices. Present retail quotations are: Egg, $15; stove, $15.50; nut, $15, and pea, $10.75.

Steam sizes in the storage yards are being picked up quite briskly and shipments to manufacturing plants are quite heavy. It will take close to six weeks or two months, however, before there will be anything like a shortage of steam coal.

The anthracite strike was accepted by Baltimore hard coal consumers in the most complacent manner. Nobody is excited and orders to the retailers are not especially heavy for this season. Some delayed shipments are still coming in, although these are diminishing. Stocks on hand probably will take care of the situation here into early October.

At Buffalo the only change since the strike began, so far as the hard-coal trade is concerned, is that coke dealers are putting up the price and anthracite retailers are practically out of coal. There is the usual cry among the local papers that the hard-coal companies are boosting prices, but the fact is that only the regular 10c. advance is generally made. One company did advance pea 50c., but it claims that it was that much below the others and is now just on a par with them.

Independent anthracite prices vary, but one concern is sending out quotations at $12 for stove, $11.50 for chestnut and $11 for egg at the mines, which is a premium of about $3.50 over schedule prices.

Lake shipments last week totaled only 32,600 tons, including 17,300 tons for Duluth and Superior, 7,800 tons for Milwaukee and 7,500 tons for Green Bay.

## Connellsville Coke Market Sees Possibilities

Almost all activity in Connellsville furnace coke in the past few weeks has been by Eastern buying, related more or less to the anthracite suspension. This has advanced the market from the July level 50c. to 75c. Spot furnace coke is quotable at $3.35@$3.65, the same as a week ago, with somewhat less Eastern buying in the past few days. Some observers are of opinion that the advance has come about a month too soon, there being as yet not enough tension to induce Eastern buyers to take hold freely. On the other hand, the fact that the production of 2,000,000 tons a week of anthracite has been stopped, while the output of coke by the merchant ovens of the Connellsville region has increased by only about 7,000 tons a week, and could hardly increase by as much as 50,000 tons altogether, in view of labor conditions, suggests that only a little buying of coke as an anthracite substitute would naturally have quite an effect on the market.

A blast furnace is understood to have bought a supply of coke for the month of September. Furnaces in general seem to be covered pretty well for fourth quarter and pig iron conditions do not suggest that any idle furnaces will have to go in.

Spot foundry coke has been gradually stiffening, and is now quotable 25c. higher, at $4@$4.50. The $3.75@$4.25 quotation had prevailed since early in May.

# Foreign Market And Export News

## Business Scarce in British Market Despite Lower Prices

The steam coal trade in Wales still remains in a very unsatisfactory state, and the immediate outlook is far from encouraging. As mentioned in a previous report, a large number of buyers at home and abroad laid in stocks in anticipation of a national stoppage, and these stocks are still lasting. In addition to this other foreign buyers sent their orders to America and Germany instead of to Wales.

Apart from the anthracite industry. where work is entirely suspended as a result of the strike, many steam coal pits are forced to suspend operations from time to time owing to their failure to get trucks cleared. Another difficulty from the point of view of the collieries which have all along remained open is the fact that pits which had previously been closed have now reopened as a result of the government subsidy.

The inquiries in Wales are very largely of a market-testing character. The operators have yielded gradually under buyers' pressure to reduce prices, and in the case of small coals the figure has reached an absurdly low level.

The Newcastle market is no better, and inquiries for export are almost negligible. Prices have reached their very lowest limit, even taking into account the government subsidy, but orders are still going to Germany. The North of England collieries are literally operating from hand to mouth.

Output of British collieries during the week ended Aug. 22 totaled 4,425,000 tons, according to a special cable to *Coal Age*. This compares with 4,370,000 tons produced the week before.

### Market Active and Strong At Hampton Roads

The market at Hampton Roads last week was "jumpy" with prices about $1 above the previous week as result of the anthracite strike. There was plenty of bituminous coal, however, although a good many mines in the southern West Virginia fields had not begun operating on full time as yet, pending an expected increase in demand.

Domestic coal jumped $1 a ton at retail for both anthracite and bituminous, although consumption of the former is not great in this territory, and the price jump is not expected to be much greater. A great many consumers of anthracite were laying in supplies of soft coal. The tone of the market was exceedingly strong and shippers took orders without effort.

### Industrial and House Coals Gain Slightly in French Market

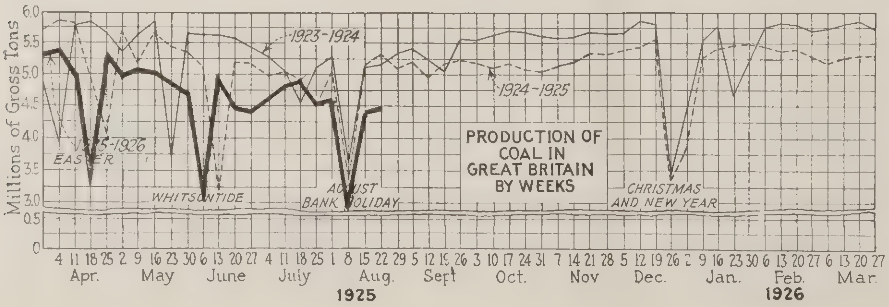
The activity which prevailed about a month ago has almost completely disappeared and the market is rather somnolent in comparison. Demand in the Nord and Pas-de-Calais, however, is being maintained and orders are fairly satisfactory. Nevertheless it is not likely that stocks are being added to at present; in fact they probably are decreasing slightly.

In household grades screened bituminous coals were perhaps a little less neglected last week than during the previous week, owing to more orders from Belgian customers. No change is discernible in the favorable situation of the market for sized coals.

Most industries show no change in their consumption and, consequently, their purchases of coal, but a few are slightly increasing them.

Empty cars are now coming in in sufficient numbers. River craft, on the contrary, are scarce and barges for coal were obtained with difficulty at 24 fr. for shipment from Béthune to Paris, the latter rate showing a rising tendency.

Following the 5 per cent wage increase granted the Sarre coal miners, the miners of the neighboring Lorraine collieries have asked for a similar advance. In a meeting with the miners' delegates held at Metz, Aug. 11, the owners declared that competition from the French northern collieries and from German imported coals would not permit them to grant any increase in wages, but that they would, however, carefully study what could be done to improve the situation and thus be able to give some satisfaction to the miners' claim.



French fuel imports in July included 1,365,575 tons of coal, 353,752 tons of coke and 89,008 tons of patent fuel, totals for the seven months ending with July being 10,089,383 tons of coal, 2,979,811 tons of coke and 681,659 tons of patent fuel. Exports in July were 300,249 tons of coal, 39,000 tons of coke and 14,103 tons of patent fuel, the seven months, total being 2,592,846 tons of coal, 215,960 tons of coke and 76,990 tons of patent fuel.

# News Items From Field and Trade

## ALABAMA

An explosion of a pocket of gas in the Dogwood Mine of the Little Gen Coal Co., in Shelby County, Aug. 27 resulted in the instant death of Will Holley and the fatal injury of Edward Clayton Roman, both white, while two negroes were badly burned from the flash.

A contract between the State of Alabama and the Bessemer Coal, Iron & Land Co. by which the former has been operating at Belle Ellen Mines with convict labor, was cancelled effective Aug. 31 and free labor will be employed in future, the mines to be operated by the owners. Under the lease agreement which has been in effect since February of this year the state not only mined the coal but also negotiated the sale of the product, paying the owners a royalty on the tonnage taken out. It is understood that state authorities have found this to be an unsatisfactory arrangement and for this reason decided to abrogate the agreement. Convicts are worked by the state at Flat Top, Banner, Aldrich and Wegra mines under a system by which the coal is mined and loaded on railroad cars at an agreed price per ton, the state not having anything to do with the sale of the product. Convict labor has been employed in whole or part at the Belle Ellen operations for many years, there being four openings.

Preparations are being made for the participation of about fifty teams from mines and industries in this district in the seventh annual field meet which will be held at Rickwood Park, Birmingham, Oct. 6, under the auspices of the Alabama Mining Institute, U. S. Bureau of Mines, Red Cross and State mining department. A program of events and prizes has been arranged and valuable trophies will be awarded the winning teams by the Alabama Mining Institute, which annually donates these prizes and plays a leading role in fostering and encouraging rescue and first-aid work in the coal-mining field. The Institute will hold its annual meet Oct. 6 for the election of three members of the governing board, which latter means officials for the next year.

## ARKANSAS

District 21 of the United Mine Workers is in the hands of a receiver, according to information received from Fort Smith. Upon complaint of the Greenwood Coal Co. and others that the district was insolvent and that the mines had suffered damage at its hands, Chancellor J. V. Bourland appointed State Senator J. V. Brewer receiver in an order commanding the district as defendant, its officers, locals, banks and coal companies to turn over to the receiver all sums in their hands held in behalf of the district.

C. L. Melton, of Alix, early in August leased the No. 6 mine of the Western Coal & Mining Co., at Denning.

## COLORADO

Herbert Addison, recently appointed receiver by the District Court for the International Fuel Co., which had large holdings in Routt County, sold the property at a foreclosure sale at Denver, Aug. 28, for $71,297 cash to Arthur Ponsford, attorney, who is acting for Pat Quealey, of Kemmerer, Wyo., and H. C. Marchant, of the Superior Coal Co., Rock Springs, Wyo. The original investment in this property was in excess of $300,000. The Routt County field is expected to be a keen competitor of other producing districts as soon as the Moffat Tunnel is completed, in 1926, which will give the Routt County operators a direct line of operations into Missouri River territory.

Judge George F. Dunklee, sitting in the second division of the district court, has authorized H. Van Mater, receiver of the National Fuel Co., to cancel lease for the mining of coal on what is known as the Reynolds-Zarlengo tract, adjacent to the Puritan mine in Weld County, due to unfavorable conditions.

The Clear Creek Development Co., in an action instituted in the District Court at Denver, Aug. 27, seeks to have set aside a foreclosure sale in which certain property of the Empire Consolidated Mines, Inc., is alleged to have been sold to Charles Cutler. Cutler, it is stated, instituted the foreclosure suit. A Denver firm intervened, claiming a superior lien on the Empire's property and the foreclosure decree was entered in its favor, according to the complaint. The plaintiff company alleges that a judgment of $21,000 it obtained against the Empire Consolidated Mines was based on a contracted indebtedness existing prior to the foreclosure suit, and declares that no part of the judgment has been paid.

## ILLINOIS

A corps of men have been engaged to put the boilers of the Keystone mine and the Consolidated Co.'s mine at Herrin in working condition. These mines, employing about 700 men, are expected to resume operations soon.

## INDIANA

Extensive additional trackage is being laid by the Big Four R.R. near Petersburg, where the road's southern coal terminal is located, to care for the increased coal business in southern Indiana. Opening of new strip mines in southern Pike County has increased the tonnage handled over the E. & I. division of the Big Four and necessitated laying of additional side tracks. The Pike County Coal Co., owners of thousands of acres of rich coal lands in western Pike County, has petitioned the Big Four to run a spur from Petersburg to Oatville, a distance of eight miles.

## KANSAS

A talk at Pittsburg, Aug. 26 by Vernon Allison, associate chemist with the safety department, U. S. Bureau of Mines, on the dangers of dust and methods of controlling it, opened a drive for safety in the southeastern Kansas field which will continue three or four months. Mr. Allison announced that a representative from the department soon will enter the Kansas field to carry on the work. Mr. Allison discussed the dangers of open lights in dusty mines and the two methods of controlling the dust: sprinkling and rock dusting. Of these, he said the Bureau had found dusting with limestone dust the most effective.

Arrangements have been completed in southeastern Kansas to send two teams to the international first-aid and mine-rescue meet at Springfield, Ill., Sept. 10, 11 and 12. The team from Western Coal & Mining Co.'s mine No. 20, which was first in the Kansas state contest, June 12, will be one, and a team from the Jackson-Walker Coal & Mining Co., which took second in the June contest, will be the other.

Permission to buy seven miles of railroad it already owned was given the Frisco R.R. Aug. 24 by the Kansas Public Service Commission. The seven miles is a coal road, known as the Pittsburg & Columbus, operating from Kramer to Weir City, Kansas. The Frisco owns all the stock and all the bonds and has been operating the line under lease for many years. The commission's decision makes it possible to make an actual transfer and incorporate the Pittsburg & Columbus road in the Frisco system.

## KENTUCKY

A gas explosion at Mine No. 3, Black Diamond Coal Mining Co., Drakesboro, on the morning of Sept. 1, following a slate fall, which released the gas, caused two men to be instantly killed, and one to be seriously burned. Four men of the seven in the entry were not injured. The mine had resumed operations within sixty days, after being down for over a year account of the western Kentucky strike.

The Imperial Elkhorn Coal Co., Sergent, is about to begin the erection of a boarding house.

The Kentucky Utilities Co. has announced its outright purchase of the big mine power plant of the W. G. Duncan Coal Co. at Greenville, for $1,000,000, including the 8,000-hp. generating plant, coal acreage to supply fuel for the plant for fifty years, two artificial lakes for boiler water, three dwelling houses for employees, 12 miles of 33,000-hp. high tension electric line, two pumping stations and switching station. The Kentucky Utilities Co. will supply the company with about 3,000 hp. when operating. The plant has been under a lease arrangement with the Kentucky Utilities Co. for some time.

Boddie and Powell, Madisonville, strip mine operators, are having test holes drilled on an 800-acre tract of strip property south of Hartford. The Maumee Collieries Co., of Terre Haute, Ind., started test drilling in the same section some time ago, but was forced to abandon the work because of lack of funds, it is said.

Further improvement of traffic handling facilities in the eastern Kentucky and West Virginia districts in which the Chesapeake & Ohio R.R. operates are promised in a statement of President W. J. Harahan, of the road, regarding contracts to be placed soon for $8,000,000 of additional equipment, principally locomotives, cabooses, two steam ditchers and two locomotive cranes.

The Elkhorn Collieries Co., Mater, is about to erect a boarding house at Kona.

Announcement has been made that the Mitchell-Willis Coal Co., of Gorman, on First Creek, in the Hazard field, will soon be in operation after a shutdown lasting nearly two years. The Reliance Coal & Coke Co., at Glomawr, which controls the Mitchell-Willis mine will operate it.

The Elkhorn Collieries Co., of Thornton Creek, with a large mine and loading tipple, is reported to be starting development of a large vein of fine cannel coal, on Colly Creek, across the mountain. Coal from the new opening will be brought across and loaded through the tripple at Thornton.

## MINNESOTA

The C. G. Hartin Coal Co. of St. Paul, whose business was sold to the Reiss Coal Co. several years ago, has been formally dissolved as a corporation.

A petition signed by seventeen prominent retail coal dealers of Minneapolis went to the City Council asking an ordinance licensing and regulating fuel dealers. It was suggested that an annual license fee of $200 be charged. This would be a move of value to the consumer and to the trade in that it would assure stability in the retail trade and reasonable assurance of reliability. The matter was referred to a committee.

Companies operating coal docks at Duluth reported a surprisingly active demand from Winnipeg for anthracite and Pocahontas coal. Buying from that quarter is being prompted by the trade up there not having recovered from recent labor troubles at Alberta mines and fears that further lake shipments of American coal for the Canadian trade may be blocked for the balance of this season. The Pittsburgh Coal Co. and the Northwestern Fuel Co. have been participating in that trade to some extent.

Aloysius E. Smith, of St. Paul, doing business as the Block Diamond Coal Co., has petitioned for a discharge from bankruptcy, after having complied with the requirements of the bankruptcy law.

A company is being formed in Minneapolis to establish a barge line to operate upon the Mississippi River to the Twin Cities. Coal would be a natural upbound cargo. Southern Illinois coal operators also are said to contemplate establishing a barge line up the river to compete for the coal business of these cities.

## MISSOURI

Prosecutions for selling short weight coal in St. Louis in the future will be brought under a state law, according to Inspector of Weights and Measures C. G. Haley and Prosecuting Attorney Albert Schweitzer. Heretofore arrests have been made under a city ordinance carrying a fine of $5 to $100. The state law provides for a jail term as the maximum punishment.

## NORTH DAKOTA

The district court at Bismarck upheld the awards of the State Board of Administration in the matter of coal supplies. The Washburn Lignite Coal Co. brought suit to prevent the state from entering into contracts with other companies for coal, holding that, its bid being the lowest, it was entitled to the business. The court held that the judgment of a court could not be substituted for the discretion of the State Board of Administration in the matter. The ruling was that even if an award were erroneously made, unless it was shown to be by collusion or fraud, it could not be interfered with.

## OHIO

A new mine is to be opened soon in the Crooksville field, according to a recent announcement. The mine is the property of the Cres-Mars Coal Co., which operates mines 3 and 7 in the Crooksville field. Ten or 15 men will be employed at first. The tipple of the mine is not quite completed as yet, but the beginning of operations is not far distant.

Calvin Holmes, of the Holmes Coal Sales Co., Cincinnati, has announced that through an arrangement with Abner Lunsford the excess output of the Banner Fork mines, at Kentenia and Tisdale, Ky., owned by Henry Ford, will be handled by his concern.

The tipple of Mine No. 5 of the Stalter-Essex Coal Co., in Pomeroy Bend, destroyed late in May, has been rebuilt and the mine is in full opera-

**Southern Coal Mine Homes Are Well Kept**

Improved streets, neat fences and garden and lawn prizes have done much to foster present-day civic pride in most industrial communities, particularly coal mine villages. This picture shows the three- and four-room types of houses erected by the Tennessee Coal, Iron & R.R. Co., at its Edgewater (Ala.) coal mine. Note the profusion of flowering and foliage plants everywhere.

tion. The tipple of Mine No. 1 of the same company, which was burned Aug. 14, has not yet been rebuilt but steps are being taken to reconstruct it.

Practically all of the larger mines in the southern Ohio field which have been equipped with screens and where lump can be produced are either in operation or will soon be opened. The Sunday Creek Coal Co. has opened all of its mines where screens have been installed and is producing about 6,000 tons daily as compared with less than half that amount produced during the summer months. The George M. Jones Co. has opened two additional mines, making four large operations in all. The mines of the Pittsburgh Coal Co. both in the Hocking Valley proper and in the Pomeroy Bend field are going, as are the mines of the Stalter-Essex Coal Co. and the mines of the Essex Coal Co. Many of the smaller mines will soon be started if conditions warrant.

**No. 11 Tipple, Stearns Coal & Lumber Co., Yamacraw, Ky.**

Receiving station of cableway and tipple, equipped with shaking screens and loading booms. The cars are handled under the tipple by car retarders.

## OKLAHOMA

The expansion shown by the mining industry in the McAlester region for this time of the year and the increasing output of the mines has led the Rock Island R.R. to put on a train out of Haileyville, local area division point. This train service reaches from McAlester to Wilburton, caring for the coal output of numerous small towns in between. Outside coal mines are served by spurs with strings of cars placed on sidings, or pulled out loaded with each daily trip.

The number of miners in the McAlester region working under the open-shop system with the 1917 wage scale is estimated at somewhat over 2,500 with 600 in the Henryetta district. It is not known as yet what per cent of the men are still at work but the number varies from normal in some of the Henryetta mines to a complete shutdown of No. 5 mine near Krebs, where the Italian miners all walked out as a result of a meeting in Krebs Monday evening. There are about 30 coal mines in the McAlester-Wilburton fields and smaller numbers at the other coal towns such as Coalgate, Lehigh, Howe, Bokoshe, and near Russellville, Ark. Only two mines in eastern Oklahoma report that they have been working with union miners under the 1924-1927 wage scale agreement.

## PENNSYLVANIA

Operations are still on the increase in the Connellsville coke region. The H. C. Frick Coke Co. has started up Leisenring No. 3 mine and fired 300 ovens at that plant, in addition to 150 more ovens at other plants already in operation. The LaBelle Iron Co. has resumed operation at its coal and coke plant on the Monongahela River above Brownsville. The Husted-Semans Coal & Coke Co. has increased operations, and the Snowdon Coke Co. has started its mine and all of the 300 ovens at its plant at Linn, near Brownsville.

Figures just compiled by the State Department of Forests and Waters show that fourteen Pennsylvania tree planters put out more than 100,000 trees each during the spring of 1925. Some of the planters requested from the state a larger number of trees than was allotted to them, but it was found necessary to limit the number to 100,000 after the tree planting season got under way, so that the smaller planters could have trees available for planting. Among the large planters were the following: Clearfield Bituminous Coal Co., Indiana, 212,970 trees; Rockhill Coal & Iron Co., Robertsdale, 100,006; Wilmore Coal Co., Philadelphia, 100,000; Berwind-White Coal Mining Co., Philadelphia, 67,900; Allegheny River Mining Co., Kittanning, 95,000; Buckeye Coal Company, Nemacolin, 67,500; Colonial Colliery Co., Natalie, 65,000; Saltsburg Coal Mining Co., Leechburg, 55,000; Kingston Coal Co., Kingston, 50,000; Potts Run Coal Co., Clearfield, 55,000.

## WEST VIRGINIA

With the mines of northern West Virginia producing 555,550 net tons of coal in the week ended Aug. 29, more coal was loaded in the 12½ counties than in any other week since September, 1923.

The Baltimore & Ohio R.R. has put all of its old employees to work and called back into the service all furloughed employees in the Fairmont district due to the increased coal loading. No new men have been put to work, however.

Rumors were afloat in northern West Virginia last week that coal operators in the New River fields were considering the advisability of raising wages $1 on the day and 10c. a ton on the loading rates to curb any movement to reunionize the New River fields.

According to information received in Fairmont, Col. Clarence W. Watson, president of the Consolidation Coal Co., and his guide, Billy Stanley, had a narrow escape from drowing recently when their 26-ft. fishing boat struck a submerged wreck four miles from the head of Wolf Island, near Cape Vincent, N. Y. Nearby ships failed to hear the distress call and Colonel Watson bailed out the boat with a two-quart dipper, while the guide pulled to Wolf Shore, where repairs were made. The propeller and a 5-in. board were pulled off the Colonel's boat, which caused the trouble.

Ground has been broken on the Hoult road, near Fairmont, for the erection of a new plant in which coal-tar products will be manufactured by the F. J. Lewis Manufacturing Co., of Chicago. The plant, it is reported, will cost in excess of $100,000. The raw materials will be obtained from the Domestic Coke Corporation, which is nearby. Creosote oil will be the chief ingredient manufactured at the plant, it is said.

Weirton Steel Co. has announced at Pittsburgh a $10,000,000 improvement program for the works at Weirton. Included in the project are 45 new by-product coke ovens to the present list and a blast furnace.

C. W. McIntire, of New York City, who is in charge of the experimental station of the Consolidation Coal Products Co., a subsidiary of the Consolidation Coal Co., announced last week that a smokeless fuel, which is a substitute for anthracite coal, has been developed at the Fairmont plant. The commercial product obtained by the pretreatment of coal can be marketed as coke and briquets. The fuel is made by means of low carbonization and the plant will start this week to produce 50 tons a day. Out of 50 tons of Fairmont coal, it is said, 30 tons of briquets are obtained. From each ton of coal, in addition to the fuel, there is obtained three gallons of tar, two gallons of light oil and gas running 1,000 B.t.u. obtained.

In the six months ending June 30 a total of 20,677,990 tons of smokeless coal was produced as compared with 17,874,035 tons during the corresponding period of 1924, an increase of 2,803,955 tons. In June alone a total of 3,704,671 net tons of smokeless was produced as compared with 2,885,222 tons in June, 1924, an increase of 819,449 tons. The gain in the Pocahontas district alone was 511,965 net tons.

**Artificial Lake Supplies Power Plant**

A rainy day at Earlington, Ky. The artificial lake in the background covers 175 acres and constitutes the only water supply of the 6,000-kw. steam plant of the St. Bernard division of the West Kentucky Coal Co. With its wooded shores this lake is a beauty spot of Hopkins County.

New River mines increased their production 120,118 tons over June, 1924; Winding Gulf mines, 105,531 tons, and Tug River mines, 81,835 tons. In June the Norfolk & Western Ry. moved 2,103,435 tons, the Chesapeake & Ohio, 1,050,025 tons, and the Virginian, 551,211 tons. The Norfolk & Western handled a total of 3,231,735 tons of coal and the Chesapeake & Ohio handled 4,740,560 tons.

In a $400,000 improvement program announced by the Consolidated Power & Light Co. in West Virginia, provision is made for the installation of coal handling machinery at Kenova.

## CANADA

F. W. Guernsey, who has just returned to Vancouver with a party organized by the Vancouver Board of Trade to make an examination of the Hat Creek coal deposit, with a view to advising the Provincial Government as to the wisdom of building a branch line from Pavilion, on the Pacific Great Eastern, to the mine, a distance of 16 miles, in order to open up the deposit, recommends that exhaustive tests be made to determine the grade of the lower seams before any action toward the construction of the branch line be entertained.

The annual financial statement of the Blue Diamond Coal Co., Ltd., shows a deficit of $88,599 for the year ending June 30, which increased the deficit account to $174,995. Total assets were $2,655,586 compared with $2,143,621 for the previous year, and current liabilities were $493,859.

Production of coke in Canada during July amounted to 89,221 tons, being the lowest tonnage recorded for any month this year and a decrease of 19 per cent from the June output of 109,604 tons.

In view of the strike of the anthracite miners in the United States efforts will be made to obtain a larger movement of Alberta coal to Eastern markets in order to better cope with the emergency. Premier Ferguson and Premier Greenfield are said to have joined in an application to officials at Montreal to further shipments, as the rate, which is a vital factor, will have to be arranged with the Canadian National or Canadian Pacific Ry.

Five hundred additional miners were given employment on Sept. 1 when collieries Nos. 1B, 2 and 4 of the British Empire Steel Corporation went on double shift for the first time since the settlement of the strike was effected. The resumption of night work means that every colliery now operated by the Dominion Coal Co. is working two shifts.

## Traffic

### Reconsignment of Hard Coal Allowed Free at Detroit

The Wabash R.R. has issued Supplement No. 1 to I.C.C. 5872, effective Aug. 2, which provides as follows: "No charge will be made for a single diversion or reconsignment of anthracite coal at Detroit, Mich., when destined to points beyond located on the Wabash or connecting lines, to which the through rate from point of origin to reconsigned destination is applicable via Detroit, Mich."

## New Companies

**The Walters Brothers Coal Co.**, Warrensville, Ohio, has been chartered with an authorized capital of 500 shares, no par value designated, to mine and deal in coal. L. E. Walters, George F. Frank, Antony J. Walters, D. M. Tubman and J. F. Potts are the incorporators.

**The Velnon Coal and Wood Co., Inc.**, of Calgary, Alberta, has been incorporated with a capital stock of $20,000 by Harold A. Jacques, Edna Allen, Lillian Thompson and others.

**The War Ridge Smokeless Coal Co.** has been organized at Clarksburg, W. Va., with a capital of $100,000. The incorporators are: George L. Duncan, John P. Keeley, E. Bryan Templeman, James J. Biblun and O. J. Billingsley.

The certificate of incorporation of the **Creek Collieries Co.** of Bolivar, Pa., has been recorded in Greensburg, Pa. The capital is $5,000 and the stockholders are J. E. Husband of Pittsburgh, P. C. Ake of Indiana and H. Irene Husband of Mt. Pleasant.

## Coming Meetings

**New York State Coal Merchants' Association.** Annual convention, Sept. 10-12, at Richfield Springs, N. Y. Executive Secretary, G. W. F. Woodside, Arkay Bldg., Albany, N. Y.

**Association of Iron and Steel Electrical Engineers.** Annual meeting at Philadelphia, Pa., Sept. 14-19. Secretary, John F. Kelly, Empire Bldg., Pittsburgh, Pa.

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries**, Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering**, Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## Industrial Notes

A deal involving the purchase of the entire physical assets and property of a railroad was announced recently by the **Hyman-Michaels Co.**, of Chicago. The Kalamazoo, Lake Shore and Chicago Ry., being unable, successfully, to compete with motor transportation now operating parallel to its right of way, recently sought and was granted permission by the Interstate Commerce Commission to discontinue service and abandon its line. The Hyman-Michaels Co. took over the entire physical assets. The work of dismantling the road and sorting of materials has already begun. The line consists largely of No. 1 80 lb. ASCE section relaying rails, suitable for use in quarries, lumber camps and mines. Every piece of equipment is being rigidly inspected.

**The Koppers Co.** of Pittsburgh, Pa., was given the contract for the construction of 77 additional byproduct coke ovens for the Inland Steel Co. at Indiana Harbor, Ind.

## Recent Patents

**Axle Counter for Mining Machines**; 1,540,019. Arthur G. Kershaw and F. J. Raymer, London, England, assignors to the Union Switch & Signal Co., Swissvale, Pa. June 2, 1925. Filed Feb. 16, 1924; serial No. 693,401.

**Miner's Cap**; 1,540,345. Frank Kowasik, Hiawatha, Utah. June 2, 1925. Filed Oct. 29, 1923; serial No. 671,367.

**Controller for Hoisting Engines**; 1,540,631. A. E. Johnson, Denver, Colo. June 2, 1925. Filed Dec. 15, 1923; serial No. 680,876.

**Hopper-Car Door**; 1,540,850. Carl M. Luth, Wilkinsburg, Pa. June 9, 1925. Filed Oct. 8, 1923; serial No. 667,258.

**Mine Cage**; 1,541,144. Wm. G. Holmes, Danville, Ill. June 9, 1925. Filed Jan. 21, 1924; serial No. 687,455.

**Coke Quenching and Loading Apparatus**; 1,541,153. Heinrich Koppers, Essen-Ruhr, Germany, assignor to the Koppers Development Corporation, Pittsburgh, Pa. June 9, 1925. Filed July 5, 1921; serial No. 482,613. Renewed Mar. 9, 1925.

**Mine-Car Loading and Haulage Means**; 1,541,361. Wm. G. Knowles, Bessemer, Ala., assignor of one-half to Arthur T. Knolwes, Bessemer, Ala. June 9, 1925. Filed March 26, 1923; serial No. 627,929.

## Keep the Issues Straight!

THE ANTHRACITE STRIKE has now entered the stage where rumor and speculation become the raw materials out of which most of the daily stories must be manufactured. The further we get away from the events preceding the suspension the easier it will be for the public to lose sight of the fundamental issues involved. In so doing, the public risks inviting a settlement that will be as injurious to its own interests as it will be to the anthracite industry. It seems wise, therefore, to dare the perils of reiteration to restate these issues with such frequency that they cannot be obscured by rumor, perversion, forgetfulness or misunderstanding.

These issues are readily understandable. They can be grasped without painful study of overwhelming statistics or the assistance of mathematical experts, budgetary specialists or trade economists. The man in the street is not even called upon to sit in judgment on the complexities of the anthracite wage structure. He is not called upon to say whether present rates of pay are adequate. But he can hardly fail to catch the significance of the action of the union in abruptly terminating negotiations before the operators could be heard upon the adequacy of those rates. The operators listened patiently for the better part of a month to the union's presentation of its demands. The union, without finishing its own case, denied the operators the right to reply. Why?

The present suspension was ordered in defiance of policies recognized and advocated by union leaders for twenty years. At the outset of the negotiations the operators asked the miners to join with them in an agreement to continue production after Sept. 1 regardless of the progress reached by that time. The union declined. The operators suggested arbitration of points upon which no agreement could be reached by the negotiators. The union declined. These offers were repeated at various times during the course of the negotiations and were as repeatedly rejected by Mr. Lewis and his associates. The record makes it convincingly clear that responsibility for the present suspension rests solely upon the United Mine Workers.

The union expresses a bitter distaste for the arbitration it once sought the high heavens to force upon reluctant producers. If the principle of arbitration was so eternally right and in the public interest in 1902, why has it become so tainted with sin in the past three years? The answer, of course, is that it has not. But, even if it were, even if Mr. Lewis were justified in his damnation of arbitration, that would be no excuse for the suspension. The operators' proposal to continue production was not conditioned upon the acceptance of their offer of arbitration.

The man in the street may not be competent to pass upon the adequacy of the wages paid the anthracite miners. That, after all, is of little direct interest to him. His direct interest is in an uninterrupted coal supply at a reasonable price. Strikes are the greatest menace to that steady flow of fuel. The man in the street, however, is competent, if he has his facts straight, to fix responsibility for any interruption to his coal supply. There is no confusion of facts to blur his judgment on that question.

## Passing the Buck

IN TIMES PAST the anthracite operators were assailed because they would not arbitrate their case with the miners. They come now asking for arbitration and only a few listen to them. These few say the mine owners are merely "passing the buck" and that they are asking the public to do what they should do themselves. Arbitration is declared wrong because the anthracite operators request it.

What would happen if operators advocated nationalization or national control of mines? We are of the opinion that it would disgust the public. The general opinion would be that the operators were "passing the buck" and that they should be men enough to handle their own affairs. Furthermore it would be said that they were hoping to make money out of the transfer on the one hand or to be assured of profits in the event of national control on the other. The public is perfectly consistent. It may have no recognized policy; it may pursue no plan of action continuously; but whatever it says or does, it shows itself to be always and everywhere against the mine operator.

## Metallurgic Economies

IN A LATER PART of this issue appears a story on thrift in the use of coal in metal mining, but really, has there not been thrift from the earliest days? Concentrators from the first sent clean ores to the smelter, for the man who sorted the ore before he smelted it saw that only the purer material found its way to the melting and slagging pot. He hunted for native metal, if he could find it, and if he couldn't he tried to get the pure sulphide, carbonate or oxide or what not. Talk about concentration! They had it in early days. Disseminated ores were not worthy of a glance.

Every time a new trick was learned in concentration leaner ore was mined and accepted, and the smelter had more to do. So the coal man found his coal in greater demand than ever. For this reason no one must take these new metallurgical developments too seriously.

When the hot blast was first used in the iron industry and hot metal from the blast furnace was taken to the steel mill, economies were made as momentous or more momentous than any today.

Powdered coal is having its triumphs, ousted, however, in places by oil, for in the copper furnace oil does not form slags as does coal whether used in larger sizes or in powdered form, particularly the latter. At Anaconda with coal on grates 2.04 tons of copper were lost in slag per 100 tons of copper obtained, with pulverized coal 2.11 tons, but with oil only 1.77 tons. So powdered coal has disadvantages even though it makes a saving of 41 per cent in the coal used as matched with coal on grates comparing the quantity and not the price. The assumption is made—and it is Bardwell and Miller who make it in a paper before the American Institute of Mining and Metallurgical Engineers—that the cost of pulverizing is offset adequately by a reduction in labor at the furnace and by the elimination of the cost of handling and disposing of ashes.

With grate firing at the Anaconda smelter 4 tons of copper are produced per ton of coal used, but when the coal was pulverized each ton produced 6.8 tons of copper. As slack was 20 per cent cheaper than lump the net result, according to the authors, was a reduction in cost of from 40 to 50 per cent per ton of copper.

The tale of economy reaches all along the line. The production of metals has recently been low and the demand for coal to smelt these metals has been even lower; but economy having once been effected we can look for a broader future because leaner and leaner ores and a widening market will make for an increased use of coal. So much has been lost to oil that when the return is made to coal the rebound will restore to the industry a stability that in recent years it has sorely lacked. Bardwell and Miller in closing their paper say that "pulverized coal is a close competitor of oil and any great increase in the price of the latter would lead to the resumption of the use of powdered coal in our furnaces."

## How Weak Is Lewis?

IF JOHN LEWIS CALLS A SOFT-COAL STRIKE it will be his flat admission that the Jacksonville wage agreement is impossible. Just now Mr. Lewis is a hard-put though still belligerent labor leader. He has seen important territory escape from union domination. He has seen business measured in huge tonnages slip over to the enemy, the non-union producers, and has had to stand and endure it even though the shift of these tonnages meant heavy and permanent losses of working time by high-wage union labor. He is cornered by economic conditions which he helped to create. He cannot offer to change the wage scale. That would mean political annihilation for him by his own rank and file. So he must effect the change by battle.

A general soft-coal strike probably is the readiest expedient at hand. In spite of the fact that a strike threat is good propaganda, Mr. Lewis is more than likely to call such a strike. He can convince many of his men that the Pittsburgh Coal Co., the Consolidation Coal Co. and other employers in Pennsylvania, Ohio and West Virginia are violating the Jacksonville agreement. He can convince them that they should strike from the State of Washington to Maryland to save their union from extinction. He can argue them into believing that even though non-union productive capacity is great enough to supply the country, the price of non-union coal during a strike would soar and transportation difficulties would arise, thus goading the consumer.

The consumer is John Lewis' target. If the public can be squeezed enough, and United Mine Workers' propaganda can be put across with its usual effect, general clamor for intervention will be loud. Then somebody will step in and relieve Mr. Lewis of his embarrassment. Enforced arbitration might cut union wages but John Lewis would not be doing the cutting.

The union stands to lose, probably, if it strikes, but it will lose eventually if it doesn't. That is Mr. Lewis' dilemma. He is desperate. Hence he may be expected to call an illogical strike. He will be violating his Jacksonville contract with the operators of Illinois and Indiana if he calls out the men in those states, but a drowning man clutches at any straw.

## Our Land of Opportunity

WATCH OUR POLITICIANS fall into rhapsodies over this land of opportunity, a country where a boy who ran barefoot to school and hardly had enough to eat could by force of character and thrift accumulate a fortune while engaged in a service of inestimable value to the public. No man, the orator declares, is barred from the right to accumulate wealth, and our individual freedom shows us the way to success. It is the American way. The road to fortune lies open to every man.

Daniel C. Jackling, mining engineer, for instance, opened up a copper mine at Bingham, Utah. Here is a man who, as president of a company which has taken $374,294,080 worth of minerals out of the ground, made $173,975,094 profits for his company and paid $131,815,787 in dividends out of a capitalization of $16,244,900. Every pound of product brought him twice what it cost him. On every sale he has averaged almost 100 per cent. The company's profits are over tenfold its investment and nearly elevenfold.

What a land of opportunity! What a marvelous man! But, one considers: What if he had been a coal operator! What a terrible tale would have been told of his exactions from the public! His achievement would have been a crime, and we would have said that he should pool his mine with the high-cost operations and should take no more than a meager profit. Metal-mine experts in the American Institute of Mining & Metallurgical Engineers would have held him up for retribution; other mining engineers on the Coal Commission would have sought to have his company controlled; no right-thinking citizen but would have scorned to put his hand against the palm of such a "coal baron."

And as for the coal miner, the public takes the view that he is not justified in seeking to get as large a wage as he pleases. This we deny, but we do say that when he seeks an undue wage by constraint of trade, Clayton Act or no Clayton Act, when he enforces his action by violence or intimidation, he must consent to have his wage set for him at reasonable levels. If he is willing to let his wage and profit come in the due course of an open market for his labor, then he is entitled to all he can get in this land of opportunity, but if he seeks it by group action, with or without violence or intimidation, he must consent to see his wage fixed by the group action of the citizens of the republic.

Any act that permits the combined action of any class of citizens as against the group interest of the whole people disrupts the commonwealth and makes a farce of government unless the group action of the public is afforded some way of making the demands of that particular class accord with reason and justice.

# Modern Concentration Mining Succeeds Where Past Methods Failed in Old Detmold Mine

## Abandoned Big Vein Coal in Georges Creek Region Is Reclaimed by Long Panels, Half Advancing and Half Retreating—Continuous Side Track Assists Haulage

**By Elkins Read**
General Superintendent, Maryland Coal Co.
Lonaconing, Md.

ALTHOUGH Old Detmold mine of the Maryland Coal Co., Lonaconing, Md., is relatively ancient—its opening dating back to 1853—the methods now employed in the recovery of much pillar coal are distinctly modern. This mine long ago was worked over and cut up into pillars which were not recovered because in the early days knowledge of mining was meager and methods primitive. No wonder, then, after a lapse of nearly three-quarters of a century, we find about 70 per cent of the coal still standing.

The mine is in a tract of what remains of the Big Vein in the Georges Creek region of Maryland. In it the old rooms and entries are caved, seemingly contesting our right to that coal which a past generation tried and failed to recover. It is easy to visualize what a large production at low cost could now be obtained, if the coal were solid again, with present-day machines, 4-ton cars and other modern equipment.

### NEW METHODS FOR OLD

THE MARKED SUPREMACY of modern methods over the old perhaps is nowhere more clearly displayed than in the Georges Creek region, where for the last 75 years the Big Vein coal seam has been mined in turn by grandfathers, fathers and sons. This contrast is the more vivid because practically one people has mined nearly all the coal taken from the region beginning in 1853. The grandfathers, recovered only about 30 per cent of the merchantable coal by driving rooms only and leaving the pillars. The fathers did better, for they recovered much of the pillar coal while mining the last tracts of Virgin Big Vein coal. The sons have been left that coal which their grandfathers abandoned and under more difficult conditions are recovering most of it by the modern methods described in this article.

But that condition having passed, we are achieving by modern methods, although under more difficult circumstances, that which our predecessors could not do. Today, coal is reclaimed by tunneling and forepoling in long panels extending along the strike of the bed from the main headings to the outcrop. Each panel is about 800 ft. wide and in length is limited only by the distance from the main headings to the outcrop.

A strip 500 ft. wide, on the higher side of each panel is mined out advancing. It is served by one intermediate haulageway and an air course within itself also by three major headings in the remaining width at the lower side of the panel, the barriers of which are recovered in the retreat.

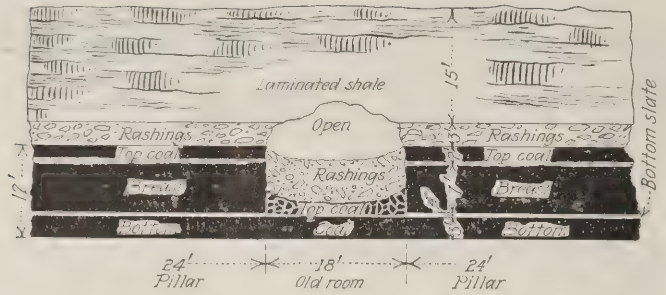
This system provides concentration and continuous working. In general the method is far ahead of what in the near past had been considered good practice and provides decided economies in haulage and ventilation. That is not to say that we have benefited as widely as we should like, for we do not have such reasonable assurance of our mine conditions as is enjoyed by companies operating in solid coal. Nevertheless, the system is working well; and by its merits should recommend itself for use generally.

The seam is 12 ft. thick, consisting of a 3-ft. bench of bottom coal separated from a 7-ft. bench of breast coal by a thin coal layer between two thin strata of slate. Above the breast coal is 8 in. of bone surmounted by a 2-ft. bed of good top coal. Over this is a bed of fire-clay shale which is soft and difficult to hold, known locally as "rashings." On top of it is a laminated shale about 15 ft. thick, which separates the Big Vein from the unimportant Redstone seam.

The Redstone seam is capped by red sandstone, 30 to 40 ft. thick. This formation and a 400-ft. cover were ever a menace to the old managements in their efforts to recover pillar coal and have since caused much destruction to the original workings. No attempt was made in the early mining to recover the 3-ft. bench of bottom coal and the top coal was left to hold the roof, so that only 7 ft. of coal was mined in rooms and entries worked in the original plan.

The Maryland Coal Co. was one of the original companies incorporated to mine coal in the Georges Creek region and still retains mineral rights to over 5,000 acres in Allegany and Garret Counties. This tract, which originally was developed by six mines, contains about 1,500 acres of Big Vein coal. The Old Detmold mine was worked until some time in the eighties. The adjoining Savage mine was opened in 1861 and abandoned also in the eighties. Another, the Kingsland mine, was opened in 1872 and abandoned just prior to 1900. Three other mines were opened and worked at later dates. These are not being re-mined now because they were operated in the years after 1890 when recovery was fairly high. There is insufficient coal left in them to warrant reclamation.

Practically all of these old mines were developed by a main heading and air course driven up the pitch. On each side, at 400-ft. intervals single butt headings were driven. Without the return of an air course the men had little air at any point far inside of the mines. Every fourth or fifth room—18 ft. wide on 42-ft.



**Bad Roof Adds to Expense**

This bed is a part of the Pittsburgh seam and like this deposit in the Pennsylvania field, has a weak roof. Over the coal in the Georges Creek region there is a soft, flaky shale, known as rashings. The coal bed is divided into three sections by bands of slate. When the mine was originally worked the bottom coal was left intact.

centers—was driven through a 100-ft. barrier pillar to the side heading above. What air did circulate was drawn by a furnace of cut stone or brick.

None of the stained coal at the outcrop was mined in those days. A belt having an average width of 200 ft. of crop coal was left around the entire property. This coal was mined between 1900 and 1910. It was then the belief of the company that all the economically recoverable coal was gone. However, along about this time J. W. Galloway, now president of the company, was made vice-president and general manager and, after going over the property, he realized the possibility of rehabilitating a dying enterprise. It was through his inspiration that reclamation mining was started in the Old Detmold and Savage mines.

During the various changes in management prior to this time the newer maps mysteriously disappeared and all that remained as guides for new operations were three old maps drawn in 1871. This made initial moves difficult.

Our first attempt at reclamation work was made at a point near the lower left-hand corner of the accompanying mine map. After tunneling through the crop workings about 250 ft. we ran into the beginning of a series of room pillars which we later discovered were located off the second left heading of the Old Detmold mine. Of course, at that time we were prospecting and knew little of the conditions so that mistakes which we made were excusable. We next made an opening in this same section at *X* and during the days of the World War these two openings were advanced to the fifth left heading of Old Detmold.

By this time enough had been learned to make us realize that in order to continue in a normal market our methods would have to be changed considerably. It was decided, therefore, to discontinue advance workings and retreat with the pillar line. In 1920 our present mine was opened by a pit mouth on the right side of Old Detmold.

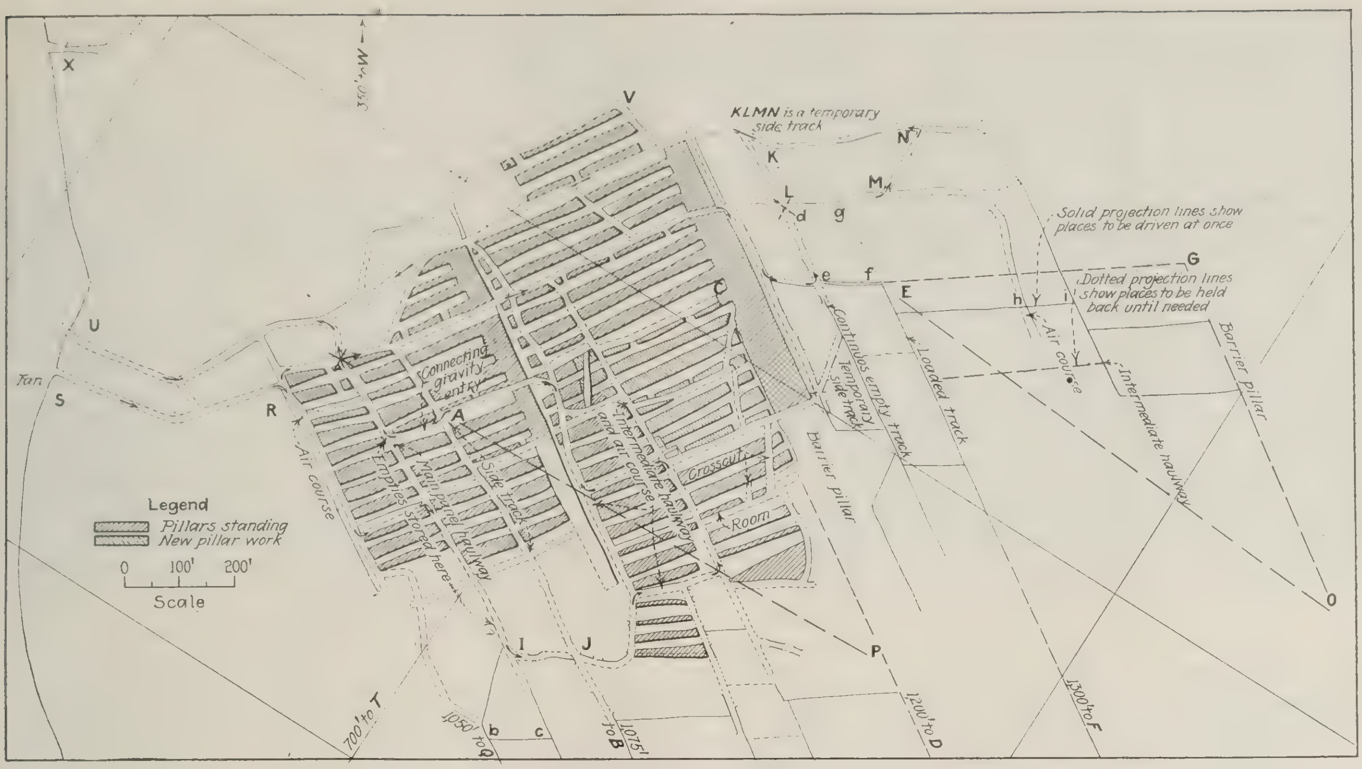
Our experience in No. 12 mine to the left of the Old Detmold main heading showed us that headings and rooms had been driven everywhere, but with the exception of a little gouging, the pillars were still standing. In all the old workings the top coal and rashings, and sometimes layers of the overlying shale, had fallen. To cross these old places various methods have been tried and finally we standardized on a method of tunneling which is described in detail later in this article.

Of necessity this tunneling is expensive and it early became apparent to us that in any successful system, tunneling must be confined to a minimum. It was decided also that the system must have as few working places as possible and that these must be concentrated and worked intensively. The reason for these requirements is that every place in the mine is held up by timber sets lagged on top and sides. Concentrated effort which is now considered an economic necessity in mining is doubly necessary in this work.

To avoid the first obstacle—excessive tunneling—our main headings and air courses are cut from the side of room pillars. These are 10 ft. wide and are kept far enough apart to avoid excessive weight. The first panel marked *RQBDPC* comprises first and second right headings of the Old Detmold mine and extends across the Savage mine to the crop line. This panel has a main air course, a haulageway and a continuous side track and room heading, all of which are driven across the old rooms and pillars paralleling the original right

**A Dead Town Revived**

Half asleep, but with one eye open, Old Detmold mine watches over Lonaconing, Md., the town which it helped to build 72 years ago. Today, with the increasing endeavor in the reclamation of Big Vein coal under these hills, prosperity is sure to be restored to this town which for many years has realized little from its buried treasure.



**Long Panels, Half Advancing and Half Retreating Prove Most Successful**

The coal between lines *CPD* and *AJB* is mined to the outcrop, advancing; barriers of the main panel haulageway, or the coal between lines *AJB* and *RQ*, is mined from the outcrop, retreating. These continuous panels are advantageous under almost any conditions because development faces are comparatively only a few feet from the live workings at all times.

headings of the Old Detmold mine. About midway between the room heading and the boundary line is an intermediate heading and an air course, the former being marked "second right" in the first panel.

The coal between *CPD* and *AJB* is being recovered on the advance, the distance between these two lines being 500 ft. The coal between *AJB* and *RQ* is to be recovered in the retreat. The same scheme is planned for all succeeding panels. When the pillar line advances to *AP* the first panel will be under full development and will continue so until this line is advanced to the outcrop. Every place in the mine is working double shift and men are switched about to meet the needs of the moment.

The mine at present is producing 450 to 550 tons in a double shift. It is probable that after the first and second panels are both under full development they together will product 800 to 1,000 tons per day, the latter being the maximum desired by the company. Main headings have been stopped and their advancement will not be resumed until a third panel is required to keep up the maximum output.

In the actual mining of a panel, 10-ft. rooms are cut from the inby side of every third room pillar, extending from the side track *AJ* to the intermediate haulageway, which is a distance of 300 ft.; and from the intermediate haulageway 200 ft. to the barrier line *CP*. Of the 200-ft. rooms, the last is driven up only a step or two in advance of the pillar line. Ordinarily the 300-ft. rooms from the main headings are not driven until required for haulage and ventilation purposes.

The pillars between these rooms are recovered by driving crosscuts on 40-ft. centers in the retreat. These crosscuts, of course, penetrate only what remains of the pillar from which the room is cut and two old rooms. Thus, every third room is entirely missed by the crosscut and by tunneling through only two old rooms two solid blocks of coal measuring 24x30 ft. are reached and recovered, together with a 14x30-ft. block in the pillar from which the room is cut.

In that part of the crosscuts included in old rooms, the top and bottom coal is recovered; but no attempt is made to recover these two benches in the old rooms between crosscuts on account of the excessive cost of dead work incidental to the handling of rock.

It would be less expensive to drive along every other pillar, but experience in No. 12 mine has proved to us that this practice cannot be followed because the support of the roof is too much weakened. We have also learned that when crosscuts are on centers wider than 40 ft. the stumps will be squeezed before they can be recovered.

Following the driving of a room to its limits by two men on each shift, the first crosscut is driven 40 ft. below the barrier line. Then a second crosscut is started at a 40-ft. interval below the first by two men. At this time an additional man is added to the first crew which has turned its attention to the recovery of the stumps above the first crosscut, making five men working in each section between two adjacent rooms.

Under full development a panel is composed of six such room sections which are worked simultaneously by five men in each. In addition, five headings are under development about half the time. These are driven only fast enough to keep them ahead of the pillar line. Thus altogether no more than 40 men will be employed per shift in the panel. The average daily output per miner, including those in tunnel places, is a little better than 6 tons. Coal is loaded on a tonnage basis and tunneling is paid for by the yard, the lump sums for each include remuneration for setting timbers.

In robbing pillar stumps only the breast and bottom coal (thickness of 10 ft.) is recovered. The 2-ft. bed of top coal is left to help support the roof. Two head-on cuts, half as wide as a room pillar, are made to recover a stump. One cut takes one-half of the stump advancing and the second cut retreating outby finishes the block. Once started, the mining of a block must be continued day and night until it is finished; otherwise the block will take excessive weight and be crushed.

Evidence of local squeezes dating back to the early days of mining is found in some parts of the mine. Not enough coal had been taken out from the old working to have caused a general squeeze. Now, since the top coal and rashings have caved and with the bottom coal left in the old places, it is practically impossible to make a clean break as the open area is not sufficiently wide. Great care must be exercised, therefore, to make as few openings as possible in the advance so as not to weaken the roof support unnecessarily. In consequence, activities are confined close to the actual pillar line.

### Predict 250,000 Tons per Year

The assumption is that the entire area of the Old Detmold mine and the Savage mine and half of the Kingsland mine can be reworked in this manner giving to the property a life of about 20 years at a mining rate of 250,000 tons per year. After the main headings of Old Detmold are driven beyond the inby boundary of No. 12 mine, panels will be laid out to the left as well as to the right of these headings. The areas marked *WXUV* and *RSQ* are reserved to maintain the output while the main headings are being drawn.

The mine mouth is located about 3,000 ft. from the tipple. Coal is gathered by mules and hauled from the side tracks to the outside by a small locomotive and thence is delivered to the tipple by a 10-ton main haulage locomotive. Although the mine operates two shifts each day, neither the locomotives nor the tipple is run more than 8 hr. The coal from the night shift is held on storage tracks in the mine. Because of the large expense of maintaining entries no runaround is provided for the small locomotive. It pushes the empties into the mine and pulls out the loads.

The sidetrack on the First Right room heading is maintained from *A* to *J*. The First Right haulageway will be extended from the main heading and maintained throughout the life of the panel. It serves as the main thoroughfare from the room sections in this panel to the main entry.

Because of the expense of widening out for switches to accommodate a gathering locomotive, none were constructed, so this motor never leaves the main haulageway of a panel except where grades will not permit running loads by gravity through one of the rooms serving as a connecting entry between the side track and the main haulageway of the panel. This practice is being followed wherever possible. Thus, loaded mine cars are gathered by mules to the side track *AJ* and are dropped by gravity through the connecting room *AT* to *T* where they are hauled away by the small locomotive which does not negotiate the switch at *T*.

When the pillar line *AP* reaches *A*, stumps will be left to maintain the side track *AJ* so long as the latter is needed in the position indicated. After the workings are advanced so far from *A* as to make the mule haulage on the side track excessively long, stumps are pulled and the side track shortened. This requires the laying of track in an advance connecting entry between the side track and the main haulageway of the panel.

By thus advancing the side track with the live working sections the inside locomotive is always kept close to the live workings and the mule haulage is limited to the distance between the heading *AJB* and the barrier line *CPD*, making a maximum haul of 700 ft. All the coal from the room workings is placed on the main side track while *abc* is a temporary side track for the development of the three major headings of the panel.

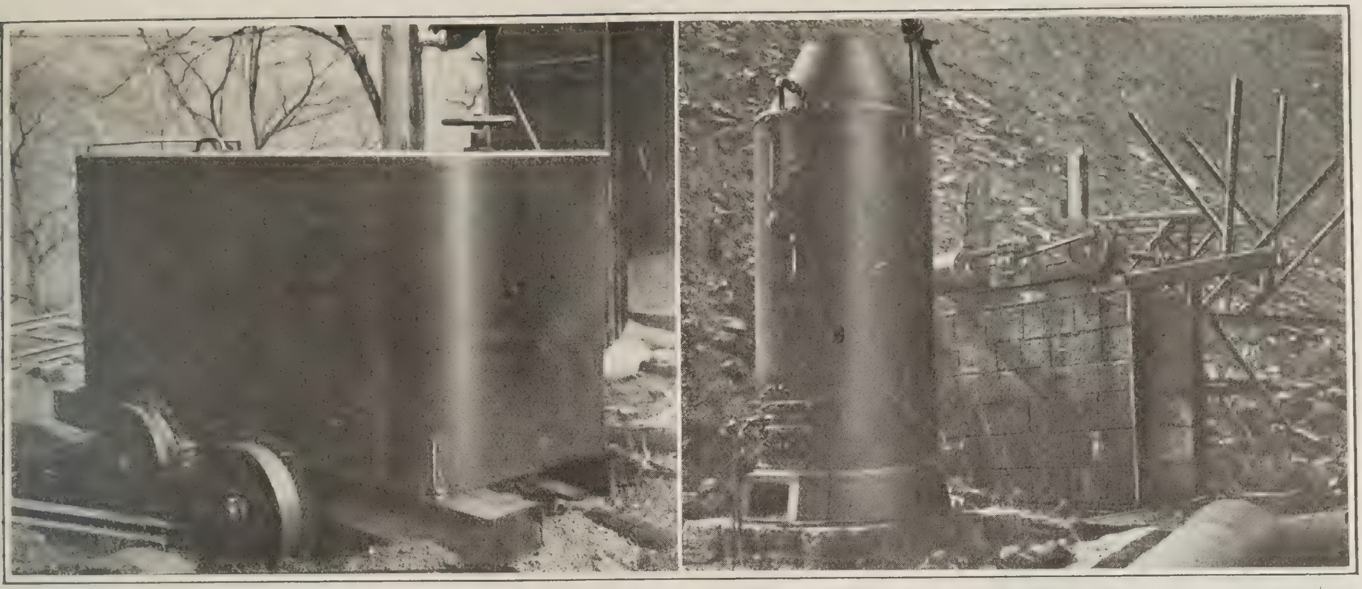
### Will Avoid Excessive Track Work

In the second panel the Fourth Right heading and its air course will be intersected by No. 1 room from the Third Right heading and the coal obtained from development work in this panel will be taken directly to the side track *defg* by one mule. A glance at the map shows that the rooms already driven from entry to entry are abreast. This practice has been discontinued. In the future, rooms between headings will be staggered as shown by the projection lines. This will be done to avoid excessive track work.

When the panel reaches capacity output, two mules on each shift will gather all the coal. The inside locomotive will handle the coal coming from two shifts and, after switching out the refuse cars, will build up

**Main Substation**

Through this plant go all the lines serving Maryland Coal Co. properties in the Georges Creek region. This company is operating the Old Detmold mine which it has reopened after many years in order to recover coal abandoned by two generations of miners.

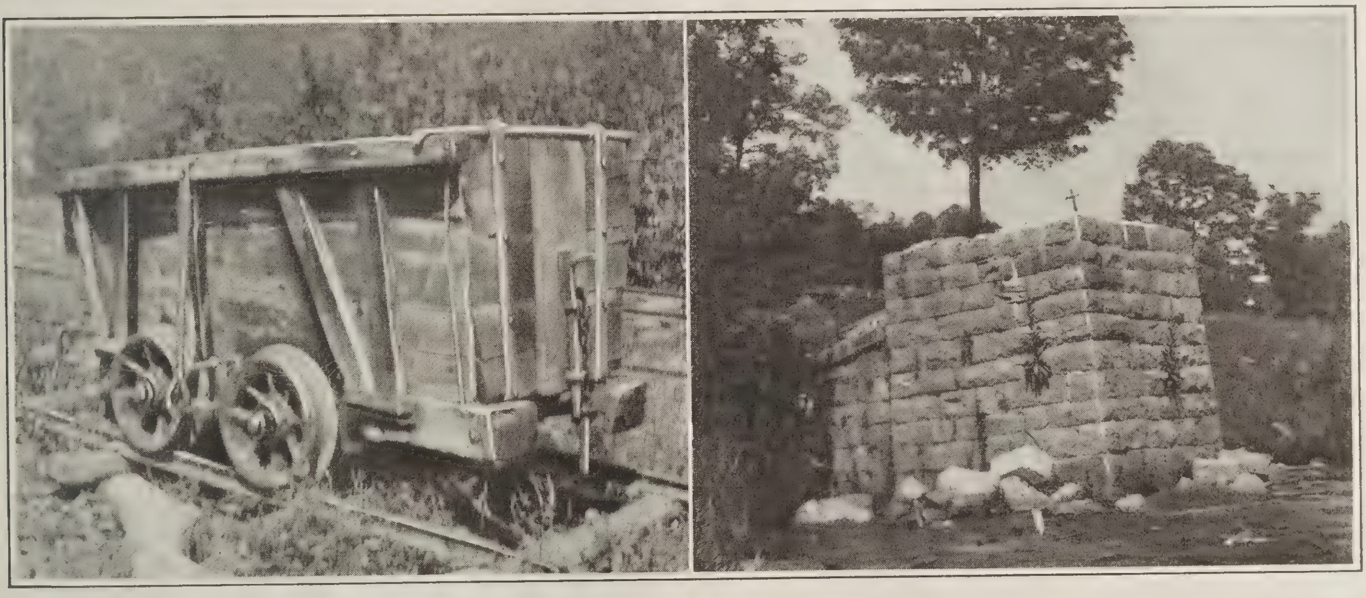


**Relics of Long-ago Mining Found in the Old Mines at Lonaconing, Md.**

At the upper left is a "bailer car" which must have been used to haul water out of the mine. The water was bucketed from sumps at various places through the workings into this car for haulage outdoors. The car probably was used a great deal because deep false flanges were worn in the wheel tires.

At the upper right is an old steam-driven fan with the blades missing from the fan frame. To be sure, an installation of this sort is not viewed by men of today as being economical. But what an improvement it was over an old ventilating furnace such as that at the lower right! The fan outfit was a plant complete in itself, with no long steam lines to waste the energy. One man for each of two shifts was required to keep this slow-motion fan running.

The old car at the lower left is a stalwart, iron-bound, end dumper more than 40 years old, which, obviously, could disgorge its load on a sloping dump track.



a trip on the main side track on the outside of the mine for the big tram locomotive. The latter, besides making a 3,000-ft. haul with all coal to the tipple, handles timbers and supplies.

### Method of Timbering

The roof in working places and live entries throughout the mine is supported by timber sets on 3-ft. centers, which are covered by flat lagging boards overhead and on each side, skin to skin, where the roof is weak or fallen as in tunneling. In driving through solid coal the lagging pieces, which are sector sections split from round timbers, are placed 1 ft. apart. The legs and cross bars are round, of 6-in. diameter or larger at the smaller end. Across the mouth of a place turned off from an entry a stringer or "king bar" is slung. This stringer supports one end of the heading cross bars and on the short-radius switches is 12 ft. long. Generally, over wide switches, it is necessary to place two stringers parallel to the heading and a third diagonally across the heading. These are 8 in. or more in diameter at the smaller end.

A system of modified forepoling and lagging is used in tunneling through falls in this mine. The forepoles are of round timbers, about 3 in. in diameter at the smaller end and 5 to 6 ft. long. These are placed 2 to 2½ ft. apart, resting on the regular timber sets which are on 3-ft. centers and covered skin to skin with lagging boards. The latter are 1 in. thick, 3 ft. long, and of varying width.

By means of iron bars, two holes 4 to 5 ft. deep are pocketed in the fallen material on one side of the tunnel and in line with the top of the timber sets. In these are placed two forepoles. The loose rock above these is carefully removed to enable placing one lagging board after another over the forepoles. After the first two forepoles are thus lagged, a third and then a fourth forepole is put in place, sometimes a fifth is required.

Although the material through which a tunnel passes is only comparatively loose, great care is exercised to

**An Old Timer**

This is W. A. McIndoe, outside superintendent at the Old Detmold mine. Mr. McIndoe has been with the Maryland Coal Co. for 52 years. He started to work when he was 12, mining with his father and has filled various positions with the company in and around the mines.

avoid starting a run. The men have been doing this work a long time and have become proficient. The forepoles and the advancing excavation above them are blocked up where necessary to hold the forepoles in place and lessen the chance of a "run."

The forepoles are lagged just far enough ahead to catch the next timber set, which is set in place after the underlying loose material is sufficiently excavated and while the front ends of the forepoles are supported by unexcavated material at that point. This completes the operation which is repeated over and over again in advancing a tunnel.

Upon leaving a pillar area and entering a fallen area the timber sets are lowered from a height of about 9 ft. to 6 ft. under the bars. In crosscutting through falls this height is further lowered to 5 ft. In the headings, the tunnels in the clear are 8 and 9 ft. wide at the top and bottom, respectively. In the crosscuts in the clear they are 7 ft. wide at the top and 8 ft. wide at the bottom. Incidentally, the timbering is not nearly so substantially done in the crosscuts as in the headings for the former are required to remain open for only a short time.

Under some conditions in this mine, timbers sometimes break immediately, and ordinarily their life never exceeds two years. Producing at the rate of 500 tons per double-shift day, this mine requires a railroad car of props for every two days.

### TEMPORARY VENTILATION SYSTEM

At present, ventilation is accomplished by a temporarily installed disk fan. One main overcast is provided at the junction of the First Right haulageway and the main intake. The air travels along the First Right air course and is conducted by temporary brattices and curtains to the working faces of the panel and back again across the overcast to the return outlet. The air circuits are indicated by arrows on the map. Another overcast will be installed to take care of the second panel. Falls are more or less open so that difficulty is experienced in controlling the air, for which reason it has not yet been determined whether to install one large fan or to use booster fans for each panel. The falls, incidentally, have some advantage in that they permit the driving of places far beyond the last new crosscut, as a certain volume of air sweeps over the falls.

The most important advantage of this system is a concentration of workings. This means low-cost haulage, better supervision, economical ventilation and less track and materials for a given tonnage as compared with that required by the usual short room-heading layout. Aside from these economies, after the panels are developed, the tonnage can be kept relatively constant from day to day by continuous operation until the property line is reached.

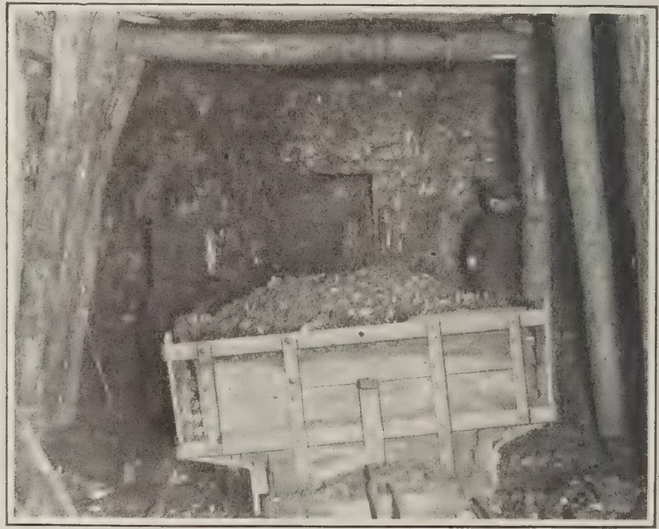
In the old panel layout with short room headings at right angles to the mains, a room heading is either under development or in the last stages of completion during a large part of the time. Thus the time during which these headings are at a high state of efficiency is relatively short.

Under the present system, once the panel is under full development it remains efficient until it is completed, which is a long time because the panel is long. And in the retreat, enough barrier coal remains to provide a complete mule-hauage section throughout its recovery.

### CAN BE MODIFIED TO SUIT CONDITIONS

This system can be modified to suit almost any conditions, even those encountered in the Middle West where no pillars are pulled. To me it seems to hold a great advantage over the methods which are now commonly used in that section. Instead of driving at right angles from the mains to a barrier line, the butt headings could be driven parallel to the mains and cut off on the rear, at the same time advancing one set of heading faces continuously until the boundary line is reached.

The system of long room headings bears the same relation to that of short room headings that a limited express train does to an accommodation train. When you get the one under way it rolls along under full steam, whereas the other has to stop at every tank station, contributing much to inefficiencies by interrupted operation.



**Mining In a Forest of Timbers**

Even in solid pillar coal in Old Detmold, places must be heavily timbered. The weight of a thick cover bearing down on the pillars for over half a century is only partly responsible for this precaution. In the early days when the Big Vein was in the virgin state the miners, even then, found the roof troublesome—so much so that they recovered little of the pillar coal. This 10-ft.-wide crosscut is blocking off a three-cornered pillar.

# Concentrator Practice in Utah Saves Coal Used Per Ton but Enlarges Total Demand

### American Institute of Mining Engineers Meeting At Salt Lake Learns of Large Progress Made at Concentrators and Savings in Coal at Smelters

**By R. Dawson Hall**
Engineering Editor, *Coal Age*
New York City

COAL-MINING MEN had an excellent opportunity to see, at the annual meeting of the American Institute of Mining & Metallurgical Engineers, held at Salt Lake City, Utah, Aug. 31-Sept. 3, how greatly new developments in smelting and concentrating are restricting the employment of fuels and may yet cause a further retrenchment in their use. But this is only per ton of product, for cheap minerals bring increase of market.

The economies practiced and foreshadowed are of many kinds, and some may be readily overlooked, for where the saving is made, there may be no fuel in use. Thus in a concentrator, the separation of ores from gangue and of metals from each other may be made so complete as to leave the smelter, which makes the semi-finished product, relatively little to do, and the concentrator, not using heat, may be electrically operated, the current being obtained from water power.

A remarkable agent, xanthate, commonly known among concentrator men as "Z," when introduced into the frothing or flotation cells in company with a frothing agent such as wood creosote or pine oil, makes possible a closer separation of the minerals being treated than can be had when xanthate is omitted. Further selective action is possible if the pyrite (iron sulphide) is rendered unfloatable by the addition of a little cyanide, the iron pyrite then, not accompanying the copper pyrite, but falling down with the gangue. The cyanide apparently does not dull the iron pyrite. It has what metallurgists term a "deadening effect," an expression that does not explain clearly the manner in which the cyanide acts.

Of course, much depends on the perfection of these methods. Should the product arrive at the smelter wholly free of iron pyrite the work of the smelter man would be greatly lightened. Only that part of the sulphur in the copper pyrite would then have to be volatilized or burned, and no iron would have to be removed. True, this is only an aim and not such an end as can be wholly attained, but in the measure in which the object sought is approached, so much the less has the smelter to do and so much the less coke, powdered coal or oil has to be used.

In smelters also fluxes must be used in quantity. These absorb an immense amount of heat and when the fluxed material is run to waste much heat is lost. With less impurity in the ore, less flux is needed, and a further saving is made in heat. So from these causes we may look for metallurgical economies similar to those effected in the power house and on the railroad. These will severely harass the operator, especially in the Rocky Mountain States where the metal industry is an important consumer of coal.

These savings, of course, reach a limit as savings have a way of doing. By selective flotation lead and zinc are already in some instances being purified from each other and from the gangue almost to that ultimate point, the lead product becoming 60 per cent pure lead instead of 30 per cent as in the past and being rid of zinc, that *bête noir* of the lead smelter man.

Sixty per cent sounds a low per centage of concentration to the average coal man, but it must be remembered that lead and zinc are in chemical combination each with another element, sulphur, and cannot be freed of that impurity in a concentrator, the action of which is merely physical. Only the smelter or leaching plant can break up chemical compounds.

Interesting but perhaps less menacing to the present opportunities of the Rocky Mountain coal producer is the leaching method of the Ohio Copper Co., of Bingham Canyon, Utah. The system of operation of this company, fortunately perhaps for the coal industry, cannot be applied generally or perhaps frequently. This company does not even mine its ore but just drives a tunnel through it and then extends branches from the tunnel and pours water on the surface of the ground above these subterranean operations.

## FLOWING WATER CONVEYS ORE

This water dissolves the water-soluble portions of the ore. Thus partially saturated the water flows into the tunnel bearing its precious mineral burden and is brought by the tunnel, with minimum impurity, to the launders where it is treated with iron scrap. The copper content in the end product is 89.39 per cent.

As may be readily understood, not all the copper in the ground is water-soluble. Of the meager 6 lb. of copper in every ton (the Ohio Copper Co.'s deposit is probably of a lower grade than any other being worked elsewhere) possibly 2.7 lb. may be leached out after many years of alternate oxidation and leaching, but the result is that the Ohio Copper Co. produces the cheapest copper in the United States and when the product is received at the smelter but little needs to be done to it as compared with what must be done with the product from other plants; so again less fuel is needed.

Other recent savings in the use of fuel for metallurgical purposes are the use of hot metal without unnecessary cooling and delay wherever that metal has to be retreated. This waste of heat has been avoided, for many years, at iron plants where steel is manufactured, and the copper plants are now taking heed to the ways of the iron-and-steel industry.

Coal loses its fight in other ways. The smelters are often a long way from the concentrators and the ore has to be hauled from the latter to the former. The concentrators need an area for tailings and an opportunity for the use of gravity in passing the rock from process to process, and the smelter needs to be where farm lands will not be destroyed or homes rendered uninhabitable by sulphurous gases. The separation of these two classes of structures causes coal to be used for transportation and there is a distinct saving in railroad fuel when the concentration of the mineral is carried further at the concentrator than has hitherto been the practice.

When the Institute party returned from a trip to the Magna concentrator of the Utah Copper Co. the visitors saw by the side of the road the badly wrecked steam-power plant of that company. For some time the Utah Copper Co. has been purchasing its power from the Utah Light & Power Co., which obtains its electrical current from water sources.

Here is another instance where coal has found a powerful competitor. In passing it may be said that the action of the Utah Copper Co. has been followed by the Carbon County coal producers.

No one knows, of course, what the final effect of the savings in the metallurgical use of fuels will be. Economies are necessary if the mines of the United States are to compete with those of far richer foreign districts such as the Katanga copper district in South Africa and the Chile Copper Co. district in South America. These savings may preserve an industry which if removed would use no fuel from the United States at all, certainly not Utah or Rocky Mountain coal and possibly not any from the United States. Katanga is well taken care of by South African coal deposits.

Just how far flotation may be used to lighten the labors of the smelter man and deprive the coal man of market is not clear. So many "gangues" can be floated, at least in a small measure, that it would be bold to say how far the principle may or may not be extended. Thus, 45 per cent of a certain quartz can be caused to float with the use of suitable agents, but other material with which it may happen to be mixed may be equally willing to float. In consequence no separation by these means may be possible.

Without avowing anything, it might be added, what a boon it would be to the iron industry if the quartz could be separated from iron oxides by flotation and the large quantities of "paint rock" and other siliceous ores made available. The coal industry of the East would lose in the coal used for the transportation and smelting of siliceous material, though it might gain in the increase of ore treated.

---

# Institute Hears Argument Over Utah Mine Safety Code

A HEATED ARGUMENT over the Utah mine safety code and the reading of two coal mining papers comprised all there was of further interest to coal men in the sessions of the Institute at the Salt Lake City meeting. No trips were arranged to coal mines and no great number of coal men attended. Those interested in coal had had their opportunity at the Rocky Mountain Coal Mining Institute meeting in Price, Utah, the preceding week.

However, enough coal men were present at Salt Lake City to make a lively discussion when it was charged that the Utah operators had framed the state mining code while they were in a condition of hysteria following the Castlegate disaster of March 18, 1924. The man who made that charge was an engineer privately employed to make a study of Utah conditions last year after a carbide company had protested to state officials that the new rule against carbide lamps was unneccessarily rigid.

At the A. I. M. M. E. first session in Salt Lake City, Aug. 31, J. C. Dick, chairman of the Utah section and Governor George H. Dern, of the State of Utah, welcomed the visitors. The governor himself is a mining engineer. The papers all related to the mineral industry. At 12 noon the members visited the Mormon Tabernacle in the temple grounds and heard the world-famous organ and in the afternoon drove to Saltair, where many bathed in the salty waters of the great lake. In the evening two technical sessions were held in the Hotel Utah in one of which A. C. Watts delivered his interesting and important paper on "Electric Shotfiring Experiments in Coal Mines," printed in *Coal Age*, Sept. 3, and Daniel Harrington, an illuminating address on "Safety Methods in Utah Coal Mines." At the other session, C. T. Keighy addressed the members on the "New Byproduct Coke Plant of the Columbia Steel Co."

At the conclusion of Mr. Harrington's paper there occurred the hot discussion of which E. K. Judd was storm center. Mr. Judd declared that the state of Utah had an unusually dangerous condition because the coal was highly explosive and the air was abnormally dry (He said the maximum and minimum saturation percentages at 6 p.m. in Salt Lake City for 36 years, computed by months varied from 27 to 76 per cent and that the percentages are still less in Carbon County). The coal also is extremely thick making the detection and removal of methane from points near the roof quite difficult. However, he believed that the record was misleading. Utah did not have such an undue fatality rate in coal mining. It was true that the disasters at Winter Quarters and Castlegate were distressing in the extreme and seemed to justify the most drastic measures but between the dates of these two catastrophies were twenty-three years without a single disaster.

In those years there were 304 fatalities, 193 being due to falls, 72 to cars or locomotives, 10 to explosives, 8 to machinery, 6 to electricity and only 5 to gas or dust. As the production of Utah is thirteenth on the list, any large accident like that at Castlegate has percentage results out of proportion to those which such a disaster would cause in West Virginia, Illinois or Pennsylvania. In a state of "hysteria," said Mr. Judd, "the operators of Utah had consented to drastic regulations which they would not have considered at all if the pressure of public opinion and the explosion at Castlegate had not overpowered their judgment."

The disasters at Rains, Utah, and at Frontier and Sublet in Wyoming had all three taken place in mines worked by electric lamps. Mr. Judd believed that Daniel Harrington, former district engineer for the U. S. Bureau of Mines, had done wisely in recommending that men be sent in after the shots have been fired to see whether brattices need repairing and to repair them where they have been displaced. It appeared to him that this would relieve the firebosses giving them more time for their inspection for gas.

Mr. Judd said that the disaster at Winter Quarters was the result of an explosion of a magazine in the mine. Some men were killed by the direct force of the explosion; some by after damp. Some dust entered into and aggravated the force of the explosion. He questioned Mr. Harrington's statement that two-thirds of the mines were gaseous, his record showing that nine were gaseous, five were doubtful and 15 were not gaseous. He had noted that judging from reports made by foremen in the last month more air was being used in non-gaseous than in gaseous mines. In the former the quantity might be 1,000 cu.ft., whereas in the gaseous mines the air supplied ran from 300 to 500 cu.ft. per minute.

Otto Herres, vice-president, U. S. Fuel Co., took much exception to Mr. Judd's remarks, especially as regards "hysteria" in the adoption of Utah's concordat. He said that most of these so-called drastic regulations were being enforced by many of the coal companies before the rules regarding them were formulated by the Commission and that they were placed in operation with the consent of the operators. In fact the operators in adjoining states had somewhat generally adopted the rules for the regulation of their own mines. As for Mr. Judd's statement regarding the inability of firebosses in some mines to provide for the removal and ascertain the presence of gas, Mr. Herres said that this shortcoming would be removed in a short while.

Benedict Shubart indignantly denied there had been anything approaching hysteria. He pointed out that the Rocky Mountain Coal Mining Institute formulated a code before the concordat was signed and that its provisions, made without pressure and of its own cool judgment, paralleled those of the code. A. C. Watts and Mr. Harrington also rose in indignant protest. Harrington declared that gaseous mines were not using less air than non-gaseous mines.

In the other meetings coal men were forgotten except perhaps when, on the evening of Tuesday, E. S. Bardisell and Roy S. Miller, of the Anaconda Copper Mining Co., Great Falls, Mont., read a paper on "The Use of Pulverized Coal in Copper-Refining Furnaces."

On Tuesday everyone went to the Magna concentrator and the Bingham mine of the Utah Copper Co., visiting on their return the Garfield smelter of the American Smelting & Refining Co.

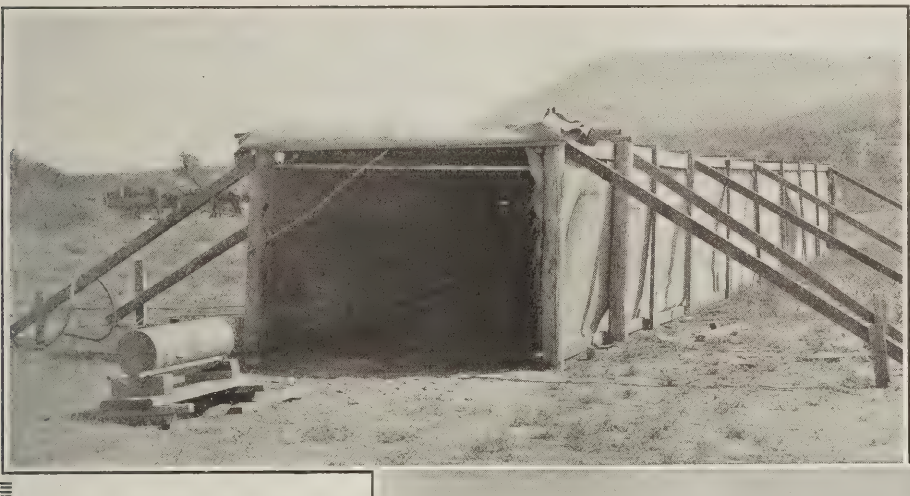
On Wednesday some went to the Murray and Midvale Smelters and others traveled nearly 50 miles in automobiles to Tronton, near Provo, where the Columbia Steel Co. is making iron from a large deposit it located in the southern part of the state using coal from Rains, and from Columbia, Utah.

Thursday some of the visitors were entertained at Park City. Others were welcomed at Tintic. Others again visited Tooele and the International smelter. That evening the visitors gathered at the Hotel Utah to see the moving pictures of the operation of ball and rod mills as modified by the presence of water and ore and by the introduction of lifters.

On Saturday after a day of rest many of the members took trains for trips in Yellowstone Park and in Zion National Park, respectively.

At Wednesday's banquet the speakers were J. V. W. Reynders, Governor Dern and Senator Charles S. Thomas. W. Mont Ferry was toastmaster. A dance in the roof garden of the Hotel Utah followed.

## *Stunts Like This Help Impress Southwestern Miners on the Dangers of Coal Dust*



This test was made at Dawson, N. M., June 7. A gallery, as shown at the left, was constructed of timber and burlap. Inside, cross-boards bearing loads of coal dust were suspended on hinges and nails. A wire to trip the boards connected them to a cannon, mounted outside the end of the gallery.

Upon firing, the recoil of the cannon jerked the wire and thus dumped the dust into suspension to meet the flash of the black-powder charge. A tremendous burst of flame and smoke resulted, as shown in the illustration on the right. Needless to say, it reduced the gallery to nothing.

# Anthracite Miners' Pay Is High For Time They Work

### U. S. Department of Labor Finds Contract Men Could Earn $8,000 a Year if They Labored Long but Averaged Only 6 Hr. 18 Minutes at Face

In the popular mind much misconception exists concerning the working conditions, hours of labor and wages received by those who actually dig the country's coal. It has long been a mental habit, indulged in by most individuals composing that vast impersonal body known as "The Public," to pity the poor downtrodden coal miner and commiserate his miserable condition, which, according to public fancy, borders upon, if it does not even constitute, industrial slavery of the most abject type. Repeated investigations by disinterested and impartial bodies have failed to dispel this false conception. One of the latest documents to set forth the true status of the mine worker is a report on "Hours and Earnings in Anthracite Mining, 1922 and 1924," printed in the July issue of the *Monthly Labor Review*, issued by the Bureau of Labor Statistics, Department of Labor, Washington, D. C. This is of unusually timely interest because of the present arbitrary stand taken by the miners' union in the anthracite region in its uncompromising demands for higher wages.

The report in question is somewhat exhaustive and voluminous, filling approximately 20 pages and containing many valuable tables. It covers a study of 56 collieries employing 44,500 wage earners during a full half month or pay period, either the last half of October or the first half of November, 1924. The figures applying to the year 1922 were taken from Bulletin No. 316 of the Bureau of Labor Statistics. Because of the length of this report only its salient features can be cited here.

### Contract Miners Work Irregularly

Most anthracite, as well as soft coal, is produced on piece work. Contract miners and contract miner's laborers constitute by far the largest class of anthracite mine workers. Of the 44,500 employees covered by this 1924 study, 11,778 were contract miners. Throughout the region day or "company" workers have fairly definite and well established hours of labor. They begin their day at 7 a.m., work either 4½ or 5 hr., take ½ hr. for lunch and quit work at 3:30 p.m. Contract or piece workers are *supposed* to follow the same routine but as a matter of fact their hours of labor depend much upon their own personal whims and inclinations. Many of them enter the mine as early as 6 o'clock and leave about noon. Others go into the mine anywhere between 6 and 7 a.m., take as much time as they choose for lunch (they usually regale themselves during odd times such as while waiting for cars), and leave the colliery anytime between 12 noon and 3:30 p.m. Few, if any, ever remain at the face after this latter hour. Indisposition, sickness, the lure of the wily trout or some other good and sufficient cause is liable to keep them from their work at least a few whole days during each month.

During the half month of 1924 covered by this report, contract miners worked 10.8 days, spent 6 hr. 18 minutes at the face each day on the average and earned an average of $9.07 per day. The average half month's pay of these men was $98.07 which would indicate a probable yearly earning capacity of $2,353.68. Over 77 per cent of these contract miners earned more than $1 per hour for all time spent at the face including the lunch hour.

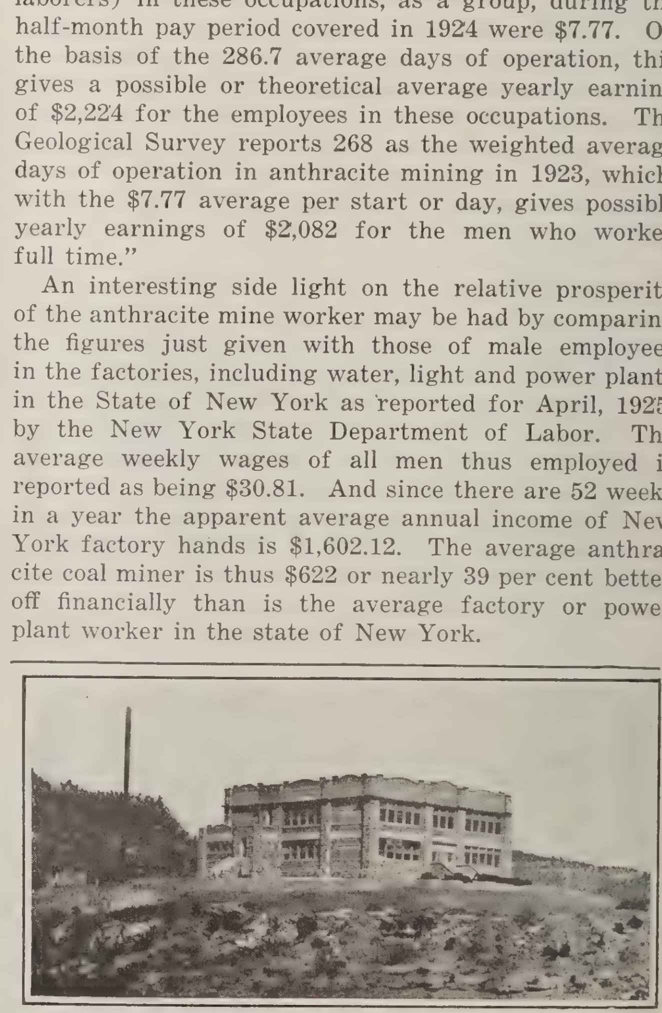
During the half month covered, 211 of these contract miners averaged over $3 per hour for all time spent at the face including that taken for lunch. This would indicate possible earnings in a full day in the mines somewhat exceeding $28. The weighted average time worked by the anthracite mines during 1924, as shown by this report was 286.7 days. If these 211 men had chosen to work at the rate that they held during the investigation, a full day every day of the year that the collieries operated their earnings would have been $8,027.60 each—and in only ten states of the Union do the salaries of the governors amount to $8,000 per year or more.

Figures covering the earnings of contract miner's laborers are scarcely less interesting. During the semimonthly period in question these men to the number of 6,794 averaged $6.47 per day and $65.39 for the half month. This would indicate annual earnings of $1,569.36.

### Average Yearly Earning of $2,224

To quote from the report: "The average earnings per start of the 23,715 employees (miners and miners' laborers) in these occupations, as a group, during the half-month pay period covered in 1924 were $7.77. On the basis of the 286.7 average days of operation, this gives a possible or theoretical average yearly earning of $2,224 for the employees in these occupations. The Geological Survey reports 268 as the weighted average days of operation in anthracite mining in 1923, which, with the $7.77 average per start or day, gives possible yearly earnings of $2,082 for the men who worked full time."

An interesting side light on the relative prosperity of the anthracite mine worker may be had by comparing the figures just given with those of male employees in the factories, including water, light and power plants in the State of New York as reported for April, 1925, by the New York State Department of Labor. The average weekly wages of all men thus employed is reported as being $30.81. And since there are 52 weeks in a year the apparent average annual income of New York factory hands is $1,602.12. The average anthracite coal miner is thus $622 or nearly 39 per cent better off financially than is the average factory or power plant worker in the state of New York.



**A Public School Building in New Mexico**

This modern stone structure is located in Dawson, N. M., where the Stag Canon group of mines is operated by the Phelps Dodge Corporation.

# Slope Conveyor Requires Less Power than Shaft Hoist

### Youngstown Sheet & Tube Co. Mine Shows Consumption of 0.31 Kw.-hr. per Ton at Shaft and 0.23 Kw.-hr. at Slope Under Identical Conditions

**By J. H. Edwards**
Associate Editor of *Coal Age*,
Huntington, W. Va.

WHEN the seam of coal to be mined lies 200 ft. or less below the surface, the use of a slope conveyor will likely prove a better proposition than a hoist. Although the item of power required per ton of coal hoisted or conveyed, is but a minor factor in the selection of equipment for a given case, it is well for the electrical man to have a general idea of what can be expected.

An excellent opportunity for obtaining a comparison of power requirements of the two methods was that afforded at the Dehue, W. Va., operation of the Youngstown Sheet & Tube Co. Here the coal lies approximately 90 ft. below the surface and for several years was mined from two openings located not over three quarters of a mile apart. One of these openings, a shaft (Fig. 1), is equipped with a modern hoist driven by a 250-hp. wound-rotor induction motor. The other opening, a slope of approximately 28 deg. (Fig. 2), is equipped with a 48-in. apron conveyor driven by a 75-hp. induction motor, also of the wound-rotor type. Each opening is served by a modern steel tipple and the rated capacity of the equipments is approximately the same, namely, about 2,000 tons per day.

The 250-hp. and 75-hp. motors are each equipped with watt-hour meters for recording the energy consumed.

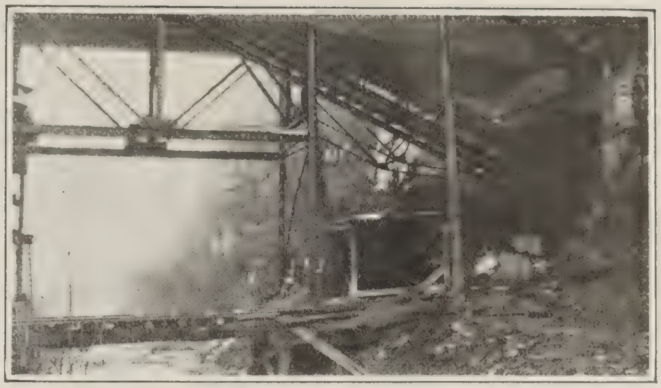


**Fig. 2—The Slope Conveyor at Dehue**

Here the average for twenty months was 0.23 kw.-hr. per ton of coal handled. A 75-hp. motor drives a 48-in. apron conveyor which enters the mine at an angle of about 28 deg. The vertical depth is about the same as that at the shaft. The conveyor has the added advantage of imposing a much lower demand on the power system.

During twenty months of continuous operation with tonnages ranging from 10,000 to 25,000 per month from each opening, the average power requirements were as follows:

| | |
|---|---|
| 250-hp. motor; kw.-hr. per ton of coal hoisted | 0.31 |
| 75-hp. motor; kw.-hr. per ton of coal conveyed | 0.23 |

In addition to the lower energy consumption per ton of coal, the conveyor has two distinct advantages over the hoist. The peak power demand is less than a third as great, and no operating engineer is required. Judging from the present trend of installations, a belt conveyor would show a still greater advantage over the hoist. This trend has received a great deal of careful thought from many mining men.

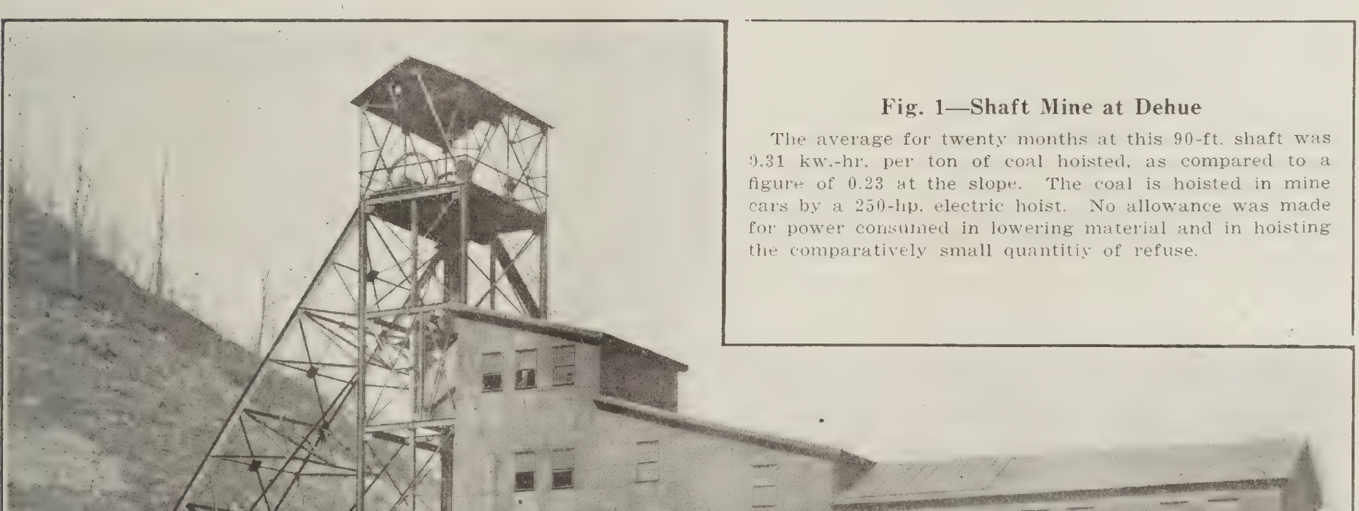

**Fig. 1—Shaft Mine at Dehue**

The average for twenty months at this 90-ft. shaft was 0.31 kw.-hr. per ton of coal hoisted, as compared to a figure of 0.23 at the slope. The coal is hoisted in mine cars by a 250-hp. electric hoist. No allowance was made for power consumed in lowering material and in hoisting the comparatively small quantitiy of refuse.

# News Of the Industry

## Pinchot Calls in Lewis and Inglis But Says It Is "Not Intervention"; Starts New Protest on Lake Rates

Governor Pinchot of Pennsylvania has taken the center of the stage in the anthracite situation. At the same time he has pledged the backing of the state to bituminous operators in the western and central districts in a rate fight against non-union competition in the lake and seaboard markets.

The Governor, whose intervention in 1923 added millions to the householders' annual fuel bill, stepped into the anthracite picture on Sept. 11 with the announcement that he had invited Major W. W. Inglis, representing the operators, and John L. Lewis, president of the United Mine Workers, to meet him on different days at his country home in Milford, Pa., to go over the situation created by the hard-coal strike. The invitations, he insisted, did not constitute an overture to intervention because he respected "the right of the President of the United States to say the first word" on that subject.

Major Inglis talked with the Governor on Sept. 12. On the following day the Governor held a conference with James B. Neale, one of the leading independent producers. On Sept. 14 Mr. Lewis was his guest. In accordance with advance announcements, no statements were issued by any of the conferees as to the course the discussions had taken or the decisions, if any, reached.

The Governor's interest in the rate situation was made known in a telegram to the Pittsburgh Chamber of Commerce published Monday morning. In that message Governor Pinchot stated that he had been deeply impressed by the serious condition of the soft-coal industry in the central and western parts of the state. "No small part of the damage," he asserted, "arises from unfair freight differentials against Pennsylvania coals." Rates to the Great Lakes and to the seaboard and interior New York and New England points, he declared, unduly favor competitors in West Virginia and Kentucky. He stated that it was his intention to proceed with an investigation into the seaboard situation "to the end that the readjustment of those rates may be taken up actively with all the backing the state government may be able to supply."

He specifically requested that the chamber take steps to ask the Interstate Commerce Commission to reopen the Lake Cargo cases, recently decided adversely to the contentions of Pennsylvania and northern Ohio, and intimated that if the cases were reopened the State of Pennsylvania would intervene in support of the plaintiffs. George R. Wallace, president of the chamber, announced that action on the Governor's request would be taken within the next few days.

### L. & N. Is Buying Heavily

Bids for passenger and freight cars, the cost of which will be approximately $3,600,000, have been asked for by the Louisville & Nashville R.R., it was announced at the office of the president Sept. 11. These inquiries are in addition to bids requested for thirty-two locomotives, costing about $1,600,000, announced recently. This is one of the largest inquiries made by railroads this year. The L. & N. is reported to have placed an order for 70,000 tons of steel rails to cost about $3,000,000.

## Retailers Back Operators In Stand for Arbitration Of Anthracite Troubles

Coal retailers of the country are lining up behind the anthracite operators in the fight to compel the United Mine Workers to accept arbitration. Concrete evidence of this stand was given at the 15th annual convention of the New York State Coal Merchants' Association at Richfield Springs, Sept. 10-12. Following an address by Walter Gordon Merritt, general counsel for the Anthracite Operators' Conference, explaining the issues of the strike, Roderick Stephens (New York) moved that the state association distribute copies of the speech to the public through its members. R. J. Wulff (Brooklyn) immediately pledged his company to take 10,000 copies. W. A. Clark, president, New England Retail Coal Dealers' Association, announced that his organization must be counted in on the plan. S. B. Crowell, president, National Retail Coal Merchants' Association, promised the support of his group in a national distribution.

The closing session of the convention went on record urging press and public to support "the anthracite operators' position that the miners shall return to work and that all grievances and demands shall be referred to a suitably chosen board of arbitration whose decisions shall be accepted by both parties to the dispute." Another resolution called upon whoever should be named to settle the strike to recognize the importance of lower prices and to work for the removal of "every unfair restriction upon output and every other restriction that prevents the attainment of a minimum production cost." A third resolution exhorted every retailer to look upon the present emergency as an opportunity for service, to adopt such policies as will best conserve supplies and promote equitable distribution and to avoid "price increases, except to the extent that such increases are necessary to equalize unusual expenses."

Mr. Merritt's address pointed out that the United Mine Workers, an outstanding advocate of arbitration in 1902, now held the doubtful "honor of being the banner bearer of industrial combat against peaceful arbitrament." Such a position he denounced as antisocial. The operators, he explained, have from time to time during the past three and one-half years offered arbitration; the suggestion that a fact-finding commission inquire into the industry; a long-term agreement, with provisions for readjustments of wages during the life of the contract; a continuance of operations pending negotiations, intervention, or arbitration, as the case may be."

Harry L. Gandy, executive secretary, National Coal Association, brought the meeting the comforting assurance that the bituminous mines of the country would be able to take care of any deficiencies in production caused by the anthracite strike. The two danger areas, the Northeast and the Northwest, were unusually well supplied with fuel at this time, said Mr. Gandy.

Mr. Stephens, in an address on "Self-Government in Business," opposed the Borah bill now being backed by the Brooklyn Chamber of Commerce and stated that the retailers hoped to have an early conference with the Brooklyn organization. Mr. Clark urged that the retailers insist upon fair distribution of anthracite and also stressed the need for a general industrial housecleaning. Eliot Farley, president, Delaware, Lackawanna & Western Coal Co., spoke briefly on genuine co-operation and complained that the industry had never sold its product to the public.

The retiring officers were re-elected. They are: Charles B. Staats, president; James M. Gaffers, treasurer; Frank A. Eldredge, recording secretary. George W. F. Woodside is executive secretary.

# Illinois Team Wins Chief Honors At International First-Aid Meet; 1,500 from U. S. and Mexico Attend

Highest honors in the annual International First-Aid and Mine-Rescue Meet at Springfield, Ill., last week were won by the Belleville (Ill.) team of the Southern Coal, Coke & Mining Co., led by Capt. D. L. Stuart. This team topped the other 65 contending teams from nineteen states and Mexico with a combined first aid and rescue score of 92.4, thus winning the congressional bronze medallion and the National Safety Council silver cup. The meet ran for three days beginning Sept. 10 and was attended by nearly 1,500 men from the mines of the continent.

The other principal winning teams and their scores were:

First-aid—Won by American Rolling Mill Co. team from Zanesville, Ohio, 99.04, Capt. Curt Magler (a congressional medal and first-aid trophies); second, Ferguson Coal Co. team, from Clinton, Ind., 98.90, Capt. Timothy Golden; third, Anaconda Copper Mining Co. team, from Great Falls, Mont., 98.76, Capt. Leon J. Deranleau.

Mine rescue—Second, Superior Coal Co. team from Gillespie, Ill., 87, Capt. James Struthers; third, Union Pacific Coal Co. team from Cumberland, Wyo., 86.5, Capt. Lyman Fearn.

William B. Wilson, former U. S. Secretary of Labor, and A. L. Assig, of Agujita, Coahuila, Mexico, who represents his country as an official of the Companie de Combustibles, the largest coal company in Mexico, were present. Mr. Wilson represented John L. Lewis, president of the United Mine Workers. Dr. Ralph Kaysen, of Milwaukee, a director of the Red Cross, officially represented the national organization.

### Bureau of Mines Men Attend

Bureau of Mines men who attended the meeting were: Dr. T. T. Read, Washington; F. C. Gregory, Duluth; E. H. Denny, Denver; Dr. A. R. Sayres, Washington; B. O. Pickard, Berkeley, Cal.; A. U. Miller and C. A. Herbert, Vincennes, Ind.; W. J. Feeney, Pittsburgh. Mine inspectors of fifteen states, representing the Governors of those states, also attended.

The first-aid tests were completed Friday afternoon. Fifty-five teams working in two relays participated. A corps of Sangamon County physicians acted as judges.

Rescue of a dummy from the gallery built for the meet was the most spectacular of the features on Saturday. The teams entered the gallery fully equipped for rescue work. Encountering imitation cave-ins, hanging roofs and "poison gas," each team located the "body" and carried it to safety. Judges watched each move, scoring the contestants on every phase of the rescue.

In an address to members of the teams and delegates, Mr. Wilson said: "The men in these teams are not only contesting with each other in these contests; they are demonstrating first-aid tactics in such fashion that anyone of the lay public watching the work will be able to apply in some measure in case of an accident the lessons he learns here."

Mr. Wilson led about four hundred of the fifteen hundred men attending the meet in a demonstration of tribute to Abraham Lincoln Friday morning when they made a pilgrimage to Lincoln's tomb at Oak Ridge cemetery. At the conclusion of Mr. Wilson's address a wreath was placed on the sarcophagus in the name of the fifteen hundred men assembled at the meet.

The banquet Saturday night was held in the Knights of Columbus club house. The winners of the trophies were announced and the awards given to the winning teams. No information as to the high scorers was given out before the banquet, the officials in charge thereby insuring the attendance of all the teams.

---

## Troops May Be Called Out In Oklahoma

With the exception of picketing at the Rock Island Mine No. 12, near Hartshorne, Okla., by from 300 to 400 union miners and sympathizers each morning, the situation in the McAlester coal fields is reported as quiet. Governor Martin E. Trapp, of Oklahoma, is investigating the rumors of intimidation of non-union men by union miners on strike to decide on the application made Sept. 8 by Sheriff Will Anderson for state troops to enforce martial law in the city of Hartshorne and Dow township. McAlester and other city chambers of commerce and business men generally are urging the use of troops.

The sheriff's action came as the result of the dynamiting of the fan house on the Rock Island Mine No. 12 at about 8:30 p.m., Sunday. The explosion came on the eve of the Labor Day celebration of union miners at Krebs, four miles east of McAlester. A hard downpour of rain shortly after noon on Monday drove many of the spectators to shelter and about 1,000 persons listened to Arch Helms, president of the Missouri union miners, accuse the operators of violating their wage scale agreements. Joseph Paggani, of Indianapolis, spoke in Italian and urged peaceful methods in efforts to win the strike, or "lockout," as union officials call it. Union meetings are held almost nightly in the region.

Miners are still at work at several of the mines in the district, of which the most important is the Rock Island Mine No. 12. For the last several mornings the non-union men on going to work have had to pass through about 200 or more union picketers and sympathizers, who so far have been reported as peaceful.

These picketers pretend to be sincere in their prayers for the men going to work and for the guards, paid by the operators to watch over their property. Out of this picketing and the prayers, however, have come rumors of intimidations, when union miners have formed committees to visit the men still working and try to get them to join the lockout.

## Railroads Protest Cut In Rate on Soft Coal To New England States

Formal protest was filed Sept. 9 by the railroads against the order issued last month by the Interstate Commerce Commission to prepare a new schedule reducing rates on West Virginia low volatile coal for movement to the Atlantic seaboard and New England States. The roads were ordered to establish the lower rates by Oct. 15.

The commission intended to make it possible to move into Eastern territory at low rates types of bituminous coal used in more or less degree as substitutes for anthracite.

The Pennsylvania, Baltimore & Ohio, New Haven, Boston & Maine and Reading railroads joined in protesting the order on the ground that the decreases would reduce revenues. They declared also there was no reason for making reductions to any point south of New England, and that under the order they would be required in many cases to charge a lesser rate for a long haul than they now charge for a short haul.

Another point raised by the roads was that the rates to Baltimore from West Virginia, under the order, would be $3.45 per ton, whereas the figure should be $3.70. The objections were set forth in a brief to the commission.

The Pittsburgh Coal Producers Association and the Pittsburgh Chamber of Commerce have joined in protesting the order of the Commerce Commission. While the Pittsburgh association is not directly interested in the case, the protest, which was in the form of a telegram to the commission, is based on the belief that the new rates will cut off shipments of bituminous coal from this district to Eastern points.

Immediately after the commission's order was issued, operators in the central Pennsylvania field set to work to get a reduction on rates from that field to the East. The producers have conferred with railroad officials during the past two weeks on this question, the traffic manager of the Hillman companies being represented at these meetings.

The railroads assert that the new rates will reduce their revenues.

The Central Pennsylvania Coal Producers' Association filed a protest with the commission Sept. 14 and asked that the rates be made effective only as an emergency provision in case of possible fuel shortage in the Middle Atlantic and New England States.

At the end of the fiscal year the Bureau of Mines had 830 employees of whom 307 held technical positions. The technical staff was distributed as follows: Washington, 44; Pittsburgh, 99; field, 164. The technical staff in Washington was constituted as follows: Engineers, 19; chemists, 12; miscellaneous, 13. In Pittsburgh the engineers numbered 43, the chemists 35 and those with miscellaneous specialties 21. The division in the field force was: engineers, 83; chemists, 27, and miscellaneous, 54. These figures do not include the technical men connected with the Bureau in a consulting capacity.

## Pittsburgh Coal Co. To Open Second Mine At 1917 Wage Scale

The Pittsburgh Coal Co., according to information from an authoritative source, will reopen another mine in the Pittsburgh (Pa.) district soon, possibly within a week, on the 1917 scale. This will make the second mine of the company to be operated on the lower wage rate, and it was declared that sufficient former employees of the company have expressed a willingness to work in the new mine to start it up practically full at once.

Opening is being delayed due to the non-arrival of some supplies and negotiations for full protection by the authorities.

A report which gained circulation in the East late last week said the company planned to reopen the Warden mine, near McKeesport, but this is not true. The new mine to be opened will be located in the same district as Banning No. 2, Whitsett Junction, which has now been running for several weeks on the 1917 scale.

On the last full day of last week the company had 222 men working in Banning No. 2 and produced 679 tons of coal, which was the highest output of any day so far.

The company was host last week to a party of newspaper men on a trip to the mine, where it was conclusively demonstrated that the reports of the number of men at work, which the officials of the United Mine Workers are consistently denying, are true. The party remained overnight and thus had the opportunity of seeing the force at work twice.

———

Production of coal in Alaska declined in 1924 to 99,663 tons valued at $559,980. Output in 1923 had totaled 119,826 tons worth $755,469. All other mining operations in the territory showed declines in 1924 except in the case of gold, which rose from 289,539 fine ounces in 1923 to 304,072 fine ounces. The total value of Alaskan mining products in 1924 was $17,457,333 as compared with the 1923 total of $20,330,643.

*Keystone View Co.*

**Sir Herbert Louis Samuel**

Chosen to head British Coal Commission which is to investigate the industry thoroughly, following the recent strike which had to be settled by government subsidy. As the subsidy is daily costing England much money, the new commission has been invested with power to make a thorough inquiry and consider all proposals for the reconstruction of the industry, which include nationalization.

## B., R. & P. Lease Ratified by D. & H. Stockholders

Stockholders of the Delaware & Hudson Co. at a special meeting Sept. 8 approved the recommendation of the board of managers for the leasing of the Buffalo, Rochester & Pittsburgh Ry. for 999 years. The managers approved the lease on June 24 and the directors of the B., R. & P. approved it May 1. In the balloting by Delaware & Hudson stockholders 77.4 per cent of the stock was represented. There were no objectors.

The lease provides for payment by the Delaware & Hudson Co. of an annual rental sufficient to pay 6 per cent dividends on the $6,000,000 outstanding preferred and $10,500,000 outstanding common stock of the Buffalo, Rochester & Pittsburgh. In a letter to the stockholders, President Loree expressed the conviction that the "terms of the lease are advantageous."

## Death Rate in Coke Making Lowest in History

Accidents to persons engaged in the manufacture of coke in the United States in 1924 resulted in 24 deaths and 1,645 injuries, according to statistics compiled by W. W. Adams, of the Bureau of Mines, Department of Commerce. The figures show a lower death rate and a lower injury rate for the coke industry than in any other year on record. Reports from operating companies show that 20,451 men were employed in the industry in 1924, and that they performed a volume of work equivalent to 6,204,448 man-shifts, an average of 303 workdays per man. The death rate was 1.16 per thousand men employed (full-time or 300-day workers), and the injury rate was 79.54. Injuries considered in this calculation are those causing disability beyond the remainder of the day or shift on which the accident occurred.

As compared with 1923, the number of employees in the coke industry in 1924 represented a decrease of 14 per cent; the number of man-shifts, a reduction of 19 per cent; the average workdays per man, a decline of 6 per cent. The number of deaths was 21 less than in 1923 while the non-fatal injuries were 948 fewer in number than in the previous year. Both the beehive and byproduct branches of the coking industry shared in the lowering of the accident rates in 1924. The beehive death rate per thousand 300-day workers was 0.75 and the byproduct rate 1.26.

Pennsylvania employed 6,819 men at coke ovens during 1924, which is more than were employed in any other state; Ohio was second, with 2,099 men. Other states employing more than 1,000 men each were: Indiana, 1,901; Alabama 1,527; Illinois 1,248, and Michigan 1,109.

———

C. P. White, Chief of the Coal Division of the Department of Commerce, who sat with Secretary Hoover's Advisory Committee on the reorganization of the Bureau of Mines, at Salt Lake City, Utah, will inspect the field stations of the Bureau of Mines at Berkeley, Calif.; Seattle, Wash.; Minneapolis, Minn.; Columbus, Ohio, and Pittsburgh, Pa.

# Bittner Calls Out Non-Union Men In West Virginia Strike Region; More Attempts at Tipple Burning

Fairmont, W. Va., Sept. 15. — A strike call to the non-union coal miners of the Fairmont field, effective Friday, Sept. 25, was issued today by Van A. Bittner, chief international representative of the United Mine Workers in charge of northern West Virginia.

The strike is to go into effect the day before the arrival of John L. Lewis, international president; Philip Murray, international vice-president, and Thomas Kennedy, international secretary and treasurer, who will participate in one of the largest gatherings of union coal miners held here recently, union officials assert. In addition to a parade, for which the miners obtained a permit yesterday, Mr. Lewis and the other international officials will address a large assemblage of coal miners at the old fair grounds, in Maple Avenue, on the outskirts of Fairmont, in the afternoon of Sept. 26.

This will be Mr. Lewis' first visit to the region since Feb. 4, when he conferred with the coal operators of northern West Virginia, signatories to the Baltimore agreement, who wanted a wage adjustment in the scale commencing April 1. The international president refused to consider this request.

A circular letter to officers and members of local unions issued by Bittner Sept. 11 announces another membership drive in the strike zone. The letter reads as follows:

"As a part of our campaign of organization in northern West Virginia, it is absolutely necessary that non-union production be completely eliminated. It is impossible at this time to disclose all the plans and policies of the United Mine Workers of America in their fight for American standards in northern West Virginia.

"Local unions are instructed to immediately proceed to accept membership of the present non-union miners and initiate these men for the sum of $1. You will be told in the very near future just when the charter of our organization will again be closed and applicants not allowed to be initiated in this field.

"Call special meetings of your local unions, select your organization committees and clear the deck for action."

### Alleged Tipple Burners Caught

After state deputy fire marshals were at work on the case for some time, Harry Craig, 32 years; Glenn Pife, 26 years, and Joseph Secreta, 19 years, were arrested Sept. 11, in Harrison County, charged with burning down the tipple at mine No. 55 of the Consolidation Coal Co., at Meadowbrook, on Aug. 29, causing a loss of $40,000.

An unsuccessful effort was made to burn the tipple of the Eureka mine of the Bertha Consumers Coal Co. at Maidsville, near Morgantown, early Friday morning, Sept. 11. The fire, which is reported to have started by igniting gasoline-soaked rags, was discovered by a Monongahela Ry. crew connected with the Maidsville yards. "Big Bertha," as it is dubbed by the miners, produces 50 cars of coal a day and is regarded as the largest single tipple mine in the Morgantown section.

Information was received in Fairmont late last week that the West Virginia Supreme Court had refused to act immediately upon the writ of error granted to Van A. Bittner, chief international representative of the United Mine Workers, who was sentenced to six months in jail and fined $500 for contempt of court. The case will come up in the next regular term and probably will not be reached before Jan. 1, if then. Former Judge Emmet M. Showalter, general counsel of the Continental Coal Co., the complaining concern, tried to get the court to pass on the writ forthwith.

### Shooting Affrays Reported

A. J. Phillips, a mine guard employed by the Jamison Coal & Coke Co. at No. 8 mine, near Farmington, was shot in the face from ambush early last week, but escaped serious injury. Bullets shot from a gun with a silencer, were found in the mine fan, company officials report. A mine guard employed by the New England Fuel & Transportation Co. shot and killed C. H. Harris, who conducts a pressing establishment at Grant Town, last week, when he attempted to stab a non-union miner with a butcher knife. All of the parties are negroes.

In the first four days of last week the non-union mines produced 5,063 cars of coal, a decrease of 784 cars compared to the corresponding period of the previous week. The output, considering the fact that only 200 cars of coal were loaded Monday, is considered remarkable. Union tonnage in the first four days—really three work days—was 825 cars, compared to 1,067 cars the previous week. On the average 183 non-union mines were at work during that time and 13 union mines. Non-union production on the Monogah Division, B. & O., on Sept. 10 set a new record at 915 cars, and mines on the Wyatt-Bingamon & Helen's Run of the Western Maryland set a new pace at 68 cars.

Little new has developed in the Panhandle strike, except that on Sept. 11 announcement was made by the Richland Coal Co., of Wheeling, that within the next two weeks it will reopen four mines in the Panhandle section closed since early in June, when receivers were appointed. A. E. Bryant and the Dollar Savings & Trust Co. are the receivers, and Mr. Bryant is authority for the statement that the mines will resume operation on a non-union basis.

The activity of the Ku Klux Klan in the labor struggle in northern West Virginia was bitterly attacked by James L. Studdard and other international representatives of the United Mine Workers at Labor Day meetings in the strike zone. When the Klan arranged a big demonstration in Fairmont on Labor Day the labor representatives charged that the organization sought to usurp a day dedicated to labor. The imperial wizard failed to arrive, however, and the affair was not of the magnitude promised.

International organizers seem to think that there is a close alliance between the Klan and non-union coal operators. On several occasions while miners' mass meetings were being held, international men say, bombs were exploded on nearby hillsides to disturb the gatherings, only to be followed later by "fiery crosses.'

Employees of the Sitnek Coal Mining Co. at Lumberport a non-union operation, held an outing Labor Day and obtained a minister to deliver an address, instead of labor agitators.

### *Temple Iron Co. Dissolves*

Final action to dissolve the Temple Iron Co. was taken at a special meeting of stockholders of the company at Reading, Pa., Sept. 2. The company has been inactive since 1914, when it was obliged to dispose of its anthracite mine holdings on the order of the U. S. Supreme Court, which ruled that it constituted a monopoly. The Temple Iron Co. for years was known as the hard coal trust and one of its presidents, the late George F. Baer, was the bitter foe of union labor.

Distribution has already been made of most of its assets. In the last few years the company has functioned in name only, maintaining its charter rights by annual meetings and election of officers. The last president of the company was E. T. Stotesbury, of Philadelphia.

---

## M. F. Burns Left $3,475,570

Michael F. Burns, who was the head of Burns Brothers, New York coal merchants, until his death on April 28, 1924, left an estate appraised at $3,475,570 gross and $3,062,114 net. The appraisal showed that he owned only 30 shares of preferred stock of Burns Brothers, valued at $4,850, and 800 shares of common stock in the Burns Holding Co., appraised at $102,110. The bulk of his estate consisted of securities valued at $2,102,996.

Mr. Burns owned real estate valued at $262,949; had mortgages and accounts valued at $536,476, and $102,946 in cash. His personal effects were worth only $5,092. He had an interest of $250,000 as a special partner in the cotton commission firm of Curran & Barry, 320 Broadway. Another taxable item was a contract with Burns Brothers, by which he was to receive $50.000 yearly from 1925 to 1928.

The will left the estate in equal shares to the daughters, Belle Schwarzmann, Elsie Cavanagh and Lillian Barry, and the son, Francis L. Burns, who got $767,528 each. The report also showed that in May, 1922, Mr. Burns gave $29,918 in cash and 200 shares of stock in the American Telephone & Telegraph Co. to each of his children, the total gift aggregating $217,194.

## Oddie Bill May Be Buffer Against Radical Action On Coal by Congress

**By Paul Wooton**

Washington Correspondent of *Coal Age*

Inquiry of members of Congress now in Washington and at the offices of others still absent from the Capital fails to disclose anyone with a definite purpose to push coal legislation. That there will be committee consideration of various coal bills is conceded generally. Some are of the opinion that some measures will reach the floor, but doubt is expressed as to the ability of Congress to agree on anything in the way of regulatory legislation.

Whether or not Senator Oddie calls up his bill providing for compulsory returns of basic facts will depend on the amount of demand from within and from without Congress. It never has been his idea to foist the bill on Congress. He has assembled some of the recommendations of various authorities on coal and has put these ideas in legislative form. He rather is of the opinion that some of those who have had harsh things to say about his bill will be anxious to see it brought forward before the Congress is very old, so as to offset radical proposals.

### Coal Commission Report Delayed

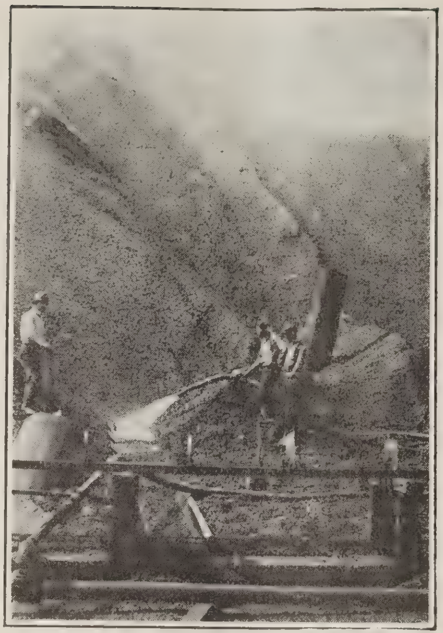
Some members of Congress are displaying no little impatience because the report of the Coal Commission is not yet available. Interest is evinced in that phase of the report which deals with a differential profits tax. It is recognized by the legislators who think the anthracite industry should be regulated that one of the great difficulties they face is to devise a method whereby a part of the profits of the low-cost producers may be applied in such a way as to make possible a reduction in the price of coal or, in the case of those anxious to help the United Mine Workers, to apply on an increased wage. The Coal Commission's plan contemplates the return of excess profits to the whole public.

In Great Britain a somewhat similar proposal took the form of the suggested wages pool. The low-cost mines would contribute to the fund from which the high-cost mines would draw. This plan has been resisted vigorously by the British industry, but it persisted throughout the discussion in the United Kingdom this summer and now a related idea has cropped up here in connection with the transportation situation.

Former Commissioner Potter of the Interstate Commerce Commission and one of the receivers of the Chicago, Milwaukee & St. Paul R.R., has suggested that freight rates be advanced and that all the profit from that increase go to the weaker railroads. His reasoning is that the stronger roads after having had a reasonable return should contribute their excess earnings to the betterment of transportation generally. He points out that a whole tier of states in the Northwest is dependent upon the C., M. & St. P. and that such a common carrier must be maintained.

This proposal has aroused unusual interest in Washington as it is recognized as simply a restatement of the principle involved in the recapture clause of the Transportation Act, the constitutionality of which already has been upheld by the Supreme Court of the United States. Furthermore, it presents the same principle involved in the Pullman surcharge, which was so decisively upheld at the last session of Congress. While Mr. Potter's suggestion amounts to a tax on the public, it is pointed out that the public, in one way or another, has to pay to keep the weak roads going and by this method they can do it without paying larger profits to the strong roads. It is agreed that the last has not been heard of the Potter proposal.

The application of some such principle to coal is expected to occur to some of the national legislators. Moreover, any number of them were in the British Isles during the heat of the coal discussion there and are familiar with the wages pool idea. That bills attempting to apply a modification of the idea to the situation here will be introduced is fully expected.



P. & A. Photos.

**Storage Pile That Will Help to Weather Hard Coal Strike**

Reserve stock at mine near Scranton, Pa., pictured on eve of the strike. The coal is being flushed through a trough into a scraper conveyor to be taken to the loading point or to the colliery to be washed and sized.

---

The Virginian Ry. will receive bids until Sept. 23 for its estimated requirements of high volatile mine-run locomotive fuel coal for the year beginning Oct. 1, 1925. Approximately 600,000 tons will be required, delivered at the rate of about 50,000 tons per month. Bids must be submitted to D. C. King, purchasing agent, Terminal Building, Norfolk, Va.

## Brotherhood Sells Its Rail Line to C. & O. Ry.

With the approval Sept. 8 by the Interstate Commerce Commission of the purchase of the line of the Coal River & Eastern Ry. by the Chesapeake & Ohio Ry. that purchase, which has been pending for several months, has been completed. The Coal River & Eastern was a subsidiary of the Coal River Collieries Co., owned by the Brotherhood of Locomotive Engineers, and is 12 miles long, having been built from Seth to Prenter for the purpose of reaching the Coal River branch of the C. & O.

In order to obtain a division of rates, the Coal River & Eastern in 1924 petitioned for authority to operate its line as a common carrier, a petition which was opposed by the C. & O., that road contending that the Coal River & Eastern was only a spur. The petition did lead, however, to negotiations for the purchase of the short line, and in May it became known that an offer of $370,000 had been made by the C. & O.

The Coal River Collieries Co. is preparing to embark upon a program of expansion, following the sale of the road, and expects to increase the output of the company to a million tons annually. The output of the mine at Prenter, now in operation, will be increased from 1,000 to 5,000 tons daily and other improvements made.

## Railroads Save on Fuel Bill

Class I railroads saved about $22,500,000 on their fuel bill during the first half of this year compared with the first half of last year, according to figures issued by the Interstate Commerce Commission. The total cost of coal and fuel oil for the first half of last year was $185,572,620 against a cost of $163,120,525 for the first half of this year. This saving of $22,452,095 resulted partly from a decrease in the price of coal and partly from economies effected by the railroad managements, as the average cost per gallon of fuel oil advanced.

Notwithstanding this saving, the railroads increased the average number of cars per freight train from 40.7 in the first six months of 1924 to 42.9 in the first six months of this year and the net tons per train from 694 to 727. In spite of the heavier and longer trains, the freight traffic of the country moved 0.4 of a mile faster this year than last.

The railroads covered in the report consumed 47,406,574 net tons of coal at an average cost of $2.78 per ton in the first half of 1925, compared with 49,721,957 tons at an average cost of $3.18 a ton in the corresponding period of 1924. In June 7,126,738 net tons of coal was consumed, as against 6,916,210 tons in June, 1924. The average cost per ton in June was $2.70, compared with $3.02 in the same month a year ago, the respective totals being $24,376,103 and $25,314,756.

# Problems In Underground Management

## Improved Low-Head Siphon Has Many Virtues

### Operates with Least Possible Head, Draws Water Over High Humps and Always Remains Primed Even Though Sump Goes Quite Dry

By **J. Alfred Scollon**
Barnesboro, Pa.

The improved siphon shown in the accompanying illustration is really nothing more than the ordinary device of this kind supplemented by a short inverted siphon at each end. It is designed to operate with the least effective pressure head, to efficiently draw water over higher summits than will a common siphon, and to remain primed, or full when the water in the sump has been lowered to the same elevation as the discharge level, or even when the sump for any reason may be completely drained.

As the effective pressure head decreases (see accompanying drawing) the velocity in the siphon likewise will decrease until the water level of the sump reaches the same elevation as the discharge level, when the flow naturally will cease. Since the water level at the suction end $A$, and at the discharge end $D$ are then the same, the hydrostatic pressure will be equal at both extremities. With the atmospheric pressure on the ends the same, the two legs of the siphon will exactly balance, regardless of the length of either. With the upturned portions $AB$ and $DE$ filled with water, air cannot enter the line from either end on account of its being so much lighter than the water in the pipe. The water is held in the line as long as it is thus balanced. When the water in the sump again rises above the discharge level, the total pressure at $A$ will be greater than that at $D$, and the siphon will resume its operation.

The limit of vertical height $S$ to the summit of the siphon is equal to the height of water column that the atmospheric pressure will balance. This limit will vary with altitude and atmospheric conditions, and may be found by multiplying the barometer height by the specific gravity of mercury (13.58 at 60° F.). Thus, if the barometer reading is 28 in. this limit will be:

$$S = 13.58 \times 28 = 380.24 \text{ in} = 31.69 \text{ ft.}$$

This improved siphon is installed and put into operation in practically the same manner as the ordinary device of this kind, and the same formula applies.

Practical considerations determine the highest permissible water level in the sump. The vertical distance, $H$, from this level to the discharge elevation may be measured and the length of the required siphon line may likewise be determined. Then if the rate of maximum influx of water to the sump is known or can be estimated, the size of pipe may be calculated. This pipe must have sufficient capacity to carry the maximum amount of water entering the sump when the height, $H$, of the water in the sump above the discharge level is as high as possible. Assuming that the curvature in the turned-up ends of the pipe is uniform, and that the radius of curvature is not less than about twelve times the diameter of the pipe, the extra friction due to these curves may be considered negligible.

The following formula is used:

$$D = \sqrt[5]{\frac{G^2KL}{8H}}$$

When

$D$ = Diameter of the pipe in inches,

$G$ = Number of gallons per minute flowing into the sump,

$L$ = Total length of the siphon line in feet,

$K$ = Coefficient of friction (usually taken as 0.01),

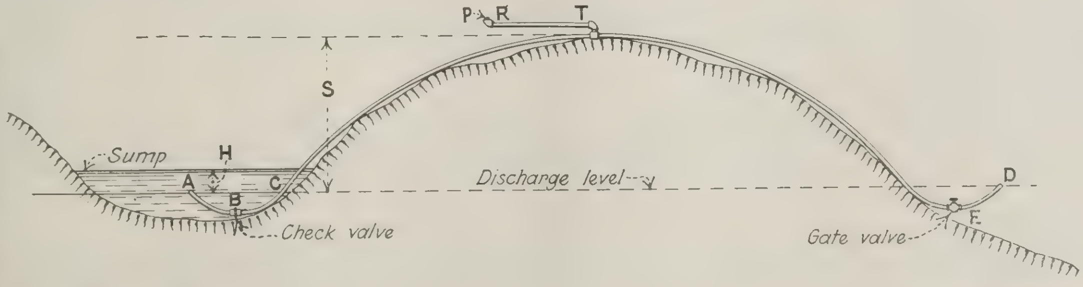
and

$H$ = Highest permissible effective head in feet.

From the same formula we find that $G = 2.83D^2\sqrt{\frac{DH}{KL}}$,

$$\text{and } H = \frac{G^2KL}{8D^5}$$

When installing a siphon of this kind it is well to make each of the distances from the low points $B$ and $E$ to the discharge level, at least six times the diameter of the pipe. If the siphon is to be used in a mine where the ventilating pressure is different at its two ends, the effective pressure head, $H$, will be increased or decreased by the height of water gage which this difference



*Arrangement of Improved Siphon*

in ventilating pressure will produce. This height of water gage should be added to or subtracted from the vertical distances from the points *B* and *E* to the discharge level.

In place of having the ends of the line turned up as shown, they may be turned downward and submerged in a barrel or other suitable receptacle filled with water. The elevations of the ends of the pipe will then correspond to the low points *B* and *E* and the overflow points of the barrels will correspond in elevation to the discharge level of the siphon as here shown. If it is definitely known that the water in the sump will never go below the level of the discharge line, the short section *AB* on the suction end may be omitted.

After the proper elevations, size of pipe, etc., have been determined the next most important consideration is so to construct the line that it will be absolutely air-tight when under pressure. Usually a check valve is placed in the line at the low point *B* on the suction end and a gate valve at the corresponding point of the discharge end. These should be closed only when the line is being primed or filled. The siphon may be primed by means of a force pump connected to either end, or by pouring in water at the summit.

In order to bleed out all the air (which may result from the formation of small bubbles in the line while it is being primed), an air chamber connected to a tee at the summit of the siphon should be used. This may take the form of an air-tight tank, or a piece of pipe, preferably of larger diameter than the siphon line, as shown by *TR*. This tank has an opening on top, *P*, that may be tightly closed by a metal plug. A valve should be placed between the summit of the siphon and the air chamber. The upper internal surface of the short piece connecting the siphon line and the air chamber, as well as that of the chamber itself, must have a continuous upward pitch, so that any air-bubbles reaching the summit of the siphon may pass, without obstruction into the air-chamber when both have been filled with water.

While the siphon is being primed, the gate valve between its summit and the air chamber as well as the vent, *P*, in the top of the air chamber are left open so that all air may be expelled. When the whole system has been filled to the top of the air chamber, and practically all air in the line has been expelled at *P*, the valve between the siphon summit and the air chamber should be tightly closed. It may be reopened when the vent at *P* has been closed.

Before opening the gate valve at *E* the short turned-up section of pipe *ED* should be filled with water. The siphon is put into operation by opening this valve.

If it is later found that the flow has stopped when the water level in the sump is above the discharge level, or if the velocity at the discharge has fallen below normal for the existing height of the water in the sump, it is probable that either the gate valve at *E* has been fully or partly closed, or that air is entering the line through a small leak. If the latter is found to be the cause of the trouble, the air in the siphon may be expelled by closing the valve between the siphon summit and the air chamber, opening and refilling chamber with water, closing it tightly, and then opening the valve between it and the siphon summit. Unless the leak is found and repaired, it will be necessary to repeat this operation later.

---

# Device for Extension of Face Tracks Has Back-Stop Horns

By C. P. Turley

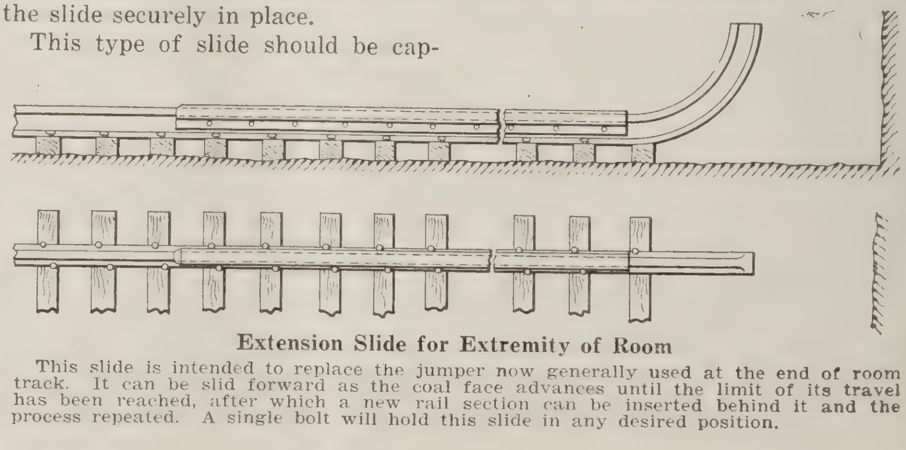
Stirrat, W. Va.

It has long been recognized by mining men that the method usually employed for extending track at the working face is inefficient, troublesome and expensive, yet little progress has been made toward overcoming these difficulties. Surely at a time like the present, when every effort is being made to decrease the cost of production, this item of expense should not be overlooked.

In seeking a remedy for the difficulties encountered in extending track, my attention has been called to a device that appears to possess many advantages over means and methods now in use. This contrivance is shown in the accompanying illustration. It consists of a steel slide, U-shaped in cross-section, with a short piece of curved rail bolted to its extremity. The slide is so made as to conform to the shape of an ordinary T-rail and readily slips back and forth upon the size of rail for which it is designed. Holes are so placed in this slide as to conform to the drilling of the rail fitted. A bolt inserted in one of these holes and passing through the rail holds the slide securely in place.

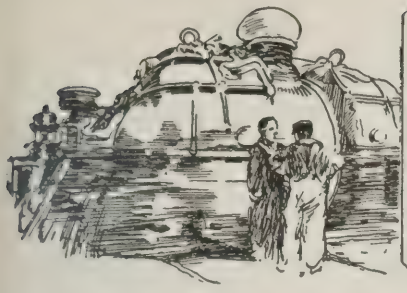
This type of slide should be capable of being extended 15 ft. Such a slide when thus used in conjunction with a 15-ft. section of rail will permit the employment of 30-ft. rail lengths. Before such a length of rail is put in place, however, the slide should be slipped over its end. As the face advances the slide may be moved forward until it is fully extended when a 15-ft. rail length may be added. Other lengths of rails and slides may, of course, be used.

If shortwall machines are to be used at the face the bolts holding the slide to the rail may be withdrawn, and the slide pushed back until the machine has passed, after which it may be slid forward again and fastened in place. The horn at the extremity of the slide is designed to prevent cars from running off the end. This effectively forestalls loss of time from this cause. Where the grades will permit, the motorman can "kick" empties to the face. Also in picking up loads he need not exercise extreme care in approaching or coupling onto them. Even if the loaded car is bumped by the locomotive it will not be derailed.

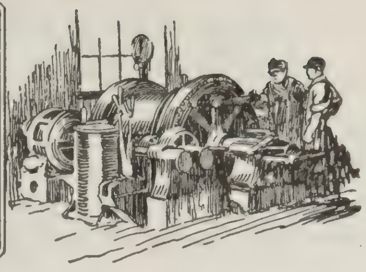


**Extension Slide for Extremity of Room**

This slide is intended to replace the jumper now generally used at the end of room track. It can be slid forward as the coal face advances until the limit of its travel has been reached, after which a new rail section can be inserted behind it and the process repeated. A single bolt will hold this slide in any desired position.



# Practical Pointers For Electrical And Mechanical Men



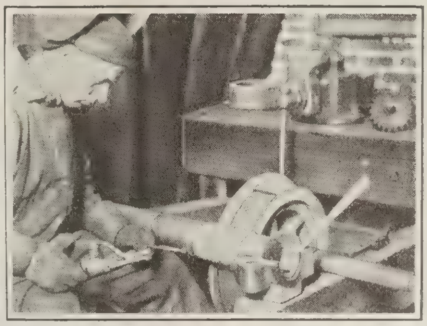
## Electric Welds Should Be Reinforced, Results of Many Tests Show

It was about 1908 that autogenous welding by means of an electric arc and a metallic electrode made its first commercial appearance. From then until 1914 the process made but slow gain, steam railway companies being the principal users. It was not until 1919 that coal mining companies began to install electric welders in their repair shops. Now an electric welding machine is considered as one of the first essentials of a well equipped repair shop.

In order to make intelligent applications of electric welding it is necessary to have an understanding of what strength can be expected from welds made by an experienced operator. The following figures are a summary of the results of tests on a series of welds made by an operator who up to that time had had about ten years' experience and was considered the best among a number of operators. The welds were made on sections of boiler plate $\frac{3}{8}$ in. thick and 3 in. wide. The ends to be butt welded were ground on an emery wheel to the correct bevel, and ordinary mild-steel electrodes of $\frac{5}{32}$-in. diameter were used. The specimens were pulled and broken in a testing machine.

| | |
|---|---|
| Tensile strength of original plate, lb. per square inch | 56,000 |
| Efficiency of joints welded on both sides, per cent | 90 |
| Efficiency of joints welded on one side, per cent | 83 |
| Ratio of strength (per square inch of section) of welded metal to the original, when plain electrodes were used, per cent | 63 |
| Same, when using flux-coated electrodes, per cent | 71 |

In every test of the welded specimens the rupture took place directly through the center of the weld rather than along the line where the added metal was joined to the plate. The average tensile strength, per square inch of welded metal at the break, was 38,200 lb.



**Welding in a Mine Shop**

Filling the tread of a steel tire and building up a worn axle are the jobs which happened to be caught in the photograph from which this illustration was made. It will be noted that the second layer of metal is being applied to the tire and that the bead is put on crosswise. The operator's face shield is raised while he changes electrodes.

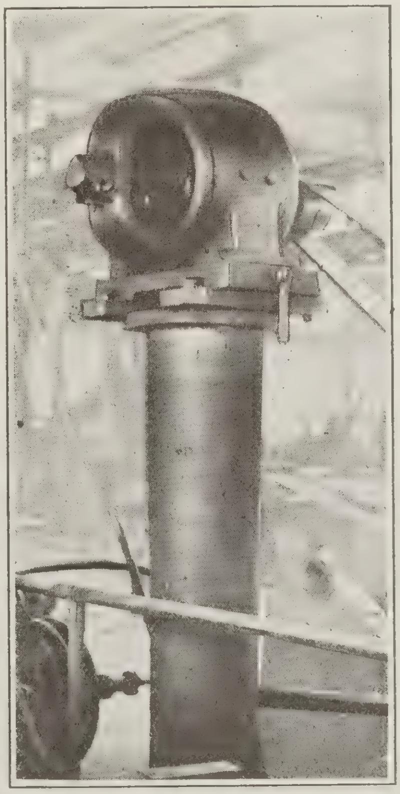
The ratio of strength of the added metal to the original, 67 per cent (an average of the above figures for plain and flux-coated electrodes), indicates that if the specimens had been reinforced at the weld to approximately 150 per cent of the original size, the strength of the welded specimen would have been equal to the original. From this is deduced the rough rule that an electric weld on ordinary low-carbon rolled steel should, if possible, be reinforced so that the weld will have an area about $1\frac{1}{2}$ times larger than was the area of the break.

## Cast-Iron Pipe Makes High Motor Stand

It is a well recognized principle of mechanics that in order to attain its maximum efficiency, a belt should be run horizontally or nearly so. This is because in this position the weight of the belt assures adequate tension and consequent friction of the belt on the pulleys. It is also well recognized that, particularly in shop and mill work, it is advantageous to place the motor driving a machine at a point somewhat elevated above the shop or mill floor. It is, however, not always convenient to find a suitable foundation at such an elevated point.

The accompanying illustration shows an elevated motor stand employed in the No. 4 shop of the Kingston Coal Co., Kingston, Pa. This stand consists essentially of an old length of cast-iron pipe, the lower end of which is imbedded in a suitable concrete foundation, set level with the shop floor. The flange on the upper end of the pipe furnishes a suitable bearing for the oak beams upon which the motor itself rests and to which it is bolted, the beams being fastened to the flange.

A support of this kind answers all the requirements of motor mounting. The cast iron pipe is sufficiently rigid to absorb any vibration that may be present, and also to resist the tension of the belt.



**Keeping It Up**

Elevating the motor well above the mine shop floor has many obvious advantages. A large cast-iron pipe set flange end up in a substantial concrete foundation accomplishes the desired result—raises the motor well off the floor, keeps the belt tight and affords a firm yet resilient base.

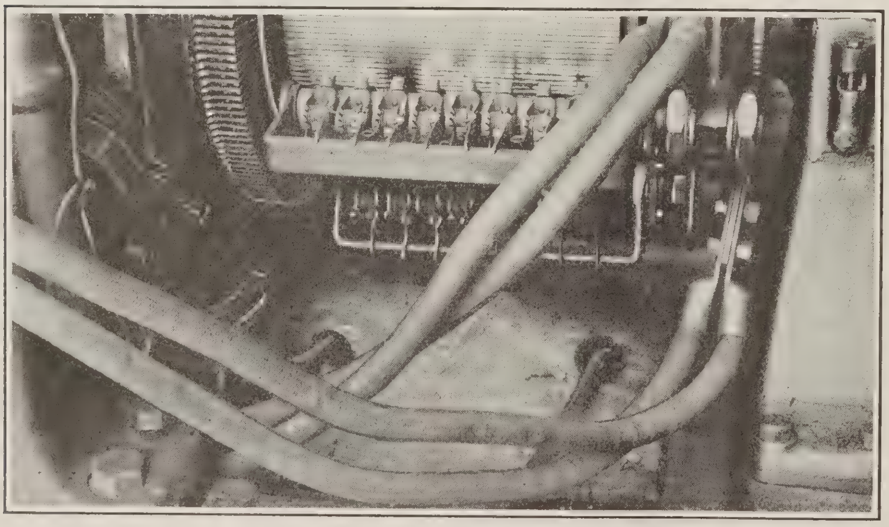
## Cable Conduits Terminate Below Floor Level

It has happened many times that the floor of a substation has been flooded, but that no damage has been done to the under-floor wiring because of the fact that it was installed in metallic conduit and the ends of this conduit carried to a point a few inches or more above the floor. Other instances have occurred where the water rose to a level above the tops and filled the conduits, necessitating a tedious job of drying out, or if neglected, resulting in grounded wiring.

For a substation located where there is good opportunity for drainage and where there is only a remote possibility of flooding, the method of under-floor wiring illustrated in the accompanying illustration has proved satisfactory. A shallow pit is provided under the machine, and a narrow trench made in back of the switchboard, and both equipped with tile drains to the outside. The conduits for the wires are carried straight from the pit to the trench, these conduits ending flush with the sides.

Advantages of this type of installation are: (1) low first cost; (2) installation does not require a skilled conduit worker and special bending tools; (3) because there are no bends there is no trouble in pulling heavy cables through; (4) wires are readily accessible for repairs; (5) no trouble is experienced in running additional small wires from the machine to the board as is necessary in case special control or protective features are added; (6) in the remote case of flooding, the conduits will drain themselves.

Mention of the last advantage brings up the point that it is well to lay the conduit with a slight pitch toward one end so there will be no chance for water to stand.



**Conduits End Flush with the Walls of the Pit**

In this particular installation of a 300-kw. converter at a West Virginia coal mine, fiber conduit is used. The other ends of the conduits terminate in the same way in a shallow trench back of the switchboard. This is an inexpensive but satisfactory method of installation.

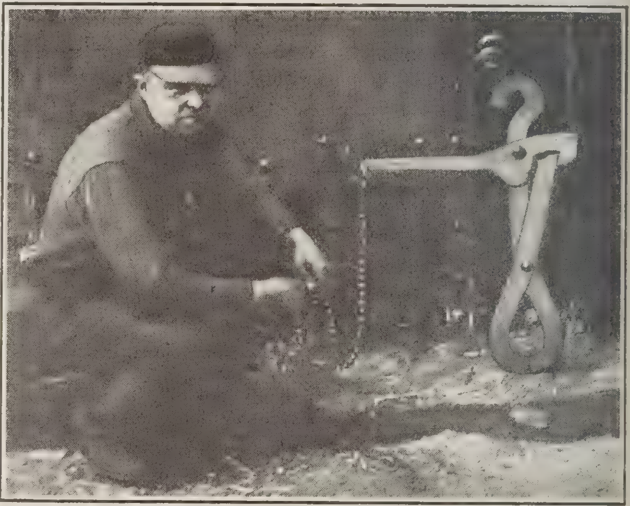
---

## Lever Latch Makes Cage Testing Safer

Many and varied are the arrangements made for testing the condition of safety dogs on cages, but they all resolve themselves into three schemes, the third of which, described in this article, is safest. One plan is to jack the cage over the mouth of the shaft allowing a little slack in the bridle chains which is taken up by a loop of hemp rope strung between the hoist rope clevis and the cage. The blocks are then removed from under the cage and the hemp rope is cut causing the cage to drop a distance equal to the slack in the bridle chains.

**"Life Tongs"**

This device, built by John Fark (in the picture), Ford Collieries Co. blacksmith, releases a cage for a test of the safety dogs. The top hook engages the hoist rope clevis and the jaws hold the drawbar clevis. A pull of the chain drops the cage. No man need endanger his life to do it, as is necessary by some other testing methods.

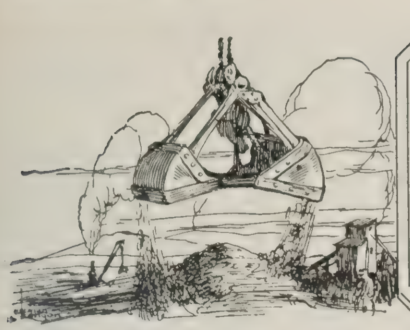


A second scheme sometimes employed is to disconnect the rope and chains from the cage and then join the hoist rope clevis to the cage drawbar by a loop of hemp rope. When the hemp rope is cut the cage may drop only an inch or two before the safety dogs catch or it may go 20 or 30 ft. Sometimes it may drop to the bottom, due to the failure of the dogs or to the rotten condition of the guides.

Neither of these two schemes can be executed easily and both—particularly the second—expose the testing men to danger. Several men have lost their lives while standing on the cage to cut the hemp rope in cases where the cage has dropped to the bottom of the shaft.

A third method, and by far the best, involves the use of a mechanical release which can be controlled from a distance. John Fark, blacksmith at the Benjamin mine of the Ford Collieries Co., Curtisville, Pa., devised a mechanism which makes the job of testing cage safety dogs safe. He and his device appear in the accompanying illustration.

His mechanism works on the scissor principle as in a pair of ice tongs. The lower jaws come together when in a closed position and are held so by a lever latch. A chain at one end of this lever opens the latch on the other end. At the upper end of one arm of the pair of tongs is a hook which, during a test, engages the hoist rope clevis while the points of the tongs encircle the drawbar clevis. In this position the tongs are the only support between the rope and cage. By a mere pull on the release chain the cage drops away from the rope.



# Production And the Market

## Public Remains Calm as Strike Continues; Soft-Coal Trade Active

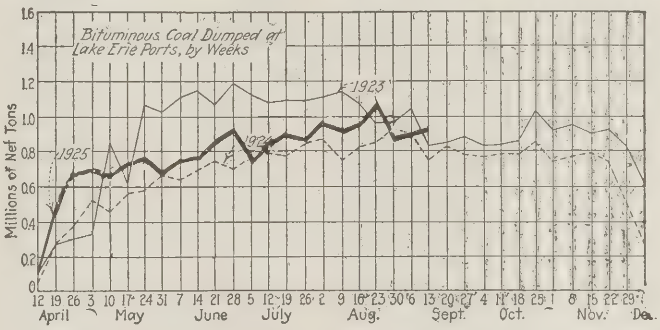
The third week of the hard-coal "suspension" finds definite steps toward a settlement no nearer than a week ago. Governor Pinchot of Pennsylvania, it is true, has had conferences with Major Inglis and John L. Lewis, but the results, if any, have not been made public, the Governor stating that his action was not an attempt at mediation but in order to keep posted on the situation. Never, perhaps, has a shutdown been marked by less evidence of panic or even nervousness on the part of the public than the present. Anthracite consumers, for one thing, have a larger proportion of their winter's needs on hand than usual at this time, and, basing their opinion on past experiences, are confident that an agreement will be brought about—through government intervention if necessary—before the danger point is reached.

The market, of course, is not lacking in vagaries, wholesale prices for domestic sizes varying according to buyer and seller. Quotations were reported ranging from $11 for stock chestnut and $12.50 for fresh mined chestnut to $14 for stove and egg. Coal in bottoms is reported quoted at $15 to $16.25 alongside. Practically all sizes but pea and No. 1 buckwheat are out of the market, old line companies taking care of regular customers as best they can.

### Soft-Coal Market More Active

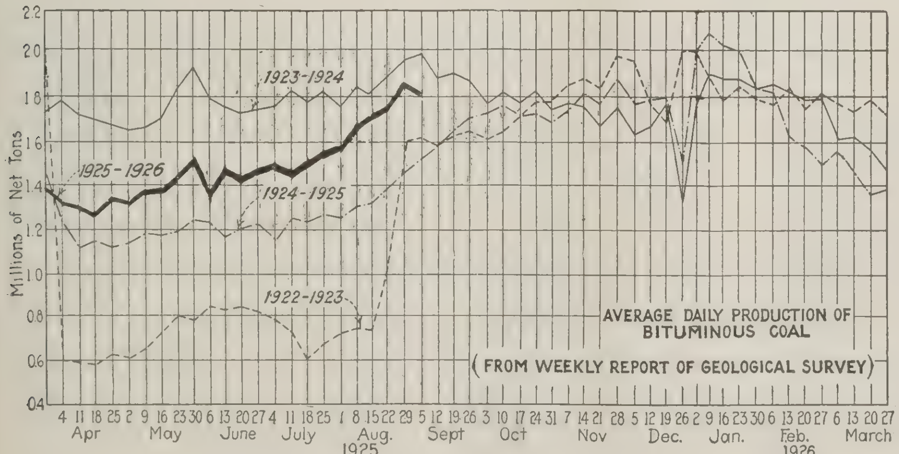
Increasing activity marks the bituminous coal trade, working time at most mines showing an advance and many operations that had been closed for some time being able to resume. The demand is strongest for high grade coals, smokeless continuing to be the outstanding market feature. It is worthy of note, however, that such union fields as southern Illinois, Indiana and Ohio are beginning to feel the benefit of the improvement in demand. In many instances operators are selling their product subject to price prevailing at the time of shipment, no definifite figures being quoted.

Production of bituminous coal during the week ended Sept. 5 is estimated by the Geological Survey at 10,808,000 net tons, compared with 11,202,000 tons in the preceding week, as shown by revised figures. There was some production of anthracite on Aug. 31, the day before the strike went into effect, but reports are insufficient to permit an accurate estimate of the output.



*Coal Age* Index of spot prices of bituminous coal receded slightly last week, standing on Sept. 12 at 178, the corresponding price being a fraction less than $2.16.

Dumpings at Lake Erie ports during the week ended Sept. 13, according to the Ore & Coal Exchange, were: Cargo, 887,705 net tons; steamship fuel, 45,331 tons—a total of 933,036 net tons, compared with 931,257 tons in the preceding week. Hampton Roads dumpings during the week ended Sept. 10 totaled 382,935 net tons, compared with 421,390 tons in the previous week.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |
|---|---|---|
| **BITUMINOUS** | | |
| Aug. 22 (*a*) | 8,582,000 | 10,522,000 |
| Aug. 29 (*a*) | 9,006,000 | 11,202,000 |
| Sept 5 (*b*) | 8,208,000 | 10,808,000 |
| Daily average | 1,560,000 | 1,801,000 |
| Cal. yr. to date | (*c*) 308,578,000 | 328,301,000 |
| Daily av. to date | 1,475,000 | 1,561,000 |
| **ANTHRACITE** | | |
| Aug. 22 | 1,711,000 | 2,209,000 |
| Aug. 29 | 1,837,000 | 2,319,000 |
| Sept. 5 | 1,451,000 | (*d*) |
| **COKE** | | |
| Aug. 29 (*a*) | 110,000 | 165,000 |
| Sept. 5 (*b*) | 112,000 | 159,000 |
| Cal. yr. to date | (*c*) 7,015,000 | 6,567,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years. (*d*) Insufficient data.

### Midwest Market Is Active

Demand for Indiana and Franklin County coals in the Midwest market continues very good; southern Illinois and Indiana Fourth Vein operators, in fact, are selling 6-in. lump at the price current at time of shipment, no definite figures being quoted. And all seem to be oversold two or three weeks ahead. The smaller prepared sizes are moved only with some difficulty except when applied on contracts made earlier in the season. A great deal of fine coal also is to be had at lower prices than have been quoted previously this year. Business on the lower grades of Indiana coal, such as Fifth Vein, remains very poor. There was a little spurt this last week, however, when the miners declared a general strike at all mines located on the C. & E. I., due to an increase in fares to the mines.

Eastern coal is still in strong demand and prices have been keeping pace. But little eastern Kentucky and West Virginia coal is offered. Certain states, such as Minnesota and Iowa, have been slow in placing orders, but the general opinion is that with cooler weather the demand will increase. The anthracite strike has not aroused the public or dealers.

Pocahontas holds strictly at the $5 basis, with mine-run at $2.55@$2.75. Though sales have been made in some states at these prices, consumers in this part of the country have not taken to the high prices. Midwest dealers look for a suitable substitute in a high-grade eastern Kentucky or other West Virginia coal. A few Chicago jobbers, finding new business not coming in as freely as it was two weeks ago, fear a reaction, though the low stocks in dealers' bins would seem to presage that the demand on high grade coal will continue to be good for some time.

Warm weather in southern Illinois has interfered with the movement of domestic tonnage. Even lump, which was somewhat scarce, has become plentiful in a way on account of dealers holding up their orders. This is general all over Illinois, however, and the result is that there is plenty of coal to be shipped and orders are easing up. Steam seems to be keeping up pretty well with production from shaft mines. Nearly full time is being worked now by nearly all the mines and railroad tonnage is reported good. Strip mines are working full time and seemingly have a good market, although prices are not what were expected. A shortage of water throughout Williamson and Franklin counties has affected production.

Mines in the Duquoin and Jackson County fields are beginning to work full time, as there is a fairly good demand for all coal. Throughout all of these fields there are several mines that have not resumed operations. The surplus of labor that was evident a month ago is rapidly disappearing. In the Mt. Olive field there is continued activity and a good movement of domestic and railroad tonnage is reported, with steam about equal to the production. Working time is three to four days a week.

## Current Quotations—Spot Prices, Bituminous Coal—Net Tons, F.O.B. Mines

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Sept. 14 | Sept. 7 | Aug. 31 | Sept. 15 |
| Index | 178 | 179 | 174 | 167 |
| Weighted average price | $2.16 | $2.16 | $2.10 | $2.02 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

In the Standard field there is some increase in working time and in demand for domestic sizes and, strange to say, steam has picked up in the last week. Prices don't mean anything as they are about the cost of production excepting at mines that are oversold, which are asking prices that the quality and preparation of the coal don't justify. Mines in the Standard field are working from three to five days a week and coal is moving fairly well. Prices are unchanged.

In St. Louis warm weather has slowed up domestic buying. Yards are full and the demand, which has been for high grade, is slipping off to middle grade and cheaper coals and a considerable tonnage of western Kentucky coal is beginning to move throughout the territory where Illinois had been firmly entrenched. Dealers are advising their customers to some extent to buy western Kentucky coal and buy the cheaper grades of Illinois coal rather than Franklin County and Carterville on account of the prices, which they assert are not warranted. The effect of this resentment which prevails in St. Louis and eastern Missouri is most noticeable in central Illinois. The movement of smokeless, anthracite and coke locally is quiet. Local wagonload steam is nil but carload is good and a little storage is being put in. Apartments still continue to take Standard for storage. Country steam is quiet but country domestic is rather active and is looking for the cheaper fuels.

## Demand Slowly Gains in Kentucky

In Kentucky the demand for coal is good and improving somewhat on steam sizes, but no price changes are reported. Domestic sizes are a trifle slow on account of drought and extremely hot weather over the South and Middle West.

Eastern Kentucky nut and slack are meeting with excellent sale north of the Ohio River, due to active consumption of industrial plants, utilities, ice and cold storage and general consuming industries. When the weather becomes more normal there should be a rapid increase in demand for prepared sizes. Eastern Kentucky mines have good orders in hand and are reported to be busy. In western Kentucky production is slowly but steadily improving. As a result of the anthracite strike inquiries for prepared sizes are coming from Eastern states.

In western Kentucky improved prices of domestic have been fairly well offset by lower prices of screenings, resulting in average per ton on mine-run basis not being much over $1.40, while eastern Kentucky, which had been getting $1 and up for screenings, is showing an average from $1.60 a ton and up.

Better prices and movement have attracted the attention of wagon and small mines that haven't operated for two years or more, and indications are that these operations will soon be flourishing again and interfering with car supply. Car shortage already is beginning to develop, in fact. Water shortage also is beginning to be felt as the result of a two months drought. One operation in western Kentucky is reported to have been forced to suspend.

Labor has been a trifle scarce in some sections, but, due to dry weather and early harvesting of crops, the part-time farmer-miner labor probably will be back in the mines earlier than usual this season.

## Improvement Continues in Northwest

Improvement continues in the Duluth-Superior market. Dealers and industrial consumers have been placing orders for bituminous and anthracite of late and the docks have been shipping out fair tonnages. Dealers and the public are calm despite the anthracite strike feeling assured that plenty of substitutes will be available.

The feature in the bituminous market is another advance of 50c. in the price of Pocahontas lump, egg and stove to $8.50. Mine-run and screenings are unchanged. Quotations in all other bituminous grades are steady and unchanged. Anthracite prices are as they were save that pea is in better demand for mixing and sells for $10.50.

Shipments from Duluth and Superior docks during August totaled 20,778 cars against 14,693 cars during July and 18,589 cars during the same period last year. The total for the year to Aug. 31 was 130,685 cars, against 133,493 cars in the same period in 1924. From present indications the movement this month will exceed the August figures.

Forty-one cargoes of coal, including three of anthracite, arrived at the docks last week. This compares with twenty-nine cargoes, including only one of anthracite unloaded in the preceding week. Ten cargoes, all bituminous, were en route.

Anthracite receipts at the head of the Lakes in August were 51,636 tons against 139,292 tons in July. Total hard-coal receipts for the season to Sept. 1 were 728,245 tons, a falling off of 212,000 tons as compared with last year. Bituminous receipts last month were 1,243,653 tons, against 1,362,574 tons during July. That brought the bituminous receipts for the season to Sept. 1 up to 5,477,764 tons, an increase of 1,467,321 tons as compared with the same period last year.

The Milwaukee market is somewhat spasmodic. Dock managers report a slowing of demand as compared with that of last week but retailers say business is brisk, with greater interest in anthracite than for some time past. The price of Pocahontas has been advanced $1. Egg retails at $12.25 shoveled and $13 carried to bins, and nut at $11.75 and $12.50, respectively. Coke advanced 60c. a ton Sept. 10. Stove and nut now retail for $13, and pea at $10. Receipts by cargo continue steady. Receipts for September, to the 10th, total 125,300 tons—5,300 tons of anthracite and 120,000 tons of bituminous coal.

## Demand Steady in Southwest

In the Southwest there is a steady demand for domestic sizes, which is easily supplied from Kansas mines, and those operators whose Arkansas mines are producing report little difficulty in filling orders from that field. Oklahoma deliveries, however, are a little slow, due to labor difficulties in that field, but production is sufficient to prevent any pronounced shortage. The industrial demand has kept pace with domestic, hence coal from all mines is being moved as fast as it is mined.

In the Colorado market last week there was no change in the demand for domestic coal from the preceding week. if anything, there was a slight recession in orders in the last two days. Operations at Colorado anthracite mines have taken such a substantial jump that they are working to a full capacity. All mines are operating without any interruption through labor or transportation difficulties.

There is more coal business in the Utah market than there was, due largely, no doubt, to the fact that fall weather is nearly a month ahead of normal. Prices are unchanged and the business generally seems to be steadier than it has been for a long time. Labor conditions are excellent, and so far no serious car shortage has been felt.

Ten of the largest operating companies with headquarters in Salt Lake City are urging the public through newspaper "ads" to purchase winter coal now, statements by railroad officials being quoted on the probability of a car shortage on account of the unusually heavy crops.

### Activity at Cincinnati Shatters Records

From Cincinnati it is reported that production south of the Ohio River, as measured by the report of the American Railway Association from its car service division, has shattered every record that has stood in the past. J. A. Morris, manager for the Cincinnati district, reports that 16,691 loads of coal were moved last week. Normal used to be 4,000 to 5,000 loads a week and around 9,000 loads was the peak of the war-time movement. The week's movement was 421 cars in excess of the preceding week and of this 3,394 cars were destined for the lakes for transshipment, the latter being 41 cars in excess of the preceding week.

This in itself pretty well tells the story of the quasi-stability of prices. High volatile has advanced very little because of the pressure that has been brought to bear for business. Retailers are firing in their orders and the movement seems without end. Only coals of limited production are skyrocketing. The low volatiles and especially those smokeless types that are counted as standard have reached the $5 mark and passed it. Most of the direct selling agencies for Pocahontas are pricing their product for immediate delivery at $5.25 and some brokers are asking $5.50 for car numbers. Some, too, say that they cannot furnish lump but hold egg at $5.25, the larger size having been sold up for the month. Stove and nut have advanced to $3.75 and smokeless screenings are held firm at $2. Most of the mine-run is at $2.50 with some of the producers asking $2.75.

In the high-volatile list the sailing has been a little different. There came a lull toward the middle of the month that caused some cautious wholesalers and producers in southeastern Kentucky and in southern West Virginia to go slowly. Hazard block is being sold generally around $2.75, some Harlan is priced as high as $3 and some Elkhorn as high as $3.25. But only the fancy Elkhorns can bring that figure and there is a greater tonnage moving $2.75@$3 than at the asked price. In West Virginia an arbitrary price fixed by one of the larger producers at $2.50 a ton holds most of the better grades down around $2.75 with $3 as an outside price. Egg sizings, generally speaking, are on a $2.25 basis, though some may go a little higher and some a little lower, not more than 10c. or 15c. either way. Mine-run generally has steadied to a higher level, but slack from both states is more free and easy at $1.15@$1.25.

At retail there has been little change from $9 a ton for the smokeless prepared $6.50 for mine-run, $6@$6.50 for bituminous lump and $4@$4.50 for slack.

Because of extreme hot weather there was a noticeable let-up in the demand for domestic grades in the Columbus market last week. Retailers are fairly busy, however, on deliveries on orders booked several weeks ago. The bulk of the demand is for smokeless, splints and Kentucky varieties. Hocking and Pomeroy lump is selling better, however, and a general movement of domestic sizes is expected soon. Retailers have advanced prices to the public. Smokeless now sells at $8.25@$9; splints, $7@$7.50 and even higher, and Ohio-mined lump at $6.25@$6.75.

Steam business has not changed materially during the past week. Contracting is not brisk, although a few sizable contracts have been closed. Screenings are selling fairly well but no advance in prices have been made. There is a sufficient supply of small sizes to take care of the demand, owing to increased production of lump.

Production in Ohio fields is gradually increasing as more mines are being opened after months of idleness. Output in the southern Ohio field is estimated at 40 per cent of capacity. Some stripping mines are being opened, which will increase the total.

The flurry in the eastern Ohio coal market, growing out of the anthracite strike subsided rather suddenly during the past few days and spot prices all along the line weakened in consequence. Pocahontas and other domestic fuels from West Virginia and eastern Kentucky have dropped 50c. to 75c. per ton, with extremely warm weather prevailing and retail dealers pretty well loaded up. Steam inquiries, though better in tone than a month ago, also have dropped off considerably and fears as to fuel supply have been allayed

Output in the eastern Ohio No. 8 field during week ended Sept. 5 dropped 1,000 tons from that of the preceding week to 266,000 tons, or about 38 per cent of potential capacity. This field has produced in the calendar year to Sept. 5 8,379,000 tons, or about 35 per cent of capacity, as compared with around 42 per cent for the same period a year ago.

### Broader Market at Pittsburgh

The Pittsburgh market has broadened somewhat further, in general, with a fair increase in consumption, a considerable movement in domestic coal and a continuance of moderate stocking. Shipments of lump, including domestic, are larger, and $2 is obtained on egg, with steam slack a shade higher and mine-run $2@$2.15. Outside of the advance in steam mine-run and a 5c. rise in steam slack, to a range of $1.35@$1.40, there is no change in quotable prices, but prices continue to show a firming tendency.

Demand for bituminous coal in the central Pennsylvania district is steadily increasing and some advance in prices is noted as compared with Sept. 1. Some of the larger buyers who have been depending upon the spot market are now trying to close contracts to cover their needs until April 1, 1926. Contract prices have not been made public but spot prices are as follows: Pools 11 and 18, $1.75@$1.80; pool 10, $1.85@$2; pool 9, $2.15@$2.30; pool 71, $2.35@$2.45; pool 1, $2.50@$2.75. Loadings show a substantial gain over those of August.

It looks as if there would be some stir in soft coal in the Buffalo market before many days, but the local trade refuses to admit that there is any yet. Consumers have good stocks as a rule and refuse so far to take any stock in higher prices. Consumption seems to keep up well and the export trade is good, but not rushing. In smokeless coal and coke there is some advance, but that is mostly in the house consumption trade. Bituminous quotations, with some advances here and there, especially for slack, are $1.60@$1.75 for Fairmount lump, $1.40@$1.50 for mine-run and $1.25@$1.40 for slack; $2.25@$2.50 for Youghioheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, and $1.30@$1.60 for slack; $1.75 to $2 for Allegheny Valley mine run; Cambria County smokeless, $6 at curb.

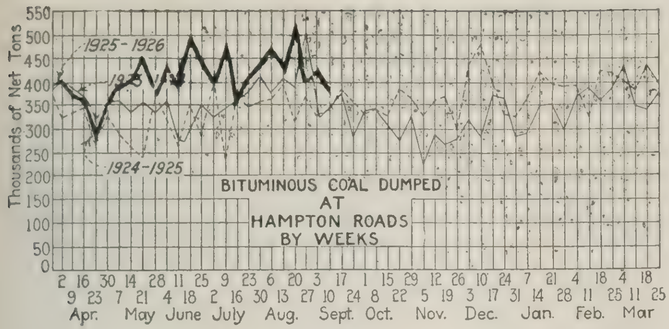
### New England Busy with Small-Lot Orders

In New England the market is still holding at high figures. Buying is reasonably active, but for the most part the tonnages are small and but few of the larger consumers are represented. Among purchasing agents there is a feeling that the bidding up of prices is being overdone and that quotations will ease off after a fortnight or so. The trade keeps whistling and points to the volume going west and the high prices obtained in that market.

At Hampton Roads there has been no material increase in the amount of coal dumped; in fact on some days certain of the agencies find themselves short. No. 1 Navy standard Pocahontas and New River are now quoted up to $5.50 per gross ton f.o.b. vessel, with indications that the shippers will try for a still higher level. More than a few contract customers in this territory are beginning to grumble over slow shipments; in some cases retail dealers are way behind the quotas they were hoping to receive.

On cars Boston and Providence the current level is $6.25@$6.50 and some of the smaller factors have none to sell even at these prices.

Pennsylvania steam coals all-rail are beginning to respond to slightly improved demand. The quality grades especially are being quoted at higher prices. Prepared sizes are very active.



## New York Market Maintains Strength

The bituminous coal market at New York continues to show strength, though demand and quotations are at last week's level. Consumers fail to show any anxiety because of the anthracite strike, but are protecting themselves against any possible shortage of coal. Anthracite has not yet become scarce enough to create any demand for screened bituminous but buying of coke has shown strength. Better business is expected during the balance of the year due to seasonal buying rather than to any other factor.

The Philadelphia market seems in a fair way to keep on improving. Probably the general business outlook has had as much to do with this as the anthracite strike. Prices have strengthened further during the last week. Handlers of highest grade special coals have had no trouble in adding something and getting it, although other shippers who have tried the same plan have not altogether succeeded. Contracting is a past issue for the present, as no one is particularly on the lookout for this kind of business, except on particularly large tonnage, which no one would pass by.

Concerns in a position to screen coal have been more active than ever, and it is a long while since so great a variety of sized coal has been offered on this market, but so far there have been practically no sales of sized bituminous coal. The coke people have fared slightly better.

The upward trend of the bituminous market at Baltimore, which was quite marked for the opening week in September, was not continued during the second week. Inquiry was of only a moderate character and prices for the most part were just maintained, and in some cases were shaded a bit. The export situation continues draggy.

Market conditions at Birmingham are better than at any previous time this year taken as a whole, and production is being maintained on a high weekly basis for this season. The output for the week of Aug. 29th., the last official figures available, showed that Alabama mines produced 405,000 net tons, which would be increased to some extent by the small operations which never report to the Alabama Mining Institute.

Steam coal is being bought fairly well in the open market, these bookings taken together with contract shipments affording the mines as now operating sufficient business to move the output very promptly. Demand continues especially strong for high-grade washed coal, of which, at times, there is a temporary scarcity. This is due to some extent to the condition of the domestic market, in which demand is not yet sufficient to readily move domestic fuel produced along with the steam product, necessarily limiting the supply of steam coal to some extent and accentuating the demand for the latter. Bunker trade is still in an inactive state.

Buying of domestic coal still lags, movement against contracts being restricted to an extent which throws more surplus on the spot market than can be readily absorbed, though there is some improvement in booking small orders and a little coal being taken on by contract holders.

Quotations are strongly established, it would seem, against any further reductions through the remainder of the year, with indications of stiffening further on some grades.

## Strike Fails to Fluster Hard Coal Trade

Although the anthracite strike has been in progress more than two weeks, comparatively little interest, much less excitement, has been shown by New York house owners, as about 70 per cent of next winter's coal supply is in bins. Retailers for the most part are apportioning supplies among regular customers and deliveries are not promised inside of two weeks. Retail prices range all the way from about $14.50 to $15.90, according to borough.

Quotations for domestic sizes at wholesale vary, depending upon the seller and buyer. There is considerable coal in bottoms, much of it owned by retailers. Very little fresh mined coal is coming forward, unless it is already sold. The old line companies are taking care of regular customers as best they can, but most independents have no coal to sell.

Quotations for coal in bottoms are reported ranging from $15 to $16.25 alongside, according to size, but the sales at the latter figure were doubtful. Fresh mined coals were reported as quoted at from $12.50 for chestnut to $14 for stove and egg, and $11 for stock chestnut. Rice and barley are reported as "out of the market" with No. 1 buckwheat quoted at $2.50@$3.

So far as shipments are concerned the Philadelphia market is about done except for pea, buckwheat and rice. All of the larger sizes held by the companies in storage yards have been disposed of, except chestnut, and all of it has been taken up by orders.

Pea is fairly plentiful with company shippers, but it would be no surprise to see it all ordered up within the next two weeks or ten days.

One of the company shippers has increased the price of storage rice coal 25c. a ton allowing buckwheat to stand at the old figures of $2.50. Barley is out of the market, as storage stocks have been cleaned up. Ordering for the two remaining steam sizes is very heavy, but the amount in storage will last for a couple of months yet. At this time it looks as if the suspension would be a long one.

The hard-coal situation in Balitmore shows but little change except that some of the dealers are beginning to cut heavily into their stocks and few of them are receiving shipments on delayed movement. Some have fairly liberal supplies and a few others may be classed as well stocked. Despite the strike the consuming public shows no disposition to hurry their orders. Although wholesale prices have advanced, the fact that little coal is coming in has led the local dealers to continue the August price schedule.

The anthracite trade at Buffalo is mostly at a standstill and will remain so till the miners go to work again. Next to no coal is coming here, but consumers are not greatly disturbed. Demand is not large, but it would be if a moderate supply of coal was coming in. Dealers say that they will supply all the pea or buckwheat that is demanded, but the consumer is in no hurry to get that. Prices are expected to remain where they are. Lake shipments last week comprised 4,500 tons to Sheboygan and 7,000 tons (pea) to Milwaukee. No more is expected to go till the strike is over.

## Light Buying in Connellsville Coke Market

The furnace coke market at Connellsville turned quiet again in the past week. Except for a little buying by blast furnaces at intervals, the market has been made by purchases by Eastern buyers, largely the public service corporations making water gas. While there is much talk of buying by others it has not run into such tonnage as did the purchases last month of water-gas makers, for deliveries over 30 or 60 days. The market is quotable at $3.50@$3.75 on the basis of recent sales, but asking prices are $3.75@$4, and probably no considerable tonnage could be had at under $4. Accordingly the gas producers will now hold off.

Blast furnaces show practically no interest. Those dependent on purchased coke are, with perhaps one or two exceptions, covered to the end of the year, if they are running, and those not running have no incentive to blow in, as pig-iron demand continues dull.

Spot foundry coke continues in light demand and remains quotable at $4@$4.50, following the recent 25c. advance from a level that had held for nearly four months.

# Foreign Market And Export News

## Coal Stocks Heavy, Business Light, In British Market

No improvement is discernible in the state of the Welsh steam coal trade, but colliery owners are hopeful that there will be some recovery in business before the end of September. Welsh coal prices are still relatively high as compared with other coals, especially German, but in view of its superior quality it is hoped that Welsh Admiralty will again win the favored position it formerly held and command prices some shillings above those of competing coals.

Though the position is not very favorable so far, this was anticipated because of the large stocks established and the fact that orders had been diverted elsewhere, some time being necessary to bring about normal working conditions. August exports have been little more than half those of August, 1923. Many collieries are engaged only half time. Stocks are enormous and very few pits are able to avoid temporary stoppages.

There is a slight improvement in the Newcastle coal trade. The prevailing low range of prices and hesitancy on the part of producers to make further concessions have had some influence in stimulating inquiries from abroad. Actual orders are slow to materialize, but foreign buyers are more disposed to sound the market, and so meanwhile steam coal turns for prompt loading has filled orders nearly a week ahead. It is therefore hoped that September will bring in a large trade. Contract business shows more life.

Production by British coal mines during the week ended Aug. 29 totaled 4,085,060 tons, according to a special cable to *Coal Age*. This compares with an output of 4,425,000 tons in the preceding week.

### Inquiry and Movement Gaining At Hampton Roads

Demand at Hampton Roads last week showed an increase, but it was not sufficient to cause any great advance in prices. Inquiries were heavier, and movement was on the upgrade.

As a result of recent improvement in prices many mines serving this territory that had been idle for months were reported in operation, and some mines that were operating three days a week for many months were on a full-time schedule.

Supplies at tidewater showed a slight increase over the previous week, and movement over the piers was slightly less. Shipments to Canada were decreasing and movement to European ports was scattered.

### French Market Shows Seasonal Pick-up in Domestic Demand

In the French coal market the demand for coal from mines of the Nord and Pas-de-Calais is increasing sufficiently this month to avoid stockage.

The usual seasonal revival in demand for home fuels in September has already become manifest. Screened coals are less neglected and orders from Belgium are more important than usual.

With regard to industrial grades the recent volume of orders has, in general, been maintained and in the sugar making industry fuel purchases are about normal.

Paris coal retailers were disagreeably surprised by the increase of "octroi" dues (city toll tax), not so much because of the advance in itself as by the fact that it was applied with scarcely any warning.

There is now a sufficiency of railway trucks, but river craft remain scarce and freight rates are increasing, the tariff from Béthune to Paris now being 25 fr.

### Belgian Industrial Coals Weak; Domestic Grades Better

Business in industrial coals has been poor in the Belgian market. British competition seems less active, however, prices of British coal being still too high. On the French side competition is also less marked, but in the face of the very light demand these two factors have had no great effect.

All categories of industrial grades have had a poor and uncertain market, with prices on the downward grade. As to stocks, they are tremendous and a number of collieries in the Borinage are at a loss where to deposit the smalls that they cannot sell.

The market for home fuels, on the other hand, is quite satisfactory and the anthracite grades are in particular favor.

# News Items From Field and Trade

## ALABAMA

The Alabama By-Products Corporation has completed the electrification of its Wegra Mine and installed electric locomotives and mining machines. Similar improvements are under way at other operations of the corporation.

## COLORADO

The International Fuel Co., of Denver, has been sold to Arthur Ponsford, Denver attorney, said to be representing coal operators of Rock Springs, Wyo., for $71,297. Ponsford's first bid of $50,000 was raised to the final figure later and approved by the bondholders' representatives. The purchase included 400 acres of coal land in Routt County, the property of the International.

The Red Canon mine, Delta, is running again, in compliance with the new state regulations.

Development work has begun on the Fort Lewis (Colo.) coal lands of the Pacific Steel Co. Preparations are already under way for the erection of a shaft house, and work on the shaft itself will be commenced at once. The shaft will be 4 x 6 ft. and unless water is encountered, it is estimated that the first 100 ft. can be sunk in about 90 days. The work will be done by hand, using a windlass and buckets. R. A. Gifford will have charge of the work for the Pacific Steel Co.

## IDAHO

V. Hufford, of the Superior Coal Mining Co., reported recently that his company would be loading coal early this month from its mine twelve and one-half miles west of Driggs. The company has 14 beds ranging from 6 to 15 ft. in thickness.

## ILLINOIS

The Forsyth Coal Co., owner and operator of the new strip mine at Ward, twelve miles south of Duquoin, started operations on a large scale the second week in September. The company owns approximately 700 acres of valuable coal land, the vein averaging 8 ft. thick about 17 ft. under the surface. The property is completely electrified, the equipment including one of the largest electric stripping shovels in operation, costing $125,000, as well as two smaller shovels for loading purposes.

Representatives of the Illinois Steel Co. and the Brereton Coal Mining Co., Brereton, have been inspecting the workings of the Jackson Coal Co. at Hallidaysboro with a view of purchase. The latter property recently went into the hands of trustees for its bondholders. The mine has been operated for about eighty-three years. Originally it was owned by the Hallidays, of Cairo, but later became the property of the Jackson Coal Co. The company holds 6,200 acres, of which only one thousand has been mined.

Fire believed to have been of incendiary origin destroyed the tipple of the Consolidated Coal Co.'s Meadow Brook mine Aug. 30. Employees told authorities three men fled from the tipple a short time before the fire broke out. The loss is estimated at $35,000. The mine has been idle for some time.

Edward H. Hebenstreit, formerly of Nokomis, who was identified with the coal mining industry in central and southern Illinois for several years, has accepted a position as superintendent of the mine of the Nason Coal Co., at Nason.

## INDIANA

Fifteen hundred coal miners employed in seven bituminous coal mines in the Clinton section refused to go to the mines Sept. 4 in protest against an increase by the Clinton & Eastern Indiana R.R. in the cost of their transportation from their homes to the mines. Monthly train tickets to the miners, formerly sold for $1.10, were raised in price to $2.50. The increase was authorized by the Indiana Public Service Commission.

## IOWA

The Sheriff mine, one mile south of Lovilia, which was formerly owned by the Sheriff Mining Co., was sold recently to Rosenbaum & Co., Centerville, who in turn disposed of the mine to a group of men of Lovilia, who have organized a new corporation known as the Lovilia Coal Co. The mine will operate on a larger scale this winter than last year.

## KENTUCKY

Contract was let the first part of September by the Imperial Elkhorn Coal Co., Sergent, for the erection of a clubhouse.

Effective Sept. 1, C. R. Bourland, of Stone, was promoted to the position of chief engineer of the Fordson Coal Co., succeeding S. E. Puckette, who is now engineer in charge of the undeveloped Peabody acreage of Fordson company in Clay and Leslie counties.

## MASSACHUSETTS

More anthracite was moved into New England in August than in any other month since records of such receipts were first compiled, in 1916. Total rail and tidewater receipts are estimated at 1,150,000 net tons, or more than 25 per cent in excess of the 913,500 net tons received in August, 1924. The highest previous mark was 1,110,000 tons in July this year. The figure for June was 921,000; May, 953,000, and April, 756,000 tons.

Leaving Port Talbot, Wales, the day following the settlement of the British coal strike, the British steamer Pacific arrived at Boston, Sept. 8, with over 4,200 tons of Welsh anthracite, which was unloaded at the Metropolitan Coal Co.'s terminal in Chelsea. Captain Beveridge said that there were two other steamers loading when he left, which were destined for North Atlantic ports, and that it was the opinion generally through the Welsh coal trade that a considerable quantity of coal would be exported hither during the strike in this country.

Transportation facilities are available to bring 2,000,000 tons of low-volatile bituminous coal to Massachusetts during the next seven months in the event that suspension of operations in the anthracite region continues, according to C. A. Rice, of the Bureau of Service of the Interstate Commerce Commission. This statement was made in answer to a telegraphic inquiry addressed to Chairman Aitchison of the commission, by Governor Fuller of Massachusetts.

Governor A. T. Fuller of Massachusetts on Sept. 9 named Eugene C. Hultmann, chairman of the Commission on the Necessaries of life, and the other two members of the commission, Charles H. Adams and William A. Kneeland, emergency fuel administrators. The administrators will be vested with war-time powers with regard to the sale and distribution of fuel for the duration of the anthracite strike.

## MISSOURI

In conjunction with the "Burn Missouri Coal" drive launched by the State Bureau of Labor recently, Roy B. Hinkle, State Labor Commissioner, held a conference in Kansas City, Sept. 9, to stimulate the Missouri coal industry.

**A Natural Bridge in the Coal Country of Southern Kentucky**

The arch has a clear span of about 70 ft. and in the narrowest place measures 32 ft. across the top. This bridge is on Rock Creek near Oz, a village on a rural mail route from Yamacraw.

Miners, mine operators and representatives of civic and commercial organizations in the state's various mining districts attended. A recent survey indicated that Missouri coal is not being used very extensively. Hinkle says that this is due to the fact that the people of the state do not know that Missouri has high-grade coal deposits, comparing favorably with those of southern Illinois and other soft-coal states.

Fire which originated from hot cinders taken from the airshaft of the Smarr and Richards coal mine, three miles northeast of Columbia, destroyed all equipment at the mine recently. The damage is estimated at approximately $1,000.

## NEW YORK

W. A. Reed, sales agent of the Philadelphia & Reading Coal & Iron Co. in Buffalo territory, was struck by an automobile on Sept. 4, while crossing a street afoot. He was injured about the head and body, but will be able to return to business in a few days.

J. Lee Hornor, of Clarksburg, coal operator, has established an agency in Buffalo with the Ford - Southward Coal Co.

J. N. Robinson, for some time connected with the Buffalo coal trade, has opened an office under the name of the Niagara Fuel Co., at 762 Bramson Building.

## OHIO

The Wayne Coal Co., of Pittsburgh, owning two stripping operations in Perry County, resumed work Sept. 10 at one of the mines after an idleness of about seven months. In all, 100 men were given employment.

The Black Diamond mine of the Maher Collieries Co., at Neffs, resumed operation Sept. 2 after a shutdown extending from April. Two hundred men are employed. The Maher Collieries Co. now has three of its larger mines in operation, the other two being at Stewartsville and Willow Grove.

Clarence Pierce and Lewis Russell, arrested several weeks ago for complicity in the burning of the tipple at the Blackstone mine, Pomeroy, and other depredations, have been released from custody. An investigation failed to show that the two men were connected with the burning. Both were miners employed at the Blackstone mine.

Directors of M. A. Hanna Co. have suspended dividend payments on the company's first preferred stock. A quarterly dividend of 1¾ per cent was due to be declared at this time. About three months ago the directors suspended dividends on the second preferred stock. For the three months ended June 30 the company reports operating income of $259,367, against an operating loss of $102,687 reported in the March quarter. After allowing for all charges, including reserves for interest, depreciation and federal taxes, a deficit of $101,880 was reported for the June quarter, against a deficit of $413,647 after similar deductions reported in the March quarter. For the first half of 1925 net operating income amounted to $156,680, against $378,091 in the first half of 1924. After similar deductions, the deficit for the half-year period aggregated $515,627, against a deficit of $458,376 reported in the first six months of 1924.

The Broscalasa mine, at Syracuse, near Pomeroy, has resumed work under the Jacksonville scale with about 30 men. The mine was opened to supply fuel for two salt mines operated by the same company.

A petition in voluntary bankruptcy was filed, Aug. 24, in federal court, by the Buckhorn Collieries Co., Cleveland, through its president, W. G. Walters. Liabilities were placed at $348,184 and assets at $327,797. The company operates in Tuscarawas and Guernsey counties.

## PENNSYLVANIA

K. M. Coolbaugh, superintendent of the Philadelphia employment office of the State Employment Bureau, has been assigned by Richard H. Lansburgh, Secretary of Labor and Industry, to make an immediate investigation of employment conditions in the anthracite area in industries other than coal as a result of the anthracite miners' strike. "Mr. Coolbaugh is the senior superintendent of the department," said Secretary Lansburgh, "and is especially qualified to advise as to ways in which the employment bureau of the department may be of service to those who are temporarily out of employment in other industries because of the strike in the mining industry."

The Pennsylvania Coal & Coke Co. reports a deficit of $55,000 for the month of July, against a deficit of $47,000 in July, 1924. In the first seven months of the year the deficit was $405,041, after all charges, compared with a deficit of $188,000 in the same period last year.

## TENNESSEE

The Cumberland Coal & Iron Co., 149 Broadway, New York, of which A. M. Wickwire is president, is reported to be planning reopening its coal mines in Dayton, and will carry out an expansion plan.

O. P. Pile, Chief Mine Inspector, and the Board of Mine Foreman Examiners will hold an examination for mine foremen in the Federal Building at Knoxville, Oct. 1 and 2.

## VIRGINIA

J. H. Dimling, for many years in charge of the steamship department of the Raleigh Smokeless Fuel Co., at Norfolk, has resigned to become vice-president and treasurer of the Tidewater Coal Inspection Bureau in charge of the steamship and custom house department. He has been succeeded in the coal business by J. M. Miller, who has served in another capacity with the company for several years.

## WASHINGTON

Suit for $37,507 damages for alleged violation of lease charges was filed in Superior Court at Seattle Sept. 3 by the Birdseye Coal Co. against the Klangley Coal & Clay Co. The plaintiff company seeks recovery of the sum in connection with coal lands leased from the defendant in 1924 in section 28, township 22 north, and range 7 east, King County. The Klangley company is charged with breaking its contract with the plaintiff in order to obtain a "higher royalty" and "to cheat and defraud" the lessee. According to the complaint, the Birdseye company, after leasing the land, spent $12,507 in buildings, roads and equipment preparatory to mining coal for the present season.

## WEST VIRGINIA

Coal mines in the 12 counties of northern West Virginia produced 522,500 net tons of coal in the week ended

Sept. 5, compared to 555,550 net tons the previous week. In the same week 190 coal mines out of 364 worked daily on the average. In the 10 weeks preceding Sept. 5 the mines of northern West Virginia produced 4,841,900 net tons, an average of 484,190 tons a week. The peak tonnage was reached in the week ended Aug. 29.

James Elwood Jones, of Switchback, McDowell County, coal operator, was the largest income tax payer in West Virginia in 1924, according to newspaper reports, at $96,160.33. William McKell, of Glen Jean, another operator, paid $43,160.33. M. L. Hutchinson, of Fairmont, president of the Hutchinson Coal Co., paid $20,676.35; Clyde Hutchinson, of Fairmont, vice-president of the Hutchinson Coal Co., paid $10,835.12; Sprigg D. Camden, of Parkersburg, of the Monongah Co., which represents the Camden heirs in royalties paid by the Consolidation Coal Co. on coal land between Fairmont and Clarksburg, paid $10,296.96.

The West Virginia Department of Mines failed to observe first-aid day at Wheeling incident to the state fair last week. The Bethlehem Mines Corporation planned to send a team to compete, but learned early in the week that the annual first-aid contests would not be held.

A number of coal companies in northern West Virginia will observe Fire Prevention Week, Oct. 4 to 10. The Consolidation Coal Co., it is reported, will observe the special occasion.

In an effort to kill the shipment of reconsignment coal to Portsmouth scales—which is merely the shipping of coal from the mines before it is ordered in the hope that some customer will come along—the Norfolk & Western Ry. announces that after Sept. 15 coal loads will have only 24 hours at Portsmonth, Ohio, for rebilling, and after that will draw down regular demurrage charges.

The New River Co., which operates 15 mines in West Virginia, now employs a general director of safety. Arch Forbes, formerly superintendent of the Cranberry No. 1 mine, is filling the new position. Mr. Forbes had considerable experience in first aid and mine rescue work before going with the New River Co. as superintendent of the Cranberry mine.

W. H. Forbes, of the U. S. Bureau of Mines, Huntington, reports that there are now 33 mines of the state on 100 per cent first aid training, and that it is expected that there will be a total of 55 in this class by the end of the fiscal year, June, 1926.

The Eagle mine of the Clark Coal & Coke Co., near Hepzibah, which is working on the American plan, claims a record in that it worked 309 days in one year. The non-union miners loaded 5,007 steel hoppers in the year, mining 280,552 tons of coal.

The Stover Coal Co., at South Nuttallburg, Fayette County, on the main line of the Chesapeake & Ohio Ry., will resume operations at once, having been closed down since the first of last April. Holly Stover, of Chicago, well known merchandiser of West Virginia smokeless coals, is president of the company. The output of the mine will run 500 tons per day and the company will employ about 200 men.

The New Cumberland Coal Co. property of 360 acres in Brooke County was sold on Aug. 26 to the United States Annuity Co., of Pittsburgh, for $25,000.

Preparations are being made by the Stonega Coal & Coke Co. to open its No. 6 mine, at Eccles, and to employ 125 men at that place. The Eccles mine has been closed for about six months. Other mines in Fayette county are employing more men and operating on a more extensive scale.

J. T. Dunigan, vice-president and general manager of the Coal River Collieries Co., of Huntington, has presented a plan to the Huntington Coal Exchange for a permanent coal exhibition for the demonstration of coal values and also for coal burning equipment. A committee of the exchange has been designated to work out the details.

**"The Grand Army of the Republic"**

Few sights are more inspiring than a parade of school children. The above could hardly be termed a parade, but is rather a formation. Even at the coal mines—this is the white school at the Edgewater (Ala.) Mine of the Tennessee Coal, Iron & R.R. Co.—the younger generation is given every opportunity to develop mentally. More and more in this country ignorance in an adult is coming to be regarded as something closely akin to a positive crime.

The Consolidation Coal Co. has decided to close for the time being at least its Mine No. 37, at Berryburg, W. Va., after operating 25 years. The various mine structures are being dismantled and the steel is being shipped to other operations. The long haul to the present tipple made it impracticable to operate the mine under existing high cost of mining and the low price of coal. The company has available for mining in the Berryburg section about 10,000 acres of coal in the Pittsburgh seam. It is understood that the property will be worked from three different openings, one of which will be on the Bear Mountain road, the product moving by way of Flemington, and another in all probability will be on Brushy Fork. At one time 600 men were employed at the mine and it loaded as many as 66 railroad cars a day.

Twenty-five non-union coal miners joined the United Mine Workers at a recent meeting held at Kilarm, according to officials of the union.

Ground will soon be broken for the development of a third mine of the New England Fuel & Transportation Co. near the Arnettsville hill in Monongalia County, according to newspaper reports. The project, which, it is reported, will be the third largest producing mine in the country, was planned more than four years ago, but no work was started on it previously. Officials at Grant Town, where Federal No. 1 is located, decline to comment on the project.

The Consolidation Coal Co. resumed operation at mine No. 97, at the Rivesville power plant of the Monongahela West Penn Public Service Co., recently. This was the last mine that the company had worked union and paid the 1924 wage scale, which it signed with the United Mine Workers following the Baltimore conference.

By Oct. 15 the Pond Creek Pocahontas Coal Co., at Bartley, McDowell County, will have completed an extensive improvement and development program. The company recently completed a big modern steel tipple and now has under construction 300 additional homes for miners, all modern and well equipped. The Pond Creek Pocahontas company is a subsidiary of the Island Creek Coal Co.

Judge I. Grant Lazelle, of the Circuit Court of Monongalia County, W. Va., issued a temporary injunction on Aug. 29 restraining the Connellsville By-Product Coal Co. and the Cochran Coal & Coke Co. from mining coal in the Pittsburgh seam under the main headway of the Sewickley seam of the Continental Coal & Coke Co.'s Liberty mine on Scott's Run. The plaintiff company in presenting its case contended that the property and lives of workmen were endangered by the mining of coal beneath the main entrance of its operation. A bill was introduced at the last session of the West Virginia Legislature to protect overlying and underlying seams. The bill, however, was never reported from committee so it is probable that there will be continued litigation where operations are undertaken by different companies in two different seams, one beneath the other.

## WYOMING

The Lionkol Co. reopened its mine at Lionkol Aug. 25 with a full crew of 150 men; every house in the Lionkol village, 65 in all, is occupied, and the company will soon reopen the company store at that place. Under present indications, the Lionkol mine will be operated six days a week with a full shift of men. The company is now producing 1,000 tons of coal daily, and expects before long to be up to capacity, which is about 2,000 tons daily. The power plant at Blairtown also was started again. This plant supplies power to both the Blairtown mine and the Lion mine of the Lionkol company. The Blairtown mine is to continue in operation.

## CANADA

A deficit of $88,599 was shown by the Blue Diamond Coal Co., Ltd., Alberta, during the year ended June 30, 1925, according to the latest balance sheet sent to shareholders. This deficit is due to fixed charges, interest paid, accounts receivable written off, and sundry adjustments, and increases the deficit account to $174,995. The deficit for the past year compares with one in the previous year amounting to $86,395.

The International Coal & Coke Co., Ltd., Coleman, Alta., plans the installation of an all-steel tipple and dry cleaning plant with a capacity of 350 tons per hour. The contract has been let to the Manitoba Bridge & Iron Works, Ltd. The structure will be fireproof throughout and equipped with the latest modern facilities, including dry cleaning tables for the proper preparation of the coal. The sizing is to be done by Hummer screens and the cleaning tables will be the product of the American Coal Cleaning Corporation, of Welch, W. Va., and similar to the machinery installed in the Blairmore plant by the West Canadian Collieries, Ltd., last year.

Output of coal from Canadian mines in June totaled 732,759 tons, as against 666,756 tons in May, being an increase of 9 per cent, but 32 per cent below the average June production for the last five years. There were slight gains in the provinces of New Brunswick, Alberta and British Columbia. Imports of coal in June from the United States and Britain were 1,470,416 tons, as compared with 1,237,755 tons in May, an increase of 19 per cent, but 9 per cent below the five-year average. Imports of anthracite totaled 407,521 tons, being 19,375 tons below the tonnage imported in May, but about 5 per cent above the 5-year average for the month. Exports of Canadian coal were 43,296 tons, as compared with 37,894 tons in May, an increase of 14 per cent, but a decrease of 68 per cent, as against the five-year average for June. The total number of men employed in the coal mines of Canada during June was 18,611, as compared with a total in May of 14,337. Production per man was 39.4 tons in June as against 46.2 tons per man in May. During June the production per man-day was 3.3 tons as compared with 2.3 tons in May.

A new process for the treatment of bituminous coal, lignites or oil shales for the production of fuel oil and valuable byproducts is under consideration by the federal Department of Mines and the officials of the Canadian National Railways, who are asked for assistance to demonstrate its feasibility. It is claimed that the process, which is controlled by a British company, can be carried on in units of as low capacity as 75 tons a day, which will permit of its being started with a comparatively small investment.

"A study of the anthracite situation in Ontario and Quebec indicates no immediate cause for alarm," stated S. J. Cook, chief of the mining, metallurgical and chemical branch of the Dominion Bureau of Statistics, last week, in commenting on the probable immediate effect in Canada of the tie-up in the United States anthracite field. "In Canada there has been a decided movement toward the further use of Canadian coals for domestic purposes, and the Dominion Fuel Board also has consistently advocated the use of coke as a household fuel. At the last session of Parliament steps were taken to increase the production of coke in Canada by providing financial assistance for companies undertaking to establish coke-making plants."

## Publications Received

**The Application of Hyperbolic Functions to Electrical Engineering Problems,** by A. E. Kennelly, professor of electrical engineering, Harvard University and Massachusetts Institute of Technology. Third edition. Pp. 352; 5½ x 8½ in.; illustrated. Price, $3.50. In this edition certain parts of the original text have been replaced by new and more recent material, a few corrections effected and five new appendices added. McGraw-Hill Book Co., Inc., 370 Seventh Ave., New York City.

**Composition of Technical Papers,** by H. A. Watt, professor of English, New York University, and P. B. McDonald, assistant professor of English, New York University. Second edition, revised and enlarged. Pp. 429; 5 x 8 in. Price, $2. McGraw-Hill Book Co., 370 Seventh Ave., New York City.

**Accounting for the Petroleum Industry,** by David F. Morland and Raymond W. McKee. Pp. 285; 6 x 9 in. Price, $4. A description of the accounting principles and procedures applicable to the petroleum industry. McGraw-Hill Book Co., 370 Seventh Ave., New York City.

**Structure of Parts of Northeastern Williamson and Western Saline Counties (Illinois)**, by Gilbert H. Cady. Department of Registration and Education, State Geological Survey, Urbana, Ill. Pp. 20; 6 x 9 in.; illustrated. Report of Investigations No. 2.

**The Master Gyratory Screen.** H. W. Falker, Ashland, Pa. Pp. 10; 6x9 in.; illustrated. Describes the operation of this screen which, in addition to being used at coal plants, can also be used for handling stone, sand, gravel, ores, etc.

**Annual Report of Coal Mines of Alabama, 1924.** Pp. 126; 6x9 in.; tables.

**Mine Timber, Its Selection. Storage, Treatment and Use,** by R. R. Hornor and Harry E. Tufft, with a chapter on **Methods of Prolonging Life of Mine Timber,** by George M. Hunt. Bureau of Mines, Washington, D. C. Bulletin 235. Pp. 118; 6x9 in.; illustrated. Describes some of the benefits and economies to be derived by selecting, preparing, storing, preserving and utilizing mine timber and gives specific information on certain preservatives and processes.

## Coming Meetings

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland, Ohio. Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries,** Sept. 28 to Oct. 3, at Grand Central Palace, New York City.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering,** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## Industrial Notes

**The Koehler Manufacturing Co, Inc.,** Marlboro, Mass., has opened a new branch at 2012 L. C. Smith Building, Seattle, Wash. **William C. Shaw,** mining engineer, has just been made representative of the company for the Northwestern states, including Alberta, Can.

**W. C. Davis,** president of Foote Bros. Gear & Machine Co., recently was appointed a member of the committee on commercial gear standards of the American Gear Association.

**W. McNamee,** formerly purchasing agent for the Holt Mfg. Co., of Peoria, Ill, recently joined the sales organization of the **Foote Bros. Gear & Machine Co.,** of Chicago. Mr. McNamee has been appointed district representative for the State of Indiana and all of Illinois except that section lying west and south of Springfield, which is handled from the St. Louis office. Territory within a radius of 35 miles of Chicago in both Indiana and Illinois is handled from the home office.

The plant, property and good will of the **Strom Ball Bearing Mfg. Co.,** Chicago, were acquired Aug. 24 by the **Marlin-Rockwell Corporation.** The business of this company will be conducted exactly as heretofore under the direction of the same personnel and department heads. The same lines of bearings under the Strom trade name will be continued as at present.

**Stephens-Adamson Mfg. Co.,** of Aurora, Ill., has taken the sole rights for chains made from "Farrell's 85 Special Purpose Cast Steel." This steel is used in the manufacture of chains for elevators and conveyors and for power transmission.

## Recent Patents

**Means for Refining Coal Slimes;** 1,539,746. Jan Willem Kleinbentink, Hoensbroek, Limburg, Netherlands. May 26, 1925. Filed Nov. 6, 1923; serial No. 673,207.

**Spraying Mechanism for Coke Ovens;** 1,541,621. Mario Carini, Belle Vernon, Pa., assignor of one-half to Arthur Vannucci, Belle Vernon, Pa. June 9, 1925. Filed April 23, 1924; serial No. 708,480.

**Coal Washer and Separator;** 1,542,627. Wm. F. Martin, Harrisburg, Pa. June 16, 1925. Filed Jan. 19, 1925; serial No. 3,461.

**Dump Car;** 1,542,914. Carl V. Shanaberger, Indiana, Pa., assignor to Mine Appliances Co., Pittsburgh, Pa. June 23, 1925. Filed Nov. 25, 1921; serial No. 517,432.

**Mine Door;** 1,543,005. Frederick A. Guth, Columbus, Ohio. June 23, 1925. Filed March 17, 1922; serial No. 544,600.

## Not Sold

THE ANTHRACITE OPERATORS, in their present controversy with the United Mine Workers, have the best case to present to the nation in the history of the industry. Their position on the cardinal points at issue is clear-cut, sound and unequivocally in the public interest. The anthracite operators are opposed to a system of negotiating wage contracts which stops production. They are opposed to a system of negotiating which makes economic pressure the arbiter of questions upon which the negotiators cannot agree. They are opposed to any change in wage scales or working conditions which will increase the price of coal to the domestic consumer. They are willing to submit their entire cause to impartial arbitration. This last offer is unqualified; there are no strings to it.

Here, if there ever was one, is a case to command widespread approval and support. And yet, nobody who takes the trouble to sample current popular opinion on the subject can escape the realization that the operators' position has made no impression on the public mind. Lay editorial discussion of the strike reveals little understanding or discrimination and even less sympathy. The industry is still in bad repute. Where the operators are not condemned separately, they are lumped with the miners in a blanket condemnation of the industry. The suspension is scored as a strike—almost a conspiracy in the eyes of some editorial writers—against the public interest. That the operators are as bitterly opposed to the strike as their critics does not find place even as a plea in mitigation.

The anthracite operators have not sold themselves to the public. To a large degree they have not tried to sell themselves to the public. This, of course, will be indignantly denied. Nevertheless, the results speak for themselves. Traditions of aloofness from the public, which were scrapped by other industries years ago, still are cherished by too many anthracite producers. Estimable, courageous gentlemen personally, they shrink from the rough-and-tumble methods by which the union leaders are able to keep public interest alert—and sympathetic. They make one or two dignified and gelid statements and retire from the field. To capitalize on gracious, personal contacts is distinctly not in their code. But worst of all, these tradition-bound leaders hamper and nullify the work of those of their own associates who are ready to fight the battle with weapons from Mr. Lewis' arsenal.

Anthracitephobia is a disease which has been coursing unchecked through the public veins for nearly ninety years. It will take more than one dose of anti-toxic publicity to eliminate it. It calls for a vigorous publicity campaign in such frequent injections that the effect of one will not be lost before another is administered. The anthracite industry, if it hopes to survive, must sell itself so thoroughly to the public that anthracitephobia will cease to exist. The only way in which that can be done is through steady, persistent, educational advertising.

General understanding of the operators' position is the best possible protection against the danger of another Pinchotian settlement. What if the union does shed crocodile tears over such a squandering of money? The job of the operators is to sell the industry to the public, not to Mr. Lewis and his followers. Unless the operators do that job, they will lose more than the present strike.

## Lean a Little Heavier

A FEW YEARS AGO when the mining industry was starting to apply electric drives to machinery, an electrical engineer who did not completely design and arrange every detail of a new installation himself, was looked upon as a weak sister. As time went on more and more equipment became available and he continued to depend largely upon himself to select the proper machinery, plan his layouts and install apparatus from time to time to keep his plant up to date.

Today the need for labor-saving apparatus and the wide diversity of equipment suitable for mine service have changed matters. The mine electrical engineer can no longer hope to have the intimate knowledge of machines that he formerly had when only a few relatively simple appliances were available, he must lean more heavily upon others for assistance.

Not a few mistakes have been made in the application of machinery at some mines and usually it will be found that these errors were committed either because the engineer tried to do too much by himself or insisted upon putting his personal impress upon everything that was done.

It often happens that because a man is not sure of himself he does not undertake to initiate a new development; instead he procrastinates hoping he will some time be able to get to the job intelligently. As time goes on he finds himself in a great maze of work, too big for him to ever catch up with. As a result his company does not keep up to date as it should and reaches a stage where it cannot be persuaded to do anything but struggle along in the same old way.

Today the successful engineer has to consult with other coal company men and with manufacturers. He must also devote some of his time to discussions and meetings with men in his own profession and keep abreast of the time through literature published on subjects covering his work.

The need for greater savings by means of machinery offers the suggestion that engineers devote more time to the business of showing their companies how to reduce costs and less time to details which usually can be more satisfactorily handled by the equipment manufacturers whose reputation stands behind it.

## What of Anthracite's Future?

UNWILLINGNESS TO ARBITRATE disputed points in the anthracite controversy indicates, on the part of the United Mine Workers, a distinct lack of confidence in the justice of their case. Mr. Lewis deports himself, in the matter, as a belligerent man who feels the weight of a dependable gun on his hip, who has unlimited confidence in his ability to use it and who intends to settle the present disagreement by nothing more peaceful than gunplay. It is not a good public advertisement of union labor methods, but Mr. Lewis can always rely upon his trustworthy and capable publicity department to turn bad advertising into good. Would that the anthracite operators could so much as prevent their own good advertising from being turned into bad by the clever miners.

If Mr. Lewis is a consistent man, his rejection this year of arbitration such as his union has plead for in the past, does not condemn the whole principle of arbitration, no matter what he may say. Instead, present day expediency actuates him. In other words he is willing to arbitrate only when he feels confident of victory. This attitude on the part of either operators or the union contributes nothing to the future peace of the industry, and it is the peace of the future which stands out as the biggest issue in today's conflict. The nation will be best served if, during the coming winter, it sees to it that nothing prevents the anthracite miners and operators from finishing a battle in the final treaty of which both sides will be glad to write peace guarantees for coming years.

## Dramatize the Wage

DOES the public ever gain a real idea from figures? We doubt it. Engineers pride themselves on having quantitative minds. If that is so the minds of the rest are qualitative. That being so why try to appeal to them with quantitative arguments? Why use calculus to explain an idea to a man who has no calculus training? After all, the public listens to the legal lights and politicians because they talk qualitatively not quantitatively.

So we, if we would talk to the man on the street, must not put the comfort, happiness and well-being of the miner in dollars, but in homes, clothing, automobiles and village streets. Now we know the miner who pays only $8 to $12 a month for a house cannot have an impressive, well finished home. We know that the city dweller pays 25 to 30, or even 40 per cent, of his wage on rent and, consequently, people believe him well-to-do by the measure of his rent and by the excellence of his clothing. He breathes comfort; he exudes prosperity.

Only by endeavoring to sell the miner a desire for a better house and better clothing, a better village and an automobile in better condition can we give the public a physical and not a numerical idea of the good fortune of the miner and his excellent wages.

In the cities, model houses have been erected to develop an increased interest in good housing, and it would be well if the mines had such places. In some cases even the house of the superintendent and the company office are not places which would serve as models of housing or exhibits of how to be comfortable.

When houses are built by the miners themselves, the architecture and arrangement are often deplorable, though there are cases where the homes so built have been more than usually elaborate. In fact, in one town of about 10,000 inhabitants, the house built by one of the miners is easily the most pretentious and permanent of any in the neighborhood—bankers and millionaires not excluded.

It is a fact that mine villages greatly need architects, not only to design but to superintend construction for a plan if well made is often marred by faulty execution and improper material. The mine engineer is really not any too well fitted to be the final arbiter as to house construction details or village layout.

## Need for New Circuit Appliances

AS A RESULT of the present economic conditions in the coal fields there is growing an increased demand for new devices to be used with drilling, loading and transporting machines. Many different types of machines have been designed and applied to the mines and not a few are still in a state of development. However, progress is being made along several definite lines and suitable circuit-control appliances and connectors are needed.

Naturally enough, nearly all appliances now used in the mines are driven by electric motors and in many instances are supplied by alternating-current energy. There is, however, a steady growth in the use of direct-current drives.

Heretofore the general tendency inside the mines has been to operate stationary equipment such as hoists and pumps by alternating-current energy, and moving apparatus such as locomotives and cutters by direct current. Perhaps the reason for this was that the direct-current motor best suited the equipment it had to drive and the alternating-current motor possessed the characteristics necessary for the stationary machines.

But today we find in the mines equipment which is sometimes stationary but frequently moved to new locations. For example, a coal loading conveyor is permanently set when it is in operation but must follow the working face from time to time. Such machines, therefore, embody the characteristics of both stationary and fixed appliances and consequently must be controlled, protected and installed to suit the new conditions.

Plugs, receptacles, fuse boxes, connectors, switches and control devices have been developed to a high degree for direct-current mine circuits used with locomotives and other portable machines, so also have similar appliances been designed for stationary alternating-current machines. But now comes a need for such three-wire appliances which will possess the features of one-wire and two-wire direct-current fixtures.

---

Gas Engineers and gas men generally are watching with considerable interest the experiment of a small gas company in Sheridan, Wyo., which is using the local lignite deposits, which are mined adjacent to the city, for the manufacture of coal gas supplied to the residents and industries of Sheridan for heating and cooking purposes. This is believed to be the first time that lignite has ever been used successfully in coal gas manufacture to the entire exclusion of other materials.

# How Strong Is the Miners' Union?

## In Bituminous Fields Has John Lewis Lost Past Gains By Obstinately Clinging to 1920 Wages?—Research Shows Labor's Deep Influence on the American Coal Industry

**By Sydney A. Hale**
Special Contributor, *Coal Age*
New York City

IS THE POWER of the United Mine Workers of America on the wane? Has the strength which in 1922 moved the President of the United States to confess that, "except for such coal as comes from the districts worked by unorganized miners, the country is at the mercy of the United Mine Workers" been so dissipated that the organization headed by John L. Lewis is no longer the controlling factor in the labor situation in the bituminous coal mines of the nation? Have the gains so painfully made in the early days of the movement and so effectively consolidated in later years been flung away in an obstinate and unreasoning attempt to maintain a wage basis that is economically out of line with competitive costs?

Readers of *Coal Age* do not need to be told that these are questions which form both warp and weft of much of the earnest discussion now going on in coal circles. Nor is the interest confined to the mining industry. Government officials are known to be deeply concerned over the outcome. Large consumers of fuel recognize that the existing state of affairs is one of the danger spots in the general business set-up. Economists are drawn to a study of the situation, finding the complexities and ramifications of the subject a challenge to their serious attention. Some alarmists in the ranks of the publicists profess to see a threatening collapse which may wreck the entire economic structure of the land.

### UNION GAINS GROUND BETWEEN STRIKES

In the general strike of 1919 the power of the United Mine Workers was such that at one time or another during that six weeks' suspension it was able to close down 71.6 per cent of the actual productive capacity—measured by 1918 performance—of the bituminous coal fields of the United States. Between the end of that strike and March 31, 1922, union control weakened notably in eastern Kentucky and in the low-volatile regions of West Virginia, where the war had given the organization a temporary foothold. Nevertheless, when the call went out from Indianapolis for another general strike three years ago, the union was able to marshal enough support to cut off 73.3 per cent of the productive capacity.

How was this possible? The handicap of an unexpired contract in the western Kentucky field, the losses in the State of Washington and in West Virginia were more than counterbalanced by the development of unexpected strength in two districts in which non-unionism was regarded as impregnably entrenched. The workers in the Connellsville region, who had not staged a demonstration against their employers in over thirty years, walked out and at one time during the prolonged struggle had 81 per cent of the production in that field tied up. In Somerset County, the non-union stronghold of central Pennsylvania, at the peak of the union attack 88 per cent of the productive capacity was down. And in Westmoreland County, where as recently as 1911 the workers had given up a fight for collective bargaining after a contest lasting over a year, there was a 65 per cent shutdown as compared with a 5 per cent shutdown in 1919.*

The effectiveness of the United Mine Workers in these

**Table I—Maximum Percentages (Based on 1918 Output) of Productive Capacity in Bituminous Coal Fields Closed by General Strikes in 1919 and 1922**

| District | Production on 1918 (Net Tons) | Maximum Percentage of District Capacity Closed By Strikes 1919 | 1922 | Theoretical Maximum Annual Tonnage Capacity Closed By Strike—in Net Tons 1919 | 1922 |
|---|---|---|---|---|---|
| Central Competitive Field | | | | | |

(*a*) Includes Latrobe, Greensburg and Ligonier districts.
(*b*) Includes all of northern West Virginia except Cumberland-Piedmont and Panhandle districts.
(*c*) Includes Tennessee and all of southeastern Kentucky except Harlan County.
+ Exclusive of country banks and local stripping operations.
† Less than one per cent.

---

This is the first of a series of articles by Mr. Hale on the labor influence on the industry. The remaining articles will appear in forthcoming issues.

*The percentage figures given represent not the percentage of mines closed down, but rather the percentage of miners absent from work and, therefore, show the part of the normal producing power of the district shut off by the strike. For a discussion of how these percentages were arrrived at the reader is referred to *Mineral Resources of the United States*, 1921, Pt. II, pp. 502-7; *ibid*, 1922, Pt. II, pp. 515-19.

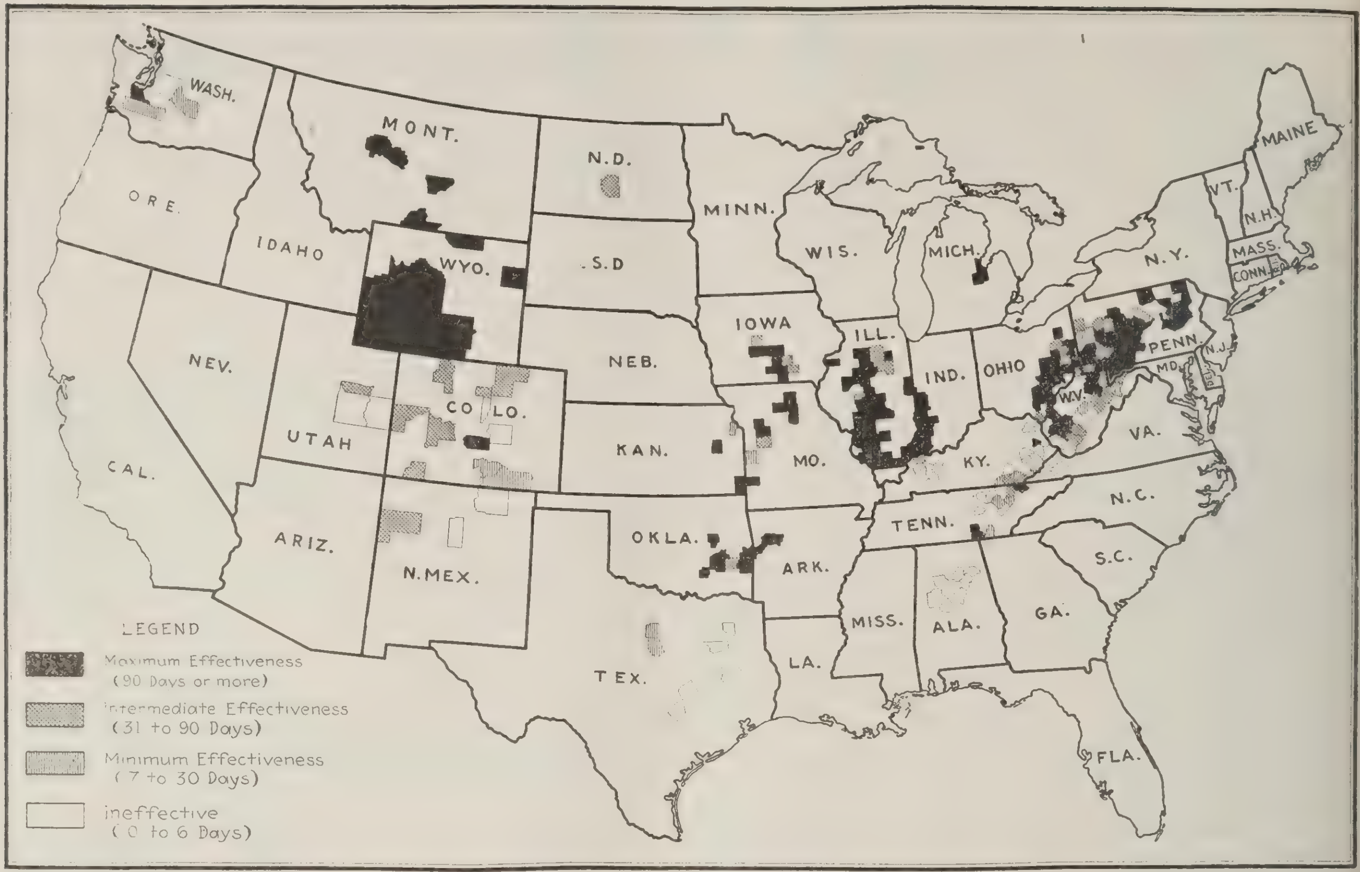

**Fig. 1—The United Mine Workers of America at the Flood Tide of Power**

This map, based upon statistics collected by the United States Geological Survey, shows the maximum effectiveness of the general strike of 1922 in the coal producing states of the country. The number of days each field was down was determined by taking the average number of days lost through strikes per man employed. As a corrective against over-estimating the importance of the intensity of the suspension in some of the minor producing districts, the map should be read in connection with the figures given in Table I showing the maximum productive capacity of each district.

two most recent direct trials of its strength, summarized in Table I, gives the necessary yardstick with which to measure the changes that have taken place since the truce signed at Cleveland, Ohio, in August, 1922, marked the beginning of the end of the general bituminous strike which had started four and one-half months before. That truce continued the basic rates—other than day rates—fixed by the United States Bituminous Coal Commission in 1920, and averaging 27 per cent above the war-time scale approved by the United States Fuel Administrator, until the following March. It also continued the advance in day rates over the Bituminous Coal Commission award won by the district strike of 1920—strikes, according to Mr. Lewis, encouraged, if not fomented, by certain operators to stop the payment of bonuses in Illinois. Another truce extended these rates until April 1, 1924. By the Jacksonville compact signed a year ago last February these rates are to be continued until April 1, 1927.

These facts are thus briefly restated because present discussion of the future of the union revolves largely around the wage rates established in 1920 and continued by the Jacksonville agreement for nearly two more years.

The post-armistice boom of 1920, with the extraordinary demand for tonnage at premium prices made it possible for union operators as a whole to pay the peak wages and still retain attractive profits for themselves. The competition for labor during those hectic months also supported the maintenance of comparable rates of pay in the non-union districts. The reaction which followed the bursting of the 1920 bubble started downward readjustments in these latter fields. Many operators, parties to the contract with the union, talked of the necessity for deflating wages, but made no move which might be construed as a violation of the existing agreements. Any hope of deflation, however, went glimmering to destruction with the 1922 strike.

The country entered that strike period with probably the greatest tonnage in storage in the yards of the larger consumers in the history of the industry. By Sept. 1, however, that reserve had been pulled down from over 63,000,000 to approximately 22,000,000 net tons, the second lowest reserve on record. The market created by this depletion of the stocks in storage and the demands for fuel for current consumption in 1923 introduced during that year a more sustained high level of weekly production than ever before witnessed in the bituminous coal trade.

But the benefits were not evenly distributed. Compared with 1918, only five states—Alabama, Kentucky, North Dakota, Virginia and West Virginia—were able to increase their output, and in those states non-union operations predominated. Illinois, on the other hand, fell back nearly 10,000,000 tons; Ohio, over 5,000,000 and Pennsylvania almost 7,000,000 tons. The losses in the strongly non-union counties of Fayette, Somerset and Westmoreland, however, were equivalent to 93 per cent of the total decline in Pennsylvania tonnage. Kentucky output increased over 13,000,000 tons, practically all of which came from the eastern part of the state; West Virginia increased nearly 18,000,000 tons.

The major producers in the union regions kept in the running through greater efficiency—man and mechanical. Even in that field, however, they were by no means in a class by themselves. Working 70 days less than in 1918, the total production for the country declined only 15,228,903 tons. An increase in the total number of men employed from 615,305 to 702,817 was responsible in part for keeping up production, but the controlling factor was increased output per man. Had the 615,305 workers reported employed in 1918 reached the same daily average output per man as the 702,817 workers reported for 1923 the 1918 group would have taken only 215 days to raise the record-breaking tonnage of that banner year. The 1918 average number of days worked, however, was 249.

There was still another factor which helped to postpone the demand for a readjustment. That was the greater concentration in mining. As explained in detail in an article appearing in an earlier issue of *Coal Age* (*Shifts in Production of Bituminous Coal*, Tryon, McKenney and McKinney, Feb. 26, 1925, p. 329), throughout 1923 there was a steady increase in the number of idle mines, the percentage of these to the total number reporting to the United States Geological Survey jumping from 8.4 per cent on Feb. 17 to 32.0 per cent on Nov. 17; a decreasing number of mines operating one to three days a week and an increasing percentage working four to six days a week.

In spite of the handicaps of higher wage rates, Pennsylvania, still predominatingly union, was able to operate an average of 213 days that year. Allegheny County, in the heart of the Pittsburgh field, averaged 233 days. Illinois, which is, except for small country banks, completely unionized, averaged just eleven days less than West Virginia. Franklin County, in the southern Illinois field, lagged only six days behind McDowell County, West Virginia, and ten days behind Mercer County. Working time in the lowly Sangamon County district of the central Illinois field actually exceeded the average for far-famed Logan County, West Virginia, by seven days.

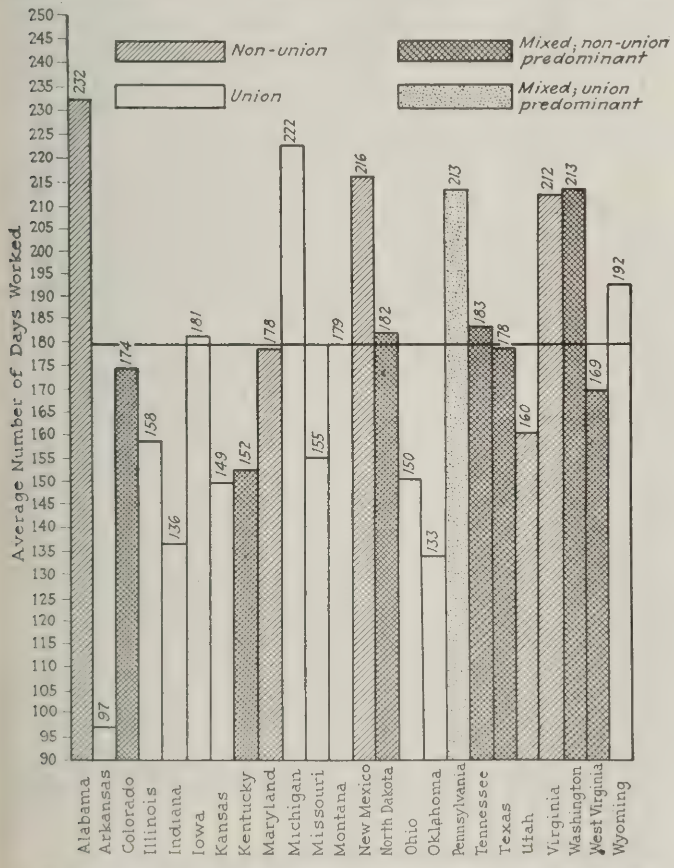

**Fig. 2—How Bituminous States Work When Demand Is Good**

This chart shows the average number of days worked in the bituminous coal producing states in 1923. Seven out of the eleven strictly union states failed to equal the average working time for the country as a whole; two out of the five strictly non-union states also fell below the national average. In the semi-organized states, four out of the seven predominatingly non-union averaged fewer days than the country as a whole.

The net results of these and other factors influencing 1923 operations were that the better situated producing companies throughout the country were able to show a profit on their year's business. This was done despite the fact that average spot prices declined from $4.38 per net ton in January to $2.18 in December and that the average realization on all tonnage mined fell to $2.68, as compared with $3.02 in 1922; $2.89 in 1921, a year of marked depression; $3.75 in 1920, the year in which the basic wage scales now in effect in the unionized districts were established, and $2.58 in 1918. This last figure is quoted because prices in that year were fixed by the United States Fuel Administrator after an examination of production costs and presumably gave full weight to the element of wages.

### Wage Ratios Increase

As previously stated, the United States Bituminous Coal Commission award, effective April 1, 1920, represented, it was announced at the time of its promulgation, an average increase of 27 per cent in the wage bill of the industry. The wage bill was in turn estimated—before adding this 27 per cent—at 57 per cent of the total reported value of coal produced. The total value of the bituminous tonnage mined in 1923 was reported by the United States Geological Survey as $1,513,327,000—an increase of $21,517,000 over the total for 1918. Wages in 1918, on the 57 per cent basis, absorbed approximately $857,491,000 of the reported value of the fuel. The increase authorized in 1920, uniformly applied to the slightly smaller 1923 tonnage, would give an estimated wage cost of $1,060,615,000, an increase of $203,124,000 as compared with an increase in value of only $21,517,000.

These figures, of course, are subject to all the vices of averages for an industry as vast and as complex as the bituminous coal industry. In the present case, these drawbacks are further magnified by the changes in wage status in 1923 as compared with 1918. The 1918 wage basis was the 1917 scale and this was generally observed throughout the soft coal regions when the Bituminous Coal Commission made its award. Therefore, the application of the 27 per cent increase to 1918 or 1919 figures gave a fair approximation. Between 1920 and 1923, however, there were certain fields which abandoned the Coal Commission scale for the 1917 basis or some modification thereof. To that extent, therefore, the application of 1920 figures and percentages exaggerates the wage total—possibly ten per cent, probably less. What the figures do show, however, is the trend, and the comparisons indicate this with startling clearness.

Through 1923 there was widespread discontent among coal producers over the wage scales. In some of the non-union districts which had been keeping pace with the union base rates, the competitive pressure became so strong that downward revisions were made. For the most part, however, little serious consideration was given to the question of operators in organized fields severing their alliance with the United Mine Workers of America. Those producing companies with up-to-date plants and alert merchandising organizations carried on with profit. Another large group of operators, who are constitutionally opportunists, held on in the hope that some dislocation of supply would intervene to curtail output and run up the prices on their tonnage to sky-rocket figures. And a third group of constitutional optimists hung on in the belief that conditions with the coming of the new year would justify the maintenance of the 1920 bases of pay or, if not, that the new wage agreement to be negotiated would relieve the organized fields of their burdens.

The signing of the Jacksonville agreement ended all such dreams. Average spot prices, which reached \$2.25 during February, 1924, dropped to \$1.98 by midsummer and closed the year at \$2.06. The average for the year, \$2.08 probably was close to the average realization on all tonnage as many of the contracts made on 1920 bases in 1922-23 expired March 31, 1924, and were not renewed. Operators so fortunate as to persuade consumers to sign up again shortly before the Jacksonville meeting knew that April 1, 1925, would mark the end of most of those contracts. Tonnage, too, began to slide off rapidly as the prospects of a general strike vanished. The number of companies who began to write their month's operations in the red grew.

Under those conditions it is not surprising that the ink had hardly dried on the signatures affixed to the Florida compact before there were demands for a modification of the wage rates therein named. Such demands naturally came first from the semi-organized fields, notably the union mines of central Pennsylvania, which were receiving the full force of the drive launched by the non-union fields to supply a greater share of the decreased coal requirements of the consumers. In the organized part of the Kanawha district an overwhelming majority of the operators, after fruitless negotiations, declined to renew contractual relations with the union.

No important union district has escaped some manifestation, some evidence of a determination to carry on without the union since it was impossible to carry on with it. In some instances, these breaks have been given a prominence all out of proportion to the tonnage involved; in others, perhaps, the extent of the defection has been unduly minimized. A correct appraisal of the effect of these changes must rest upon a knowledge of the conditions in each major field.

**These Are Some of the Men Who Make Island Creek Mines Outstanding**

Many of these operating officials and executives have been at the Island Creek Coal Co.'s group of mines in Logan County, W. Va., for years. They have seen the company's production mount as the organization grew in industrial importance. This year they expect their properties to ship at least six million tons. In the background of the photograph is shown the home of W. A. Hunt, general superintendent, at Holden, W. Va.

In the picture the men are, back row, left to right: W A. Hunt, general superintendent; J. J. Foster, auditor; H. L. Bradshaw, electrical engineer; E. R. Dunsford, assistant superintendent of Mines 11 and 12; J. Lindley, superintendent of Mines 11 and 12; R. G. Lazzell, assistant superintendent of Mines 7 and 8; A. J. Alexander, assistant superintendent of Mines 15, 16, 17 and 18; R. E. Salvati, superintendent of Mines 15, 16, 17 and 18; Roscoe Garrett, master mechanic at all the operations.

Front row, left to right: A. R. Beisel, general manager; J. H. Madison, superintendent of Mine 20; Mike DePietro, superintendent of Mine 21; W. J. Crutcher, manager of commissaries; Ed Mooney, superintendent of Mine 1; L. T. Dodd, mine inspector; W. S. Parsons, superintendent of Mines 7 and 8; Ed White, general carpenter foreman; L. D. Thompson, foreman of mine electricians.

# Mine Substations Properly Equipped and Located Help Cut Down Power Costs

**By J. E. Borland**

General Engineering Department, Westinghouse Electric and
Manufacturing Co., East Pittsburgh, Pa.

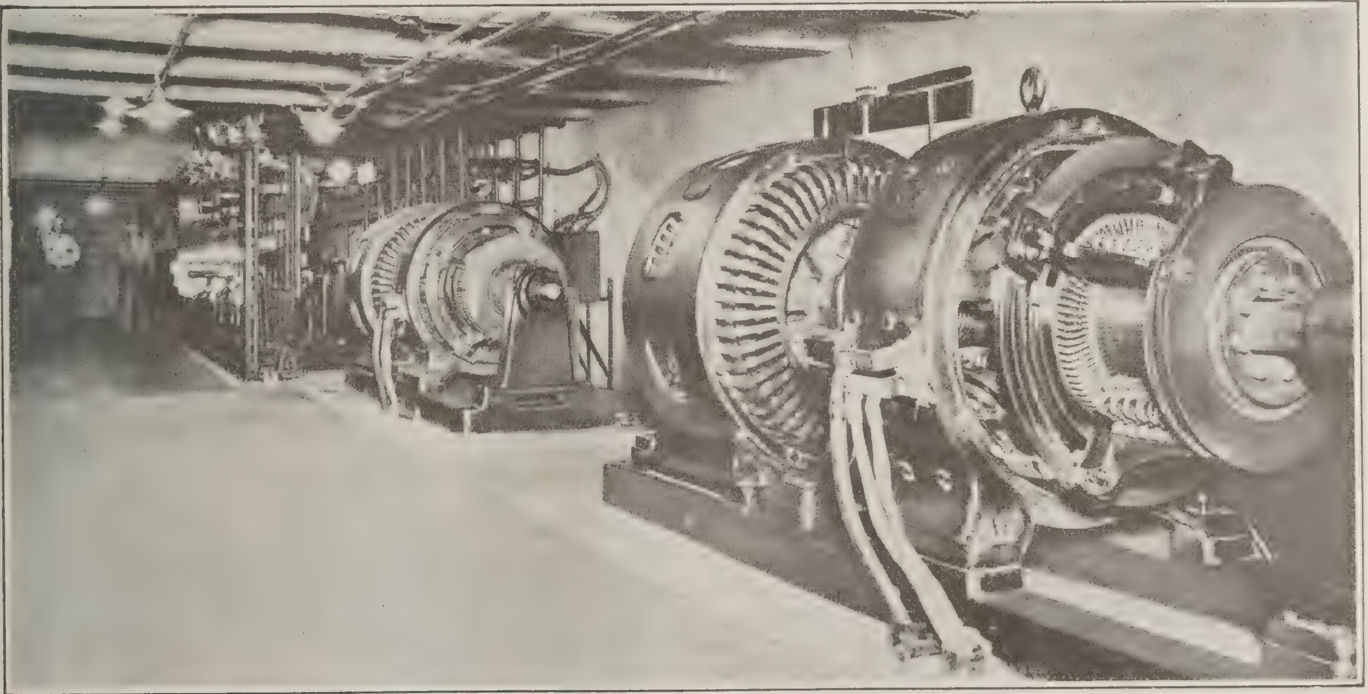
DEVELOPMENT in the application of electric power to coal mining has long since passed the point where it is considered necessary to compare the advantages of this service with other possible forms of drive. The only exceptions are certain applications, such as the main ventilating fan and the man hoist of a shaft mine, for which steam drive is often used through the belief that it will furnish greater insurance against interruption of service. The benefits derived are often questionable if the cost of operation is taken into consideration.

It is always possible to use the more economical electric drive for any mechanical operation and provide against interruption by adding a standby gas engine unit, arranged to drive the fan directly, or coupled to a low-frequency generator to supply power to alternating-current motors on the fan or man hoist, operating these at speeds reduced in proportion to the drop in frequency and voltage. Such a unit is needed only in emergency and with occasional tests it is always available for service within a few minutes. It is, therefore, possible to use motors for any operation in the production of coal, with assurance of power supply at any vital point.

This applies particularly to those cases where power is received at the mine in the form of alternating current, either purchased from a public utility company or distributed from a power station maintained by the coal company. There are still numerous mines of moderate size which are isolated from a reliable distribution system, and these often have a direct-current generating plant installed near the mine opening. Purchased power always has an advantage over such small plants, and depending on the life of the mine and other considerations, it often proves economical to change over to such service if it becomes available.

In some operations where a large power demand is made by a group of mines in a given locality a generating station of proper capacity is located at the most convenient point with respect to load distribution, water supply, etc. Such a station may be operated with economy and reliability approaching that of purchased power, particularly if there is a supply of fuel with low market value, and a convenient source of good water. With this system as well as with purchased power, transmission over a considerable distance is necessary so that power is delivered to the mines in the form of alternating current at a voltage of 2,200 or higher.

The principal underground application of power in coal mining is usually to locomotives for main haulage or gathering service, and as the characteristic of the series wound, direct-current motor is best adapted to mine locomotive service, the direct-current system is used for underground distribution in all mines using trolley locomotive haulage. It is possible to use alternating-current motors for other applications such as



**By Getting Close to the Center of Load Much Better Voltage Is Maintained on the Power Circuits and Less Energy Is Lost**

In this underground substation two 300-kw. synchronous motor-generator sets change the alternating-current energy to 275-volt direct-current energy which is supplied to the mining equipment. Another advantage of these machines is that they help in a large measure to correct the lagging power factor created by induction motors on the alternating-current system pumps, fans, air compressors, cutting machines, loading machines, etc., but with the trolley circuit carried throughout a mine it is seldom economical to install a separate alternating-current distribution system, and direct-current motors are generally used on these drives also.

With power received in the form of alternating current, a means of converting this to direct-current power is necessary at or convenient to the opening of every mine using trolley locomotive haulage.

The equipment used for this purpose may be a rotary converter or a motor-generator set, the latter consisting of a direct-current generator driven by either a synchronous motor or an induction motor. The synchronous motor is used practically always because of certain operating advantages, notably the possibility of power factor correction and its constant speed, which are not provided by any other type of alternating current motor.

As the name implies, the synchronous motor-generator set consists of two machines, an alternating-current synchronous motor and a direct-current generator, the rotating elements of which are connected directly together. The stator of the synchronous motor is provided with a distributed polyphase winding which may be designed for high voltage, so that in many cases the full line voltage may be used without the necessity of installing step-down transformers.

Standard machines are wound for either 2,200 volts or for 4,000 volts, three phase, 60 cycles. The rotating part carries a multipolar, direct-current field winding, usually with six poles giving a speed of 1,200 r.p.m. on a 60-cycle circuit. The field is excited from the direct-current generator in case the direct-current voltage is 275, but with 600-volt generators a separate 125-volt exciter is added to the set, so that the rotor of the motor is the same for either 2,300- or 4,000-volt stator windings. A squirrel-cage winding is provided in the pole faces which permits the motor to be started as an induction machine, and adds to its stability in operation.

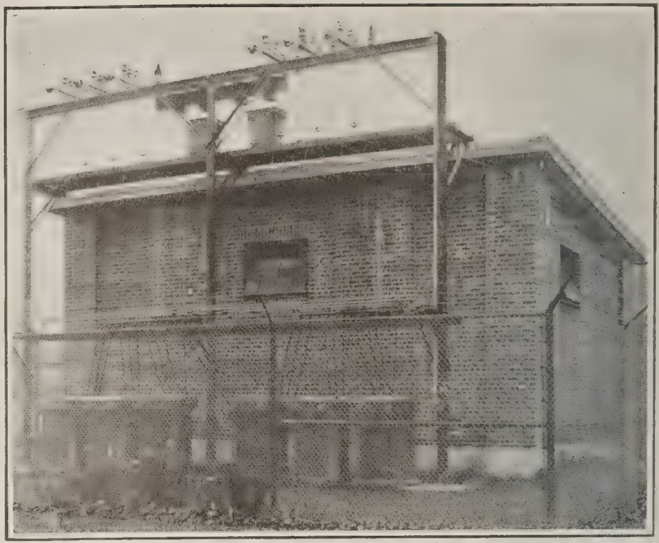
The direct-current generator is compound-wound and usually is provided with a rising voltage characteristic to compensate in part for the drop in voltage in the direct-current feeders on heavy load.

### Switchboard Equipment

The standard switchboard equipment for a synchronous motor-generator set includes a motor panel and a generator panel mounted side by side, with the starting and running breakers, auto-transformers, field rheostats and auxiliary apparatus mounted at the rear on pipe frame work.

The set is started by closing the switch connecting the motor winding to low voltage taps of the auto-transformers, all other switches being in the open position and the motor field permanently connected to the armature of its exciting machine. Under the induction motor action on the pole face windings of the synchronous motor, the set comes up to speed and will lock into step within a minute. The motor field excitation should then be increased to a value which tests show will produce the minimum rush of current when the transfer is made to the full voltage. The running switch is then closed, and the motor field rheostat is adjusted to give the desired power factor.

Adjustment of the generator field rheostat will then give correct generator voltage, and the direct-current circuit breaker and knife switch can then be closed. If the set operates in parallel with others nearby, the equalizer switch should be closed before connecting to the line. A common direct-current voltmeter with plugs to the different machines should be used to adjust voltages to the same value before paralleling.



**Permanent Substation Houses Two 150-Kw. Rotary Converters**

Sometimes there is no better place than the outdoors in which to locate a power converting substation. This one is equipped with two rotary converters supplied from outdoor type transformers.

Proper division of load may be obtained by adjustment of the generator field rheostats, and with the voltage characteristics made suitable for parallel operation at the time of installation, the generators will divide the load in proportion to their ratings over the entire range of load.

The other type of machine often used in a mining substation is the rotary of synchronous converter. This consists of a single machine the construction of which is very similar to a compound wound direct-current generator, with taps taken off the rear of the armature winding to six collector rings carried on the shaft. Its design and proportions are different from those of a direct-current generator, however, and it has a proportionally larger commutator than a generator of corresponding rating. The synchronous converter is supplied with alternating-current energy at its slip rings and delivers direct-current energy at the commutator.

With respect to the external circuits it has the essential characteristics of a synchronous motor on the alternating-current side and those of a direct-current generator on the direct-current side. Since the alternating-current and direct-current voltages of the machine are induced in the common armature winding by the same field, there is a fixed ratio between these voltages.

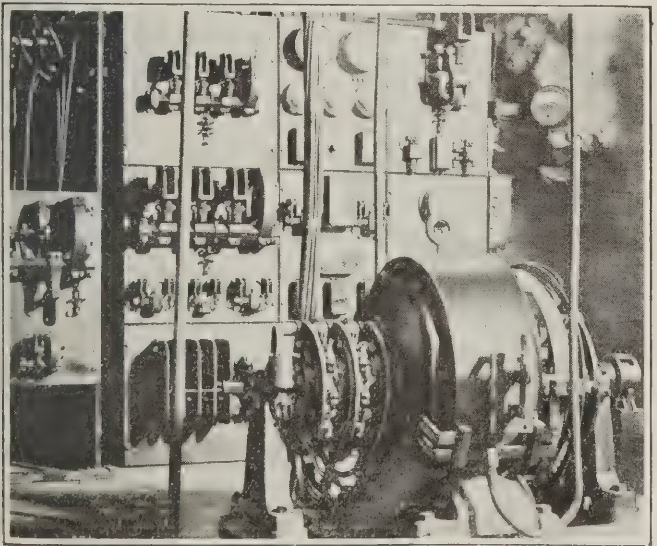
This ratio is influenced to some extent by the design of the machine, but is approximately 0.72 for a standard machine, wound for six-phase, diametrical connection. This means that a 275-volt converter requires approximately 198 volts on the alternating-current slip rings, and three transformers to supply the proper voltage accordingly are necessary with each converter. These transformers have a high-tension winding wound for the line voltage and are provided with reduced voltage taps to adjust for low voltage on the line. Taps are also provided on the low-tension winding so that reduced voltage may be applied to the rotary converter during starting.

Switchboard equipment for the rotary converter includes an oil circuit breaker for the high tension side of the transformer, a three-pole, double-throw, knife switch for starting, a two-pole, double-throw, field switch, field rheostat, direct-current carbon circuit breaker, knife line switch, and meters.

In the larger ratings of the modern design of commutating pole converter, it is necessary to raise the direct-current brushes from the commutator by a brush-lifting device to prevent injurious sparking during the starting period. Two brushes of opposite polarity are left down to carry the shunt field current. With the brushes raised the oil circuit breaker is closed, connecting the high tension windings of the transformers to the line. Then the double-throw, knife switch is closed on the starting contacts which connect the slip rings to the reduced voltage starting taps. The machine comes up to speed and locks into step by induction motor action on a squirrel-cage winding in the field pole faces.

If the direct-current voltage builds up with reversed polarity it is corrected by reversing the field switch momentarily, returning it to the operating position when the direct-current voltmeter reaches zero. When correct polarity is indicated the starting switch is thrown to the running position. The brushes may then be lowered and the direct-current breaker and line switch closed, an equalizer switch being closed first if the converter operates in parallel with others.

In many respects the characteristics of the rotary converter and the synchronous motor-generator set are similar, and while the starting and switching equipments differ in some details, it cannot be said that one is more difficult to operate than the other. There is no particular difficulty in operating rotary converters in parallel, and with proper adjustments of fields and reactance on the alternating-current side satisfactory division of load will be obtained. As in the case of direct-current generators, equalizer connections are necessary with rotary converters operating in parallel. With parallel operation it is also advisable to provide reverse-current relays to trip the circuit breakers, and a speed limit device should be used on the machine to prevent possibility of overspeed on inverted operation.



**Outfit Quickly Put in Service**

This rotary is installed in a simple yet efficient manner. The cables are suspended overhead instead of being placed in underground conduits.

While the reliability of the rotary converter is possibly not quite as good as that of either the motor or generator, making up a motor-generator set, the reliability of the motor-generator set is determined by two machines instead of one with the rotary converter, so that there is little to choose between the two types from this standpoint. The rotary converter has been thought a little more sensitive to flashover than the direct-current generator, but trouble from this source is rare with properly designed machines. The rotary converter is inherently a low-voltage machine so that the factor of safety of the insulation is higher than with the synchronous motor wound for high voltage. The synchronous motor, however, is less affected by disturbance of the power supply.

### CONSIDER OPERATING CONDITIONS

The decision between rotary converters and motor-generator sets for a mining substation is properly made through consideration of their respective characteristics, first costs and operating costs, taking into account the nature of the power supply and the terms of the power contract, particularly the clause on power factor. If the conditions are such that one equipment shows little advantage over the other, the decision usually is determined by the personal preference of the engineer making the selection. Under most conditions satisfactory operation is obtainable with either type of equipment.

The first cost of the rotary converter and transformers is about 90 per cent of that of an equivalent motor-generator set without transformers, but this will be offset to some extent by the more complicated wiring of the rotary converter and transformers. A further saving may be made in the building as the rotary converter requires less floor space than does the motor-generator set and the transformers may often be installed on the outside.

The efficiency of a rotary converter is considerably greater than that of a motor-generator set, for example, the combined efficiency of a 150-kw. rotary converter and transformers at full load is about 91.5 per cent, while the efficiency of a 150-kw. motor-generator set at full load is 85.2 per cent. The light load losses of the rotary converter are also less than those of the motor-generator set, the no-load inputs being about 5 kw. and 19 kw. respectively. The result of these differences is that less energy will be consumed by the rotary converter than by a motor-generator set on the same load, and this saving will be greater if the machines are required to operate for long periods at light load, as, for example, to supply power to several small motors during non-working hours.

One great advantage of the synchronous motor generator set is the ability to operate the motor at leading power factor, and thus correct to a greater or less extent a lagging power factor load caused by induction motors and transformers on the alternating-current line, the amount of correction depending upon the relative size and characteristics of the synchronous and inductive loads.

To secure this feature standard motor-generator sets for mining service are equipped with synchronous motors designed for operation at 80 per cent leading power factor. Most power contracts provide for a reduction in rates when a high power factor is maintained, so that even with a greater energy consumption due to its lower efficiency, the power bill may be less with the synchronous motor-generator set.

The important operating advantage of the synchronous motor-generator set is the independence of the alternating-current and direct-current circuits. While the alternating-current and direct-current voltages of a rotary converter have a definite ratio in a given machine, the voltage of the direct-current generator may be regulated entirely independently of the alternating-current voltage applied to the synchronous motor, and the alternating-current circuit need not be considered in adjusting the direct-current machine for proper voltage characteristics and parallel operation.

Variation in voltage on the alternating-current line will have no effect on the direct-current voltage of the motor-generator set, whereas the direct-current voltage of the rotary converter will vary in proportion to any change in the alternating-current voltage. In case the frequency of the power supply varies, the speed of the motor-generator set will follow with proportioned variation in direct-current voltage.

### Selection of Types

Frequency variations have little effect on the direct-current voltage of the rotary converter. The frequency of the power supply is practically constant in most cases, but considerable variation in the line voltage is often obtained so that the synchronous motor-generator set has the more desirable operating characteristics.

The rating of machines to be used in a mining substation is determined by the maximum peak, the average demand and the maximum demand sustained for any considerable length of time. Sufficient capacity should be installed so that the maximum peak will be within the 100 per cent momentary overload guarantee, and so that overheating will not occur during periods of heavy sustained load.

When the number of motors in use and their ratings and operating characteristics are known, the required substation rating can be readily calculated, by taking into account the probable maximum demand and the diversity factor of the load. The substation rating in kilowatts usually may be about 50 per cent of the total horsepower of connected motors, because of the diversity factor. The power required for development of a mine can be estimated with fair accuracy by comparison with similar existing operations, and it usually is desirable to allow some reserve capacity in the first substation installed to provide for additional load as the mine is extended. Other units are added if the need for more capacity develops.

If a mine depends upon one substation for its power supply it is preferable to divide the total capacity required into two units, so that a tie-up will not be caused by trouble with one machine. A saving in the power will also be effected by taking one unit out of service if it is necessary to supply a small demand in non-working hours. The higher cost of installing two machines instead of lumping the capacity in a single unit is warranted by the added insurance, as the loss in production through a complete tie-up might easily wipe out the difference in a short time.

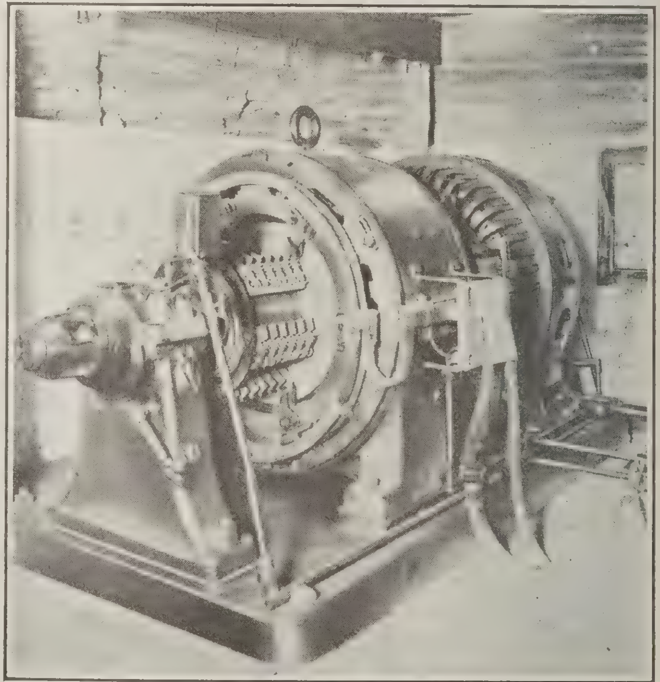
The first substation usually is installed convenient to the mine opening to save feeder copper and so that it may be given attention by men employed regularly at other work on the surface, in case a regular attendant is not present. The direct-current feeder circuit at first usually consists of a single 0000 trolley wire and bonded rail return. As the development of the mine progresses, with increasing load and movement of the load center to a greater distance from the substation, additional feeders in parallel with the trolley wire and return become necessary to maintain suitable voltage at the motors.

In many cases the waste due to low voltage at the motors is not fully appreciated. The voltage drop in the distribution circuit represents a proportional loss of the power delivered by the generating equipment, which serves no useful purpose. That is, if the substation is carrying a load of 1,000 amp. at 275 volts, it is delivering power at the rate of 275 kw., and if the average voltage at the motors is 200 volts, the line drop is 75 volts and the power loss 75 kw., which is more than one-quarter of the substation output.

The loss in power is by no means all the waste, however, for with low voltage the motor speeds are reduced, with consequent loss in production. Putting it another way, the capacities of machines are impaired, requiring more units to produce the required tonnage. Another item, often overlooked, is the increased motor maintenance caused by low voltage. Shunt or compound motors, such as used on pumps, compressors, etc., decrease in speed with reduced voltage, the drop in speed being proportionately less than the drop in voltage because of weakening of the shunt field strength. Such drives usually require practically a constant torque, and as the torque is proportional to the product of the field strength and the armature current, weakening of the field with low voltage requires an increase in the armature current to carry the load.

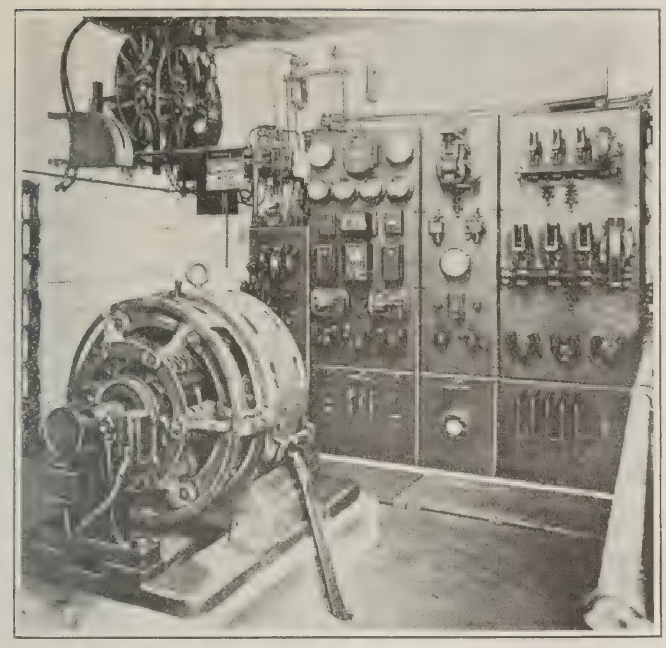
This results in overheating and frequent burnouts unless the drives are sufficiently over-motored to allow for such abnormal operation. Standard motors of this type are rated for operation at 230 volts and may be operated at 10 per cent less voltage without injury.

Series motors used on locomotives, cutting machines,



**Inside Substation Equipment Which Is Started by a Push Button**

Automatic switching equipment is provided for this 200-kw., 275-volt synchronous motor-generator set. The control apparatus not only starts and stops the outfit but always stands ready to guard and protect it and the outgoing circuits from damage.



**Small Units Made Automatic Require Little Attention**

Here is a 150-kw., 275-volt rotary provided with automatic control and located inside the mines. The switching equipment clearly shown in the background comprises all the control apparatus sufficient to provide safe, reliable operation.

loaders, etc., decrease in speed almost in proportion to the reduction in voltage. While the current taken by these motors is not affected, the loss in speed requires them to be in service longer, and since they are rated on an intermittent basis, this often results in excessive temperature and deterioration of the insulation on the windings.

These items are reflected in the cost per ton of mining coal, so the problem of maintaining proper voltage should be considered on an economic basis, and a balance obtained between the cost of adding to the feeder capacity and the saving effected thereby, making allowance for the somewhat intangible items of better operating speeds and motor maintenance.

In calculating the capacity of a distribution system using a rail return, the total cross-section of the rails can be used provided they are properly bonded and cross-bonded, the resistance of bonds being a small part of the total. This part of the system should be carefully installed and maintained, as track bonds are often easily damaged by derailments and other causes.

When additional capacity in the system becomes necessary, bare, stranded, copper conductors may be added in parallel with the rail return. The positive feeders paralleling the trolley wire usually consist of rubber insulated, braid covered, stranded conductors carried on insulators along the rib or overhead, and connected to the trolley wire at intervals by means of feeder clamps. When adding feeders it is advisable to estimate requirements several years in advance, so as to avoid the expense of frequent changes.

In operations which have been advanced to a long distance from the original opening, it often proves more economical to install additional converting equipment near the load center rather than go to the expense of installing heavy feeders to deliver the desired voltage. This practice has been assisted by the development of automatic switching equipment, which permits operation without any attention other than an occasional inspection by one of the electrical men and thus obviates the necessity of a regular attendant.

Alternating-current energy usually is carried to the substation over a wood pole line, but when this is not practicable the high-voltage, alternating-current cable may sometimes be carried along one of the main entries, suitably protected in underground conduit.

Where the mine workings are close to the surface the converting equipment often is installed in a building on the surface and direct-current feeders run down a borehole, air shaft or other opening. A large part of the cost of the building can be avoided by installing the substation underground and running the alternating-current feeder to the inside. The cost of transporting materials and equipment in rough country is an item upon which a saving often can be made by locating the substation in the mine.

For carrying the alternating-current line into a mine, a three-conductor, lead-covered cable is advisable, and if the cable is suspended in a borehole or shaft, an armored sheath may be necessary to carry the weight. Pot heads should be used at each end to seal the cable and exclude moisture.

An underground substation should be located as near as practicable to the load center and preferably along an entry that will be kept in good condition throughout the life of the section, so that the station will be accessible for inspection and maintenance. The equipment should be installed in a clean, dry room, and provision should be made for ventilation by diverting air to the room or installing a small fan to cause a circulation of air through the room. In gaseous mines, ventilating air should be taken from the intake air course.

### AUTOMATIC STATIONS BECOMING POPULAR

Automatic switching equipments for mine substations usually are arranged to start from a push button or time switch, and so are not strictly automatic as the term is understood in railway work. With this exception, however, all operations in starting and protecting the equipment are performed automatically, and more efficiently than possible with manual control, as no false moves are made. Protection from overload, overheating, unbalanced operation, low voltage, excess speed and hot bearings is automatic, and the station is locked out of operation by any trouble requiring the service of a maintenance man, the nature of the trouble being indicated by an annunciator type of relay. The value of this type of equipment for mining work is indicated by its swiftly increasing use.

Whether underground or on the surface the substation equipment should be installed in a fireproof room with ample space for safety and accessibility. Sufficient headroom should be allowed, and an I-beam installed over the axis of each machine to facilitate handling the equipment. A concrete floor is to be preferred, and the location of equipment should be planned and conduit placed before pouring the floor. With properly drained pits and conduit, lead-covered conductors are not necessary in wiring. The bedplates of machines should be carefully leveled and grouted in place to obtain an even footing and avoid vibration.

The mining substation in most cases might be regarded as the heart of the power equipment, and the utmost care is warranted to insure the greatest economy and reliability. It has been the endeavor of this article to point out that these features are obtained not only by careful selection of the size and type of equipment, but also by a thorough study of the distribution of load and location of stations.

# Frick Conveyor System Proves Its Efficiency

Few installations of coal-mine machinery or equipment have ever attracted more widespread attention than the system of underground conveyors installed several months ago by the H. C. Frick Coke Co., to transport coal from the Colonial mines to the Monongahela River and there load it onto barges. This installation represented so radical a departure from current practice that it immediately arrested the attention of mining men everywhere and much comment and conjecture were indulged in long before the machinery was finally put in motion. From the start, however, this installation proved a success and it is understood that several other conveyor systems of a similar type are now under consideration both by the owners of this one and by other companies.

Although the principal dimensions of this installation have already received publicity the more salient of them may well be repeated. The total length of the conveyors is 22,927 ft. and the total height through which the coal is raised amounts to 357 ft., 7⅜ in. Originally this conveyor system was made up of 20 sections or separate belts, but in January, 1925, belts Nos. 8 and 9 were combined into one unit, making a section 2,439 ft. long or the longest single conveyor belt in the world. Prior to the combination of these two sections belt No. 11 was the longest in the system, its length being 1,513 ft.

Alternating current at fairly high potential is employed to drive the various elements of this system. Thus, each section is actuated by an independent motor. All of these machines are of the wound-rotor type for 2,300 volt, 3-phase, 60-cycle current, and all operate at 900 r.p.m. The entire system is controlled from No. 1 motor room.

In order to bring this current into the conveyor tunnel three boreholes have been sunk at various points along its course. The position of these holes as well as the plan and elevation of the entire line may be seen in the accompanying illustration. It will be observed that this conveyor system does not, as might at first be supposed, extend in a straight line from the loading to the discharge point. On the contrary, changes of direction each amounting to almost 45 deg. are introduced between the combined section, belts Nos. 8 and 9, and section No. 10 and also between sections Nos. 12 and 13.

Belts in this system have a capacity for handling 1,500 tons per hour when running at a speed of 500 ft. per minute. Ordinarily about 1,000 tons of coal is continuously in transit and 1,500 hp. is required to operate this conveyor system. Only one belt in the entire system, No. 7, has a net drop and this amounts to only slightly over 12 ft. All of the others lift the coal the total amount of this elevation varying from 1½ ft. in belt No. 8 to over 43 ft. in belt No. 1. Belts Nos. 1, 2 and 3 are fitted with a single-pulley type of drive; all other sections have tandem drives. All tandem-drive gears boxes are duplicates.

All the various belt sections are geared together, the head pulley of one section being connected to the tail pulley of the next section. Thus should any belt cease running, a ratchet will come into engagement and the section behind must either drive the one ahead or must also stop. This prevents the piling up of the coal in the chutes.

Adequate protection from falls of roof is afforded throughout the length of the conveyor tunnel by steel timbering where local conditions demand and by brick arches where high caving has taken place.

tipple resembles a railroad tipple. Thus barges are floated under it and loaded by eight chutes working simultaneously. A barge can be loaded out in 10 minutes. It can be moved up or down stream by means of a barge mover.

under a rotary dump 374 ft. long or capable of discharging 35 to 40 mine cars simultaneously. This dump is operated by compressed air, the compressor being located near its inner or river end. The No. 20 belt is fed from the bin or hopper beneath this dump by 34 duplicate feeders, driven by a single motor. This hopper is capable of holding 1,250 tons of coal.

At the opposite end of the conveyor system the coal is delivered to a tipple on the Monongahela River where barges are loaded. These barges are 26 ft. wide and 175 ft. long. Each is capable of carrying 850 tons of coal. Each storage bin at the tipple is capable of holding 1,200 tons. Coal is delivered to each barge by means of 8 chutes operated simultaneously. A barge thus can be loaded out in 10 minutes. Each shuttle conveyor on the tipple can handle 1,000 tons of coal per hour. All gates and chutes as well as the barge mover are controlled from the operator's room under the bins.

From the time when this conveyor system was first installed up until July 1, 1925, it had handled a total of 2,598,304 tons of coal. This meant an average daily performance of approximately 10,500 tons. In the light of such a performance it is not strange that other similar installations are being seriously considered both by this and other coal producing companies.

## Are Separate Traveling Ways A Safety Factor?

Separate traveling ways should be provided in mines, and should be on intake air. Employees walking along haul roads are exposed to hazards, even where standard clearance and shelter holes are provided, Frank Hillman, safety inspector for the Woodward Coal and Iron Co., Mulga, Ala., told the Mine Inspectors' Institute of America at the Peoria convention this year. Today, electric haulage is the means of transportation of coal in many mines. Longer trips are hauled at a higher rate of speed. And in case of derailment, cars usually get over in the clearance space. Even where shelter holes are provided, we are not always sure that the employee will get in one when he sees or hears the trip coming. Then again, where electric haulage is used, the trolley wire is usually placed on the side of the entry opposite the traveling side. In many mines the wire is about 5 ft. above the level of the track and is not shielded. When tools are carried by hand, such as bars or drills, there is the hazard of striking the wire and causing an accident. Then again, an employee may strike the wire with his head. I have known of fatal accidents from this cause.

Where rope haulage is used, there is danger of stepping on a roller, or, in the opening under it. During hoisting time the rope may rise up, or where it is on a grade, cars may break loose and run back.

Several years ago I investigated an accident where an electric motor was pulling a long trip of loaded cars up a grade, when near the top the coupling broke, part of the trip ran back to the bottom of the grade, where it wrecked at the mouth of a heading. The cars struck a number of miners, on their way to working places, causing the death of four and injury to seven.

In producing headings, the haulage hazard is not as great, due to the smaller number of men traveling, and fewer number of cars and trips. And as miners enter their working places at different points, it would entail a heavy expenditure to provide a separate traveling way.

**This Mine Adds to Its Life by Going Deeper to Another Bed of Coal**

About 18 months ago, at No. 1 mine, the Norton Mining Co., or Nortonville, Ky., started production from the No. 9 bed. At present this coal is brought up through the 280-ft. shaft, the low, wooden headframe of which is seen at the left in the illustration. Work is about to start in driving a shaft, 80 ft. upward, to connect with the bottom of the 200-ft. main shaft of the No. 11 bed. A hole has been drilled from the bottom of the old shaft down to the No. 9 seam. This will serve to check the location and to help to dispose of any gas encountered. The newly-extended, two-level shaft will be the main hoisting shaft for both measures. The 165-ft. smokestack, seen at the right, was but recently completed. It will furnish natural draft for the new power plant now under construction. A new steam hoisting engine will be installed as soon as the shaft is extended to the lower level. The Norton Mining Co. is a subsidiary of the Monro-Warrior Coal & Coke Co.

# Coal Stripping in West Kentucky

By J. H. Edwards
Associate Editor, *Coal Age*,
Huntington, W. Va.

In the headpiece one of the two coal-producing units employed at the Dempster mine is shown in operation. The 54-in. bed of clean coal lying practically level is dug from the solid by a shovel with a 2-cu.yd. dipper. A berm is left to support the loading track, the coal shovel being kept a few hundred feet in rear of the stripper, thus assuring sufficient track space for the empty cars.

FROM HIGHWAY and railroad contracting to coal stripping is a natural step for the five Dempster Brothers who now operate one of the largest strip mines in the country. One of the secrets of successful contracting is the wise selection and intelligent application of high-capacity equipment. A few years ago the steam shovels used by such contractors were considered marvels of size and strength. Today they are dwarfs beside the huge stripping shovels used in daylight mining. Coal stripping is primarily an excavating rather than a mining problem. As a result it has fallen to men experienced in excavating to take the lead.

The stripping operation of the Dempster Coal Co. is located at Dempstertown, near Earlington, in the West Kentucky field. In this vicinity the No. 9 bed outcrops in places. Over large areas it is covered by a rather soft overburden less than 75 ft. in thickness. This is unfavorable to underground mining but favorable to stripping. The acreage leased by the Dempsters is owned by the West Kentucky Coal Co. This firm, although a large producer, confines its activity to underground work, leaving the recovery of its shallow coal to interests such as those represented by the Dempster organization.

The coal bed at Dempstertown averages 54 in. in thickness and is free from partings. It lies practically horizontal, but the overburden is by no means uniform in thickness. The surface ordinarily would be called "rolling" ground. This means that, in general, it is not possible to prosecute mining on a straight line but instead it must be advanced in irregular fashion conforming to the surface topography.

The method followed is to take a development cut around the outcrop, that is as close to it as the quality of the coal will permit, then to make successive cuts toward the center of the hill until the entire area is mined or until a point is reached where the overburden is too thick for economic removal.

The large stripping shovel is followed by a small one that loads the coal, directly from the solid, into side-dump cars. The entire strip of coal exposed by the spoil shovel is not loaded but a berm, upon which the haulage track is located, is left along the advance side. Usually the coal is kept loaded out to within about 200 ft. of the stripper. It is necessary to maintain a certain distance in order to have track space for the trip of empties being loaded.

Each producing unit consists of a stripping shovel, a coal-loading shovel and the necessary cars and locomotives for hauling the coal to the tipple and keeping empties spotted within reach of the coal-loading machine. Two complete units of this kind are in use at the Dempster mine. The smaller consists of a Bucyrus model 225 stripping shovel followed by a model 50-B loader. This equipment is shown in action in the headpiece. A 6-cu.yd. bucket is used on the stripper and one of 2 cu.yd. capacity on the smaller machine which is a loader.

The larger unit consists of a Marion model 350 stripping shovel and a model 27 loader, of the same make. Figs. 1 to 5, inclusive, illustrate this equipment. The large stripping machine weighs 438 tons, and when shipped from the factory formed a load for 14 cars. The boom is 90 ft. long and the dipper stick 68 ft. The weight is carried on double-flanged wheels, four to a

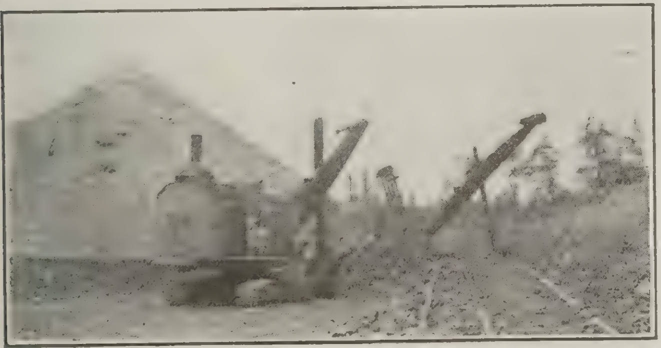

**Fig. 1—The Noon-Hour Shutdown**

Stripping operations require large capital investments and consequently shutdowns of whatever nature are costly. From the mine owner's standpoint the operating crew's luncheon is an expensive meal. The long reach of the stripping machine is emphasized by the size and height of the spoil bank at the left in the illustration.

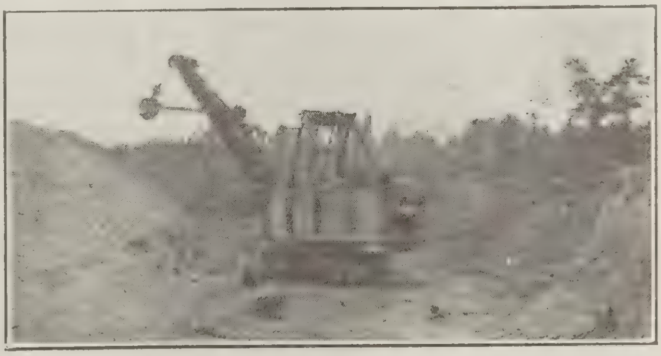

**Fig. 2—Cutting Around the Outcrop**

At the point here shown the overburden does not exceed 25 ft. in thickness, whereas in other parts of the property as much as 65 ft. is sometimes encountered. The coal is immediately overlain with a hard shale but the dipper dislodges this formation without the aid of explosives. Sizable trees and large stumps seem merely to whet the stripper's greedy appetite.

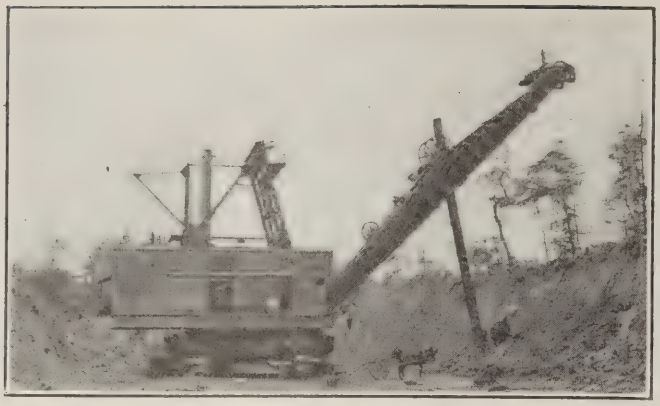

**Fig. 3—The Giant at Rest**

This is one of the largest stripping shovels yet produced. As shipped from the factory knocked down, it formed a load for 14 railroad cars. The mule below the boom is not a miniature or toy type but a good-sized draft animal.

truck, with a truck at each of the four corners of the under frame. Each truck is connected to the machine through the medium of a hydraulic jack, which facilitates leveling. All wheels are drivers, and the track on which they operate consists of 6-ft. lengths of 120-lb. rail. No ties are used, the rails being laid directly upon the top of the coal.

This "350" shovel was designed for an 8-cu.yd. bucket, but one of 6-cu.yd. capacity has been substituted in order to make it possible to dig most of the overburden without shooting. In Figs. 1, 2 and 3, the large shovel is shown making a development cut around the outcrop of a new territory. The maximum thickness of overburden in such a cut is not over 25 ft. as contrasted to 65 ft. which is the greatest that the shovel has handled to date.

Picking and preparation of the coal produced is accomplished at the modern, four-track, 2,500-ton tipple shown in Fig. 6. Loading facilities consist of two booms, an egg chute and a nut chute. The usual sizes shipped are 6-in. lump, 6x3-in. egg, 3x1¼-in. nut and 1¼-in. screenings. The production record to date is 2,430 tons loaded in 7½ hours.

This production was reached in less than two years after February, 1923, when preliminary work was begun on the development of the mine. This is a good record considering the fact that much construction work was necessary. A water supply for the steam equipment was provided by building a dam, and erecting a pumping station that forces the water through several miles of pipe line from the artificial lake to the mine. Other necessary construction included the tipple, an office and commissary, a club house, and 80 dwellings.

Exact figures as to the number of men required to produce 2,500 tons per day at a strip mine such as the one described are not available because up to the present many of the employees have been spending all or part of their time on construction work. A careful estimate would place this number at 75. This includes tipple men, office help and all other persons actually engaged in production, preparation and shipping of coal. This means an average of 33 tons per man.

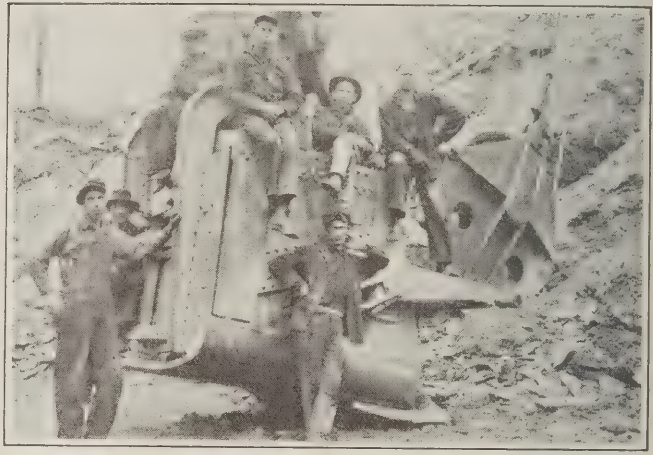

**Fig. 5—The "Business End" of the Stripper**

A 6-cu.yd. bucket is neither toy nor feather weight. The operating crew consented to forego the joys of their dinner pails long enough to get into this picture in order to show the relative size of the dipper. If the overburden were shot before stripping an 8-cu.yd. bucket could be used on this machine.

While it is generally conceded that coal can be produced at a lower cost by stripping than by underground mining, sight should not be lost of the large investment

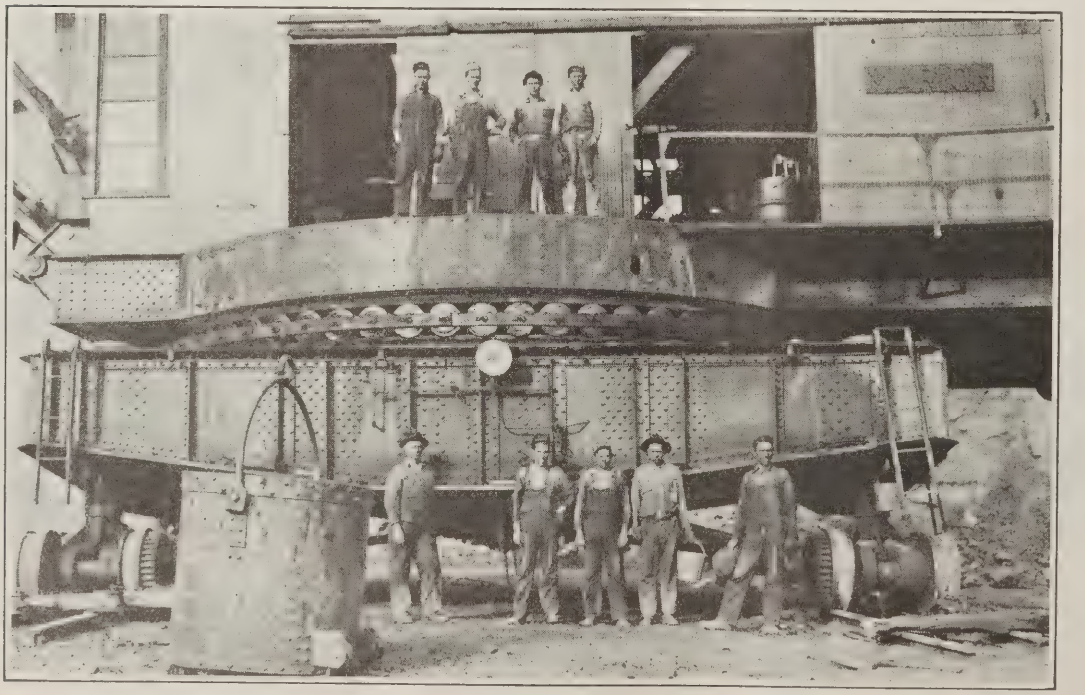

FIG. 4

**The Underframe**

Four trucks support the shovel. Each truck has four double-flanged driving wheels carried in a frame that acts against the plunger of a hydraulic jack. Interconnection between the four jacks makes leveling of the deck frame rapid and easy. The track over which the shovel moves consists of 6-ft. lengths of 120-lb. rails laid directly on the top of the coal without ties, bridles, anti-spreaders or other supporting or holding devices.

FIG. 6

**The Preparator**

In the early stages of the coal stripping art the product of open pits acquired a bad reputation. Therefore it behooves present-day operators to exercise special care in their preparation. This 2,500-ton four-track tipple is equipped with screening equipment and picking tables assuring careful preparation of the mine product.

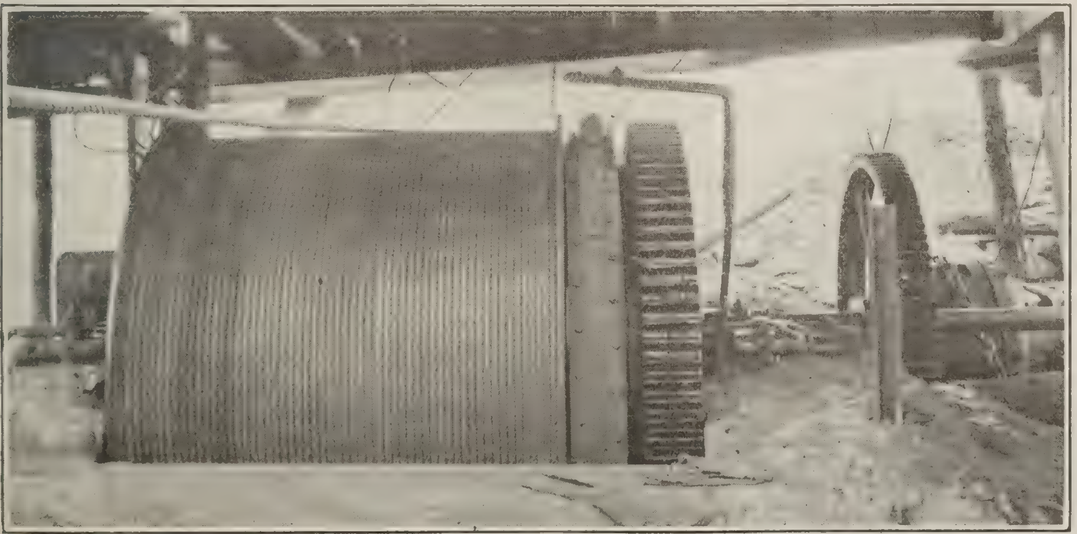
necessary at a modern strip mine. One large revolving stripper, alone, costs approximately $100,000, while the loaders represent a proportionately smaller outlay. Such a plant as that operated by the Dempster Brothers involves a capital charge running up to several hundred thousand dollars.

## Stay Out of Abandoned Mines, Bureau Warns Public

Warning against entering any place where the air does not circulate unless one is first assured that it contains enough oxygen to support life, is given by Dr. Thomas T. Read, safety service director of the Bureau of Mines, Department of Commerce, in commenting on the recent death of three persons who entered a well near Rockwood, Md., to make repairs to the piping. Wells, abandoned mines, and other confined spaces where the air does not circulate may be filled with black damp, and the incautious person who ventures into them may be asphyxiated. Black damp is a miner's term for air that has become depleted of its oxygen and consists mainly of nitrogen and carbon dioxide. It is not poisonous, but, being heavier than ordinary air, it lies in a confined space like so much water and a person who goes into it is as effectually cut off from the life-supporting oxygen as if he had gone under water. Unless immediately rescued, he will die as quickly as he would by drowning.

Such accidents are much more common than is generally supposed, Dr. Read continues. Not long ago, one of two men who were strolling near Summerville, Ala., walked a few yards into the slope of an abandoned mine. His companion saw him fall and, instead of immediately trying to rescue him, ran to a nearby house for help. By the time help was obtained the man was dead. Last autumn a boy delivering bread for a bakery stopped at an abandoned mine, near a highway between Culbertson and Froid, Mont., and climbed down the ladderway. He was overcome by black damp. Another boy who tried to rescue him was also overcome, and by the time help reached them both were dead. Many other similar cases might be cited.

Such deaths could be avoided if people would not enter abandoned mines, wells, and such places unless they have some definite duty to perform there, it is pointed out. If it is necessary to enter a place of this description, it is easy to test for the presence of black damp by lowering a lantern to the point at which it is desired to go. If the lantern goes out, black damp is present and should be removed before entering. In the case of a well an opened umbrella can be used to bail it out, like bailing water out in a bucket, or a current of air may be set up by any convenient means. But no one should enter until the lantern burns without flickering, after which it will be safe.



**Outside Rope Hoist**

In many cases large haulage-rope systems around the mines accomplish results unattainable by other means. Another advantage lies in the fact that the hoist motor is stationary and the electric or steam control is simple and rugged. In gaseous mines the hoist and motor may be located outside and the coal may be hauled by ropes operating through boreholes.

# Raising Canaries for Gas Tests

### Birds Can Be Raised or Purchased but Former Plan Is Preferable — Two Broods of Young May Be Reared Yearly

By Frank H. Kneeland
Associate Editor, *Coal Age*,
New York, N. Y.

FOR many years past canaries have been almost universally employed in the mines in testing for the presence of carbon monoxide (CO) or white damp. Mice have been similarly used but to a far less extent, not only because they appear to be less sensitive to this deadly gas, but also because their signs of distress are less quickly recognized than are those of a bird. Birds sit on perches and when overcome fall off. This is unmistakable evidence to man that unless provided with a gas mask he is in danger.

In order to have always on hand a number of canaries ready for any emergency several coal companies raise birds of their own. Doubtless many others would follow the same procedure rather than buy birds when needed if only the art of successfully rearing the young were better understood. The following is written largely from notes given by a man who for years has had charge of the canaries as well as the safety apparatus and equipment of a large coal company.

It is preferable but not absolutely necessary to keep canaries at some point near that where the breathing apparatus is stored. In all probability both birds and helmets if ever needed at all will be needed simultaneously. For this reason they should not be far separated. The building in which the birds are kept should be both sunny and well ventilated but its temperature should never be allowed to fall below the freezing point.

## Overfeeding Should Be Avoided

A full grown canary, like a dog or a man, should be fed just a little less than he wants to eat. Fat birds are less satisfactory than those in the best of condition. Most canaries eat about a teaspoonful of mixed bird seed per day. This can be purchased ready mixed at any pet store as well as at many feed stores. Birds should be fed once and watered twice daily.

In addition to their allowance of seed or dry food they should be given all the green stuff—lettuce, chickweed, spinach and the like—that they will eat. If this is not available, as may be the case during the winter, apples or pears cut into chunks or slices may be given in its stead. Cuttle-fish bone and sand should be kept in the cages at all times but the latter should be changed periodically, say every two or three weeks.

Canaries also should be fed a tonic consisting of anise seed, dried blood, meat scraps and the like. Some birds will eat such a tonic with moderation and as a result can have it before them all the time. Others will devour it to excess and consequently should be fed with it only periodically. A tonic of the kind above mentioned may be purchased ready prepared being known as "bird manna."

A shallow basin or dish of water should either be kept in the cage at all times or be introduced at regular intervals, say once a day. Apparently some birds do not care to wash themselves while others delight in it, habitually bathing several times a day if given the opportunity.

Cages should be thoroughly cleaned at least once a month. Cleaning at much more frequent intervals tends to make the birds nervous or "skittish." The less canaries are handled the more satisfied and contented they are. A cage that can be detached from its bottom and be lifted from it greatly simplifies the cleaning process.

The mating season begins in the latter part of March or early in April. Two to three weeks before birds are to be mated their cages should be hung close together or the birds should be placed in a double cage with a partition between them. They should be thus hung for two or three weeks before being put together. Unlike the common barnyard fowl the canary is a monogamist, that is, he will tolerate only one mate at a time. To put a male bird into a cage with two or more females is certain to cause trouble.

## Fruit Strainer Used for Nest

About the first of April birds that have become acquainted with each other by occupying adjacent cages as above outlined, may be placed in the same cage. Almost immediately it is necessary to prepare a nest. An ordinary metal gauze fruit strainer answers the purpose excellently. This should be padded with cotton and covered with some hard-surfaced cloth such as canvas. Any soft fabric will cause trouble by catching the birds' claws.

No matter how carefully such a nest may be prepared the birds will try to improve upon it by lining it with material of their own choosing. They prefer something fibrous and in order to supply them with the necessary material it is well to place within the cage a small piece of untwisted rope or a little coarse horsehair.

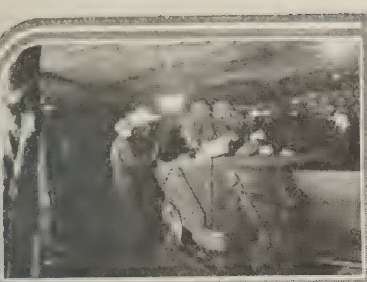
Ordinarily four or five eggs will be laid before the female begins setting. As soon as the hen starts to set the male should be removed but hung in a cage close at hand so that each bird can see the other. The eggs will hatch in from thirteen to fourteen days after the last one has been laid.

As soon as the young birds are hatched ¼ of a hard boiled egg mashed fine and containing both white and yolk should be placed within the cage in a separate dish from that containing food for the adult bird. This ration should be continued until after the young birds start eating for themselves. The mother should be separated from the brood as soon as the young birds have learned to eat which will be in about four to five weeks.

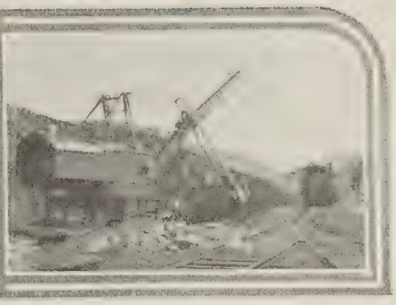
## Two Broods May Be Raised

For the young birds when they begin eating, the bird seed should be soaked in cold water for two or three hours before feeding. This should be continued until their bills get hard enough to crack the dry seed, after which it is not necessary. The mother bird may be bred a second time immediately after the first brood is taken away.

In breeding, the mating of two birds from the same brood or from different broods from the same parents should be carefully avoided as this degenerates the stock. As singers male canaries far excel the females, but so far as sensitiveness to carbon monoxide is concerned there is no noticeable difference between the sexes. A light-colored bird, however, is more sensitive to gas than a dark one. A dark-colored bird has been known to survive, without apparent ill effect or injury, a gas mixture that killed a light-colored bird almost instantly.



# News Of the Industry



## Effort to Call Out Non-Union Men In West Virginia Will Fizzle, Say Operators; Summonses for Lewis

While considerable comment is heard in northern West Virginia over the proposed call extended to the non-union coal miners to strike and join the union on Sept. 25, and the visit of John L. Lewis, international president, the following day, coal operators generally do not expect much of a strike. The United Mine Workers, however, is holding a series of mass meetings in various sections of the field to renew interest in the organization and talk strike activities.

Meetings were held recently at Monongah, Rivesville, Lowsville, Grant Town, Kilarm, Watson, Kingmont, Farmington, Dakota, Barnesville, Ida May, Enterprise and other towns.

In commenting on the proposed strike Van A. Bittner, international representative, said: "The response to the strike call which will become effective on Sept. 25, 1925, will be greater than that of April 1 and, from reports coming in from our field workers and the men in various non-union mines, we are almost certain to get a 100 per cent response. The coal companies that are operating non-union mines and using the so-called American plan as a smoke screen realize that the strike will be very effective and, as noted in these non-union coal companies' newspaper statements, they are attacking the United Mine Workers in a most vicious manner.

"Invitations have been sent to all district presidents to have delegations attend the demonstration in Fairmont on Sept. 26 and every district under the jurisdiction of the United Mine Workers will have delegations present at the demonstration.

"A written permit to hold a parade in Fairmont on Sept. 26 was granted the United Mine Workers by Mayor Thomas F. Buckley. It is expected that at least 30,000 people will take part in the parade and at least 10 bands will furnish the music."

Coal operators predict that the new strike will fizzle out like the one on April 1. A reaction will then set in, they say, which will cause the striking miners to sour on the union and return to work. The backbone of the union in the region at present consists of foreigners and it is predicted that many of these radicals will never again be given employment by coal operators in this field.

Philip Murray, international vice-president, and Thomas Kennedy, international secretary and treasurer, will take part in the demonstration of Sept. 26.

A second attempt was made to burn down the tipple of Eureka mine of the Bertha-Consumers Co., at Maidsville, near Morgantown, on Sept. 15. A ball of lighted oil-soaked waste was tossed into the plant by two men, who made their escape, according to the night watchman, who extinguished the blaze.

In the first four days of last week the non-union mines loaded 6,300 cars of coal compared to 970 cars loaded by union mines. Coal production eased up somewhat last week due to the late placement of empty coal cars on Sept. 24 on the Monongah Division, B. & O., the first for a long time.

According to reports received from Morgantown during the latter part of last week if John L. Lewis comes to Fairmont on Saturday a series of summonses will be served upon the union chief on injunctions issued against him and other union officials by the Monongalia, Harrison and Marion Circuit courts. The Continental Coal Co., the Chaplain Collieries Co., the Brady-Warner Coal Corporation and the Shriver Coal Co. are among the companies that have obtained injunctions.

### "Yellow Dog" Is Now a "Wienie"

While injunctions don't permit miners to use the term "yellow dog," the union pickets have adopted a substitute in the word "wienie," the common name for frankfurter. The use of this term recently caused a disturbance for which a non-union miner employed at the Dawson Coal Co., at Lyon, was arrested and fined $20.

The Chesapeake mine of the Fairmont-Chicago Coal Co., at Barrackville, will reopen on a non-union basis this week. It formerly worked non-union, but closed down six weeks ago.

The Consolidation Coal Co. will resume operation at Baxter mine this week on an open shop basis, it is reported. This mine was closed down for some time.

The Kelly Creek Collieries Co., in southern West Virginia, has notified the members of the United Mine Workers that they may remain in the company houses at Ward, after the company had sued for the property. The union was told not to erect barracks and it is believed that the company will soon effect a settlement, it is reported. The company is connected with the J. A. Paisley interests.

### *Fake Wage-Advance Notices Posted at Connellsville*

The Connellsville coke region was amazed last week by the surreptitious posting of notices at independent operations that the Frick scale would be restored at those plants on Sept. 21. The authenticity of the notices was promptly repudiated by the operators at whose plants they appeared. The posting was generally considered the work of union sympathizers trying to stir up discontent in the region, which has been one of the question marks in the labor situation since the unexpected walkout in 1922.

Late last year the independent operators raised their wage scales to meet those paid by the H. C. Frick Coke Co. The business that developed, however, would not support the advances and wages were again reduced. At the present time there is said to be little chance that there will be any upward revision.

---

## Virginian Denied Injunction

The injunction sought by the Virginian Ry. to restrain the Interstate Commerce Commission from applying through Western freight rates on carload shipments by way of the Chesapeake & Ohio Ry. was denied Sept. 19 by a special court at Richmond, Va., sitting for the Southern District of West Virginia.

The Virginian desired to establish through Western rates on coal by way of the Norfolk & Western. The court held that the commission had exclusive jurisdiction as to whether the shipments originating on the Virginian should be routed by way of the Chesapeake & Ohio or the Norfolk & Western.

Judge McClintick, of the federal District Court of Southern West Virginia, dissented from the order, which was read by Judge Waddill of the U. S. Circuit Court of Appeals.

The order of the commission was entered on May 19 to become effective June 25. It was sought by West Virginia coal operators and shippers, who claimed the Chesapeake & Ohio route would afford them better facilities.

After the decision Sept. 19, the Virginian sought an interlocutory injunction, pending appeal.

## Strikers in Oklahoma Determined to Win; Picketing Is Orderly

A rumor was in circulation Sept. 16 that Henryetta (Okla.) miners were breaking with the union and that a group there had declared that they would abandon the strike instituted by the United Mine Workers. The rumor is emphatically denied by union officials.

Heavy picketing on the part of striking union miners and sympathizers is the only development in the McAlester-Hartshorne-Wilburton coal area, according to Sheriff Will Anderson, who is keeping in touch with the situation. The picketers are meeting both morning and evening now in an effort to get the working miners to join the ranks of the strikers.

The number of men working in the mines remains practically the same, according to reports. In the meantime the state is maintaining its observation in the county to determine if troops should become necessary. So far union men have been peaceful and little disorder has been reported.

Owners of the Rock Island mines are to have a conference in Oklahoma within the next few days, at which time coal contracts for the future will be considered. It is known that a temporary agreement made with Kentucky mine owners is being considered from the standpoint of permanency. It is believed the conference will be of vital interest to the people in this part of the state.

The union miners in the Henryetta field are as determined as ever to win the strike, in the opinion of Andrew Steele, international representative from Missouri, who accuses the operators of bringing non-union workers from Henryetta to the mines in Pittsburg County in an effort to make a showing of men at work in the mines here.

James A. Reed, U. S. Senator from Missouri, and Prince Freeling, former Attorney General of Oklahoma, have been added to the list of legal counsel of the United Mine Workers of Oklahoma and Arkansas to defend the organization and its members in cases growing out of the open-shop wage war going on between the union men and the operators, it has been announced by union officials.

Reed will have charge of the Kansas City proceedings wherein $18,000 belonging to the mine workers has been tied up in the Commerce Trust Co. of Kansas City through injunction proceedings instituted at Fort Smith, Ark. In this case a receiver is asked for the district No. 21 organization of Oklahoma and Arkansas. The Chancery Court there issued an order prohibiting the organization from interfering with its deposit in Kansas City.

**Sanders A. Wertheim**

President of Burns Bros., New York's largest coal dealers, as he embarked on the Cunard liner "Berengaria" for London, Paris and Rome, Sept. 16, said that if the hard-coal strike was not settled by Oct. 1 he would arrange for the shipment to this country of 50,000 tons of Welsh coal per month. Mr. Wertheim said the real object of his trip was a pilgrimage to the Holy Year festivities in Rome.

## Banning No. 1 Mine Opens; Working Force Growing

The Pittsburgh Coal Co., extending its operations with the 1917 scale as the basic condition, has started another mine in the Pittsburgh district. Much to the surprise of the company officials, the new operation, in so far as labor is concerned, proved an instantaneous success.

The day announcement was made that Banning No. 1, at Van Meter, Pa., two miles from Banning No. 2, had started up on the 1917 scale, there was a flow of men to the mine and some even came to the general offices of the company in Pittsburgh. The first day of operation, Wednesday, Sept. 16, 29 men went to work, but on Thursday there were 105 men at work and this had climbed on Friday to 141 men.

On Saturday 212 tons of coal was produced at Banning No. 1, with 138 men at work. On the same day a new record at Banning No. 2 was made with the production of 800 tons.

Banning No. 1 mine was closed in May of this year, one of the last mines to be held open in the face of the Jacksonville wage scale, which, according to company officials, combined with Southern field competition, made it financial suicide to continue operation.

In opening the second mine, the company carried out the policy adopted on Aug. 20, when the first mine was placed in operation. It was announced at that time that other mines would be started as soon as a sufficient number of former employees at any mine petitioned the company to return to work.

Banning No. 1 mine is located on the Youghiogheny division of the Pittsburgh & Lake Erie R.R. Part of the mine property is in Fayette County and part in Westmoreland County.

---

The Boston & Maine Ry. has rejected all bids for 5,000,000 tons of railroad fuel for delivery within the next five years and is receiving new bids at the offices in Boston.

# Politics to Affect Hard Coal Strike, Washington Believes; Tardy Buying Of Substitutes Causes Concern

**By Paul Wooton**
Washington Correspondent of *Coal Age*

Outwardly the anthracite situation is so calm that the man in the street is forgetting that a strike is in progress. Prices of coal are not rising noticeably. The people throughout most of the country's area have been sweltering and have given little thought to the winter. Absolutely no public pressure has been brought to bear on the situation.

There are indications, however, that something is going on beneath the surface. The belief is growing that this strike is going to turn on political considerations and on political understandings. There is no sign of the issue's having become involved in national politics, but the visits of John L. Lewis to Governor Pinchot—one openly and one privately—indicate that the political leaven is at work. When men who typify controverted questions of public policy, backed by large and determined groups of followers, are engaged in a fight for high federal office, a political development in a single state easily can be forced into the national arena.

Except for the fact that federal agencies dealing with coal are receiving a few more letters than is customary, there is no evidence in Washington that 158,000 men are on strike and that there is a cessation in production of a fuel always heretofore regarded in large areas of the country as essential to life. The position of the administration is becoming increasingly clear. Early news dispatches from Swampscott might have meant anything. Fragmentary replies to questions were interpreted in various ways. The Hearst papers saw in these utterances promises of prompt federal intervention. The conservative press thought they contained assurances that no drastic action would be taken. Later the tone of the Swampscott dispatches became more positive that the administration would not intervene.

### Administration Waiting for Public

Now that the President has returned to Washington, no questions as to coal are being answered at the White House. In fact no federal officials are allowing themselves to be quoted on coal. This is believed to be due to the fact that they do not want observations of theirs to create the impression that the federal government is going to step in and save the situation. They want the public to act in its own interest.

It is apparent that federal officials are watching with concern the failure of the public in the anthracite consuming areas to start the buying of substitutes. Production of soft coal declined during the first week of the anthracite strike. The decline is only partly explained by the Labor Day holiday. It is now apparent that the heavier movement of soft coal in August was not due to the purchase of substitutes but to the accumulation of larger reserves by the steam trade.

Prices of bituminous have reacted only slightly to the strike. The average spot price of the week of Sept. 12 was only 15c. a ton higher than that of a year ago. The quarter from which the highest prices have been offered is not New England. It is not from the North Atlantic seaboard, but is from the Middle West, where but little anthracite has been used for some years. Every check that can be made from current statistics indicates that the buying of substitutes has been very limited indeed.

Those who want to see this strike settled within the industry are glad to note that no delegations of governors are arriving in Washington to ask for help in getting coal. They are pleased at the absence of telegrams from Chambers of Commerce, but they wish the public would become aroused to the extent of filing hurry-up orders with their dealers or local fuel committees for the substitutes they will need to carry them through.

---

## Name Subcommittees to Study Mine Bureau Work

As the result of the action at Salt Lake City of Secretary Hoover's advisory committee, representative of the mining industry, subcommittees are engaged in an intensive study of the details of the work of the Bureau of Mines. These subcommittees will report to the full committee late in October at a meeting to be held in Pittsburgh.

By dividing up the work the members of the committee can devote their time to the activities with which they are most familiar. Since it is impractical for the full committee to have frequent meetings, this arrangement provides finished material on which it can act. The subcommittees and the subjects assigned to them are as follows: L. S. Cates and J. F. Callbreath, metallurgy and ore dressing; J. V. W. Reynders, fuel economy; H. Foster Bain and F. P. Hanaway, mining methods; D. M. Folsom, petroleum and natural gas; Mr. Bain, non-metallics; J. G. Bradley and Mr. Hanaway, safety; C. P. White and Mr. Folsom, collection and dissemination of information; Messrs. Bradley and White, economics and statistics; Messrs. Bain and White, service to the government; Messrs. Reynders and White, duplication in activities; Messrs. Cates and Callbreath, consolidation of experiment stations.

The broad scope that the committee's work will cover is indicated further by the decision of the full committee at Salt Lake City to submit recommendations along the following lines:

The advantages and disadvantages of decreasing the number of mining experiment and field stations and concentrating the work at a few centers.

To what extent should the Bureau enter the field of economic studies of the industry?

Should a limit be placed on the amount of the Bureau's funds and the time of its staff which now are absorbed by service to other branches of the government?

How can the pooling and redistribution of technical information be bettered?

How are the "fundamental and underlying problems" of efficiency in the mining industries, on which the Bureau is required by law to do research work, to be delimited? Where should the state or the industry take up the work?

In the safety work is the correct proportion of effort being placed on the work most needed and that most likely to yield results? Is a continuance desirable of the present field work and that on permissibility?

Is it desirable to co-operate with the states in the matter of furnishing technical service to the state mine inspectors?

What safety instructions, demonstrations and educational work should the Bureau conduct?

Should the operation of mine rescue and safety stations be turned over to the states or to the local associations of coal operators?

### To Guard Against Duplication

While the preliminary reports made to the committee indicate that there is little duplication of work between the Bureau of Mines and the other bureaus of the Department of Commerce, the committee decided that it is advisable to make a record of the facts in that connection and to suggest methods which will guard against duplication in the future.

Messrs. Bain and White were requested to submit a special recommendation as to the transfer of functions from or to other bureaus of the department.

At the Salt Lake City meeting of the committee testimony was presented on the general work of the Bureau, on non-ferrous metals, on the Salt Lake City and Reno stations, metallurgical work on Arizona copper, explosives, safety, iron ores and treatment.

---

## *Illinois Mine Installs Five Coal Loaders*

The Troy Coal Co., Troy, Ill., has installed automatic loading machines in its mine. The mine is being operated sixteen hours a day, the miners being paid a flat scale. Five new machines have been placed in service. The men working on the machines are paid $8.54 per day for one class of work and $8.04 for another.

With the men working on a flat scale it is not necessary to weigh the coal at the bottom of the mine. The weight is not taken until the coal is loaded into the railroad cars.

## Americans Miss Coal Trade Opportunities in Argentina

Return cargoes do not constitute an indispensable requisite of export trade, in the opinion of H. Foster Bain, who recently completed a study for the Argentine government as to the possibilities of iron and steel making in that republic.

Argentina gets most of its coal from Great Britain. It always has been assumed that the British obtain this business because coal moves in the ships that go out to get wheat. Mr. Bain had occasion to check the import figures covering coal and found that the coal movement was heavier in months when grain was not moving. His inquiry also revealed other instances in which return cargoes are not taken, particularly when they are made up of dissimilar materials.

Mr. Bain thinks Americans could sell more coal in Argentina and other countries if they were to go after the business more persistently. Purchases of British coal are influenced in part by the fact that the railroads and some of the other large consuming industries are British-owned. Their purchasing agents are Britishers with their offices in London. They buy British coal more as a matter of convenience than as a matter of sentiment. If there were no price or other advantage they probably would buy from their own countrymen. The principal objective of a purchasing agent is to make a good showing and the principal objective of a corporation is to produce dividends.

Since American coal can undersell the British product in Argentina under present conditions Mr. Bain thinks agents for American exporters might call upon some of the London purchasing agents of Argentine companies.

There are, of course, other problems to work out. One of them is to teach consumers how to burn American coal to the best advantage. Only one consumer in Argentina uses stokers.

One of the best ways to induce the railroads to burn American coal, Mr. Bain suggests, would be for Americans to get into the transportation game in the southern republic. With a railroad run on American lines to serve as an object lesson, he feels that there would be resort to more American supplies than coal.

## *Will Move Strikers to Idle Mine Villages*

Although the Pittsburgh Coal Co. has served twenty-eight eviction notices on miners at Banning No. 2 mine, eight miles from West Newton, Pa., the company has not evicted any of the men. These men and their families, who owe from two to twenty months rent, will be given the option of being moved to other villages of the company. If it is found necessary to take active eviction steps, sufficient trucks will be provided by the company at its own expense to haul the household goods of each family to a town of its choice where the mine has been closed down because of inability to operate at the wage scale demanded by the leaders of the United Mine Workers. It is understood that many of those served with notices have elected to return to work.

The man who owed the most rent had lived in a company house since December, 1923, without paying a cent. The rent charged is $8.93 a month. Many of the men now working at the Banning mines earn that amount in a single day.

To promote economy, efficiency and unity of direction, the explosives physical testing section, the explosives chemical laboratory, and the liquid oxygen explosives research of the Bureau of Mines, Department of Commerce, will be combined into the explosives section of the Pittsburgh Experiment Station, with G. St. J. Perrott, assistant chief explosives chemist, in charge. Mr. Perrott will give special attention to explosives research and will report to Dr. Charles E. Monroe, chief explosives chemist, through the superintendent of the Pittsburgh Station. Spencer P. Howell, explosives engineer, has been transferred to Pittsburgh to continue work on liquid oxygen and special investigations. J. E. Crawshaw, explosives engineer, will be in charge of physical testing, and C. A. Taylor, associate explosives chemist, will be in charge of chemical testing.

## Average Value of Anthracite Shipped; Local Sales; Colliery Fuel, And Total Output, by Regions, 1922-1924

(Per Gross Ton)

| Year and Region | Shipments | | | | Local Sales | Colliery Fuel | Total Output |
|---|---|---|---|---|---|---|---|
| | Domestic | Pea | Steam | Total | | | |
| 1922 | | | | | | | |
| Lehigh | $8.03 | $5.93 | $2.70 | $6.05 | $3.97 | $2.34 | $5.56 |
| Schuylkill | 8.25 | 6.04 | 2.44 | 5.78 | 4.44 | 0.78 | 4.98 |
| Wyoming | 7.87 | 5.81 | 2.79 | 6.52 | 5.78 | 1.69 | 6.02 |
| Sullivan County | 9.07 | 6.97 | 2.42 | 5.22 | 6.18 | 2.00 | 4.84 |
| | $8.00 | $5.92 | $2.63 | $6.21 | $5.07 | $1.38 | $5.61 |
| 1923 | | | | | | | |
| Lehigh | 8.62 | 6.34 | 2.57 | 6.36 | 3.80 | 1.77 | 5.84 |
| Schuylkill | 8.87 | 6.34 | 2.47 | 6.31 | 3.87 | 0.72 | 5.63 |
| Wyoming | 8.29 | 5.95 | 2.62 | 6.81 | 5.92 | 1.43 | 6.40 |
| Sullivan County | 9.29 | 7.14 | 2.39 | 6.81 | 6.56 | 2.60 | 6.73 |
| | $8.48 | $6.17 | $2.55 | $6.60 | $4.80 | $1.21 | $6.08 |

## New Byproduct Coke Plant To Open at Troy, N. Y., Soon

The new byproduct coke plant of the Hudson Valley Coke & Products Corporation, located on the Hudson River just south of Troy, N. Y., is nearing completion and will be ready for operation soon. This undertaking represents the association of blast furnace, fuel selling and beehive coke manufacturing interests for the purpose of providing coke for a blast furnace, gas to several municipalities and the general fuel market with the excess coke production.

The corporation operating the plant is owned by the Burden Iron Co., of Troy, M. Tutein, Inc., of Boston, and the Oliver & Snyder Steel Co., which owns three large mines and a total of 1,108 beehive ovens at Redstone Junction, Pa. The Oliver & Snyder Steel Co. expects to furnish all the coal for their byproduct ovens.

James A. Burden, president of the Burden Iron Co., Troy, is chairman of the Hudson Valley Coke & Products Corporation; the president is Harry Oliver, who is also president of the Oliver & Snyder Steel Co., of Pittsburgh, while John W. Doty, president of the Foundation Company, is vice-president.

The first unit of the Troy plant will consist of a battery of 55 ovens, capable of turning out approximately 500 tons of coke and 17,000,000 cu.ft. of gas every 24 hours. The entire plant, including the blast furnaces, gas holders and apparatus for recovering and treating various byproducts, such as coal tar, ammonia sulphate and benzol, will cover some 50 acres of ground and will cost around $6,000,000. Two additional units of 55 ovens each may be installed later on, so that the coke-making capacity may ultimately be 1,500 tons a day.

Designed by the Foundation Oven Corporation, of New York, this will be the first installation of the so-called American type of oven in the United States. This type of oven has been in use for four years in British Columbia, however.

## Consumption of Coal and Oil By Utilities Up in July

Public utility power plants in the United States consumed 3,170,582 net tons of coal in July, according to a report by the U. S. Geological Survey. This compares with 3,089,578 tons in June, as shown by revised figures. Fuel oil consumption by utilities in July totaled 852,464 barrels, compared with 790,812 barrels in June as shown by revised figures.

The average daily production of electricity by public-utility power plants in July was 172,200,000 kw.hr., less than one per cent lower than the average daily output for June.

Since the daily rates of production of electricity for these two months were practically the same it is evident that the low average daily rate for May in comparison with April and June probably was due to the output for May being reduced by the five Sundays and the holiday included in the month.

## Plan Merger of Many Mines In Illinois

A consolidation of many important coal mines in the Fifth and Ninth districts of Illinois is planned by the Bell & Zoller Coal Co., of Chicago, Ill., with the backing of Chicago, Baltimore, Philadelphia and Boston bankers. The proposed company would have $35,000,000 capital.

Homer F. McDonald, of the Meteor Coal Co., and H. Beddoe, of the Bresse-Trenton Mining Co., are taking options for the Chicago concern and are attempting to line up all the important coal properties in the district within a radius of 100 miles of East St. Louis, Ill.

The options are being taken with the understanding they are transferable to the Bell & Zoller company and call for cash payment at the time of the transfer. They expire Nov. 1.

It is reported that the merger proposition has been put to about 85 per cent of the mine owners and that a number have agreed to sell.

Companies approached are said to include: West Virginia Coal Co. and subsidiaries, Lumaghi Coal Co., Kolb Coal Co., Bresse-Trenton Mining Co., Columbia Coal Co., St. Louis & O'Fallon Coal Co., Miller Coal & Coke Co., Donk Bros. Coal & Coke Co., and Southern Coal, Coke & Mining Co.

It is reported that the Mount Olive & Staunton Coal Co. and the New Staunton Coal Co. have granted no options and probably will not be approached. W. J. Jenkins, president of the Consolidated Coal Co. of St. Louis, also has stated that no options have been given by his company.

## River Coal Movement Increasing Rapidly

Despite the fact that the Monongahela long has enjoyed the distinction of being the world's busiest waterway, the density of traffic on this stream is increasing at such a rate that it is difficult for improvements to keep pace with the demands of commerce. General Edgar Jadwin, acting chief of engineers, has just returned from a trip over the river during which he inspected some of the engineering works on the stream. The availability of the 56 x 720-ft. Elizabeth locks, which will accommodate at one time a towboat and six barges, the standard fleet on the Monongahela, is proving a great asset to those using the river.

General Jadwin is impressed with the additional tonnage which must be handled by water because of the improvement at the Alice coal mine of the United States Steel Corporation, which he visited with the 400 other guests of the corporation on its annual "inspection" day. That property now has in operation a belt conveyor having a capacity of 10,000 tons daily. The other steel companies also are augmenting their output of waterborne coal.

General Jadwin points out that the intensive use of waterways in the Pittsburgh area is not confined to the Monongahela. The tonnage on the Allegheny has doubled in ten years and now exceeds 5,000,000 tons. The practical completion of the system of dams, with 110 x 600-ft. locks, on the Cincinnati-Pittsburgh sector of the Ohio means, General Jadwin believes, the extension of the zone of dense traffic to include that 470-mile stretch of improved waterway. While the traffic on the Ohio will be of a different character from that in the Pittsburgh area, it promises to grow rapidly into a very large tonnage.

### *Heating with Oil Costly*

On an average, it costs approximately one-third more to heat a house with oil than with bituminous coal, according to statements recently made by a fuel engineer of high standing. This estimate is based on the use of a high-grade oil burner, but if figures are based on use of a low-grade oil burner the percentage of increase becomes much higher. The cost of the mechanical equipment and the fact that it is relatively short-lived make it necessary to stress the factors of interest and amortization, which establishes the oil burner as a luxury.

---

The cost of living index number of the National Industrial Conference Board as of July 15, 1925, according to a survey just completed, is found to be approximately 2 per cent higher than that of March 15, 1925. Slightly more than half of this increase occurred between June 15 and July 15, 1925. Between March and July, 1925, average increases in the cost of food were 6 per cent; in clothing 1.1 per cent and in light, 0.7 per cent. Average shelter and fuel prices decreased 1.7 per cent and 3.3 per cent respectively; average sundries prices did not change in this period. Between July, 1920, when the peak of the rise in the cost of living since 1914 was reached, and July, 1925, the cost of living decreased 17.5 per cent. The increase in the cost of living since 1914 was 68.7 per cent.

## Want Big Muddy Improved For Coal Traffic

Possibilities of rendering the Big Muddy River navigable, which coal men declare would materially lower the price of Illinois coal and bring the Illinois mines back into prominence, will be discussed at a public meeting Oct. 1 in the U. S. Engineer's office in the Federal Building, St. Louis, Mo. The Big Muddy traverses Jackson, Franklin and the northwest corner of Williamson County, Illinois.

"Improvement of the river to 15 or 20 miles above Murphysboro would tap a barge traffic of 50,000 tons a day," declared E. J. Wallace of the Wallace Coal Co., St. Louis. "If the channel was built only to Murphysboro, some 30 miles above the Mississippi, the tonnage would be cut in half, but even that would give employment to thousands of miners. Only a third of the Illinois mines are in operation now. They have been steadily losing ground because of high freight rates—$1.37 a ton from Franklin County to St. Louis—and the cost of union labor."

The government is making its preliminary examination of the project to determine whether the traffic available and general topography of the river warrant a survey. The survey, if it is authorized by Congress, will go into every detail of necessary improvement and possible development of traffic and will be submitted to Congress for final action.

## Exercise of Reading Rights Extended Six Months

The U. S. District Court in Philadelphia on Sept. 21 granted an extension of six months for the exercise of the rights of the Reading Company in the certificates of interest for Reading Coal shares.

Application for the extension was made to the court by William Clark Mason, counsel for the Reading Company, on the ground that to date only about 45 per cent of the rights issued by the Reading Company to its stockholders had been exercised.

## Men Employed and Days Worked in Anthracite Region in 1924

| Region | Average Number of Men Employed | | | | | |
|---|---|---|---|---|---|---|

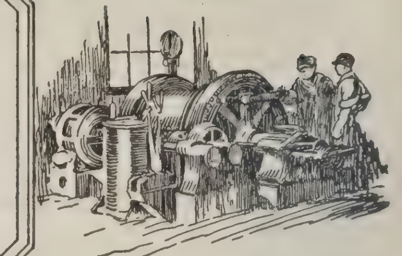
# Practical Pointers For Electrical And Mechanical Men



## Air Blast Through Canvas Tubing Cools Tube Driller

Drilling boiler tubes has never been advertised as a "soft job." At the Earlington plant of the West Kentucky Coal Co., doing this work formerly was considered as out of the question during hot summer months. The grating or open-steel platform on which the operator must stand to drill the tubes of the 552-hp. boilers is close to the roof of the boiler house, and is in the 5-ft. space between drum ends of adjacent boilers. The heat radiated from the drum ends of the "live" boiler combined with the heat of the air in the top of the boiler house made it impossible for a man to stay on the platform any length of time.

But in a well regulated plant the heat of summer must not interfere with the efficiency of the boilers, so during this last summer drilling of tubes has been done whenever necessary, and accomplished with perhaps as much comfort as during cold weather. This was made possible by use of the equipment illustrated in Figs. 1 and 2. It consists of an asbestos-covered shield to protect the operator from the direct radiation from the drums of the "live" boiler, and of a motor-driven blower with canvas tubing for delivering a blast of cool air up through the grating on which he stands.

The wood-frame asbestos-covered shield can be seen at the right in Fig. 1. The size of this shield is approximately 5x5 ft. When drilling the tubes of the boiler at the left, the operator stands just back of the large vertical steam pipe in the foreground.

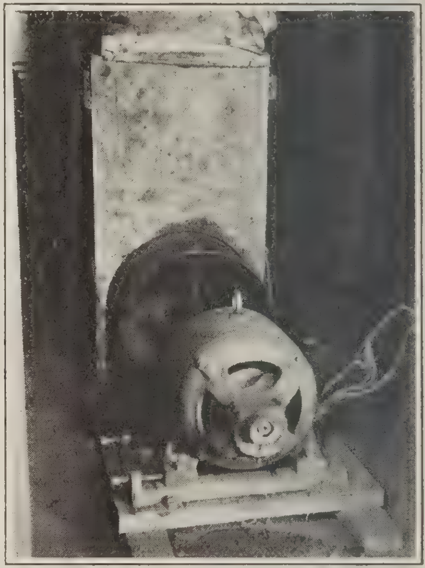


**Fig. 2—Drives Cool Air up to the Tube**

The upper end of the canvas tube leading from this 18-in. fan is tied to the under side of the grating on which the driller stands.

The blower, with canvas tubing leading up to the platform, is shown in Fig. 2. This ventilating unit is made up of a 2-hp., 1,750-r.p.m. motor direct connected to an 18-in. straight-flow fan. It is located on the boiler room floor directly below the operator's platform. The upper end of the tubing is tied to the underside of the open-steel floor of the platform. The air delivered by the blower is practically at the temperature of the outside air, for the reason that the unit is not more than 20 ft. from a large open door, and the incoming air has little chance to become heated before entering the suction.

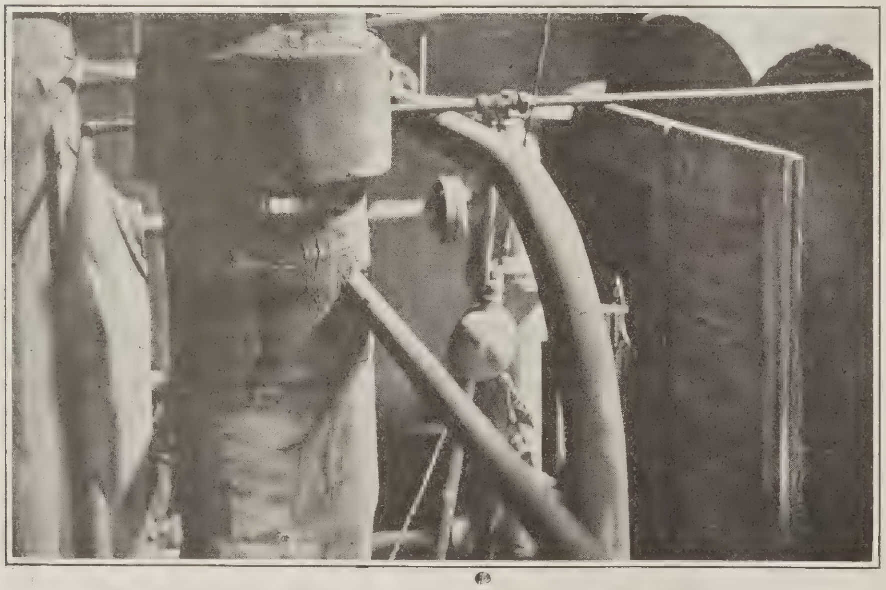

**Fig. 1—Between Boilers and Close to the Roof Is a Hot Place**

The ends of the drums of the "live" boiler are not over 4 ft. from where the operator must stand when drilling tubes. To give protection from the direct radiation, the wood-frame asbestos-covered shield at the right is used. This, in combination with the blower, Fig. 2, makes drilling of tubes a bearable job in the summer time.

---

## Handy Home-Made Planer Is Valuable in Mine Shop

In most mine shops, the wood planer is a machine tool which, more likely than not, is conspicuous only by its absence, although, in such places it could be used to excellent advantage.

The accompanying illustration shows such a machine built up by the shop force in the No. 4 shop of the Kingston Coal Co., Kingston, Pa. The frame of this machine is made of structural shapes chiefly angles, while the gears, rollers, springs, etc., were picked up as odds and ends around the plant, only the planer knives having to be purchased specially. As may be seen in the illustration, the driving belt is completely incased in a sheet-iron box, thus being entirely safe. The driving gears of this machine, which is about 18 in. wide, or will take a board of that width, are belted and

**Not Fazed by Long Use**

This machine was built in the shop where it is now used. It performs its work effectively and looks as if it would last almost indefinitely. Its chief drawback is the fact that no means have been provided for removing the shavings by air blast. This, however, is a minor disadvantage. The belt is inclosed for safety.

back-geared from the main shaft.

Although this machine perhaps lacks many of the refinements found in factory-built planers, it nevertheless is extremely handy and does much work every day. It has been in use for about twelve years and judging by its present condition it appears to be good for indefinite further use.

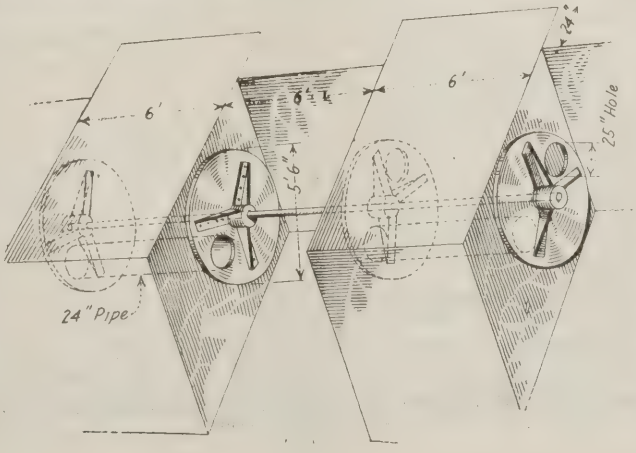
## Barrier Permits Men to Pass But Seals Off Gas

Mines usually are separated by barrier pillars. As a general rule no passage of any kind is made in such separators or they cease to be barriers. In many instances, however, it would be highly advantageous if an opening could be had through the barrier from one mine to another that would permit the passage of men yet prevent the movement of gas or air. The accompanying illustration shows how the Tennessee Coal, Iron & R.R. Co. has solved this problem and secured a seal between its Edgewater and Bay View mines that permits the passage of men.

In the passage or break-through that is driven through the pillar separating the two mines, two 6-ft. reinforced concrete stoppings have been constructed. Each of these contains a piece of 24-in. steel pipe extending entirely through it from side to side. These two pipe openings are in line with each other. Through both concrete blocks also, extends a heavy shaft that turns in bushings embedded in the concrete. To this shaft four spiders, to each of which is attached a steel disk 1 in. thick and 5 ft., 6 in. in diameter, are keyed.

Each of these disks has a 25-in. circular opening cut through it, which, when the disk and shaft are revolved, comes in line with the 24-in. pipe embedded in the concrete stopping. The disks are fastened to the shaft in pairs. Thus the shaft can be turned so that the holes in one pair of disks will unmask the 24-in. pipe through the concrete block upon either side of which the disks are located. When this occurs, however, the openings in the other pair of disks, being at 180 deg. from those in the first pair, effectively close the opening in the second concrete stopping.

When a man wishes to pass through this seal he first rotates the disk nearest him until the opening in it unmasks the cast-in pipe leading through the concrete. He then crawls through this pipe into the space between the two blocks of concrete. Here he revolves the disk adjacent to the next concrete wall until the hole in it comes opposite its pipe. This closes the opening in the first block. Thus, regardless of the position of the disks the opening between the two mines is always closed. Men may go through the barrier at will but appreciable quantities of air, gas or water can never pass.



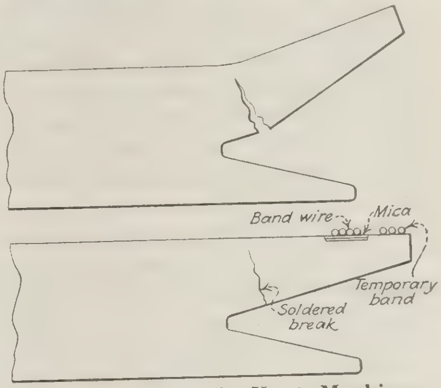
**Men May Pass but Gas Cannot**

Two heavy concrete blocks bar the passage through the break-through between Bay View and Edgewater mines. Into each of these a 24-in. pipe is cast. Its ends, however, are protected by steel plate disks, each of which is fitted with a 25-in. opening. One pipe is always covered, preventing the passage of air or gas.

## Quick Repair Keeps Mine Going

At one of our mines a 200-kw. rotary converter, about twelve years old and with a thin commutator, threw out one of its bars. The bar broke nearly through as shown in the accompanying sketch, and was badly bent by striking the brush holders before the machine could be stopped. To keep the machine in service while waiting for a new commutator, we straightened the bar and soldered it together at the break. We then forced it down in place and held it there with a band of binding wire until a more permanent repair could be made. This was done by turning a groove in the commutator about ¾-in. wide and 1/32 in. deep close to the end of the bars and outside of the path of the brushes. Four turns of band wire under heavy tension were then wound in this groove, being insulated from the bars by means of about .025 in. of mica. The commutator was then trued and the machine put back on the line. It is now running and appears to be as good as ever.

R. R. Schellenger,
Electrical Engineer.

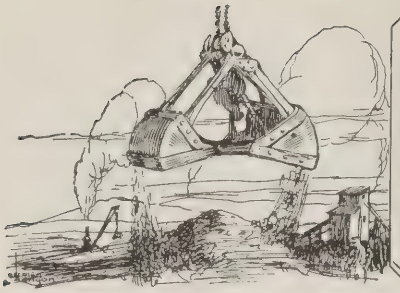


**Ingenious Repair Kept Machine in Service**

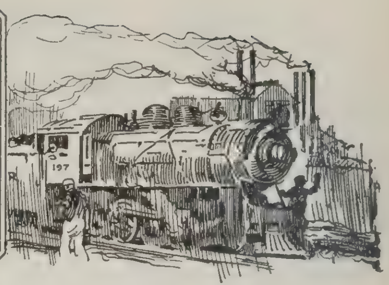
The broken commutator bar shown in the upper sketch was straightened and soldered before being pushed back in position. A temporary banding wire set in a groove cut in the commutator holds it in place.

## Adding Castor Oil Makes Shellac Flexible

For most purposes insulating varnish should have the property of remaining flexible. Shellac becomes brittle when dry. This is one of the reasons why it has been replaced to a great extent, in the repair shops, by special varnishes. In an emergency when special varnishes are not available, a flexible insulating liquid can be made by mixing castor oil with prepared shellac. Adding 10 to 15 per cent of the oil will make the shellac remain flexible after drying.



# Production And the Market



## Bituminous Coal Trade Sags in Hot Wave; Hard Coal Quiet Despite Strike

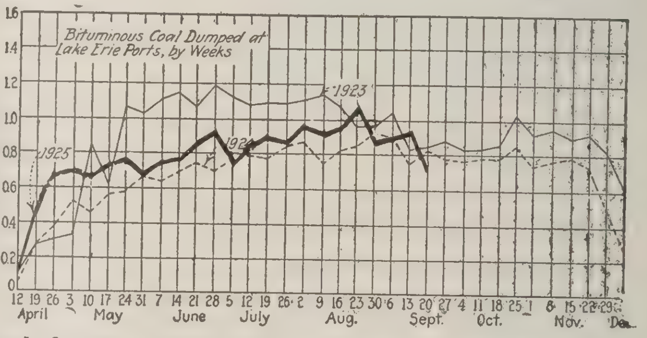
Much of the flurry of soft-coal buying which began at about the time of the hard-coal "suspension" petered out during the past week and the market has developed into a weather proposition for the time being, a hot wave extending over most of the country having taken most of the life out of the business. As usual, strike or no strike, the consumer refuses to get worked up over coal when the weather is warm. Even smokeless, which has been the market headliner right along, has lost considerable of its strength, shippers having found that they had run it up too fast when the bottom showed signs of dropping out at Cincinnati. As a matter of fact, prices, with few exceptions, show an all-round easing tendency.

The Midwest trade has been particularly hard hit, practically all grades having slowed up in Illinois, with a consequent slight curtailment of working time. Prepared sizes are somewhat weaker in Kentucky with a slight downward tendency in price. Business at the head of the lakes shows sustained improvement; shipments off the docks are increasing as demand for both steam and domestic gains, and prices show a steadily stiffening trend. Coal is moving better in Colorado, Utah and the Southwest, though labor unrest in Oklahoma is hampering output in that field.

Trade in Eastern markets is fairly steady with a tendency to gradual improvement. In New England and Ohio, however, a slight easing up is in evidence. Thus far, the increase in buying that was expected as a result of the anthracite suspension has not developed in accordance with advance reports. The attempt to call out non-union miners in West Virginia is not expected to have much effect.

Both sides are sitting tight as the hard-coal strike goes into its fourth week, and as summer weather lingers anthracite consumers show no disposition to become excited. Nothing larger than pea is being shipped and it is likely that all of that will soon be ordered. Buckwheat is still plentiful. Retailers are well stocked with domestic sizes, however, and with careful handling will be able to take care of reasonable needs for several weeks yet. Substitutes are not in much demand as yet.

Output of bituminous coal during the week ended Sept. 12 is estimated by the Geological Survey at 9,993,000 net tons, loadings on Labor Day being 40 per cent of a normal workday. This compares with 10,826,000 tons in the preceding week, as shown by revised figures. Five thousand tons of anthracite was shipped from dredges during the week ended Sept. 12 compared with 432,000 net tons produced during the preceding week, when the miners quit work.



*Coal Age* Index of spot prices of bituminous coal on Sept. 21 stood at 185, the corresponding price being $2.24.

Dumpings at Lake Erie ports during the week ended Sept. 20, according to the Ore & Coal Exchange, were: Cargo, 708,393 net tons; steamship fuel, 45,729 tons—a total of 754,122 net tons, compared with 933,036 tons in the preceding week. Hampton Roads dumpings during the week ended Sept. 17 totaled 332,097 net tons.

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Trade Slackens

Inactivity marked the Midwest coal trade last week. Though most operators in the Franklin County field and those producing the better grades of Indiana coal are still behind in filling orders, it is apparent that this surplus of orders will be absorbed rapidly and a fixed price will appear on lump coal, instead of business being taken on the basis of price current at time of shipment, as for the past two weeks. While orders are plentiful on block with practically none to be had on the open market, the smaller prepared sizes and screenings are still hard to move.

The anthracite strike has not disturbed the general condition in this territory to any extent. Mild weather has had much to do with the falling off in demand, and a further drop is expected. There is no demand for the cheaper grade of coal, with the exception of that covered by contracts. Screenings are somewhat stronger, however, as little is available, but in general the condition in Indiana still remains very poor.

Demand for Eastern coals has fallen off considerably. There has not as yet been a reduction in price, so far as West Virginia and Kentucky coals are concerned, but orders are so scarce that there will no doubt be a cut in order to move tonnage and keep the mines going. A great deal of consignment coal is available, and, of course, speculators are taking a loss on this so as to avoid demurrage. The only real setback the market suffered was on Pocahontas coal, and jobbers who have speculated on this coal are taking considerable losses.

Warm weather has hit southern Illinois hard and over the Franklin and Williamson County field, as well as in Saline, activity has been slowing up. Lump is still moving but egg and nut and even the steam sizes are slow. The warm weather has knocked the props from under everything. Railroad tonnage continues fairly good and the strip mines are working full time, but the shaft mines have been affected. There has been no change in prices since last week but working time has dropped off slightly and unbilled loads at the mines have increased several times.

In the Duquoin field conditions have been affected much as in the other fields. Working time has dropped off a day a week, with no change in prices, but railroad tonnage from this field is almost nothing. In the Mt. Olive district just enough of domestic sizes is being shipped to take care of steam contracts and working time has dropped off two days a week generally in this field. In the Standard district conditions are unusually bad. Coal continues to be sold for the most part at cost or below and there is general dissatisfaction. Working time ranges from two to four days a week. Railroad tonnage is fairly good but nearly all mines have "no bills" on hand every night of all sizes. Prices are unchanged.

Warm weather put a quietus on retail deliveries in

## Current Quotations—Spot Prices, Bituminous Coal—Net Tons, F.O.B. Mines

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Sept. 21 | Sept. 14 | Sept. 7 | Sept. 22 |
| Index | 185 | 178 | 179 | 169 |
| Weighted average price | $2.24 | $2.16 | $2.16 | $2.04 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

---

St. Louis last week and there will be little activity until cooler weather comes. All grades of coal were affected and dealers are paying demurrage because their yards are full. The country demand has also fallen off and dealers in the country seem to have more coal on hand than they can conveniently take care of. Local wagonload is quiet, carload has slumped off some and country steam is hard to locate. No change in prices.

### Demand Wanes in Kentucky

The Kentucky market sagged a trifle on prepared sizes last week, due in part to hot weather, along with the fact that Eastern demand as a result of the anthracite strike hasn't developed as rapidly as expected. It is said that some of the jobbers and brokers, figuring that there would be a rapid increase in demand and price, bought a good deal of coal in advance of the anticipated movement, which failed to materialize, causing a slump for the time being.

Local coal men report that while some houses are asking $3.25 for best 4-in. lump in eastern Kentucky, there is practically no coal at over $3, more at $2.75, and some offgrade stuff as low as $2.50. Lump and egg are weaker at $2@$2.50 a ton; mine run is steady at $1.50@$1.75 and screenings firm at $1.10@$1.40.

Western Kentucky 6-in. block is a shade weaker at $1.90@$2.15, some asking $2.25. Lump and egg are firm at $1.85@$2; nut, $1.40@$1.75. Demand in general is not as good as it was, though nut is in very fair movement. Not much mine-run is moving, the price being steady at $1.25@$1.50. Screenings are in smaller production, as a result of reduction in output of prepared, and the price has advanced to 75c.@90c.

Steam movement continues good and demand strong, especially on screenings. Cooler weather will start prepared moving again and aid the market materially.

### Northwest Market Stiffens

Dock operators at Duluth and Superior note a sustained improvement in business in the last ten days. Shipments have been substantial so far this month and it is expected that the August record of 20,778 cars will be surpassed. The flurry in anthracite ordering that developed when the strike set in is over for the time being, but a revival is looked for when normal fall weather appears.

Orders for Pocahontas have more than doubled as compared with a year ago and the movement is expected to continue to gain when domestic buying opens next month. Two of the docks reported that they are completely sold up in prepared sizes and are pushing mine-run with a fair measure of success. Lump, egg and stove are steadily stiffening, the third advance of 50c. within six weeks becoming effective this week, bringing the dock figure to $8.50. Mine-run and screenings are unchanged at $5.25 and $4.25, but dealers expect an advance Oct. 1.

The market in all high-grade Kentucky coals also is stiffening with increasing domestic demand, but apart from Pocahontas, quotations on soft coals are unchanged.

Dealers are getting set for a heavy demand for domestic coke and briquets as anthracite substitutes. Quotations are $8.50 for coke and $9 for briquets.

Demand for steam coals from industrials is improving and inquiries from utilities are gaining as a result of low water in hydro-electric storage dams.

Receipts of coal from Lake Erie ports are continuing in good volume, thirty-nine cargoes, including one of anthracite, having been unloaded at the docks last week. Stocks of bituminous coal on commercial docks are now placed at 3,700,000 tons and anthracite supplies at 275,000 tons.

Coal dock managers at Milwaukee report a falling off in demand as compared with a few weeks ago. Dealers are ready, but orders from consumers do not materialize. The situation at the anthracite mines has not alarmed consumers, who seem to feel that differences will be smoothed out before supplies on hand are exhausted.

Receipts by lake for the season up to Sept. 17 total 2,422,815 tons—488,234 tons of anthracite and 1,934,581 tons of bituminous coal. The receipts during the same period of 1924 aggregated 1,811,433 tons—497,223 tons of anthracite and 1,314,210 tons of bituminous coal. During the month of August Milwaukee received 37,330 tons of coal by rail—3,325 tons of anthracite and 34,005 tons of bituminous.

### Southwest Trade Gets Tonic

A brief period of temperature in the 70s and 80s has had a tonic effect on the Southwestern market. Dealers still are buying in substantial quantities and new mines are opening in Kansas, which is profiting by the instability of production resulting from the strike in Oklahoma and Arkansas. While output has not been cut in the latter state, the strike and the uncertain labor conditions which preceded it have deterred some of the larger operators from reopening their mines. In Oklahoma, less coal is being mined than before Sept. 1 and the psychological effect has been to curtail the demand for coal from that field.

Demand for domestic coal in the Colorado market continues to increase. As a result the mines are speeding up production. Prices are: Walsenburg lump, $5.50; washed nut, $4.50; washed pea, $3; Trinidad coking lump over 6-in. screen, $4.25; over 3-in. screen, $4; nut, $3.75; pea, $3; Trinidad Segundo coke, $7.50; Crested Butte high grade anthracite Nos. 1 and 2 (furnace size), $7.25; Nos. 3 and 5 (base burner size), $7.75.

Coal is moving better in Utah now than for many months. There is still much less coal in storage than a year ago, due to the fact that the elimination of storage rates this year kept many from purchasing winter supplies in June, July and August. Some of the mines are working near capacity and the majority are working at least half time. Lump coal is selling best, but there is a good demand for all sizes. The increased working time at the mines is causing a little surplus of slack.

### Smokeless Flops at Cincinnati

At Cincinnati the price of smokeless was run up too fast, and last week it came a cropper. Starting the week with $5 and $5.25 asked for coal that could be delivered immediately, sour reports from the markets that had been the best takers caused some jobbers and others who had been playing the market too strong to put their tonnage overboard around $4.50 for egg and $4.75 for lump. Again, the weather has been a depressing factor, and even some producing companies that had been fishing for a $3 market on mine-run early in the week were willing to talk $2.50. Then again an overload of coal was taken out of the usual contractual channels and diverted to the week-to-week market.

High volatile was in much better shape. Here the Hazard block, which has moved up to $2.75, has been able to maintain its position, as has Elkhorn at $3@$3.25 and the Harlans around $2.75@$3. The dead weight of $2.50 as the quotation by Logan County's biggest producer has held some of the West Virginia prize coals back, but quality, advertised and specialized stuff has been able to hold in the range of $2.75@$3 in spite of the setback to Pocahontas. Egg prices hold fairly firm with a spread of $2@$2.50 and mine-run has stiffened within a general range of $1.50@$1.75. Only slack and screenings have not improved their position.

Car records for the week fell a little below those of the week preceding but were far ahead of those of last year. Retail business still feels its way locally, prices having eased slightly. River business is at a low ebb, due to the low stage.

Because of extreme hot weather and also due to the fact that retailers are pretty heavily stocked, domestic buying at Columbus is not as active as a week ago, but prices have not weakened to any extent. Only a limited amount of smokeless is coming into the Columbus market. Splints and Kentucky block varieties are moving fairly well. Ohio grades have not shared in the general activity, although quite a few mines have been opened, after an idleness of from several months to a year.

Little change has taken place in the steam trade. Contracting is reported at intervals and most of the larger consumers have made agreements for a large part of their requirements. Some of the manufacturing plants are buying on the open market and prices have not advanced, even in the face of the anthracite strike. Screenings are slightly weaker, owing to the increased production of lump and other prepared sizes.

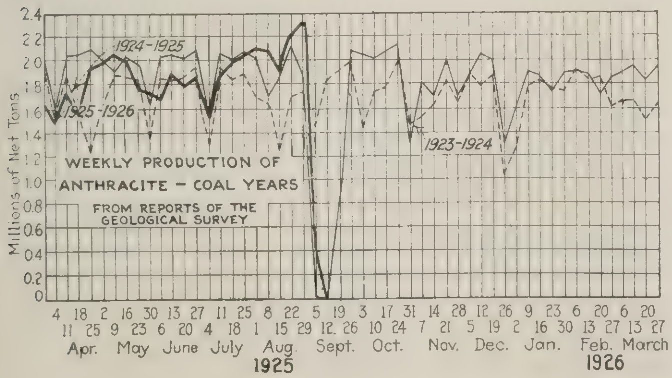
Lake records show that the Hocking Valley R.R. at Toledo has handled 1,178,000 tons more up to Sept. 16 than was handled last year up to the same time.

The situation in eastern Ohio is unchanged as compared with a week ago, and this sameness also applies to spot prices. Demand for both steam and domestic has lapsed into the lethargy which prevailed during the summer months. Were it not for the fact that Ohio mines are shipping some Lake coal and certain buying on the part of railroads and a few other large steam consumers, the demand for bituminous would be as dull as ever. One or two mines in eastern Ohio are said to have recently reopened mainly for shipping Lake coal.

### Demand Gaining at Pittsburgh

Demand for Pittsburgh district coal increased a trifle more in the past week, chiefly by way of a heavier movement of domestic lump. In general prices are somewhat higher than when the movement began to open up early in August.

Steam lump is moving fairly well. Consumption is slightly heavier than in July and some consumers are stocking in a moderate way. The market has been stiffening, and is now quotable for ¾-in. Pittsburgh district steam lump at about $2.25@$2.35, although some sellers consider $2.35 the minimum.



Steam slack, which stiffened a trifle a few weeks ago, has lately been at the old range of $1.30@$1.40, but this represents a better market, for with more shipments of lump there is more slack and it means better demand for this not to have definitely depressed prices.

The labor situation is growing more complicated and uncertain, the men at two Connellsville plants having gone on strike last week. The Pittsburgh Coal Co. is now operating two mines.

No stir is visible in the Buffalo market despite the hard-coal strike; a 50c. advance in some sorts of smokeless about covers it. The increased output is a puzzle to everybody, for consumers are not stocking up, so they must be using it. Quotations are $1.60@$1.75 for Fairmont lump, $1.40@$1.50 for mine-run and $1.25 to $1.40 for slack; $2.25 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, and $1.30 to $1.60 for slack; $1.75@$2 for Allegheny Valley mine-run; Cambria county smokeless sells for $6@$6.25 at the curb.

### New England Market Eases

Cessation in demand from the west for New River and Pocahontas has increased the movement to the southern loading piers and as the demand for coal there has been very light, f.o.b. prices have suffered considerable decline this past week. For the very best of the low-volatile mine-run coal $5.32 gross ton f.o.b. is as high as is now asked against $5.50 a week ago and very good coal has been offered at $5.25. Some tonnage of fair quality coal has been available as low as $5.10.

This lower level at the piers has been promptly reflected at the New England tidewater terminals, where demand, which has been light for several weeks, has dropped to almost negligible proportions and even orders for one or two cars have been acceptable at $6.50 gross ton on cars Boston. For these small orders last week $6.60 was minimum and up to $6.75 was obtained. For orders running into sizeable tonnage it is more likely that $6.50 would be shaded, but there has been nothing of this nature consummated. At Providence certain shippers are making strong efforts to hold the price at $6.50 on cars for high-grade Southern coal, but orders at that figure have been scarce and $6.40 is named not infrequently for excellent coal. Some tonnage of smokeless has been offered at $6.35 and as low as $6.25 is heard.

Arrivals at all of the tidewater discharging terminals have been light the past week and practically all of the tonnage discharged at railroad wharves has been sold before making port. Consequently distress coal continues conspicuous by its absence; otherwise prices doubtless would be even lower.

The all-rail market has come into prominence this week through a rather liberal demand for prepared coal for domestic use. Coal from the Broad Top district seems to be most popular and is commanding $4.75@$5 net ton mines. Certain shippers here are guaranteeing degradation not more than 10 per cent and in this way are obtaining $5.25.

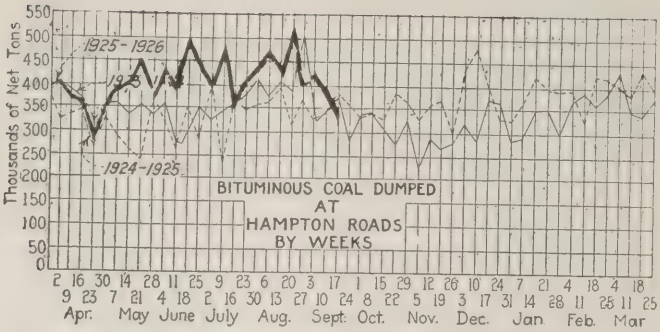
### Business Steady at New York

The bituminous coal market at New York is in good shape. Demand is steady and quotations are firm at last week's level. Buyers are able to get their orders shipped promptly because of the heavy output. Most of the coal moving is on old orders at low prices, new orders being booked at advances of from 20c. to 30c. above those figures.

It will be at least three weeks or a month before the effects of the anthracite strike will be felt in the soft-coal industry unless there is a sudden change in weather conditions. Consumers are slowly increasing their reserves. The better grades are scarcer and even the cheaper coals are in better condition than they were a few weeks ago.

Soft coal demand seems to have lagged a bit at Philadelphia during the past week, but the general expectation is that it will pick up additional momentum before long. Railroad fuel is fairly active and more satisfactory, particularly on new business placed lately.

The fact that the miners' union has called a strike of non-union miners in the Fairmont field effective Sept. 26 has created barely a ripple here. The tide situation is



quite flat, for, outside of bunkering, which is at the normal rate, nothing is being done in the shipment of cargoes over the piers.

While it cannot be said that gas and steam coals are decidedly stronger at Baltimore the fact remains that the entire soft-coal situation is stiffening slowly. Demand is increasing not only in this section, but jobbers here are interested in considerable movements westward, especially of gas coals. Coal men in Baltimore are not taking seriously the threat of a strike in the non-union fields on Oct. 1. Local industries are beginning to lay in supplies or to get under contracts for the fall and winter season, although a much larger proportion than usual continue to buy in the open market. Prices remain about the same as quoted last week, although the tendency is to buy nearer the top figure than the minimum quoted on average selling prices. Despite predictions that the export trade was not due for any material increase in September, the second week of the month has seen quite a substantial loading.

There has been no material change in market conditions at Birmingham in the last week. Domestic buyers continue to show an indifference toward stocking coal heretofore unknown at this time of year, yards as a whole carrying the smallest reserves on record just prior to the beginning of the winter. Spot sales are scattering and do not amount to any great tonnage in the aggregate. Contract-holding mines are being restricted sharply in the movement of fuel under agreements and considerable domestic product is being applied on steam orders.

Inquiry and bookings for all grades of steam coal are fairly good, high-grade washed product still being most active, with output and movement running neck and neck on some of these grades. The medium and lower qualities are not so readily taken but are being disposed of without great effort. Bunker trade shows no special activity, with about the normal consumption being called for at the Southern ports. Prices are unchanged.

Buying of foundry coke is somewhat more active than a few weeks back, with quotations on byproduct ranging $4.50@$4.75 and beehive $5 per net ton ovens. There is sufficient call for the domestic sizes to move the supply, much of this product going into the North and Middle West for use in heating plants. Quotations are $3.50 for nut and $4 for egg.

## Hard-Coal Consumers Calm

With the possible exception of stock coal and a few loaded bottoms in the harbor the visible supply of anthracite at New York is cleaned up. Retail dealers have good stocks on hand and so far have been able to take care of their customers, although not filling all orders at one time.

A comparatively small volume of hard coal is moving through wholesale channels. The boats that dotted the harbor and piers when the strike was called have been unloaded to a large extent and the remaining few are owned by middlemen.

Some stock coal is coming through, but the tonnage is small. Operators, with few exceptions, are not quoting prices and the figures that are obtainable are mostly from middlemen who have loaded boats on hand. The tendency to pay exorbitant prices, which was prevalent in former strikes, is not so noticeable this year, buyers hesitating considerably before paying the prices asked by middlemen.

While some effort has been made to urge the use of substitutes, orders have been few, but a more intensive educational campaign is certain if the strike continues much longer.

Local quotations last week were about as follows: Egg and chestnut as high as $17.25 alongside; stove, $18 also alongside. Pea coal was quoted on a basis of $6.50@$7 f.o.b. mine, while stock chestnut was quoted on a basis of $13 at the loading place.

Though no coal has been mined for three weeks, Philadelphia consumers seem indifferent. Of course, a heavy tonnage was put in the cellars this summer and summer weather lingers.

Company shippers are about done shipping any size larger than pea, with the last shipments of nut now running. It is believed that only one big company has any pea in storage and it is predicted that it will all be ordered by the end of this week. The supply of company buckwheat seems unlimited and orders are not coming along very fast. Rice is still in fair supply. Users of barley are having their needs taken care of by the substitution of rice.

Retail prices have stiffened considerably, the large sizes averaging close to $16 a ton. Stove is scarce with all dealers, yet some of the more important ones quote chestnut at $16 a ton, while stove is only $15.50. Pea coal generally is $11@$11.50.

At Baltimore stocks on hands of dealers are being gradually released, many still sending out coal on new business. If present conditions are long continued there will be a pinch unless renewed shipments begin from the mines. Undoubtedly there will be a turn to substitutes. Many consumers here are only partly stocked and quite a number have no hard coal in their cellars.

The Buffalo hard-coal trade is at a standstill but dealers are tranquil about the situation, even if there is complaint and showing of distrust. There is plenty of pea and buckwheat to be had at former prices, but consumers show little interest.

There is no business in water coal and there will be none till new-mined coal is in. It does not appear that the upper-lake ports are anxious for more and it is likely that they will stand a liberal shortage without suffering. The use of coke and smokeless coal will prevent any real distress.

Offerings of egg, stove and nut anthracite in New England have about come to an end but the big companies are still taking orders and shipping pea at regular company circular. Retail demand for anthracite slowed somewhat last week, but there is still a brisk demand for coke, so the big factor in New England-made coke is now about three weeks behind in deliveries.

## Connellsville Coke Market Unsettled

On account of fear of labor trouble Connellsville coke operators have been quite indisposed to push sales, and because of recent advances in the market Eastern buyers have been less disposed to buy, the result being a very quiet market in the past week, as to turnover.

The spot furnace coke market is quotable on the basis of latest sales at $3.75@$4, a 25c. advance, but these figures are perhaps nominal in view of latest developments.

The Jones & Laughlin Steel Corporation, which is now operating 10 of its 12 blast furnaces, has made inquiry for 20,000 tons of coke a month over the last quarter, but the trade figures it needs nearer 40,000 tons and is indisposed to quote at all, except possibly for October. The company's mines are in the union district so that it is not in position to produce its usual quantity of coke.

The independents in the Connellsville region have a scale fully 30 per cent below the Frick scale and thus have been in a delicate position when the Frick company has lately blown in so many ovens. Labor troubles might easily arise, and to advance wages would be injudicious when the coke demand is due to the anthracite suspension, for after a settlement the operators would be left with a higher coke cost than the blast furnaces could stand for.

Spot foundry coke continues dull, and accordingly the market remains quotable at $4@$4.50.

# Foreign Market And Export News

## Trade Lags Despite Low Prices In British Coal Market

Hopes for an improvement in the British coal trade in early September have not materialized and the outlook at the moment is very unfavorable. Though prices have reached their lowest level, foreign buyers still believe that they will recede still further and are holding up their orders. In addition to this consumers at home and abroad have heavy stocks still on hand. Accumulations at the pits are growing and it is only day-to-day shipments that enable the collieries to carry on. In some cases it has been possible to avoid stoppages, but several collieries have had to close down for periods varying from two to ten days. The operation of the pits under the present conditions is most costly, and though the excess of wages payable under the new agreement is borne by the government subsidy, few pits are being worked at a profit. It is hoped that this month will see some improvement due to decreased stocks in buyers' hands.

Low prices have failed to bring any more business to Newcastle, and the market is exceedingly quiet. Coal is offered freely for current shipment and at slightly lower prices, but business is not forthcoming. The only contract to report is one for forward shipment of various consignments totaling from 60,000 to 100,000 tons of Durham coals for Hamburg over twelve months, beginning October, at 16s. 6d. per ton for coking unscreened, c.i.f., and 16s. 10½d. for second Durham gas coals, c.i.f., with a guaranteed percentage of ash. These prices, after deducting freight, etc., leave under 13s. per ton for the coal.

Output by British collieries during the week ended Sept. 5, according to a special cable to *Coal Age*, totaled 4,255,000 tons, compared with 4,085,000 tons in the preceding week.

### French Market Is Lacking in Noteworthy Developments

In the French coal market nothing noteworthy has happened of late. Consumption is in *statu quo* and the demand upon the Nord and Pas-de-Calais collieries, on the whole, remains satisfactory. Contracts, on coming due, are generally renewed without difficulty.

The market is well sustained with regard to home fuels. As to screened varieties, they are less neglected than heretofore. Sized descriptions continue in excellent request. The demand for industrial coals is stationary.

Rouen has announced the arrival of a consignment of anthracite samples from Russia. Several French firms are trying hard to obtain a monopoly on these fuels. Russian anthracite, as sampled by consumers of the Parisian region, has been found to resemble American anthracite in that it ignites less readily than Welsh anthracite.

During the entire month of August the O. R. C. A. received from the Ruhr 230,471 tons of indemnity coke, an average of 7,750 tons daily.

The Office des Houillères Sinistrées, which has the charge of the sale of indemnity fuels has issued a new price schedule which embodies a number of advances, in some instances as high as 20 fr.

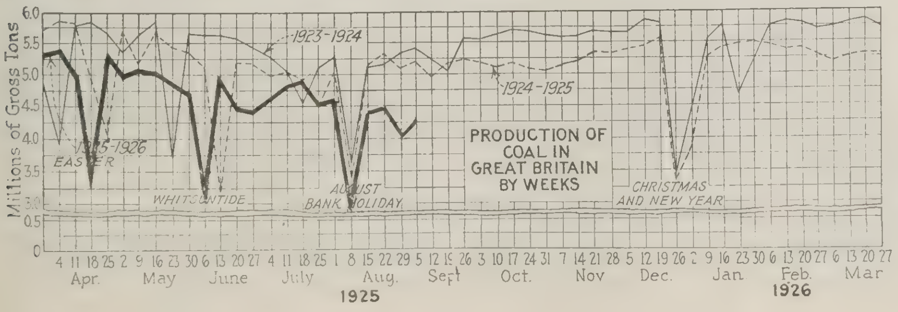
### Belgian Market Brightens As Steel Plants Resume

Announcement of the resumption of work in the iron and steel industry has given a fillip to the movement of industrial coals and cokes in the Belgian market. The improvement is manifest at Mons, Charleroi and Brussels. Collieries report orders more numerous and shipments active. Moreover, stocks are being resorted to with more vigor.

Up till now, however, there has been no talk of changing prices. As German and British competition is still keen, a decrease is not improbable.

Reports are current that wages may be cut, 15 per cent being the reduction that was to be proposed to the mixed commission. However, it is a ticklish matter to press at a time when the index number is on the rise.

The situation in house fuels continues good, with prices hardening for anthracite descriptions at inland points. With regard to briquets the situation is unchanged.



### Trade Eases Back to Normal At Hampton Roads

The first rush of coal buying, following the anthracite strike, having died down, business at Hampton Roads last week was about normal, with prices only slightly weaker than the week before, and demand holding its own. Foreign business was somewhat off, but bunker and coastwise trade was holding up.

Supplies at tidewater were normal and a number of mines reported production increasing in view of a possible heavy demand for coal during the next month. The tone of the market was firm, inquiries were steady and shippers were anticipating a steady increase in demand during the next month.

# News Items From Field and Trade

## ALABAMA

Erskine Ramsay, former vice-president of the Pratt Consolidated Coal Co., and a large stockholder and director in the Alabama By-Products Corporation, with which the former company was merged a year or more ago, has announced a gift of $100,000 to Birmingham-Southern College and a like amount to Howard College, local institutions. Mr. Ramsay is internationally known as a mining engineer and inventor of machinery for the preparation and handling of coal, and is one of Birmingham's foremost industrial and civic leaders and capitalists. Intensely interested in the cause of education, Mr. Ramsay has in recent years contributed liberally of his means to state institutions, giving $100,000 toward the establishment of an engineering hall at Alabama Polytechnic Institute, Auburn; $100,000 to the State University at Tuscaloosa, and a similar amount to the Alabama College for women, located at Montevallo.

The Galloway Coal Co. will give a barbecue to its employees at Carbon Hill Sept. 26, at which time contest will be held with first-aid and mine-rescue teams from all its operations participating for the purpose of deciding which teams will represent the company in the seventh annual field meet to be held at Rickwood Field, Birmingham, Oct. 6. Officials of the Alabama Mining Institute and prominent mining executives throughout the district have been invited to attend.

The Birmingham station of the U. S. Bureau of Mines will be equipped with a new truck with mine-rescue apparatus, including five tanks of oxygen, a pump, five Burrell gas masks, safety lamps, etc. The truck and equipment is expected to be received in time to be placed in service by Nov. 1 and will replace the old truck and apparatus which has been in use for many years. The station is in charge of F. E. Cash as resident engineer.

The byproduct plant of the Republic Iron & Steel Co., at Thomas is rapidly nearing completion and is expected to be ready for operation the latter part of October. The ovens and equipment for the preparation and handling of the byproducts are being built by the Koppers Company, there being 57 ovens in the battery, so arranged that additions can be readily made to meet future requirements. The plant will be complete and modern in every respect, employing the latest and best methods known for coking coal and extracting and handling the various byproducts.

## ARKANSAS

Judge Frank A. Youmans has granted the Western Coal & Mining Co. a temporary restraining order enjoining Jack Weatherman, of Franklin County, against interfering with the operation of the company's mine No. 6, at Denning, by cutting off its water supply. The order was granted without notice to the defendant. Hearing on an application for a preliminary injunction was set for Sept. 21. The plaintiff made bond in the sum of $5,000. The order enjoins the defendant from removing pipes from the pond on his land, from which the plaintiff obtains water to operate the mine. The affidavit of A. L. Toenges, superintendent of the plaintiff company, was presented to show that the defendant had threatened to remove the pipes.

## ILLINOIS

After having been closed down for eighteen months the Assumption coal mine, at Pana, has resumed operations, a new company having been organized and taken over the mine. The mine is 1,006 ft. deep, the deepest in Illinois, and the coal is considered the highest grade coal mined in Illinois.

Maplewood Mine No. 1, Farmington, has reopened as a co-operative mine.

Mine No. 9, at Langley, has finished a straight twenty-six day run making a record hoist, which averaged 5,500 tons a day for the actual working days of August. No. 8 Mine, Tovey, Ill., has had a daily average of over 5,000 tons for the twenty-six working days of August and No. 58 has increased its output as well. The pay roll of these three mines for the month of August will total more than a half million dollars.

Capitol Mine No. 57 of the Peabody Coal Co., Springfield, hoisted 1,731 pit cars in eight hours Sept. 3. The present management of this mine has brought the hoisting record from a thousand-car average to the present record in the last three years.

The coal mine at Edinburg, which has been closed the past two years, will be reopened soon.

Coal production and the number of miners employed in the Edwardsville district showed a decided falling off during the year ended on June 30, last, according to the report of Mine Inspector A. E. Lewis. The report showed that 3,959 miners were employed and 3,100,688 tons produced during the year. In 1923-24, 4,376 men were employed and 3,444,685 tons produced. Seven men were killed and 241 injured during the last year. The average, one death to each 442,955 tons, was about normal. The miners used 30,771 kegs of powder to blast down the coal, the report shows.

H. C. Knemoeller, county mine inspector of Macoupin County, reports that a total of 6,216,408 tons of coal was mined in that county during the fiscal year ended June 30, 1925. This is about 150,000 tons more than was produced in the year previous but is about one and one-half million tons short of the high mark.

Thomas J. Smith, of Pana, has for the eleventh successive term been appointed by the County Board of Supervisors County Mine Inspector of Christian County, making 22 successive years under both Republican and Democratic administrations.

A minature coal mine which will depict in detail the operation of hoisting coal from the earth, screening and dumping it into cars, together with moving pictures showing all underground operations of a mine, with first-aid and rescue work, is being shown at the Illinois State Fair at Springfield. The display has been prepared by the Peabody Coal Co., Chicago, and is in charge of G. J. Stelte, an official of the company's office in Springfield. The model mine is 6 ft. high and is constructed on a ratio of 1 to 24, being an exact reproduction of the company's mine No. 9 in Christian County. The model mine is electrically operated and is driven by a minature power house. The entire model is enclosed in glass, thereby preventing spectators from being annoyed by dust, yet permitting minute observation of its workings.

A 6-ft. bed of coal at 500 ft. was passed through Sept. 12 in the drilling of a prospect oil well on the Fitzpatrick farm near Pana. Three showings of oil were found. It is planned to mine the coal for market purposes.

## INDIANA

A mortgage of $300,000 given by the Bledsoe Coal Co. to the Terre Haute National Bank, Terre Haute, has been filed with the County Recorder there. The development of 3,400 acres of coal land owned by the Bledsoe company around the new Dresser power plant, southwest of that city, is said to have been the reason for the large advance.

This sum will be used in the sinking of shafts and otherwise putting the field on a production basis. The mortgage was given by the directors with the approval of the stockholders with the proviso that it be paid off in ten annual instalments of $30,000, the first payment due Sept. 1, 1926. Seven per cent interest is being charged.

Fire of unknown origin recently destroyed the mule barn at Crown Hill mine No. 5, at Clinton, together with eighteen mules in the barn. The building was insured.

The Radiant Coal Co., Terre Haute, has filed a final certificate of dissolution.

The Fort Branch coal mine, at Fort Branch, which has been closed since last April, has resumed operations, after signing a contract whereby electric loading machines will be used. Installation of the machines made necessary a new wage contract with the miners.

If a general strike of the anthracite coal industry continues thirty days or longer, the Indiana coal fields will resume full operation, according to Tyler G. Lawton, president of the District No. 11 United Mine Workers. Already in relation to the immediate resumption of work, some of the mines in Sullivan County have received large contracts and are enjoying a complete revival in business. In citing a similar instance, Mr. Lawton said in 1902 the soft coal fields were in about the same condition as they are now. The anthracite miners were called out in a general strike in April of that year and stayed out for more than nine months. Almost immediately the soft coal industry resumed full operations.

Contracts for the supply of coal for the coming school year at Terre Haute have been awarded. Bray Brothers were given the contract for supplying one-half the coal on a bid of $3.69 for 1¼x2-in lump from the Starko mine. The DeLuxe Coal & Coke Co. was given the other half on a bid of $3.70 for 1¼x2-in lump and $3.50 for 2x4-in lump. A number of other companies entered bids.

The New York Central Lines, whose southern Indiana coal terminal is located at Petersburg, will begin work with a large force of men soon building additional trackage to take care of the increased coal business in southern Indiana. The opening of new strip mines in Pike County is increasing the tonnage along the E. & I. division of the road, making it necessary for the company to build more yard tracks at Petersburg. The Pike County Coal Co., which owns thousands of acres of rich coal land in the western part of the county, has asked the railroad to run a spur road from Petersburg to Oatville, eight miles southwest.

The Winslow Mining Co., Winslow, has filed a final certificate of dissolution with the Secretary of State.

Asserting that they are justified in striking because of the increase by the C. & E. I. R.R. in transportation rates, members of the Clinton train committee of the United Mine Workers met recently with district officials and members of the Terre Haute train committee in a conference in an attempt to settle the trouble which has the Clinton field tied up. It was decided to send representatives to confer with John L. Lewis, to determine whether Terre Haute miners would join the Clinton strikers. The understanding is that Phil A. Penna, secretary of the Indiana Bituminous Coal Operators' Association, has communicated with Mr. Lewis regarding the strike and is treating the matter as a breach of contract.

## KENTUCKY

Heavy rains over the week end, starting on Sept. 12, have improved the water supply materially in Kentucky. Several mines were handicapped by a long drought and dried up water supplies, it having been reported that a few isolated operations were forced to close down in early September, due to lack of boiler water.

Involuntary bankruptcy proceedings were filed in the U. S. District Court at Covington, Sept. 5, against the Sullivan-Pond Creek Coal Co., which has its principal offices at Shock, Pike County. The complainants were the Rice-Hutchins Baltimore Co., Baltimore, Md.; the Banks Miller Co., Huntington, W. Va., and the Persinger Hardware & Manufacturing Co., Williamson, W. Va., whose claims aggregated $1,404.85.

The properties of the Letcher Coal Mining Co., in Letcher County, near Whitesburg, which have been in the courts for some time, are still idle, awaiting a final court order. The Harlan Coal Co., Louisville, which is a large creditor figures to take over the mines and place them in operation.

Seven coal towboats with 45,000 tons of coal were among eight boats that passed the Maysville locks on Sept. 4, on an artificial river rise. The Lockmaster at Dam No. 33 reported 953 boats through the locks during the month of August.

## MINNESOTA

T. T. Hammitt, sales manager of the North Western Fuel Co., Minneapolis, was a visitor at Duluth during the week of Sept. 19. He commented upon the steady gain in sales of dock coal throughout southern Minnesota as a result of the adjustment in the all-rail rates from the Illinois, Indiana and Kentucky mines into that territory.

Ford Motor Co. interests at Duluth have said that steps by which the company will obtain title to the Superior dock at Duluth now under lease to it are being taken. They hope the company will be able to carry through an extension and improvements to the dock during the coming winter. In the meantime the two Ford steamers are maintaining their schedules of runs with their coal to this market.

A conference is to be held this month in St. Paul, of Twin Cities business men and representatives of the Illinois Coal Operators' Association with Brig. Gen. T. Q. Ashburn, chief of inland waterways transportation, to discuss the use of the Mississippi River for transporting southern Illinois coal to the Twin Cities by barge.

## NEW YORK

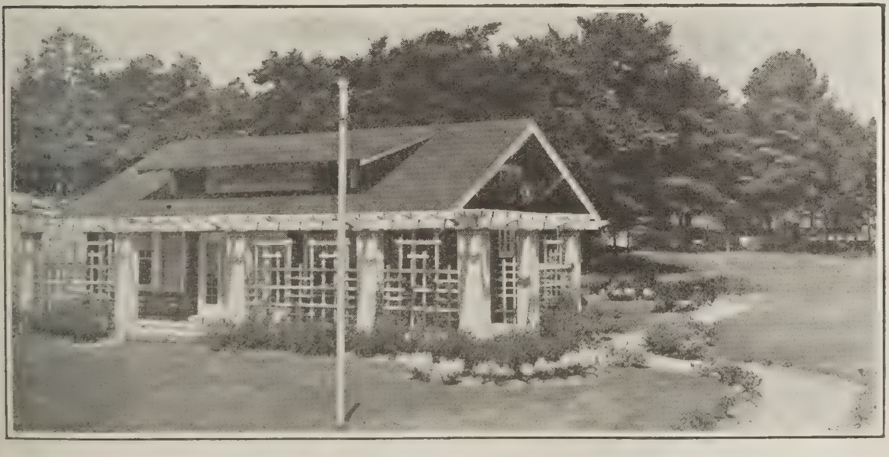
Joseph J. Eagan, a well-known Buffalo coal shipper, has bought a large interest in the Acme Coal Co.'s mine at Reimersburg, Pa.

## NORTH DAKOTA

Lignite producers of North Dakota anticipate increasing their production should the effects of the anthracite strike call for it. It is claimed that the production of last year of slightly over a million tons can be doubled.

## OHIO

One of the mines of the Maher Collieries Co., of Cleveland, located at Neffs, which had been idle for eight months, has opened recently employing approximately 300 miners. The mine has a capacity of about 2 000 tons daily and production is rapidly reaching the peak. Three mines of the Lorain Coal & Dock Co., of Columbus.



**Modern Kindergarten at Edgewater, Ala.**

In this attractive little building the children of this Southern mining town begin their efforts in "book learning." No more does the metropolitan youngster "get the jump" on his industrial-town cousin in the matter of early education. Not alone in this but in many other small communities the kindergarten has today become an established reality.

have been operated during the entire summer. They are the Blaine, Crescent and Stanley operations, with a capacity of about 7,500 tons daily. Two other mines of the same company, the Wheeling Creek and Lincoln operations, have been idle for some time. Car shortage is now appearing on the B. & O. in the eastern Ohio district, which is reducing the output to a certain degree.

August was the most disastrous month in the history of the coal mining industry in Ohio in point of fatalities, according to a recent report of Jerome Watson, chief of the Ohio Division of Mining. Eleven fatalities occurred during the month compared with one in July. Based on the number of men employed, the record of August was the highest ever known.

In a statement given out by the Hocking Valley Railway Co., covering loadings at the Toledo docks of the company for lake shipment up to Sept. 16 a total of 5,798,115 tons was loaded, as compared with 4,620,543 tons during the same period in 1924.

## PENNSYLVANIA

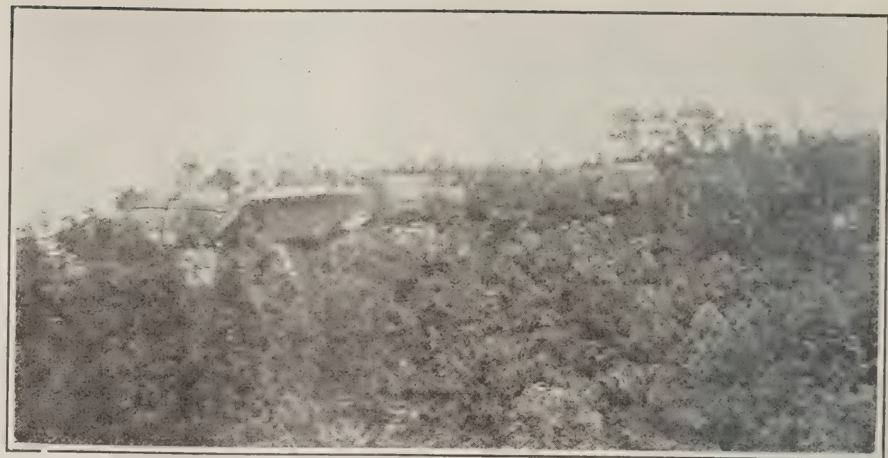
The Pennsylvania Coal & Coke Co. has awarded a contract for complete electrical equipment for four automatic mining substations to the Westinghouse Electric & Manufacturing Co. Although the total power rating for the four stations is but 1,100 kw., the stations are unusual in that the operation and control are entirely automatic. This contract represents the largest ever awarded for this class of equipment. Three of the stations are at Ehrenfeld; one for the automatic control of a 300-kw. motor generator set, another for a 200-kw. set, while the third will control two 200-kw. sets. The fourth station, located at New Shaft, will control two 100-kw. motor generator sets.

The mines and coke ovens of the Cascade Coal & Coke Co. at Sykesville, which have been idle more than two years, have been started up. It has produced over 325,000 tons in recent years and employs 375 men. It is owned in Buffalo and the product is used in the furnaces of the Rogers-Brown Iron Co., at Buffalo, N. Y.

The Armerford Coal Mining Co. and the Margaret Coal Mining Co., both of Pittsburgh, will be merged under present plans. Special stockholders' meetings were called for Sept. 22 to act upon the merger.

The monthly report of the U. S. Engineers at Pittsburgh for August shows that there were moved 1,553,660 tons of coal and 98,370 tons of coke on the Monongahela River, 452,680 tons of coal and 34,300 tons of coke on the Ohio River and 93,000 tons of coal and 12,400 tons of coke on the Allegheny River.

Eighty-nine of the 195 industrial fatalities reported for the month of August to the bureau of statistics of the State Department of Labor and Industry occurred in coal mines. There were 80 in other industries than that of mining and 25 among the transportation and public utilities companies. Fifty-eight of the mine deaths were in the anthracite district of the state and 31 in the bituminous region.



**In the Mountains of Kentucky near Stearns Co.'s Mines**

Markings on the cliff, the old settlers say, were made by the Indians, which accordingly they have designated as the "Painted Indian Signs."

A coal tipple owned by the Richards Coal Co., at the foot of Edgebrook, Brookline, in Pittsburgh, was damaged slightly by fire recently.

All right, title and interest in the Blanchard-Moshannon Mining Co. was sold to Robert P. Hunter, as trustee, at the receiver's sale held at the plant near Karthaus, Centre County, on Sept. 8. The purchase price was $34,000, subject to mortgages and agreement accounts of a face value of approximately $340,000. Mr. Hunter purchased the property for the Clinton-Moshannon Mining Co., which was recently incorporated and which, it is stated, will operate the mines. Included in the new corporation are the principal creditors of the old Blanchard-Moshannon Mining Co. William G. Blanchard of Pittsburgh, who was the dominating factor in the Blanchard-Moshannon Company, has been eliminated from the new enterprise.

The men at the Jamison Coal & Coke Co. mine near Perryopolis, Fayette County, struck Sept 9, for restoration of the high peak wage scale, which approximates the scale provided at the union mines by the Jacksonville agreement. The wage scale at this plant was reduced to the 1917 scale last spring. This plant has been working steady for some time. About 400 men are employed. The men are still out.

## UTAH

Coal production in Utah during July, according to an official report just issued, was 323,087 tons, compared with 364,948 tons in July of last year. Output in July of this year is the smallest since July, 1921, when 278,092 tons was mined in the state.

## VIRGINIA

The mines of the Consolidation Coal Co. at Alfredton will be placed in operation again soon, according to an announcement made by the company. Officials have been busy employing men and getting plants in shape to resume operation after a suspension of more than twelve months. Mine No. 225, at Alfredton, is in fact already running.

The Wilson Coal Corporation expects to resume operations at once on Hill Creek, west of Richlands. The plants of the company have been leased for three years by M. Ziegler from the Wilson Coal Corporation, which is owned by Richlands business men. Mr. Ziegler will assume management of the operation at once. A force of men has been at work for some time cleaning up and repairing the machinery preparatory to opening the mines. This company employs between seventy and eighty men. The Bull Creek Coal Co., also located on the Hill Creek branch of the Norfolk & Western, has already reopened its mines and is shipping coal regularly. The mines of this company were opened on Sept. 1 after being shut down for several months. The general office of the company is at Johnson City, Tenn. It is stated that the Glenburke Coal Corporation and the Field Scott Coal Co., also with mines on the Hill Creek branch, are working practically every day.

## WEST VIRGINIA

Directors of the Island Creek Coal Co. have declared an extra dividend of $1 a share on the common stock in addition to the regular quarterly distribution of $2. Dividends of the same amount have been paid on the common stock in the seven preceding quarters. The regular quarterly dividend of $1.50 a share was also declared. All distributions are payable Oct. 1 to stockholders of record Sept. 21.

According to statistics just compiled covering the production of the Logan field, August, 1925, proved to be the biggest month in the history of the field. Approximately 36,400 cars of coal were shipped. The record of week ended Aug. 15, when 8,546 cars of coal were taken out of the field. Thus far this year production is almost 2,000,000 tons in excess of that for the corresponding period of last year.

The Soviet commission of Russia has just completed a visit to the mining fields of southern West Virginia along the Norfolk & Western Ry. In the party were Prof. Leo D. Scheviakoff, professor of mining engineering of Ekaterinoslav Mining Academy; Dimitri M. Souchevski, chief engineer, Cherbinovka Coal Mines, and Robert P. Waggoner, director of the bureau of construction, United Coal Industries of Donetz Basin. S. Rosoff, of the Amtorg Trading Corporation, American representative for large mining trusts of London, Moscow, Kharkoff, Vladivostok and other points, acted as interpreter for commission.

The United Mine Workers have erected additions to the barracks at Rosemont and Wendel in the Flemington field.

The Dixie mine of the Dixon Coal Co., on the Western Maryland Ry, began operating non-union early in September.

The mining extension department of West Virginia University began registering students in all of its classes Sept. 21. Classes are first being organized and work will begin next week and continue until the latter part of May, 1926. During last year there were 1,315 men registered in the classes compared to 500 six years ago. Homework and examinations are a part of the course prescribed. Classes probably will be established in coal mining regions, where the largest number of coal miners and officials can be reached and indications are that the Welch, Williamson, Mount Hope, Montgomery, Logan and Wheeling sections will be awarded schools this year. There is a far greater demand for schools this year than ever before.

A circular letter was issued Sept. 16 by Van A. Bittner, chief international representative in West Virginia, instructing every local union of the United Mine Workers in northern West Virginia to appoint a committee of three to act as an educational committee, whose duty it shall be to obtain the necessary school books for the children of striking miners, because in West Virginia the parents purchase their children's books in the majority of the school districts. The letter suggests that members exchange books where possible.

Norton mine of the West Virginia Coal & Coke Co., on the Charleston Division, B. & O., resumed operation recently. This is a large mine, producing from 40 to 45 cars of coal a day.

Helen mine of the Hughes Coal Co., at Gypsy, Harrison County, was recently equipped with a 200-kw. motor generator set, which was used for the first time Sept. 15. The set will receive power from the 22,000-volt line of the Monongahela West Penn Public Service Co., instead of receiving its power from the Clarksburg trolley wires, as previously.

In the first eight months of 1925 the coal mines of the 12½ counties of northern West Virginia produced 14,576,450 net tons of coal. The monthly production was as follows: January, 2,179,200 tons; February, 1,705,400 tons; March, 1,844,250 tons; April, 1,294,650 tons; May, 1,464,950 tons; June, 1,744,750 tons; July, 2,036,650 tons; August, 2,306,600 tons. Most of the tonnage was produced on an open-shop basis after April 1.

A new tipple has been erected at the mine of the Corona Coal Co. at Hepzibah, Harrison County, to replace the plant burned down by incendiaries. Coal is loaded from two openings in the mine by the means of conveyor belts, but the coal is dumped through the same tipple. The improvements cost approximately $35,000.

Under the terms of chapter 87, Acts 1915, passed at the last session of the West Virginia Legislature, the law relating to the issuance of scrip by coal companies and other corporations to their employees has been changed so as to render scrip issued, under the new law, payable only to the employee to whom issued. The new law, which has just gone into effect, further allows such scrip to be made redeemable in merchandise. It is stated that the new law is intended to break up the practice of poolroom operators and various others who have for many years been in the habit of buying scrip from employees and hoarding it up in large amounts and then presenting it for payment several months after it was issued.

The fact that the Paisley interests, operating in the Wheeling district, have adopted the plan of paying their employees only once a month instead of semi-monthly as provided in the union contract may lead others to adopt the same policy although so far reports indicate no requests for permission to do it have been made upon the union. The men at the five mines of the company in the Wheeling district, however, have accepted the new plan, the officials of the union taking the view that it was a matter resting with the men only.

The Poca-Pack Coal Co., with an authorized capital of $125,000, has been organized by J. C. Pack, of Bramwell, and has begun operations with Paul Pack, son of J. C. Pack, as superintendent. The company is owned exclusively by J. C. Pack and family. This property is in the Winding Gulf field, on the Virginian Ry., and was formerly owned by the Smith-Pocahontas Coal Co., the property having been sold at public auction in July. The plant is thoroughly equipped to ship 10,000 tons a month of No. 3 and No. 6 Pocahontas coal. Mr. Pack is well known in the Pocahontas trade and has been closely identified with the development of the coal industry in the southern part of West Virginia for many years.

### CANADA

Production of coke in Canada in June receded to 109,694 tons from 130,068 tons in May and 131,484 tons in April. A loss in output was reported by all provinces.

William Sherman, president of District No. 18, United Mine Workers, including Alberta and a part of British Columbia, has resigned his position and is leaving for the United States. Until his successor is appointed the interests of the organization will be looked after by Robert Livett.

## Traffic

### Hold Hearing on Rates To East St. Louis

Taking of testimony in the Perry Coal Co. application for reduced freight rates on coal shipments to East St. Louis, Ill., were resumed before the Illinois Commerce Commission in the East St. Louis City Court on Sept. 15. Judge George W. Pillow of Marion, Ill., presided.

The case is directed against the Alton & Southern R.R., but nine other coal hauling roads are affected. They are the Pennsylvania, Southern, Illinois Central, Baltimore & Ohio, Illinois Traction, Terminal Railroad, St. Louis & O'Fallon, East St. Louis & Suburban and Belleville Electric.

Twenty-three coal companies are interested. They seek lower rates on coal shipped into East St. Louis from close-in mines.

There are two other cases pending before the commission. One affects mines within a radius of 20 to 60 miles of East St. Louis and in the other coal companies outside that zone are seeking to benefit by any reduction in freight rates granted the other two zones.

The coal companies contend that Illinois freight rates are high compared with those in Indiana and other states where conditions are similar.

## Coming Meetings

**National Safety Council.** Annual meeting Sept. 28 to Oct. 2, at Cleveland. Ohio Managing Director, W. H. Cameron, 168 No. Michigan Ave., Chicago, Ill.

**Tenth Exposition of Chemical Industries.** Sept. 28 to Oct. 3, at Grand Central Palace. New York City.

**Alabama Mining Institute.** Annual meeting, Oct. 6, Birmingham, Ala. Secretary, J. L. Davidson, Birmingham, Ala. The Seventh Annual First-Aid Field Meet also will be held on this date.

**American Gas Association.** Annual meeting, Oct. 12-16, at Atlantic City (Steel Pier), N. J. Secretary-manager, Alexander Forward, 342 Madison Ave., New York City.

**Kanawha Coal Operators' Association.** Annual meeting, Oct. 15, at Kanawha Hotel, Charleston, W. Va. Secretary, D. C. Kennedy, Charleston, W. Va.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Harlan County Coal Operators' Association.** Annual meeting, Nov. 18, at Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering.** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## Obituary

**Dr. Arthur Jenkins,** 54 years of age, of Harlan, Ky., half owner of a mine near Harlan, died at a hospital in Lexington, Ky., on Sept. 5, of pneumonia. His son, Raymond Jenkins, travels in the Southeastern Kentucky mine section for the Hercules Powder Co. Two other sons and his wife survive.

**Alfred Reddington,** 65, of Charleston, W. Va., died in a Charleston hospital after an illness of several months. In 1887 Mr. Reddington went to West Virginia, locating in McDowell county as an engineer for the Turkey Gap Coal Co. and Crozer Coal & Coke Co., and also for the Crozer Land Co. In 1900 he became general manager of the Marmet Coal Co., serving with that company until 1907 when he resumed his private practice as civil engineer. He is survived by his wife, five daughters and two sons, three sisters and two brothers.

**W. P. Johnston,** 39, president of the Johnston Brothers Coal & Coke Co., and president of the Johnston Brothers Mining Co. of Wheeling, W. Va., died while seated on a chair in his bedroom at 5:30 a.m., Sept. 15. He had just recovered from an attack of peritonitis. Mr. Johnston was graduated from Linsly Institute, Wheeling, and for ten years had been one of the leading business men of the city. Funeral services were held Thursday afternoon, Sept. 17.

On Sept. 13 death claimed **L. A. Butterfield,** age 70 years, of Birmingham, Ala. He succumbed to an apoplectic stroke which he suffered three days earlier. Mr. Butterfield was long associated with mining interests in Alabama, being connected at different times with the Tennessee Coal, Iron & Railroad Co., Sloss-Sheffield Steel & Iron Co. and Tutwiler Coal & Coke Co. He came here from Charleston, S. C., in 1886. At the time of his death he was secretary of the Alabama State Land Co., owners and dealers in mineral lands. He leaves a widow, three daughters and one son.

**Alfred Frerk,** senior member of the firm of Henry Frerk, coal dealers of Chicago, and treasurer of the Chicago Coal Merchants Association, died Sept. 11, of heart disease at his home, 3655 North Harding Avenue, Chicago. Mr. Frerk, who was 51 years of age, was born in Chicago and virtually grew up in the coal business. He was an enthusiast in the development of the Villa community district and was an organizer of the Four Seasons Club of America.

## Industrial Notes

P. S. Gardner, president, **American Rheolaveur Corporation,** New York, and Andrews Allen, of **Allen & Garcia Co.,** engineers, Chicago, have returned from Europe, where they spent six weeks jointly inspecting installations of the Rheo coal washing system at prominent coal-mining plants in England, Wales, France, Belgium and the Saar. Mr. Allen states that his investigations and studies show the Rheo-washer to be ideally adapted to meet coal-preparation needs in this country. Mr. Allen announces that arrangements have been made with the American Rheolaveur Corporation for the Allen & Garcia Co. to install Rheo coal washing plants in the United States.

**L. M. Zimmer** has been appointed general sales manager of the **Linde Air Products Co.,** manufacturers of oxygen, and of the welding gas division of the **Presto-O-Lite Co., Inc.,** manufacturers of dissolved acetylene, succeeding L. M. Moyer, who resigned Aug. 1, 1925.

On Oct. 1 the **Hydrotator Co.** will move its Philadelphia office to New York City, combining it with the office of Edward B. Day at 110 E. 42nd St. Mr. Day is president of the company.

**The Kuhlman Electric Co.,** of Bay City. Mich., announces the appointment of the **D. H. Braymer Equipment Co.,** 727 W. O. W. Building, Omaha, Neb., as district representative in Iowa and Nebraska.

**The Conveyors Corporation of America,** 326 West Madison Street, Chicago, announces the appointment of **Rowland & Burns,** 39 Cortlandt Street, New York City, as district engineers for New York and vicinity.

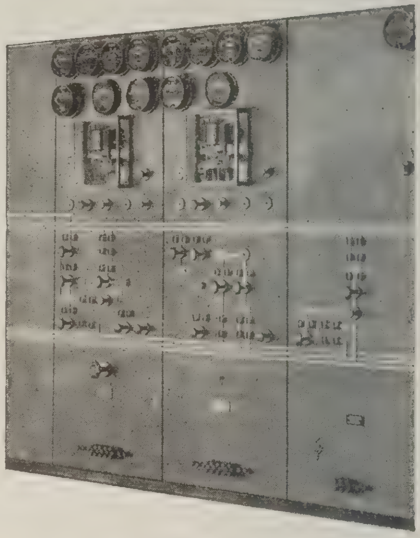
# New Equipment

## Steel Switchboard Proves Itself Suitable

A new type of switchboard, constructed of stretcher-level sheet steel, has been designed by the Westinghouse Electric and Manufacturing Co., that may be used advantageously in power plant and substation installations. This new type of switchboard is light, substantial, sturdy and easily erected.

The influx of steel switchboards has been a gradual one since 1915 when it was found that the ordinary slate and marble boards would not stand up under severe operating conditions. They were brittle and easily broken and were subject to stain by oil which marred the appearance of the board. In addition they were heavy and cumbersome.

For some time stretcher-level steel switchboards have been used on small installations in a more or less experimental way and have proved successful, so that they are now being installed on larger projects. The outstanding features of this new type of board are its lightness, substantial nature, appearance and inexpensiveness. The erection and maintenance costs are lower than those of the slate and marble boards. Their erection, in addition to being cheaper, is more simple because the framework is an integral part of the panels.



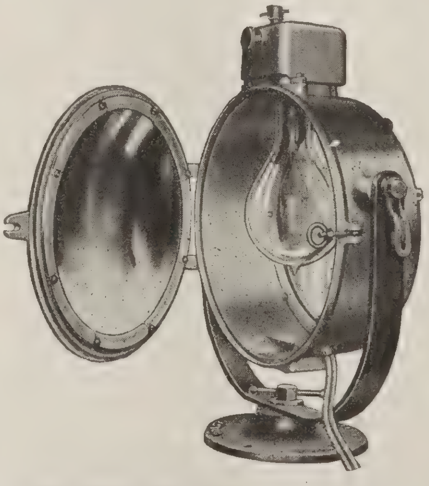
**Meters and Switches Mounted on Steel Panels**

Switchboards made of sheet steel like this one cannot be easily broken. They are light and easy to install.

The steel panels are given a baked enamel finish similar to that used in the automobile industry. They thus present a most pleasing appearance and in addition are impervious to moisture and resist corrosion.

## Floodlight with Reflector On Rear Door

The Electric Service Supplies Co., of Philadelphia, recently placed on the market a new type of Golden Glow floodlighting projector, known as type FLA-1419, for mine yard or other similar service. This new unit has been designed to provide a simple and rugged housing, being made of cast aluminum alloy in which is mounted a standard 14-in. reflector.



**Lamp Has Convenient Adjustments**

It is easy to clean the reflector on this lamp because the reflector is mounted on a hinged door. Adjustments of the light are made from the outside.

The design of the body of this new projector is unusual in that the glass reflector is mounted in the door which opens from the back of the case, thus providing easy access for the renewal of lamps and for cleaning the reflector. The door closure is a series of baffles with machined-surface fit and provides a simple, substantial and effective weather-tight joint without any type of gasket.

### Easily Focused

This new unit provides ample ventilation through liberally designed apertures at the bottom and top of the body. An easy and simple focusing mechanism is enclosed in the top ventilating cap, which permits focusing of the lamp entirely from the outside and without tools.

The body of the projector is mounted on trunnions in a yoke of ⅜ x 2-in. steel bar stock which may be rotated in the heavy cast-iron base. The curved front glass of the projector is of special heat-resisting pressed glass, approximately ¼ in. thick, which practically eliminates breakage.

These new floodlights when fitted with a 1,000-watt 115-volt PS-52 standard multiple burning lamp may be used successfully with maximum ranges of 3,000 to 3,500 ft. when mounted on towers 70 to 90 ft. high. The light has a soft, non-glaring character and is very penetrating.

A lamp of this character can be easily cleaned or adjusted when located on the top of a mine yard building.

## Lewis Shows His Hand

THE LAST VESTIGE OF DOUBT that President Lewis aims to get the government to fight his battle for him is now removed. In his speech at the union demonstration in Fairmont, W. Va., marking the opening of the new strike effort in that state, he said frankly enough that since "the Jacksonville agreement was negotiated and executed with the aid and co-operation of high government officials . . . . the industry has a right to expect that the moral influence and power of those same government officials will be utilized to preserve the integrity of the agreement and to maintain, in the public weal, the tranquility of the coal industry." In other words he had no solution for his problem of enforcing the Jacksonville agreement except the strike weapon and if somebody at Washington doesn't make the Pittsburgh Coal Co. and others live up to the contract, he could afflict the nation with another general strike.

There is one thing the mine owners of the country can do in defence of the industry. They can devote themselves earnestly and at once to convince the people of the land that the public weal can best be served if the citizenry and the government refuse positively and absolutely to take any hand in the controversy. Mr. Lewis may call the general strike, altogether forgetful of the public weal. It will be troublesome for a period but the nation will get a good deal of non-union coal and if no outside agency comes to Mr. Lewis' aid during that period, the United Mine Workers will ultimately cave in. No other development will serve the whole people of this nation better in this instance than a strike that fails.

Since it is impossible to compel mine workers to work if they do not approve of the contract they have, and since it is impossible to operate a mine that loses money, unless somebody makes up the deficit, popular control of mines, such as a strike-harassed nation might vision, would not relieve the country of its coal troubles. Furthermore, public control of coal would be as costly as was public control of railroads. Thus the people of the land stand to win nothing by taking up the cudgels Mr. Lewis is laying out invitingly. The most effective position they and the operators of coal mines can take today is: If there must be war, let it come. A labor force would be slow indeed to begin hostilities in the face of such a public opinion.

## Our Smaller Institutes

NATIONAL AND EVEN STATE INSTITUTES gather together only a few people outside of those who attend from the neighborhood where the institute is held. There must always be only a few who can make the longer journey to larger institutes, and consequently there is great need for local sections and chapters to complete the activity and give the village or town its full opportunity.

At Rock Springs, Wyo., for instance, is an institute, a chapter of the Rocky Mountain Coal Mining Institute, which holds meetings once a month and usually listens to two papers from members. When any of its people take a trip to mines in other states or go to institute meetings in other places, they make a report of what they learned and saw and what their opinion is of developments elsewhere. Thus the views of the members are enlarged.

It has been remarked that when any town chooses its school teachers from the immediate vicinity, the teaching gradually becomes poorer in quality. In some towns the teachers come from half the states in the Union. Last year in Rock Springs were represented teachers from New York and Louisiana and eighteen other states.

Just so with institutes. They grow weaker and weaker if they do not draw their inspiration from outside. In every district there are some who travel and when they do the local institute should fertilize the narrower experience of their members with information regarding the conditions in more distant points and avoid the inbreeding of ideas, which makes progress impossible.

## Will Not Arbitrate

CLEVER INDEED, and to many convincing, is the reply of the scale committee of the anthracite miners to Walter Gordon Merritt, counsel for the anthracite operators, refusing "to arbitrate the terms and conditions that are to be written in and to constitute a contract," between the anthracite employers and their employees.

Everyone, doubtless, is quite ready to grant that a working man has a right to quit work if he doesn't like his wage and to lie idle or seek other employment unless he gets from his old employer what he believes he ought to, or can, get. He has, as the scale committee asserts, as much right as a clothing dealer to ask his own price, and most people will say more right. But the United Mine Workers must remember that this is *not* precisely the right they are seeking.

What they demand is privilege to conspire to get high wages, using the expedient of quitting in large groups thereby endangering the health of the public, and they do it in an industry where no one not already a miner is legally allowed to work. Should any one believe that the work at the operator's figure looks attractive, he could not undertake it legally, and indeed he would find it dangerous to engage in it as has often been proved, for violence is nearly always employed against those who seek such work.

Having thus combined against the public, the mine workers should submit to arbitration. When they take corporate action they should refrain from jeopardizing public interest. Within its borders there must be no power greater than the American commonwealth. If any latitude to combine is allowed by law it must be accepted with a due sense of responsibility and utilized so that it will in no case border on oppression. That assurance will be afforded if the mine workers show a willingness to confer or to arbitrate and to work while doing the one or the other. Operators in the past have opposed arbitration, but they are learning that they cannot refuse to accept it so long as they act corporately, and the anthracite operators, made a unit by the corporate action of the mine workers rather than by any act of their own, are ready to submit the wage question to what is "practically the only peaceful solution devised for situations of this kind," to quote Mr. Merritt.

It is useless for the United Mine Workers to list instances of the determination of individuals like Rockefeller and Judge Gary or operators in a small district like Mingo as evidence of a disposition on the part of employers to act as the mine workers are doing. Such persons because they are individuals or inconsequential groups of individuals are within their rights. Moreover, these strikes did not in any measurable way injure the consumer.

The public, on most occasions where business, health and happiness are jeopardized, has called loudly for arbitration, and the anthracite operators have not been unmindful of the reasonableness of that demand. That is why they resign their rights, such as they are, and agree with the people that these difficulties with their employees should be settled without a suspension.

The Scale Committee declares that the "Coal Operators do not agree or offer to arbitrate the price at which they shall sell coal." True, the mine operators are not being asked to arbitrate their prices, and the reason is clear. *They* are not on strike. *They* have not suspended production to raise the price. If they had done so they would one and all be under prosecution or in jail. There is a rough and ready way provided to deal with such corporate action against public interest.

Nevertheless, anthracite prices have been arbitrarily fixed at times when there was no suspension of production, nor any suggestion that it was even contemplated and no semblance of proof or reasonable suspicion that any concerted action to raise prices was in contemplation. And this was done with only questionable legal justification and withal in these cases without protest from the operators affected. The public need seemed at the moment at least to many, to demand regulation, and under those conditions the operators consented and made no complaint.

## A Lesson in Double Saving

FREQUENTLY WE WAIT for necessity to drive us to make changes or adopt new devices. Last year, at the New Haven Machine Tool Exhibit, the induction motor load produced such overheating of the cables, because of low power factor, that many of the machines had to be shut down. This year the individual motors will be equipped with static condensers. Thus poor power factor conditions will be corrected at the source and the cables will be able to carry a much higher power load without overheating. There is a lesson in this for those who operate coal properties.

At mines uneconomic circuit conditions often pass unnoticed. More thought is centered upon the success with which the motor renders a given service than upon the efficiency with which it uses electrical energy. Even when a motor circuit begins to give trouble, the general practice is to bark up the wrong tree. If heavy wattless currents heat up conductors, larger cables are installed. When an induction motor will not develop sufficient torque, because of high voltage drops occasioned by circulating wattless currents, a larger motor is used. When the alternating-current circuit breaker opens—too frequently because of poor power factor loads supplied through it—the overload setting is raised until the switch renders no reasonable protection.

Such practices are exceedingly expensive, but, most regrettable of all, they aggravate the difficulties rather than correct them. Power factor penalty clauses in power schedules no doubt will change false reasoning in such matters. When power bills become too high, static condensers and synchronous motors will be more numerous. Then power costs will become smaller and equipment replacements less frequent and more money will be available for modernization and profit-making devices.

## Shallow Mine Fires

ALL THE WORK of closing off a shallow mine fire by stoppings is destroyed if the surface is not adequately policed and holes due to caves are not promptly filled. Wherever the pillars are destroyed by the fire, the roof will fall and may make openings to the surface. But falls occur in other places, due probably to the weakening of the roof consequent on falls in adjacent areas. When a piece of roof collapses to the surface directly over a burning area the gases will rise from the fire, and the atmosphere will be impregnated with sulphurous fumes. Here, however, the air is rising and consequently the fire is not being fed through these holes. It is true that such places should be filled, but it is wrong to leave unfilled the other holes where there is a connection but no fire activity, for it is just there that air probably is *entering*.

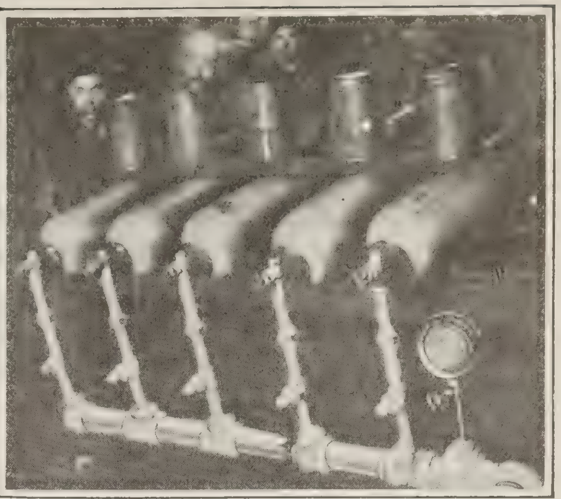
When the holes are big, pot shots along the edge will fill them up with surface material and rock. Then a scraper and shovels can be brought into operation, and surface material can be spread so as to make a good covering, which must, however, be watched day by day lest holes develop. As a fire dies, vacuum develops and the more vacuum the more active leakage. So, when the fire is down is just the time to be the more meticulous about covering it entirely. If the fire breaks out again the last condition is worse than the first.

If care be not taken the fire may become so furious as to make any preventive measures difficult and even dangerous. The surface earth also may become exhausted, and other earth may have to be brought in from distant points and carried across land that may have unseen but dangerous caverns beneath. A mine fire is not to be played with, and especially is it dangerous where a tangle of vegetation makes observation difficult. In such places it would be well to remove all shrubs so that the area might be closely watched. If the fire should spread, the area to be watched and treated will soon become so large as to bring a severe burden on any company's finances and may indeed involve the abandonment of mines.

# Drowning a Mine Fire In Carbon Dioxide

## Sealing Inaccessible Area Has Small Effect —Magazine Article Suggests Gas Attack— Carbon Dioxide Speedily Quenches Fire

**By Charles H. Strange**
Assistant to the President Pine Hill Collieries Co.,
Pottsville, Pa.



A MINE fire is troublesome enough in a single seam of coal. In an anthracite operation like that of the Pine Hill Coal Co. near Minersville, Pa., where operations are conducted in five seams badly crushed, tipped and superimposed, the difficulties were so great during a serious fire that extraordinary methods to combat it were necessary. The best known practice in sealing with concrete and projected cement did not suffice. The fire finally was extinguished by the injection of more than 500 containers of carbon dioxide into the ineffectively sealed area. In the process a good deal of experience was gained that might be of value in fighting mine fires anywhere.

### A LITTLE GAS DOES A BIG JOB

**PUTTING out a mine fire with $CO_2$ is not a herculean task of filling a mine full of this gas—nor even filling an entire sealed-off fire area. Air is already 79 per cent inert (nitrogen). The remaining 21 per cent oxygen need be reduced only to such a point as will produce an atmosphere incapable of supporting combustion. Thus, if a sealed area is almost airtight, a volume of carbonic acid gas equal to only a small fraction of its cubic contents need be introduced. But even if the area is not entirely airtight, the heavy $CO_2$ will smother a fire if it can be introduced close to the burning zone, just as common fire extinguishers put out flames in a corner without filling the entire room with gas. This is an important conclusion that Mr. Strange offers after his experience with the mine fire he describes in this article.**

The unusual expedient of fighting the fire with "soda fountain gas" was resorted to only after the men of the coal company had done the best they could with the other means at their command. Then a copy of *Coal Age* was produced that told how gas had extinguished an underground fire. The men at Pine Hill followed the same plan and won. The fire was reported Feb. 28, 1924, in the Red Ash bed on the fourth or 200-ft. level. In this locality the bed is geologically the middle split of the Mammoth bed. It is highly irregular in both thickness and character, varying from 1 to 6 ft. in thickness and from a hard firm coal to one of a decidedly shelly nature. In most places it has a firm, granular sandstone top with a fairly good sandstone bottom.

In the vicinity of where the fire was reported about 40 ft. of sandstone parting separates the Red Ash from the bottom split of the Mammoth bed (at this operation known as the Black Heath). Similarly about 200 ft. of sandstone separates it from the overlying bed, known as the Buck Mountain. Ordinarily, the top split of the Buck Mountain should-overlie the Red Ash, but this top split has been here displaced by a great overthrust fault. The Red Ash bed was about 6 ft. thick in the area affected by the fire and pitched at about a 40-deg. inclination.

The shaft workings of the Pine Hill Colliery were laid out for mining by a sort of panel system. Cross-tunnels on each level were driven across the measures at approximately 1,500-ft. intervals, all beds pitching at approximately 40 deg.

At the time of its discovery the only evidence of the fire was smoke and fumes coming from the section east of No. 1 tunnel on the fourth level and entering No. 1 overhead air tunnel which is a direct return to the fan. The fire therefore evidently was east of this tunnel, back in old workings and inaccessible, as this section had been robbed about 1,500 ft. east to No. 2 tunnel. The third, or 400-ft., level had been robbed above, as had the second, or 600-ft., level, up to a chain pillar under the first or 800-ft. level. This chain pillar had been left to support a watercourse to surface drainage. It had run through to the lower level at a number of places close together at the western end, and these had been filled with rock and gob material. At one place also it had run through near the open eastern end.

---

The headpiece accompanying this article shows the carbon dioxide manifold, made up of ordinary pipe and fittings, through which five cylinders of the liquid gas could be discharged simultaneously. The valves on these cylinders were prevented from freezing by a stream of hot water kept playing on each from the carbide cans on the plank above them. Note, however, the frosty condition of the pipes. The hot water was condensed from steam run into the mine through pipes ordinarily used to bring in drinking water for mules.

This watercourse, which originally was a haulageway, had been sporadically neglected and maintained for over 70 years, and since the fallen material had been walled up along the high rib instead of being removed, this passage was very narrow with low headroom in places. The run-through opening at the eastern end of the watercourse was the only apparent return from the old workings and the only outlet for gases and blackdamp from the fire section except for the No. 1 air tunnel on the fourth level. Air in the return from the old workings in the Red Ash bed at the eastern opening of the watercourse for at least ten years, to my own personal knowledge, had been low in oxygen. It contained, however, in addition to a trace of methane, a fairly high content of carbon dioxide with a resulting preponderance of nitrogen. It thus formed a typical blackdamp containing considerable moisture and having a temperature of approximately 80 deg. F. Its composition was characteristic of returns from old workings throughout the southern anthracite field.

### Immediate Inspection Attempted

As soon as this fire was reported, everyone inside the mine was notified to proceed to the shaft bottom. Only a small force was in the mine at the time, as the day shift had gone home and only timbermen, repairmen, pump men and a few gangway miners and tunnel men were at work. All of these men were held at the shaft bottom and told to wait for further instructions. An inspection party was made up of company officials and upon investigation it was found impossible to proceed further east than the No. 1 air tunnel. This was not only because of the smoke and fumes there present but also because the territory had been robbed to the tunnel and the section was closed. The roof had broken and fallen and the material had run down the pitch and blocked the section, so as to render it impassable.

No explanation as to the origin of the fire was forthcoming. It was located in old workings that had been abandoned for almost five years. No flame could be seen in the short distance through which one could peer through the broken material. At this point the gases coming off from the fire were only at about 100 deg. F., so that it was believed that the fire was small and located possibly 200 or 300 ft. to the eastward. It was found to be practically impossible to attack the fire by direct means and accordingly it was decided to seal off the territory where it obviously must be located.

No evidence of smoke or fumes was found at No. 2 haulage or air tunnel, about 1,500 ft. to the eastward. Incidentally, in making his rounds the fireboss had noted for approximately a week previous an unusual, low-hanging fog along the gangway in the bed overlying the Red Ash, which was open from the No. 2 tunnel about 200 ft. west.

### Little Evidence Found

No evidence of fire was found at the eastern end of the watercourse opening in the Red Ash bed, which was the only other accessible place in this measure, except on the fifth level, where breasts had been driven through to about the middle of the territory between tunnels Nos. 1 and 2 on the fourth level. The faces of these breasts ended in the old robbed and impassable fourth level gangway. Here a slightly greater amount of black damp than was usual was the only evidence of fire that could be detected.

Because of the worked and robbed condition of the Red Ash bed, the only practical method of sealing off the fire area at the western end was to close the tunnels leading to the bed at the different levels, where this was possible. Such sealing would be assisted by a fault that cut the bed off at the western end. Concrete walls about 18 in. thick and reinforced with old scrap iron, as well as being hitched into the top, bottom and ribs, were hastily constructed. For convenience in reference, these were numbered. The chief seals thus built between the Black Heath and the Red Ash measures were at the following places:—Fourth level, No. 1 haulage tunnel, seal No. 12; No. 1 air tunnel, seal No. 11; No. 2 haulage tunnel, seal No. 8; No. 2 air tunnel, seal No. 8-A. On the fifth, or 80-ft. level, No. 1 air tunnel, seal No. 9; No. 1 haulage tunnel, seal No. 10. On the third level, No. 1 tunnel, seal No 3.

These seals were built with a hinged iron manhole door. A 6-in. pipe with a valve was placed near the bottom to relieve any accumulations of water, while a 2-in. pipe with a valve was placed near the top for air sampling. These seals as well as the top and ribs for a foot or more adjacent to them were heavily coated with a roof repair compound to insure their being air-tight.

At this time the fire was very quiet, emitting no puffs or explosions, and no difficulty was experienced in building any of the seals except that at No. 1 air tunnel on the fourth level. Here smoke and fumes were

**Ready for Use**

This shows the supply of liquid carbon dioxide at the top of the shaft. Over a carload of these cylinders were emptied in extinguishing the fire This gas so diluted an atmosphere already deficient in oxygen that the fire was drowned quite as effectively as if water had been directly applied to it.

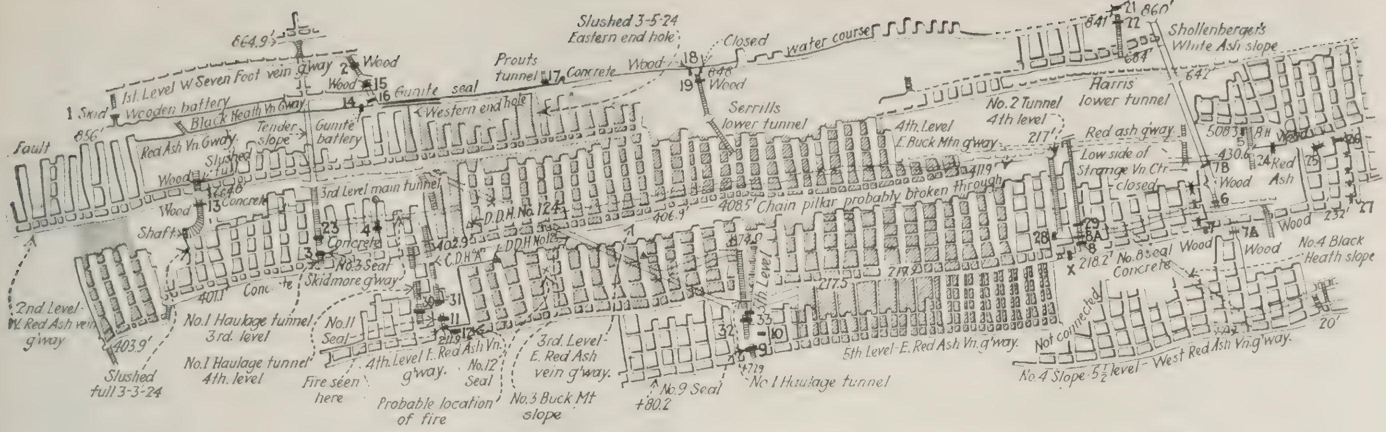


**Fig. 1—Plan of Pine Hill Coal Co. Mine Workings Showing Probable Location of the Fire**

Fire apparently originated in a region so badly caved as to be inaccessible for direct attack and the indirect method of smothering consequently had to be resortedto. Inasmuch as several heavily pitching beds are here super-imposed one above the other (see Fig. 2) this mine plan is not as easily comprehended as is one showing a single bed lying nearly level.

present in volume. At this point, also, the work of concreting was carried on under difficult conditions, as the necessary materials had to be carried up an old chute for approximately 35 ft. and then along an old monkey heading for another 25 or 30 ft. to the air tunnel. This work was done by a bucket brigade and inasmuch as the air tunnel was a return for this heading, these men were in fresh air, as the fans were left in operation on the normal exhaust system. This was not the case, however, with the man who actually poured the concrete into the seal form, as he was directly in the path of the hot gases. This man was, therefore, equipped with an oxygen helmet. The men distributed along the heading were similarly equipped so as to be ready for any emergency, but did not use their helmets. Later on they, as well as the one working at the seal, were supplied with gas masks. This equipment proved entirely satisfactory and the work proceeded more rapidly after its adoption as the masks were not so heavy and bulky as the helmet equipment.

Five men equipped with oxygen helmets were held in reserve at No. 1 haulage tunnel on the fourth level ready for any emergency. It took from 10 p.m. of the evening upon which the fire was discovered until midnight of Feb. 29 to complete concreting the seals. In the meantime, wooden batteries and concrete seals were being constructed at other locations (as shown on the accompanying map) as an extra precaution.

Jesse Hensen, foreman, with the Pennsylvania Bureau of Mines, arrived early on the morning of Feb. 29 and gave extremely valuable advice and assistance in the handling of the situation.

### Boiler Ashes Slushed In

It was found impracticable to build a secure seal across the No. 1 tunnel on the second level, as the inside end of this passage leading to the Black Heath bed under the Red Ash measure was inaccessible. Accordingly a 6-in. wrought iron pipe line was run down the shaft to this level and boiler ashes from an old bank near the top of the shaft were slushed in until it was completely filled. In order to be sure that this passage would be entirely blocked as well as to allow for settling, an elbow was placed at the discharge end of the pipe and an extension run up into a roof fall. By this means, the discharge of the pipe was about 4 ft. above the roof of the tunnel. In a similar manner, breast No. 8 from the fourth level in the Red Ash was slushed full from the shaft to the third level gangway.

At the watercourse on the 800-ft. level, a 6-in. pipe was laid into the outside of the eastern hole in the same pillar and slush run in to seal this opening. At the western end, where this pillar had run through, and the space had filled up with loose rock, it was not practicable to seal the low side with slush, and simultaneously keep the watercourse open (as was desired). This opening was, therefore, sealed in the following manner:— West of the hole, where the top and ribs were fairly solid, these surfaces were coated with gunite. Small sets of timber were then placed inside of the old gangway sets which were somewhat decayed. The small sets were then boarded on the inside with planks, to which expanded metal was nailed and the covered passageway thus constructed was then coated on the inside with gunite. This passageway was carried past the broken ground and again sealed to the top, ribs and bottom. The bottom was here covered with about 6 in. of "yellow boy" or sludge that was present in the watercourse.

Because this work had to be done from the western end, in which direction the return air moved, the cement projecting machine operator was equipped with an oxygen helmet. At this point the danger was ever present that carbon monoxide might be encountered at any moment. As soon as all seals in the Red Ash bed were completed work was resumed in the balance of the colliery, only four working days having been lost.

### Analyzed Air Samples

On March 4, samples of the air were taken at the various seals and analyzed. The results of these analyses are shown in Table I. On March 20, it was noted that seal No. 11, in the No. 1 overhead tunnel, was becoming extremely hot, some portions of the wood form left on the concrete being charred. Upon looking through the air-sampling pipe the fire could be seen, blazing furiously and emitting a decided roar. This seal was accordingly reinforced with an extra 2 ft. thickness of concrete as an added precaution.

Obviously the fire was gaining headway. It was believed that either it had not had sufficient time to consume the oxygen, that had been sealed in with it, or that the seals were not tight at the eastern end of the fire territory. Analysis of air samples showed that the fire was getting oxygen, evidently from above the No. 2 tunnel on the fourth level, as well as from the

fifth level. A large quantity of fresh air had been sealed in in the fifth level, as the workings at this point were live. Naturally this would have to be consumed by the fire before it would smother itself but it was known that the interval between the eastern end of the fourth level and the surface was not tightly closed. All levels above the fourth had been robbed and were inaccessible to sealing.

It would, of course, have been possible to put down boreholes in a direct line with the pitch from the watercourse to the fourth level and slush in a silt barrier. The surface conditions, here encountered, however, would mean starting the drill through 40 to 60 ft. of a mine rock and slate refuse bank. This method also would have entailed running the slush into a robbed territory with no possibility of controlling its course, which would have resulted in an utter uncertainty of making a tight seal. Furthermore, it would have taken weeks or possibly months to put down the holes and complete the slushing. In the meantime, the fire would be getting beyond control. It was necessary, therefore, that something be done and done quickly.

### Black Heath Passages Sealed Off

It was thought by Mr. Brennan, state mine inspector, that possibly the parting between the Red Ash and the underlying Black Heath measure had broken through and that the fire was getting air through these crevices. Accordingly passages in the Black Heath bed were sealed off in the same manner as those in the Red Ash. In order to do this, it was necessary to seal off the water course entirely. Even in the case of the Black Heath bed, however, it was impracticable to make a tight seal at the eastern end of the territory.

About this time I recalled having once read an article describing how liquid carbon dioxide had been used in combating a fire in the Bitner mine of the H. C. Frick Coke Co. The copy of the magazine containing this article was found and studied and it was accordingly decided to try the use of this gas. The following conditions were assumed to exist in this particular case:— The western end of the fire territory, according to available maps, inspections, and the result of air tests, as well as general observation, was considered to be practically air-tight, but the eastern end could not be sealed effectively. If then carbonic acid gas could be discharged directly into the fire in sufficient volume, it would dilute the oxygen and, together with the nitrogen present in the mine air, form a body or cloud of inert gas or blackdamp. This would blanket the western end of the territory and hold back or prevent fresh air from reaching the fire area.

Furthermore, by introducing carbonic acid gas and diluting the oxygen content of the mine air to 8 or 9 per cent, conditions that would extinguish the fire would be hastened, whereas waiting for the fire itself to create such conditions would entail the liability of its spreading over a great area and attaining large magnitude before the oxygen would be depleted to such a point that it would not support the combustion of incandescent coal.

I was also much impressed by a statement made by G. S. Newth in his textbook on inorganic chemistry, to the effect that "the power of carbon dioxide to extinguish flame is so great that a taper will not burn in air in which this gas is present to the extent of 2½ per cent, and in which the oxygen is reduced to 18½ per cent."

### Obtains Supply of Carbon Dioxide

From a local bottling works I ascertained that it obtained its supply of carbon dioxide from a plant in Newark, N. J. I accordingly got in touch with the manager of this concern, who immediately sent out four 5-ton trucks loaded with 320 cylinders of gas, each containing about 50 lb. or 450 cu.ft. at average atmospheric temperature and pressure. The four truck loads arrived the next day, March 21, and on Sunday, March 23, a carload containing 250 cylinders arrived.

In the meantime, the seals leading to the Black Heath bed were being completed. Introduction of the inert gas was not begun until Wednesday afternoon, March 26, when the last seal had been completed and all were carefully inspected. A water gage, such as is used on mine fans and a recording pressure instrument, were placed on the No. 3 seal at the third level in the Red Ash bed. (The air sample and water release pipe in the Red Ash seals had been lengthened and run through the Black Heath seals). The gage showed a varying pressure behind the seal of from 0.1 to 0.25 in., of water, with rapid fluctuations at intervals.

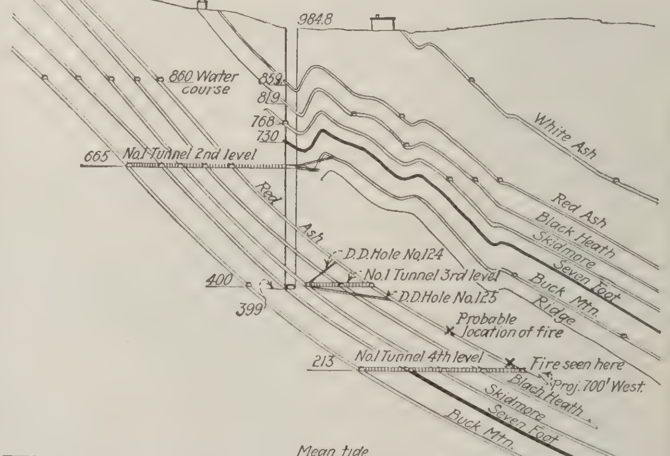

**Fig. 2—Cross-Section of the Measures Worked**

As may be here seen, the measures have been dislocated by a fault. The coal beds appearing on the right are continuations of those on the left of this figure. They have, however, been lifted and pushed sidewise, relatively, by the thrust of the faulting movement. More or less caving between beds apparently allowed the fire in the Red Ash to draw air from the Black Heath. Seals, accordingly, had to be constructed in both these measures.

**Sending Cylinders Into the Mine**

Sacks of cement are also shown ready to be lowered. This fire was successfully fought with two materials—cement, which, in the form of concrete and gunite closed the fire area practically air tight, and carbon dioxide which then extinguished the fire.

Manifolds, to each of which 5 cylinders of gas could be attached, were employed. These were fitted with valves, pressure gages, etc. One was attached to the No. 11 seal air sample pipe, and the other to the corresponding pipe in seal No. 12. Instead of using blow torches to prevent the discharge valves from freezing, steam was run into the water pipes leading to the barn on the fourth level at a point opposite No. 1 tunnel and which normally conveyed drinking water to the mules. This steam left these pipes as hot water near the place where the cylinders were set up in the Buck Mountain gangway, about 200 ft. from the seals. Above each cylinder was placed an old 10-lb. carbide can. This was kept full of hot water, which was directed in a small stream from a nail hole punched in the bottom of the can and played onto the valve of the cylinder. This prevented the valve from freezing.

### EFFECTS OF GAS SOON NOTICED

Carbide dioxide gas was turned into the seals at 2:40 p.m. of Wednesday, March 26. At 3:20 the recording water gage at seal No. 3 on the third level showed an abrupt drop from 0.1 in. to below zero, thus indicating a vacuum. This negative pressure could not be registered, however, as the water gage was constructed to record positive pressures only. It was evident, however, that the inert gas introduced behind the seals was cooling off the fire quite rapidly. By 7 p.m., Wednesday, 194 cylinders had been emptied into the fire area and by 6 a.m. Thursday morning, this number had been increased to 436. By 4 p.m. of Thursday, 558 cylinders had been discharged and only 12 full ones remained. These were poured in, one at a time, taking eight hours for the discharge of each (some of the cylinders had been accidentally emptied through leaks in the safety cap and from other causes).

**Table II—Analysis of Air Samples Taken April 1, 1924**

| | Seal | | | Composition of Air in Per Cent | | | |
|---|---|---|---|---|---|---|---|
| Passage Sealed | Level | Location | Number | Oxygen $O_2$ | Carbon Dioxide $CO_2$ | Carbon Monoxide CO | Marsh Gas $CH_4$ |
| Water Course........ | First | Western hole | .. | 4.6 | 5.61 | none | 0.82 |

| No. 1 Haulage Tunnel | Fifth | ............ | 9 | 19.4 | 0.17 | none | none |

An air-tight vestibule was constructed leading into the Black Heath seal at No. 1 (haulage) tunnel on the fourth level, and on March 29, an oxygen helmet crew passed through this seal and on to seal No. 11 in the air tunnel where the fire had been seen burning intensely on March 20. The air sample pipe was here disconnected and upon looking through it, everything appeared dark behind the seal. A thermometer was introduced through this pipe and the temperature inside the seal was registered as 182 deg. F.

### AIR SAMPLES AGAIN COLLECTED

On April 1, air samples were collected as before, their analyses being shown in Table II. On April 16, the temperature was 105 deg. F. at the No. 11 seal in the No. 1 air tunnel on the fourth level. Analyses of air samples taken on April 16 are set forth in Table III.

During the last week of April a long-distance, recording thermometer of the mercury tube type was placed in seal No. 11, and the cable carried out in No. 1 tunnel through the Black Heath seal. This instrument was so placed that temperature readings could be taken with greater convenience and safety than was before possible. The conditions surrounding No. 11 seal had become extremely dangerous, as the timbers had started to break and the ribs and top were spalling off because of the intense heat to which they had been subjected. The use of oxygen helmets, necessary when taking the temperatures at this point, was inconvenient as well as dangerous.

**Table III—Analysis of Air Samples Taken April 16, 1924**

During March air samples were taken at the various seals approximately every day. In April they were taken every three or four days, while in May, about once a week. Only a few representative analyses are here given, as it is not desired to burden the reader with unnecessary details. The nitrogen content of the air also has been omitted.

### CONSIDERED FIRE EXTINGUISHED

The air sample of April 18, taken in seal No. 11, where the fire was first discovered, was the last one to be secured at any point in the mine showing the presence of carbon monoxide. The samples taken on May 10 are set forth in Table IV. As the result of these analyses and those of other samples taken later, from time to time, showing a gradually cooling temperature, the fire was considered to be extinguished.

**Quenching the Fire**

This shows one of the seals through which carbon dioxide is being poured. When this gas leaves its containing cylinder it is at a temperature of approximately 40 deg. below zero, Fahrenheit. It thus has a decided cooling influence upon the atmosphere into which it is poured. In fighting this fire this refrigerating action was manifested by a pronounced drop in pressure within the seals a few minutes after introduction of the gas was begun.

During May, it was decided to drive two Diamond drill holes from the Skidmore bed gangway on the third level (which was accessible) to such points and at such angles as to bring one hole into the Red Ash bed within the fire zone under the old chain pillar below the third level a little east of No. 1 air tunnel on the fourth level. The other should have holed through into the Red Ash in about the same plane as the first but above the old chain pillar. Such holes would furnish accurate indications of conditions existing in the fire area both as to the composition of the air and the existing temperatures in these various localities.

The first hole drilled, No. 124, was above the chain pillar and after much difficulty in getting through the robbed Black Heath measure, it entered the Red Ash on May 26. The analysis of air taken from this hole showed oxygen 9.7 per cent, carbon dioxide 5.14; carbon monoxide none; marsh gas ($CH_4$) 1.83 per cent. The temperature was 120 deg. F.

Hole No. 125 intended to reach the Red Ash bed under the same pillar, met with many mishaps and finally the diamond bit was lost when it was estimated that the hole had just reached the bottom slate of the Red Ash measure. Analysis of the air taken from this hole showed oxygen 8 per cent; carbon dioxide 5.23; carbon monoxide none; marsh gas 1.49 per cent. The temperature was 88 deg. F.

### Tested Air and Noted Temperatures

As an extra precaution, a diamond drill hole, No. 126, was put down from the 7-ft. bed in the fourth level through the robbed Skidmore and Black Heath measures reaching the Red Ash at the face of breast No. 10, about 500 ft. each of where the fire had been seen at No. 1 tunnel. The air sample taken from this hole on June 20 showed oxygen 1.3 per cent; carbon dioxide 7.76; carbon monoxide none; marsh gas 2.38 per cent. The temperature at this point was 104 deg. F. Electric thermocouple, long-distance, recording thermometers were placed in these drill holes and the temperatures noted daily.

By October the temperature in seal No. 11 had fallen to 78 deg. F., and that in the drill hole above the chain pillar in the fire zone to 108 deg. The temperature in the last drill hole mentioned at breast No. 10 of the Red Ash measure was down to 84 deg. F. The seals isolating the fire area have never yet been opened although all danger of reignition has to all appearances long since passed away.

During June, 5 gal. of amyl acetate (banana oil) had been poured into seal No. 11. About one week later the odor of this liquid became perceptible at No. 1 tunnel seal in the fifth level. This was the only place where the odor was ever detected, indicating an extremely sluggish movement of air through the fire area, which was, of course, the condition to be desired as reignition is thus rendered improbable.

Regarding the use of carbon dioxide for extinguishing mine fires, I have found the opinion prevalent that the sealed fire territory must be completely filled with this gas before the fire will be extinguished. In other words, most people think that each 100 cu.ft. of space must be filled with 100 cu.ft. of carbon dioxide before the fire will die. They are wrong.

### General Assumption Disproved

To all practical intents and purposes pure air consists of 21 per cent oxygen and 79 per cent of nitrogen by volume. Nitrogen is exactly as inert a gas as is carbon dioxide, so that roughly four-fifths of the space sealed in with any fire is already filled with an inert gas and only one-fifth contains oxygen. This must, of course, be diluted to the point where it will not support combustion.

Furthermore, if carbon dioxide can be so introduced that it will fall directly onto or in close proximity to a fire, it is evident that a smaller quantity of the gas will be necessary. As an example, a popular and efficient portable hand fire extinguisher contains a liquid that frees carbon dioxide when it comes in contact with heat. This gas then smothers the fire by forming an inert gaseous blanket above it. A small extinguisher will thus put out quite a large blaze in the open. It is not necessary to fill an entire room with carbon dioxide from the extinguisher before any fire in it will be quenched, provided the extinguisher can be played directly upon the blaze.

This same principle applies in extinguishing mine fires with gas. The volume of carbon dioxide needed, is, after all, small and the more directly it is applied to the fire, the smaller the requirement.

# History Records How Miners' Union Got Strangle Hold on Central Competitive Field

**By Sydney A. Hale**
Special Contributor, *Coal Age*,
New York City

THE CENTRAL COMPETITIVE FIELD offers the most logical starting point for a survey of the labor situation in the bituminous industry. For over a quarter of a century the coal districts of Illinois, Indiana, Ohio and western Pennsylvania have been the citadel of union strength. There more than anywhere else, unless it be in the Southwest or the relatively unimportant Michigan coal field, organized labor has been strongly entrenched. That attempts are now being made in parts of the Central Competitive Field to seek escape, not from collective bargaining, but from the inflexible domination of the international officers of the United Mine Workers of America is in itself convincing evidence that there is solid ground for the charge that the organization headed by John L. Lewis is facing the most critical period in its history.

The commanding position of the Central Competitive Field in union affairs is not the outcome of whim or chance, but the result of developments which stretch back to the beginnings of a national labor consciousness in the soft coal industry. The movement was cradled in Illinois back in the Civil War days. Mark Hanna was its friend fifty years ago. It was Col. W. P. Rend, also a Central Competitive Field operator, who encouraged the National Federation of Miners and Mine Laborers—one of the predecessors in interest of the United Mine Workers—to issue call after call for a joint conference of operators and miners. To his persistence and that of other operators whom he won over to his views was largely due the first joint interstate agreement, signed in Columbus, Ohio, in February, 1886.

That milestone in collective bargaining which brought producers of Illinois, Indiana, Ohio and Pennsylvania into group contractual relations with their workers in response to the call "to frame a scale of wages, agree upon uniform working conditions, adjust market and mining prices in such a way as to avoid strikes and lockouts and to give each party an increased profit from the sale of coal" did not mark the end of the dissensions which had wrecked the earlier labor organizations in the bituminous field. Neither did it usher in any era of unbroken solidarity in the ranks of the producers in those four states. It was not until January, 1898, that the now famous joint interstate conference held at Chicago drew the operators and miners of Illinois, Indiana, Ohio and western Pennsylvania into an association that was not seriously disturbed for the better part of a generation.

The Central Competitive Field, therefore, has an organized labor background of over 60 years' duration. During nearly half of that time the organization has been so close and so powerful that it has become the fashion to speak of the mines in this region as 100 per cent union. Strictly speaking, this is not wholly correct. Scattered throughout the four states are the small country banks which recognize no union in their labor relations. As a matter of fact, in some cases the intermittent operation of these mines is a co-operative or a family affair. The number of workers employed at any one mine of this class is small and their activities escape the scrutiny of both the state and the union.

Illinois mining laws, for example, apply only to operations where ten or more men are employed. By far the greater number of these mines are saved from compliance by this provision. And that number is not small. The 1923 Illinois state coal report listed 194 local mines in Fulton County alone—and only seven of this number employed ten or more men. The production, however, was inconsiderable, aggregating 259,327 tons, with the majority of the mines producing less than 1,000 tons in the year. It is not surprising, therefore, that the union exhibits a fine disdain for the labor status of these pits and passes by their non-unionism as a thing of no concern.

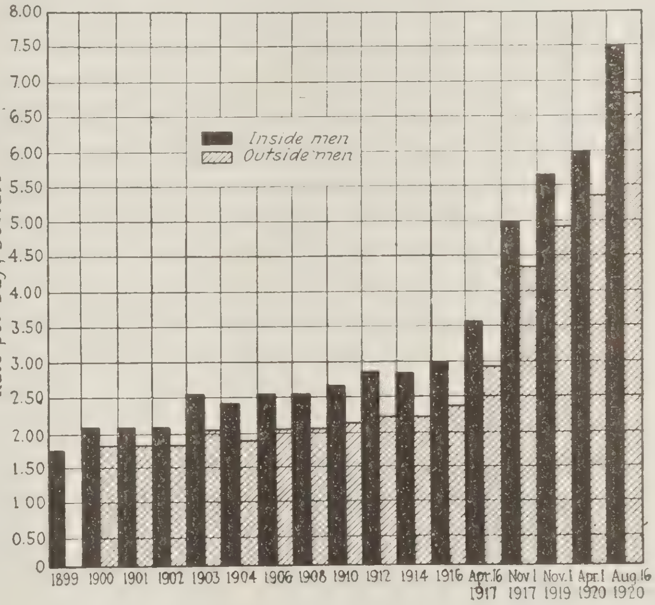

**Fig. 3—Increases in Day Wage Rates Under Union Domination**

This chart, based upon figures furnished by the Illinois Coal Operators' Association, shows the upward movement in base rates to inside and outside day labor since the organization, for collective bargaining, of the Central Competitive Field.

The quarter of a century of close relationship following the signing of the joint interstate agreement of 1898 has not, as is well known, been free from strikes. There have been several suspensions of varying length, intensity and territorial sweep. But even in the most prolonged struggles, as in Ohio in 1914-15, there was no real attempt upon the part of the oper-

Second of a series of articles describing the changes in the labor status of the different bituminous coal producing districts of the United States in recent years. The first appeared in *Coal Age*, Sept. 24, 1925. Another article will be in an early issue.

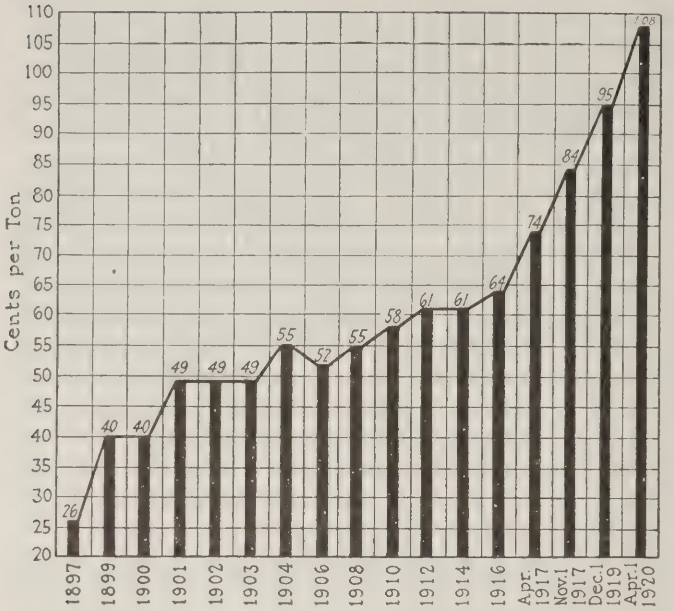

Fig. 4—The Steady March of Tonnage Rates in Union Territory

The rates shown are those paid for pick-mining in the Danville, Illinois, district. The Danville rate, which is the same as that paid in Indiana, is the base rate for the greater part of the Central Competitive Field. Rates, both pick and machine mining, in other parts of the four-state territory are adjusted differentially to the Danville base.

ators to challenge the control of the United Mine Workers of America over their destiny. Such efforts, it appeared, had faded out of the picture years before with the collapse of the resistance of Pana and Virden operators to the 1898 agreement. Joseph Leiter's spectacular fight against the union a few years later was the leadership of a forlorn hope. William J. Lester's experiment which culminated in the Herrin massacre was the venture of a man not identified with any other operator or operating group in Illinois.

It is only in the present year that growing resentment over the unqualified refusal of the international officers to recognize post-war economic readjustments and to meet the operators to discuss downward revisions in wage rates in the same spirit in which the producers met with them to approve upward revisions during the war years has flared into open rebellion. Up to this year it has been a question of making the best bargain possible with the union. There was no suggestion that, if a satisfactory bargain could not be made with the union, the operators would dispense with the union. Even the abortive attacks made by the producers of Ohio and western Pennsylvania in 1922 were attacks upon the Central Competitive Field system of making contracts—not attacks upon the principle of making contracts between the operators and the United Mine Workers of America. If there have been schisms in the quarter of a century, the schisms have been in the ranks of the employers, and the union leaders have been astute enough to use internal market jealousies to further their own cause.

During the long period in which the supremacy of the United Mine Workers of America was fully acknowledged by the operators, the labor factor in production cost has been subjected to a steady upward pressure—continuous except for the interval covered by the two-year contract ended March 31, 1906. That was the only time since the United Mine Workers became the dominant force in the Central Competitive Field that there was any reduction in wage rates conceded by the

## Table II—Central Competitive Field Production in Relation to Total Bituminous Output

(In net tons)

| Year | Illinois | Indiana | Ohio | Western Pennsylvania* | Total in Central Field | Total Bituminous Tonnage—United States | Central Competitive Field—Per Cent of Total Output—Year | Five-Year Average |
|---|---|---|---|---|---|---|---|---|
| 1898 | 18,599,000 | 4,921,000 | 14,517,000 | 15,349,000 | 53,386,000 | 166,594,000 | 32.0 | |
| 1899 | 24,439,000 | 6,007,000 | 16,500,000 | 17,157,000 | 64,103,000 | 193,323,000 | 33.2 | 32.5 |
| 1900 | 25,768,000 | 6,484,000 | 18,988,000 | 17,421,000 | 68,661,000 | 212,316,000 | 32.3 | |
| 1901 | 27,332,000 | 6,918,000 | 20,944,000 | 9,967,000 | 65,161,000 | 225,828,000 | 28.9 | |
| 1902 | 32,939,000 | 9,446,000 | 23,520,000 | 24,267,000 | 90,172,000 | 260,217,000 | 34.7 | |
| 1903 | 36,957,000 | 10,795,000 | 24,838,000 | 25,593,000 | 98,183,000 | 282,749,000 | 34.7 | 33.2 |
| 1904 | 36,475,000 | 10,842,000 | 24,406,000 | 24,556,000 | 96,273,000 | 278,660,000 | 34.5 | |
| 1905 | 38,434,000 | 11,895,000 | 25,553,000 | 28,378,000 | 104,260,000 | 315,063,000 | 33.1 | |
| 1906 | 41,480,000 | 12,093,000 | 27,732,000 | 34,098,000 | 115,403,000 | 342,875,000 | 33.7 | |
| 1907 | 51,317,000 | 13,986,000 | 32,142,000 | 38,471,000 | 135,916,000 | 394,759,000 | 34.4 | |
| 1908 | 47,660,000 | 12,315,000 | 26,271,000 | 30,871,000 | 117,117,000 | 332,574,000 | 35.2 | 34.1 |
| 1909 | 50,905,000 | 14,834,000 | 27,940,000 | 33,960,000 | 127,639,000 | 379,744,000 | 33.6 | |
| 1910 | 45,900,000 | 18,390,000 | 34,210,000 | 40,988,000 | 139,488,000 | 417,111,000 | 33.4 | |
| 1911 | 53,679,000 | 14,201,000 | 30,760,000 | 39,117,000 | 137,757,000 | 405,907,000 | 33.9 | |
| 1912 | 59,885,000 | 15,286,000 | 34,529,000 | 41,787,000 | 151,487,000 | 450,105,000 | 33.7 | |
| 1913 | 61,619,000 | 17,166,000 | 36,201,000 | 46,267,000 | 161,253,000 | 478,435,000 | 33.7 | 32.8 |
| 1914 | 57,589,000 | 16,641,000 | 18,843,000 | 39,098,000 | 132,171,000 | 422,704,000 | 31.3 | |
| 1915 | 58,830,000 | 17,006,000 | 22,435,000 | 40,974,000 | 139,245,000 | 442,624,000 | 31.5 | |
| 1916 | 66,195,000 | 20,094,000 | 34,728,000 | 43,188,000 | 164,205,000 | 502,520,000 | 32.7 | |
| 1917 | 86,199,000 | 26,539,000 | 40,749,000 | 47,816,000 | 201,303,000 | 551,791,000 | 36.5 | |
| 1918 | 89,291,000 | 30,679,000 | 45,813,000 | 50,558,000 | 216,341,000 | 579,386,000 | 37.3 | 35.7 |
| 1919 | 60,863,000 | 20,912,000 | 35,877,000 | 42,350,000 | 160,002,000 | 465,860,000 | 34.3 | |
| 1920 | 88,631,000 | 29,091,000 | 45,276,000 | 49,824,000 | 212,822,000 | 563,734,000 | 37.8 | |
| 1921 | 69,603,000 | 20,320,000 | 31,943,000 | 34,090,000 | 155,956,000 | 415,952,000 | 37.5 | |

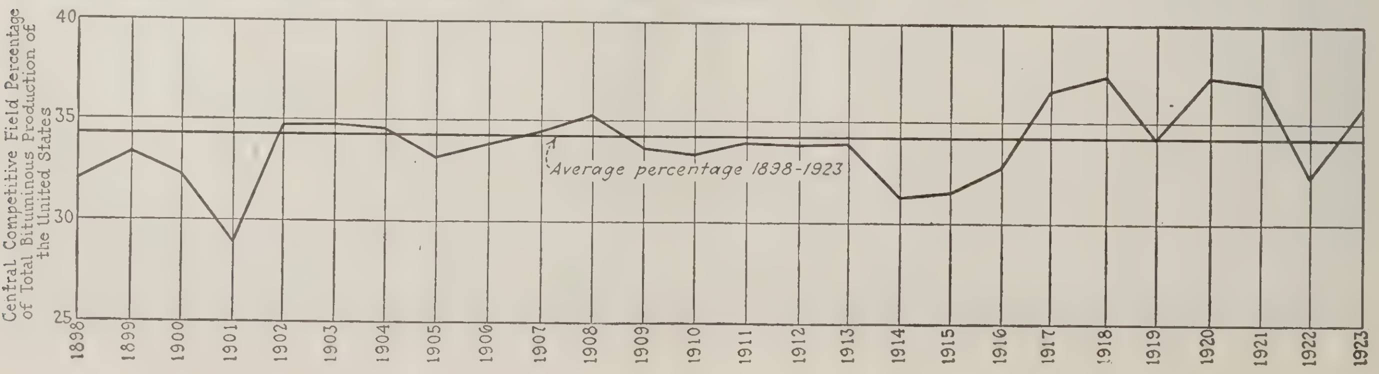
| 1923 | 79,310,000 | 26,229,000 | 40,546,000 | 56,618,000 | 202,703,000 | 564,157,000 | 35.9 | |

* Covers Allegheny, Armstrong, Beaver, Butler, Greene, Lawrence, Mercer and Washington Counties.



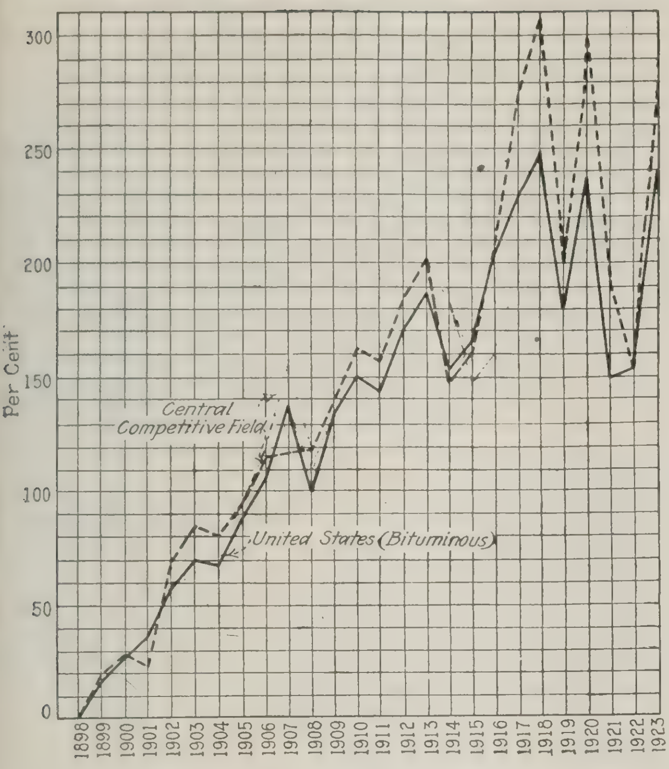


**Fig. 5—Has the Central Competitive Field Kept Step?**

The increase in production, on a percentage basis, since 1898 shows little variation when the growth of the Central Competitive Field is compared with the growth of the United States as a whole. As a matter of fact, the increase in production, taking 1898 output as 100 per cent, has been somewhat greater in the Central Competitive Field than in the United States.

union. The 1906-08 contract restored the rates in effect on March 31, 1906, and the upward movement was renewed. Compared with basic day rates for inside labor in effect in Illinois mines in 1899-1900, the rates continued under the Jacksonville agreement, and still in effect, represent increases of 414 and 394 per cent. In 1899 inside day labor received $1.75@$1.90; today the rates are $7.25 and $7.50.

The base (Danville district) pick-mining rate, to which practically all of the other mining rates are differentially adjusted, has risen from 40c. a ton under the 1898-99 agreement to $1.08—an increase of 270 per cent. The thin-vein Pittsburgh rate was 42.73c. per ton in 1898: at the present time it is $1.1164. These increases are shown graphically in Figs. 3 and 4. The mining rates in the other districts making up the Central Competitive Field show like trends. Due to the imposition of flat increases on the base rates, there have been some variations in percentage increases, but the general trends have been the same.

What effect, if any, has this union control with its advancing wage rates had upon production? A comparison of the production record of the Central Competitive Field as a unit with that of all the bituminous coal producing districts of the United States is not unfavorable to this union-dominated region. Despite the inroads made by other districts, the figures incorporated in Table II show that the Central Competitive Field has maintained its relative position with an almost insignificant fluctuation. On a percentage basis, taking 1898 output as the base, the line of increase closely parallels that of the country as a whole. As a matter of fact, Fig. 5 shows that, except during the first years of the century, the percentage gains in the Central Competitive Field have been slightly greater than those registered by all the bituminous mines of the United States.

But the picture changes when the Central Competitive Field is broken up into its component state units. The fluctuations become more violent. Illinois and Indiana reveal a much more rapid, and, on the whole, consistent, growth than do Ohio and western Pennsylvania. In these variations in relative growth, pictured graphically in Fig. 6, we glimpse the situation which has caused the rising tide of dissatisfaction with the policies of the United Mine Workers of America. The picture changes, too, if a comparison is made between average daily output in the Central Competitive Field today with corresponding periods two years ago.

Inasmuch as the general level of production for the country as a whole has been below that of 1923, this in itself would not be particularly conclusive. The rub

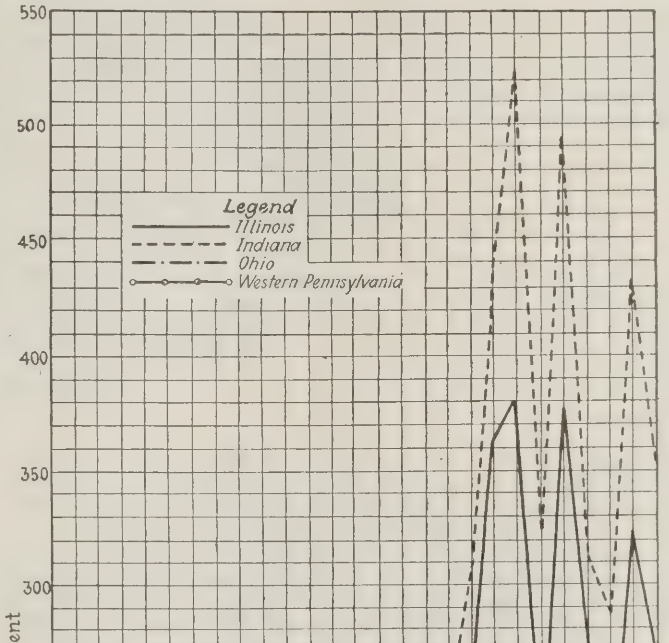

**Fig. 6—An Unevenly Distributed Increase**

The gains shown in Fig. 5 have not been evenly distributed among the component parts of the Central Competitive Field. On the percentage basis, Indiana has gone ahead faster than the other districts, and Illinois ranks second. Ohio and western Pennsylvania, more exposed to non-union competition, have lagged.

comes in the fact that the output in non-union West Virginia and eastern Kentucky has been exceeding the rate maintained by those unorganized fields in 1923, while the four states in the Central Competitive Field show a rate considerably under the 1923 indices for the corresponding weeks.

To say that labor alone is responsible for a retrograde movement in Ohio and western Pennsylvania would be stretching the truth. There are other competitive factors which enter into the situation, not only in Ohio and Pennsylvania, but also in Indiana and Illinois. There are the factors of quality, of preparation, of transportation, of merchandising acumen. In some cases freight rates are a big handicap; in others the rate structure is protecting the high-cost operating fields from more intensive competition.

The operators have not been idle: they have tried to lessen these handicaps. But labor still remains the biggest factor in mine costs and the United Mine Workers of America the stumbling block to a readjustment. So irritation, disgust, despair and, finally, desperation characterize the reactions of the producers in this great region to their labor problems.

## Georgia Has One Coal Mine

Although Georgia has only one coal mine in operation at the present time—that of the Durham Coal and Coke Co. on Lookout Mountain—there is enough coal in the state, according to a statement by Dr. S. W. McCallie, state geologist, to last the state 200 years at its present rate of consumption.

The coal deposits of Georgia, according to Dr. McCallie, are to be found in Sand, Lookout and Pigeon Mountains, and lie chiefly in the counties of Dade, Walton and Chattooga, where they form a part of the northern extension of the Coosa and Warrior fields of Alabama. The coal area of the state is approximately 170 square miles. This area is estimated to have had originally 933,000,000 tons of coal. About 12,000,000 tons have been mined, leaving still in the ground a total of 921,000,000 tons. The coal now being mined is semi-bituminous.

## Country Used 55,134,000 Lb. of Permissibles in 1924

Sales of permissible explosives in 1924 amounted to 55,134,151 lb., according to reports made by manufacturing companies to the Bureau of Mines, Department of Commerce. This total was about 9 per cent less than the total for 1923, the decrease being due to the decline in the production of coal during 1924. As compared with previous years, however, the sales in 1924 represented an increase of 21 per cent over 1922, 25 per cent over 1921, and 2 per cent over 1920, the record year prior to 1923.

The coal-producing states were the principal consumers of the permissibles sold in 1924. Pennsylvania used 50 per cent of the total quantity, West Virginia 17 per cent, Alabama 9 per cent, Illinois 7 per cent, and Kentucky 4 per cent. Each of these states used 1,000,000 or more lb. of permissibles and their aggregate consumption for the year was more than 47,000,000 lb.

Of the total quantity of permissible explosives sold during the year, coal mines used 94.6 per cent. The remainder was reported as follows: Metal and nonmetal mineral mines, 0.9 per cent; railway and other construction work, 0.5 per cent; and miscellaneous purposes, 4 per cent.

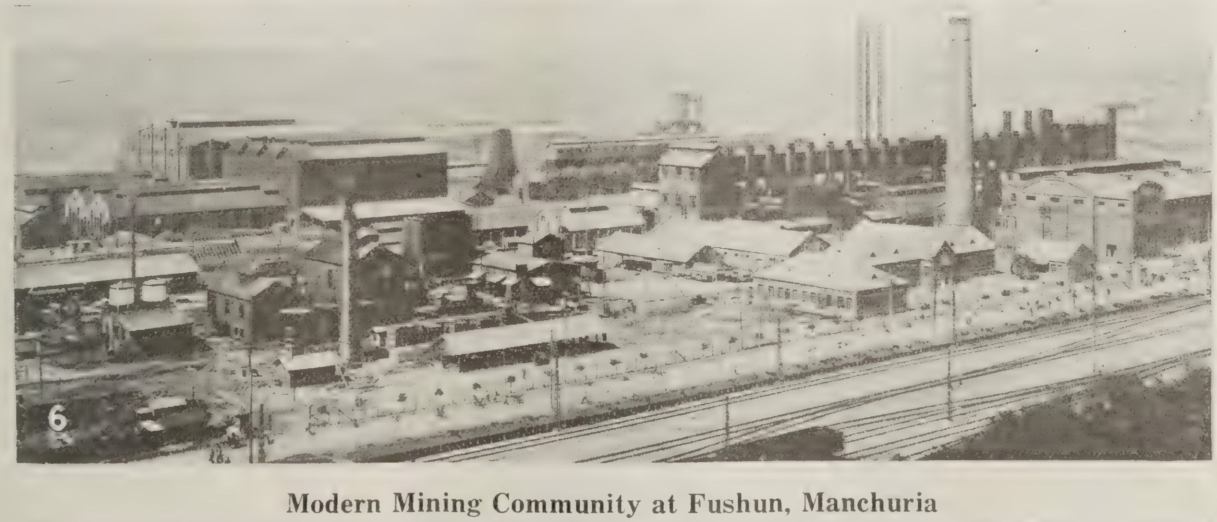
## New Detonator Is Devised

A superior detonator for high explosives has been devised by the Bureau of Mines. It has been found that silver azide retains its explosive properties regardless of the presence of moisture. This overcomes one of the objections of mercury fulminate, which loses its sensitiveness under certain conditions of use in some mines.

In connection with its efforts to find new uses for silver the Bureau investigated all of the unstable compounds of silver. While the superiority of silver azide has been demonstrated, none of the other compounds gave promising results although silver fulminate is a thoroughly efficient detonator and can be substituted for mercury in case of an emergency.

**Kentucky Mine**

Plant of the Rogers Bros. Coal Co., at Bevier, Ky. Note in the foreground the steam exhaust from a small direct-current plant, and just beyond it the transformer substation of the power company. The Rogers Bros. mine is one of a very few that has abandoned purchased power and reverted to the use of the old direct-current power plant.



### Modern Mining Community at Fushun, Manchuria

The coal mines at Fushun, Manchuria, were acquired in 1907 by the South Manchuria Ry., which has made Fushun one of the model colliery towns of the world. Up-to-date methods have been brought from the United States including the sand-flushing system. The views shown in the illustration are: 1—Auditorium for the entertainment of employees of the Fushun colliery; 2—Elementary school building; 3—Relief crew at the Fushun colliery; 4 and 5—Homes of employees and skilled workers at the Fushun mines; 6—Mund gas works connected with and forming a part of the Fushun colliery.

# News Of the Industry

## New Strike Move in West Virginia Launched with Parade and Speeches; 2 per Cent Respond, Say Operators

Fairmont, W. Va., Sept. 29.—Coal operators of northern West Virginia assert that the call to the non-union miners to strike Sept. 25 is a flat failure, and that all but three of the mines in the region were working with a full complement of miners early this week. A statement issued by the producers reports that less than 2 per cent of the total of 12,000 to 13,000 men that had been working removed their tools in compliance with the union's notice to quit.

Officials of the Consolidation Coal Co., the largest producer in the region, said that they had their usual force at work for a Monday following a pay-day, and that some of the mines had more men than usual.

Open-shop mines produced 1,444 cars of coal Saturday, the first day of the strike, or 36 cars less than the previous Saturday and 82 cars less than two weeks before, when a pay day was observed.

Non-union operations, with 200 mines working, loaded 1,483 cars of coal on Monday, or 116 less than on the previous Monday and 120 less than two weeks before.

### Union to Fight On

Van A. Bittner, chief international representative of the United Mine Workers, announced in a statement that "the response to the strike has exceeded our expectations. Several mines where we had no organization at all have been completely closed down." He added that the union would continue the fight and that he had "arranged to stay in West Virginia until the battle is over."

John L. Lewis, international president of the miners' union, prior to leaving Fairmont for Scranton, Pa., stated that the United Mine Workers would keep up the campaign "in northern West Virginia regardless of the length of time it takes to completely unionize the mines and compel the coal operators to abide by the terms of the Baltimore and New York agreements."

The miners allege that the Irona mine of J. H. Weaver & Co., near Kingwood; the Willard mine of the Fairmont & Baltimore Coal Co., the Despard mine of the Despard Fuel Co., in the Clarksburg field, and the Owings mine of the Consolidation Coal Co. were affected early this week. Between the miners' strike, a lull following pay day and the opening of the hunting season there were some defections, which probably will be made up later in the week.

When Lewis arrived in Fairmont to take part in the demonstration arranged by the union for Saturday he was greeted with a barrage of injunctions, but he told the 25,000 to 30,000 assembled miners and their families that the day would never come when the coal operators would be able to print enough injunctions to drive the miners' union out of West Virginia.

### Meeting Starts With Parade

The meeting began after a parade of 8,000 men, women and children held in connection with the issuance of the strike order. The other speakers were International Vice-President Philip Murray and Secretary - Treasurer Thomas Kennedy. Van A. Bittner was chairman.

In his remarks Mr. Lewis said that the United Mine Workers had just started to fight in northern West Virginia and asserted that few of the coal operators had made any money since the struggle began and intimated that they would not do even as well in the future.

"Led by the Pittsburgh Coal Co. and the Consolidation Coal Co., the two largest coal producing companies in the United States," said he, "many operators in western Pennsylvania, northern West Virginia and central Pennsylvania have repudiated the Jacksonville agreement and have struck down the wage structure of the industry.

### Lewis Attacks Operators

### *Murray Generalizes*

Philip Murray, international vice-president of the United Mine Workers, asserts that many independent coal companies operating under the Jacksonville agreement are making money. In a statement issued in Pittsburgh, Pa., the miners' official says there is no justification for the reduction in wages asked by the Pittsburgh Coal Co., but he failed to cite any companies that were actually making money operating under a genuine Jacksonville scale.

Murray pooh-poohed the "excuse" by the Pittsburgh Coal Co. that a wage cut would increase its business and give the employees more regular employment. "There are today 22,000 men at work in the mines of District No. 5, all of whom are enjoying the provisions of the Jacksonville agreement," he said.

Murray failed to state whether these men were working one day a week or six days.

"It is obvious that coal mining is an intermittent occupation and cannot provide steady employment to the miners," he said further.

There are many who will agree with him.

"In their mad efforts to escape their honest obligations to free American labor, the coal operators in these districts have not failed to utilize every instrument of oppression and repression. They have torn up their wage contracts; they have closed their mines for long periods in order to starve their employees into submission; they have evicted their employees from their homes; they have manned their properties with armed mine guards; searchlights, barbed wire fences, stockades and such paraphernalia of war; they have resorted to the use of unfriendly courts and have sought to bind the workers hand and foot by the issuance of court injunctions, stripping the worker of nearly every right guaranteed him under the Constitution; they have, in substance and effect, conducted a campaign of community terrorism in the isolated mining villages.

"This is a situation which should command the attention of the public and of the government. The stability of the entire bituminous industry is threatened by this reprehensible conspiracy and attack upon the very principle of collective bargaining in the coal industry. Some of the individual coal operators who have violated their agreement with the United Mine Workers are men of national prominence and are looked upon as being leaders in business, in finance and in statecraft. Their action bodes ill for the future.

"The mine workers have been taught to believe that a wage contract once entered into should be preserved with sanctity and honor and its mutual obligations should be fully liquidated. Are the mine workers of the nation now to be taught that a wage agreement is no longer binding, and that recognition of the principle of collective bargaining by the employees is merely a sham and hypocrisy? If this be true, then the nation's industry faces a future of chaos and confusion. If it be not true, then the organized mine workers have

# Operators Reiterate Their Stand; Miners Repudiate Arbitration In Hard-Coal Controversy

The Anthracite Operators' Conference, at a meeting at the Railroad Club, New York City, Sept. 24, reiterated its stand that the strike in the hard-coal region should be settled on a basis which will avoid future suspensions. The members voted to decline any settlement that does not provide for arbitration of all grievances and continuous operation of the mines pending the making of new wage agreements. "We want peace," asserted W. W. Inglis, chairman of the operators' section of the anthracite subscale committee, "not a truce."

The Conference formally adopted a resolution approving the work done by the subscale committee in its fruitless negotiations with the United Mine Workers at Atlantic City, N. J., before the strike. The meeting was attended by the full membership of the operators' subscale committee and many other hard coal producers. S. D. Warriner, president of the Lehigh Coal & Navigation Co. and chairman of the Conference, presided.

No sign of a break in the strike situation proper was visible as the suspension entered its second month. The position of both sides is unchanged. Reports from the region indicate that the financial status of the strikers is still comfortable. The only official word from the United Mine Workers was a telegram addressed to the New England Retail Coal Dealers' Association defending the union's refusal to submit the controversy to arbitration. The telegram was sent in answer to a speech of Walter Gordon Merritt, general counsel for the Anthracite Operators' Conference, in which Mr. Merritt told the New Englanders that responsibility for the tie-up rested with the union and urged arbitration.

On Sept. 28 the Scranton Chamber of Commerce, at its first fall meeting, laid plans to offer its services as an agency for ending the strike. Resolutions were adopted placing the chamber on record "in favor of the principles of mediation and arbitration." In order that the organization might be in a position to intervene if the outlook for such action appears propitious, Ralph E. Weeks, head of the International Correspondence School; Ralph A. Amerman, banker, and E. J. Lynett, newspaper owner, were appointed a committee "to co-operate in bringing about a renewal of negotiations between operators and mine workers, and it was further

"Resolved, That the committee be directed to use its efforts in bringing about the adoption of a new working agreement containing a clause providing that in the future when differences arise that cannot be adjusted in joint conference or through mediators these differences shall be submitted to impartial and competent arbitrators. In the interests of the anthracite producing communities and that portion of the public using anthracite coal we urge miners and operators to immediately resume negotiations looking forward to a new agreement."

It was intimated that there would be a further announcement of the committee's plans. Two of the members, Messrs. Weeks and Amerman, were prominent in the work of the Citizens' No-Strike Committee, which failed in its efforts to avert the strike. In view of the union's attitude toward arbitration, it is probable that the new committee will be unable to make any headway with Mr. Lewis and his associates unless the committee's platform be substantially modified.

## Latrobe Coke Plants Resume

Derry No. 1 and the Duquesne plant of the Latrobe-Connellsville Coal & Coke Co., at Bradenville, Pa., resumed operations last week.

Orders have been issued for the immediate firing of 320 ovens at the Carpentertown plant, near Mt. Pleasant, and it is said that the outlook is good for the firing of ovens at the Beatty plant of the same company within the next two weeks.

The Greensburg-Eastern Coal Co. has announced that within a week the mining of coal will be resumed. The Cambridge Coal Co. has announced an increase in wages.

## Britain's Coal Peace Short Lived; Volunteer Body Prepares for Strike

Predictions that the "settlement" of Great Britain's coal troubles arranged less than two months ago would be only temporary are coming true already. After meetings with Premier Baldwin on Sept. 23 and 24 the miners have arranged to hold a special conference on Oct. 9 to consider the situation and decided to boycott the recently appointed Coal Commission until a real settlement is reached.

The miners charge Premier Baldwin with breaking the pledge given by him to them and the trade union movement to the effect that there would be no reduction in wages or increase in working hours during the "coal truce" arranged last month, pending a final settlement of differences between the miners and owners.

They assert that the Premier is siding with the contention of the owners that they can cut wages. At Tuesday's meeting with the Premier the miners' representatives pointed out that certain mine owners were reducing wages by tampering with basic rates. After considering the matter over night, the Premier stated that as the 1924 agreement was to continue and since under that agreement the base rates were variable, they were variable also during the truce.

While there is no immediate danger of a crisis like that of a few weeks ago, the miners are in no mood for calm and dispassionate consideration of the ills of the industry.

A volunteer organization to be known as the "Organization for Maintenance of Supplies" has been set up in preparation for the general strike which many people think to be not far off. It is compiling a register of all willing to assist in maintaining vital services of the nation in the event of a crisis. The President is Lord Hardinge and among the members of the council are Admiral Jellicoe, Major Gen. Lord Scarborough, Lord Falkland, Lieut. Gen. Sir Francis Lloyd and Admiral Sir Alexander Duff. The organization is stated to be non-political and will enroll volunteers of both sexes as special constables, workers in maintaining public service and transport, drivers, messengers, cyclists and clerks.

Four categories of recruitments are proposed: First, for the protection of public services, and, if necessary, to act as special constables; second, operating the railways handling foodstuffs; third, to act as drivers of vans and lorries; fourth, messengers, in the event posts, telegraph and telephone communications are stopped.

## Alberta Strike "Settled"

"The coal strike at Drumheller, Alta., is now as good as settled," a special despatch to the *Edmonton Journal* from Drumheller says, "The miners recognize that the three Gouge mines will remain U. M. W. but they claim that the Mid-West mine has recognized the new union and hope other mines will do the same. It is expected that all the mines will be working this week."

---

a right to expect a sufficient crystallization of outraged public sentiment to compel those coal interests who made the agreement to abide by its provisions.

"The federal government has an obligation in the premises. The Jacksonville agreement was negotiated and executed with the aid and co-operation of high government officials. By the same token the industry has a right to expect that the moral influence and power of those same government officials will be utilized to preserve the integrity of the agreement and to maintain in the public weal the tranquillity of the coal industry.

"There can be no misunderstanding or beclouding of the issues involved in this question. The mine workers simply ask that those coal operators who executed the three-year wage agreement with the United Mine Workers be compelled to live up to their contracts and not act the part of industrial knaves and poltroons who seek to render to their employees less than is their just due.

"It is the purpose of the organized mine workers to exercise their strength and influence to preserve the honor of their wage agreement and to demand that under its provisions fair treatment be accorded them."

# Coal Mine Accidents Kill 195 in August; Rate Below Last Year

Accidents at coal mines in the United States in August, 1925, caused the loss of 195 lives, according to the U. S. Bureau of Mines. As the amount of coal mined was 53,765.000 tons, the fatality rate for the month was 3.63 per million tons, compared with 3.45 for the preceding month and 4.07 for August last year, a reduction of 11 per cent.

Reports for August showed 46 fatalities at anthracite mines in Pennsylvania and 149 at bituminous coal mines in all states. As production of anthracite in August was 8,882,000 tons, the per-million-ton death rate was 5.18, as compared with 5.36 for August last year and with a ten-year average rate of 5.83 for August. Bituminous mines produced 44,883,000 tons of coal in August, thus indicating a fatality rate of 3.32 per million tons as compared with 3.82 last year and 3.90 average for August during the ten years 1915-24.

In the first eight months of 1925 there were 1,461 fatalities; in the corresponding period last year 1,661. The eight months' tonnage was 381.840.000 and 363,520,000, in the two years, respectively. These figures indicate a fatality rate of 3.83 per million tons for the present year and 4.57 for the first eight months of 1924, a reduction of 16 per cent. The eight months' fatality rate for anthracite mines alone was 6.11 per million tons, based on a production of 62,489,000 tons, as compared with 5.67 and an output of 59,247,000 tons during the first eight months of 1924, an increase in the death rate of 8 per cent. For bituminous mines alone the fatality rate for January to August was 3.38, based on a production of 319,351,000 tons, as compared with a rate of 4.35 and an output of 304,273,000 tons for the corresponding months last year.

A comparison of the per-million-ton rates from various causes for the first eight months of the two years follows:

| | Jan.-Aug. 1924 | Jan.-Aug. 1925 |
|---|---|---|
| All causes | 4.569 | 3.826 |
| Falls of roof and coal | 1.895 | 1.781 |
| Haulage | 0.622 | 0.618 |
| Gas or dust explosions | 1.265 | 0.670 |
| Explosives | 0.184 | 0.194 |
| Electricity | 0.140 | 0.115 |

## Miners Vote to Postpone Convention Till 1927

A referendum on the proposal to postpone the biennial convention of the United Mine Workers until January, 1927, has received almost unanimous approval.

It was announced at headquarters of the organization, in Indianapolis, Ind., Sept. 21, that the principal business of the convention would be the formulation of a new wage scale agreement to supplant the one entered into with the operators at Jacksonville, Fla., in 1924, and which expires in 1927.

The holding of a convention in 1926, the next regular year, is deemed unnecessary by union officials.

# Neekamp to Urge Canal From Kentucky to Lakes

C. J. Neekamp, of Ashland, secretary of the Northeast Kentucky Coal Association, has been appointed a member of the Kentucky commission to advance the projected construction of a canal from eastern Kentucky coal fields to the Great Lakes. Mr. Neekamp states that the commission is to meet at Toledo within the next thirty days. The proposed canal, if constructed, would connect the eastern Kentucky coal fields to Atlantic ports by way of the Great Lakes and the St. Lawrence River.

There has been spasmodic agitation for a good many years for a canal from the Ohio River to the Great Lakes, but it has not met with any success. In recent years canals have been proposed from Toledo to the Ohio River by way of the Scioto River at Portsmouth and by way of the Miami River near Cincinnati. A good deal of engineering work has been done on the various canal projects and much data has been compiled.

It is explained by Mr. Neekamp that the eastern Kentucky-Great Lakes canal is proposed to be part of the general Ohio-Lakes canalization plan.

---

The Central Pennsylvania Coal Producers' Association informs Eugene C. Hultman, vice chairman of the New England Governors' Coal Committee, that the central Pennsylvania bituminous field can furnish to New England 1,000,000 tons of prepared sizes of low-volatile coal per month in the event of a prolonged anthracite strike.

## Coal-Mine Fatalities During August, 1925, by Causes and States

(Compiled by Bureau of Mines and Published by *Coal Age*)

| State | Underground | | | | | | | | | | | | Shaft | | | | | Surface | | | | | | | Total by States | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Falls of roof (coal, rock, etc.). | Falls of face or pillar coal. | Mine cars and locomotives. | Gas or dust explosions. | Explosives. | Suffocation from mine gases. | Electricity. | Animals. | Mining machines. | Mine fires (burned, suffocated, etc.). | Other causes. | Total. | Falling down shafts or slopes. | Objects falling down shafts or slopes. | Cage, skip or bucket. | Other causes. | Total. | Mine cars and mine locomotives. | Electricity. | Machinery. | Boiler explosions or bursting steam pipes | Railway cars and locomotives. | Other causes. | Total. | 1925 | 1924 |

## Strikers Encouraged By Public's Failure to Prepare for Long Strike

**By Paul Wooton**

Washington Correspondent of *Coal Age*

If the present strike should continue as long as did that of 1922 it would run into the dead of winter. If this should happen it would be the first time in the history of the industry that production of anthracite has been at a standstill during the cold months. The great strike of 1902 was settled on Oct. 25. The strike of 1922 ended Sept. 11. The lesser disturbances seldom have run beyond midsummer. Stoppage in winter means that no coal would be leaving the mines currently. There would be no mobile supply of anthracite to take care of emergency needs.

Knowing that production would be only 60 per cent of normal, it was relatively simple in 1922 to adopt a rule under which each customer received 60 per cent of his normal requirements and, knowing just how much he would receive and with some anthracite on which to build, the consumer easily could eke out his needs with substitutes.

A very different situation presents, however, when nothing is passing through the distribution machinery. The bituminous operators, even with the best of intentions, cannot match, on short notice, a system which the anthracite industry has been a generation in building up. They have neither the records nor the intimate familiarity with the habits of the domestic consumer in anthracite territory.

Anthracite consumers practically have wasted four precious weeks that should have been devoted to frenzied stocking of substitutes. New England is doing something in the way of planning, but little progress has been made in moving soft coal into consumers' bins.

The public in the anthracite-using area realizes that if the men go back by Nov. 1 no one will know there has been a strike. Even if the men stay out they know there would be no serious trouble until Christmas, and that seems a long way off. Observers in Washington believe that these consumers are underestimating the difficulties which they may be called upon to meet and are overconfident of their ability to meet them. They are going along blithely without any conception of the difficulties that would surround the obtaining of substitutes for the 1,000,000 tons of anthracite they burn each week in cold weather.

These consumers are in a position to exert a potent influence on the duration of the strike. Heavy buying of substitutes in September would have put a different complexion on the situation even now. Since the best month for providing this reserve largely has been frittered away, it has had the effect of encouraging the mine workers. They believe their prospects are brightening. They have the savings and other resources necessary to stay out as long as they did in 1922.

Some think the New England governors would be justified in becoming somewhat jingoistic. Were they to familiarize themselves with some of the horrible details of what has happened in the insufficiently fueled cities of Russia, they could paint pictures calculated to arouse the people to a point where they would act. While there is no possibility in this country of freezing people en masse, actual distress has to be avoided by some form of political pressure which makes for unstable settlement and has all the debilitating results which follow too much paternalism.

**William F. May**

Mr. May is supervising engineer of the New York office of the Anthracite Coal Service, the bureau established by the hard-coal operators to hold the front line trenches against the forces of fuel oil and bituminous coal. The Anthracite Coal Service is busy analyzing the fuel problems of large industrial consumers and also co-operates with the retail coal merchants in keeping the wagon steam trade sold on anthracite. Mr. May brings to his task a wide practical experience in land and marine engineering. He can meet the fuel-oil engineer on his own ground because Mr. May himself was once a fuel-oil addict before the Anthracite Coal Service plucked him from the burning.

### *Picnic Spirit Still Prevails*

Traveling in his sedan at a moderate speed through a town in the upper section of the anthracite field, where the miners are on strike, a man well acquainted in the region was handed a "pink" slip to appear in court to answer a charge of speeding. The officer who handed it to him is a striking miner serving as a police deputy.

Before the date set to answer the summons the alleged speeder decided to talk the matter over with a coal company official in charge of a mine in this little town. Just as soon as the subject was mentioned the coal company man said he would fix up the matter so that payment of a fine would not be necessary. In explaining the reason for the unprovoked charge, he said, "You see, the boys [meaning striking miners] want to have a little clambake next week and are therefore raising the necessary funds by pinching everybody going through the town in a closed car."

## Handle Coal Ten Times In 15 Miles

Cars of coal shipped from the Shiloh mine, near Belleville, Ill., to East St. Louis, Ill., but fifteen miles distant, are handled no less than ten times between the mines and the National Stock Yards, East St. Louis, K. B. Hannigan, assistant traffic manager for the Southern Ry., testified before the Illinois Commerce Commission in East St. Louis, Ill., Sept. 18. The commission is taking testimony under an application of the Perry Coal Co. for a reduction of freight rates on coal shipped within a radius of twenty miles of East St. Louis.

Hannigan stated that the rate to East St. Louis is 91c. and to St. Louis $1.16 and that a rate of 44c. between East St. Louis and St. Louis is never used.

The hearing has lasted for several days. The railroads have introduced testimony of city officials and miners from towns outside the 20-mile zone to show that any cut in the present rate would serve to break up existing groups and ruin business for many.

Those who testified for the railroads were William E. Church, Mayor of Lenzburg, Ill.; E. T. Hoffman, Mayor of Beckemeyer, Ill.; A. J. Hummert, superintendent of the Breese-Trenton mine; H. G. Koch, grain dealer, of Breese; H. C. Hall, merchant, Pocahontas, Ill., and a member of the Bond County Board of Supervisors.

There are two other cases pending before the commission. Mines outside the 20-mile zone seek to benefit from any cut in freight rates allowed the close-in mines while other coal companies beyond a zone of 60 miles from East St. Louis are asking a reduction to conform to any decreases given the first two zones.

## Kentucky Still Fights Against Raise in Differentials

J. Van Norman, attorney for the West Kentucky Coal Bureau, Louisville, appeared before the Interstate Commerce Commission, in Washington, Sept. 22, to protest against a proposal of the Alabama Coal Operators Association to increase to 50c. a ton from 25c. the present differential in the freight rate from west Kentucky over Alabama on coal moving to the Mississippi Valley. Kentucky is now at a disadvantage in handling the Mississippi Valley business and some convincing arguments were produced. The Louisville & Nashville R.R. and Illinois Central R.R. backed the Kentucky interests.

Kentucky rates have been a bone of contention of late, due to non-union production costs, etc. Just recently the famous Lake Cargo case was settled in favor of the east Kentucky operators, but Governor Pinchot, of Pennsylvania, is trying to have it reopened. A third complaint is from Virginia operators, who want the differential increased from 20c. to 50c. a ton on Kentucky coal over Virginia. A fourth case is that of the southern Illinois operators, seeking an increase from 25 to 50c. a ton in the differential on Kentucky coal moving to Chicago and the Northwest.

## Seek Solutions for Hazards Of the Underground

Discussion, with printed papers presented but not read, formed the basis for the meetings of the Mining Section of the National Safety Council at Cleveland, Sept. 29-Oct. 1. The papers had been distributed before the meeting, and, as the members had read them, all that was needed was a brief presentation, after which the members discussed them at length.

E. A. Holbrook, dean of the School of Mines and Metallurgy, Pennsylvania State College, outlined the hazard from falls of roof and coal and the means of approaching the problem, having reference to the engineering problems, those of organization and the personal equation. Mr. Holbrook believed that where more men were placed in charge of safety more economies were effected. Men too often were not instructed as to the manner in which danger might be avoided. Some even did not know how to sound the roof.

R. V. Ageton, safety engineer of the Tri-State Zinc and Lead Ore Producers Association, in his address declared that the attempt to promote safety by fear made men adventurous and anxious to prove they could cheat death by their agility and intelligence. He declared that goggles had been introduced into a mine by giving them to two men, letting the rest clamor for them.

### Employs Psychology

Had they been forced on the miners or even urged on them with precepts and bulletins they would have reacted unfavorably to them and refused to wear them, as they had in other mines. Later men from other plants were found to be "stealing" the goggles, believing that it was unsafe to work without them. To Mr. Ageton it seemed that it was never well to impose a lot of commandments on men. They resented being constantly admonished even when it was done for their good.

The experience of Utah with safety regulations of a drastic kind was recited by Daniel Harrington, consulting engineering of Salt Lake City, Utah. He declared that the cost entailed by some of the regulations was not as great as the savings they effected. Others cost but little, and on the whole only about 10 per cent of the operators and 10 per cent of the men would now return to the old ways of operating. It is fair to say that many of the new methods are not new to some of the operators, and this Mr. Harrington made clear.

K. T. Sparks, safety engineer, Central Mine Rescue Station, Wallace, Idaho, spoke on institutions for centralizing mine resue work, and William Conibear, safety engineer, Cleveland Cliffs Iron Co., Ishpeming, Mich., described the safety practices of his company.

From A. W. Dickinson, safety engineer, the Union Pacific Coal Co., Rock Springs, Wyo., the members learned of the advanced methods of ventilation, mine inspection and rescue work introduced by his company, which has a special ventilation engineer in charge of that feature of operation and has inspections made by committees at each mine.

F. C. Gregory, resident engineer of the U. S. Bureau of Mines, Duluth, Minn., questioned whether the best results could be obtained in the depressing mental atmosphere of a mine rescue training station, however equipped. He believed in dramatization. Though he didn't bring out the resemblance he used the word "maneuvers," and he evidently believed that the men and officials of a mine should be taught in the same way that is used to instruct the rank and file and the officers of an army in the business of war.

The National Safety Council had a number of other interesting meetings including an executives' session, a health session and a general session on public safety and education. There were also an A B C session for safety men and meetings of the American Society of Safety Engineers.

## *Business Best Able to Regulate Itself*

Governmental regulation of business, while perhaps necessary for a small section of the business world, can never do as well as business can do for itself, is the conclusion of the National Industrial Conference Board in a report on the "Regulation of Competitive Practices." The "real basis for hope of the preservation of the competitive system of business enterprise lies in its own power of self-regulation," the report says.

While the Federal Trade Commission has been of value in relieving the congestion of the courts and its activities are effective in many cases of unfair competition where appeal to the courts is impractical, in the view of the Conference Board, much is also being accomplished in a positive way by the growing activity of voluntary business associations in purging industry and trade of undesirable tactics. While government regulation is useful and effective in a negative way, says the board's report, the initiative of trade bodies in ridding commerce and industry of unfair practices is more significant of the "transformation now going on from cut-throat warfare for profits toward a more chivalrous competition."

## Repeal of Hoch-Smith Resolution Sought by Indiana Interests

A movement to repeal the Hock-Smith resolution adopted at the last session of Congress, which ordered the Interstate Commerce Commission to investigate the entire freight-rate structure in the United States, was launched recently at a meeting of the traffic and freight committee of the Indiana State Chamber of Commerce. Twenty-eight traffic managers of industries over the state and secretaries of Chambers of Commerce in a number of Indiana cities, attended the meeting and the committee expressed its position as opposing all general increases in freight rates as proposed by the carriers.

## Herrin Blast Kills Three; Massacre Suspects Dead

Three coal miners were killed and a fourth probably fatally burned in a gas explosion Sept. 26 in Mine 7 of the Consolidated Coal Co., near Herrin, Ill.

The bodies of the dead miners, James Galligan, a cousin of Sheriff George Galligan; William Druzinski and John Fulkins, were recovered after they had been entombed several hours. Pete Serena was rescued, though he was so severely injured that he may not recover.

The explosion resulted from accidentally touching off a gas pocket. The mine normally employs 500 men, but only a few were at work when the explosion occurred. All except three reached the surface.

Galligan was indicted for participation in the Herrin massacre of 1922, but never was tried.

Otis Clark, who also was among those involved in the 1922 massacre, was found shot to death in front of his home, near Herrin, Sept. 27.

Clark was tried twice for the mine murders and twice acquitted, despite the state's evidence that he was the man who took control of the mob after it left the mine, led Superintendent McDowell down a side road and fired the first shot that killed the non-union workers.

Clark was the first man indicted for the massacre and was arrested as he attempted to flee from the county.

Since the trial Clark had been operating a soft-drink establishment. When his body was found Sunday morning a revolver was clutched in one hand.

## Plan to Supply Coal Needs Of New England

Ways to expedite the movement of an adequate supply of bituminous coal to New England were discussed at a conference at the State House, Boston, Mass., on Sept. 26. Those participating were John Hays Hammond, chairman of the New England Governors' Coal Committee; Eugene C. Hultman, Massachusetts Emergency Fuel Administrator; C. B. Huntress, of the National Coal Association, and Harry L. Gandy, executive secretary of the association.

Mr. Gandy gave assurances of willingness and ability of bituminous operators to meet the fuel requirements of the six New England states, but stated that as a practical means of handling the situation a survey of definite needs should be made by each state. Mr. Gandy pointed out that surveys which show need only in tonnage requirements for a state do not give sufficient information. He suggested that state committees make canvasses of dealers and other large purchasers for definite information as to kind, quality and quantity of bituminous coal desired, which would furnish operators with information needed, whereas today operators are in the dark as to coal requirements and prospective purchasers do not know where to get the kind of coal they require.

# Viewpoints of Our Readers

## Is This the Remedy for Low Coal Prices?

Do you suppose anybody ever went down cellar to stoke the furnace, and said to himself: "It's a crime that coal is so cheap"? Do you suppose anybody ever drove in at a service station for gas and said as he counted out his dimes and quarters: "It is at least a misdemeanor to pay so little for gas"? I know a man who has done both.

The price of coal, like the price of oil and natural gas, has always been too low—too low as a resource, if not in the cellar. Coal has been so cheap that it has been profitable to waste it in many ways, particularly by leaving nearly one ton in the ground for every ton brought to the surface, and by burning it in inefficient boilers and furnaces, which obtain only a small fraction of the energy in the coal.

Now there are many good souls who trust in God to see that the human race will never lack the heat and power that is necessary to civilized life; and this is all very beautiful, but we ought not to overload anyone, even God, with responsibilities. As George Otis Smith once said, the motto on our coins should not be made our national policy in dealing with our natural resources. As far as we can see ahead, civilized life will always depend upon coal. The demands of industry are constantly growing; the American coal pile is larger each year; and it is only reasonable that we should ponder a little as to whether later generations will not need the coal that we are wasting.

Cheapness is always an invitation to waste—cheapness of anything. When our forests were worth little or nothing, we cut them wastefully or set a torch to them. When oil was selling for 10c. a barrel in the San Joaquin Valley, the operators let thousands of barrels run to waste down the ravines. Even at the present time we probably use twice as much gasoline and lubricating oil in our automobiles as would be necessary if these products were expensive enough to be worth saving. When natural gas was a mere nuisance in the oil fields, it was, of course, wasted outright or sold to carbon plants—which was about the same thing. Whatever is cheap is wasted; and of course coal in the ground, before any labor has been put on it, is very cheap. It would be hard to estimate its value, but, except in the case of anthracite or the higher grades of coking coal, it would not be worth more than a few cents a ton. And so it is ruthlessly wasted.

No censure is due the individual who wastes cheap coal. No man could handle it economically, at a profit. No operator could dig all the coal in his lease regardless of quality or thickness of veins, and stay in business. The settlers who burned the woods; the oil men who piped ten-cent oil off to a safe distance and burned it; the coal operators who left 40 per cent of the coal in the ground, were doing about the best they could. Their product was not worth saving carefully.

### HIGH PRICES BRING CONSERVATION

There is only one way to encourage economy in the use of coal—or any other resource—and that is to raise the price of it. Or you can turn this around and say that it is impossible to raise prices without encouraging economy. It is impossible to raise the price of anything without reducing the quantity consumed. That is why I never could see the point to government efforts to keep coal prices down, while leading government officials were preaching the gospel of conservation. Let me repeat: There is no conservation without high prices; and there can be no high prices without conservation.

If coal prices were raised considerably—let us say doubled—coal would be economized in many ways. Seams that were not worth mining before could be mined profitably. Locomotives would be built which would get perhaps 100 per cent more energy from a given quantity of coal; and furnaces would be greatly improved. Hydro-electric power, or "white coal" would be developed to take the place of some of the coal power, and windmills would be built to utilize wind power. Houses would be made warmer, so they would not require so much heat. Wood, millions of cords of it, would be burned in stoves that now burn coal; and of course the supply of wood can be renewed for a million years.

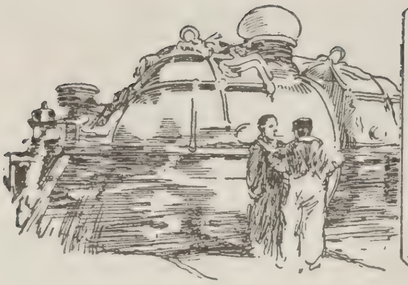
Suppose we admit the need for conservation, how can we make coal expensive enough to encourage its conservation? The most obvious means would be a change in our taxation system, in two directions: In the direction of a lower tax, or no tax at all, on coal deposits; and in the direction of a heavier tax on coal production. A tax on coal resources, or deposits, or lands, or whatever they may be called, is an encouragement to exploitation leading to low prices of coal, and, therefore, an encouragement to waste. On the other hand a tax on coal production would discourage production, encourage higher prices of coal, and, therefore, encourage conservation. There seems to be no good reason why any tax should be levied.

This idea is not radical or untried. It has long been recognized by taxation experts that the tax on standing timber should be light, while the main burden of taxation should be on the lumber cut. Pennsylvania has her tax on anthracite exploitation; several states have "severance taxes," on oil production; and at least one state has such a tax on coal production. In foreign countries, mineral deposits are usually owned by the government, but, of course, this means that the resource itself is not taxed, at any rate.

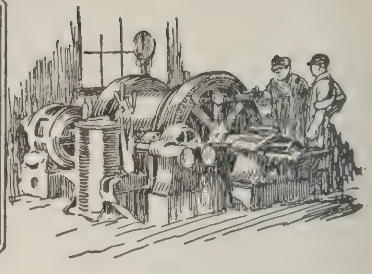
### PAY TAX OUT OF PROFITS

Such a scheme of taxation has many advantages. In the first place, it would levy the tax at the time when the tax payer was in a position to pay it easily. A coal company gets no revenues from coal deposits until they are put on the market—and that is the logical time to assess the tax. In the second place, such a scheme would fit the tax to the income more exactly than any tax on deposits ever could, since it would be paid at the time the income accrues. In the third place it would make coal mining a somewhat less speculative business, since the operator would not be subject to taxation far in advance of the receipts of a commercial income; and finally, and most important, it would have a tendency to conserve our coal deposits. Some will think this unnecessary, but the day when our coal is gone will probably be a cold day for the human race.

JOHN ISE,
Professor of Economics.
University of Kansas.



# Practical Pointers For Electrical And Mechanical Men



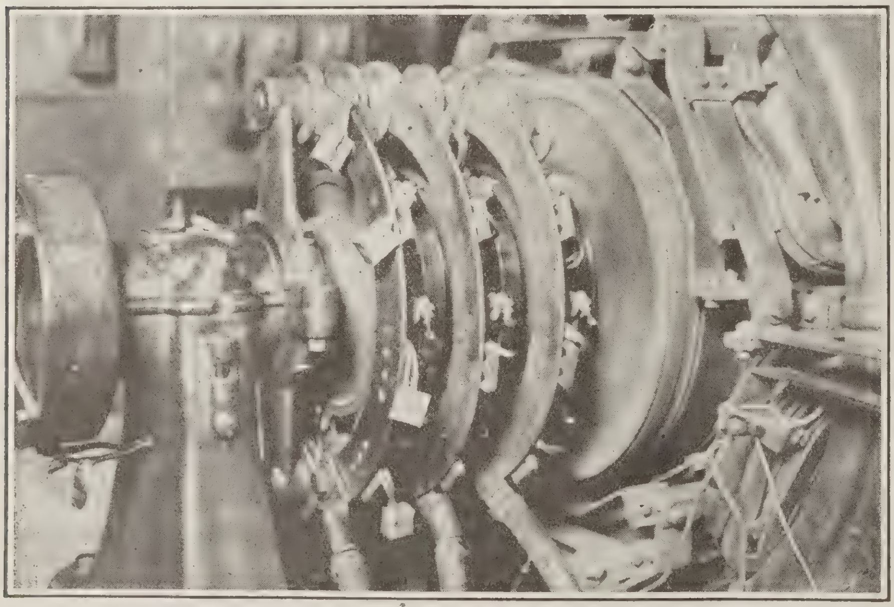
## Converter Operates Satisfactorily From Two Transformers

Doing the right thing in an emergency often prevents a shutdown. Emergencies, however, do not often arise; therefore a man in charge of equipment may not have had previous experience with a certain emergency when it appears. For that reason it pays the electrical man to gather information on the best methods for combating various out-of-the-ordinary failures of electrical equipment that might occur.

There have been many instances of unnecessary shutdowns of mines because of troubles with synchronous-converter substations. The type of converter equipment most commonly used is the six-phase, diametrically-connected machine in combination with three single-phase transformers. Some of the unnecessary shutdowns which have occurred could have been avoided had the electrician known that such a converter will operate satisfactorily with but two transformers in circuit, provided the average load is not over 57.7 per cent of full load rating of the machine.

Reuben Lee, chief electrician, of Stanaford, W. Va., describes the case of a 300-kw. converter of the Elkhorn Piney Coal Mining Co. being operated for several days with all of the brushes removed from one collector ring. This ring developed a flat spot of such degree that it could not be remedied by ordinary stoning. During the middle of the week the sparking got so bad that a shutdown of the converter and therefore of the mine seemed imperative, but as the result of a "happy thought" the brushes were raised from the damaged ring and the converter continued in operation until Sunday, when the flat ring was trued and ground to first-class condition.

Raising all of the brushes from one ring is equivalent to disconnecting one transformer entirely; therefore, if a transformer fails it can be cut out and the converter operated on the remaining two, provided the average load is not over 57.7 per cent of full-load rating. Mr. Lee stated that he found that the converter would not always start from a standstill when being operated from two transformers unless the armature was turned by hand to a certain fixed position.



**Operating with All Brushes Raised from One Ring**

During one week a ring of this six-phase converter developed a flat spot which caused severe sparking. A shut-down was avoided by removing the brushes from the ring. This was equivalent to cutting out one transformer. The affected ring was repaired the following Sunday.

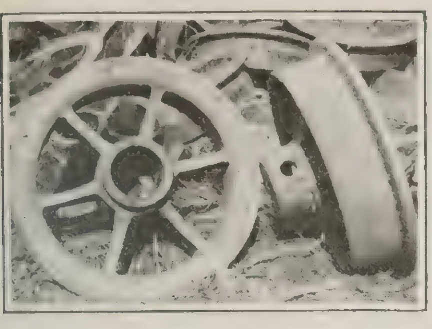
---

### Small Mine Jobs for a Little Foundry

An interesting phase of car-wheel repair work is shown in the accompanying illustration. It involves an application of foundry work which is unusual. The car wheel we use has a pallet in the hub which serves as an abutment for the cotter key in the end of the axle. This pallet is cast in when the wheel is made and occasionally breaks out, thus leaving the wheel free to run off the axle, which it promptly does.

Until we developed our method of repair we sent the wheels back to the makers, who furnished new wheels for those that had failed. The cost of freight both ways made this an expensive arrangement so we made some experiments in repairing them. After a few failures we succeeded in getting a satisfactory method.

Several ⅝-in. holes are drilled in the wheel hub opposite the location of the broken pallet. The wheel is then placed in the sand in the foundry with the open end of the hub up. The bottom of the hub is filled with molding sand up to the level of the outside face of the pallet and then a split core is inserted in the wheel. This core makes the mold for the pallet and locates it opposite the holes which were drilled in the hub, the holes making an anchor for the new pallet. A mixture of hard bronze, made from our mine shop scraps, is then poured into the space between the core and the bore of the wheel. When cold the sand is knocked out and the wheel is ready for service.



**Salvaged Wheels**

It is a simple job to repair these wheels when they break at the hubs. The cost of repair at the mine is lower than the freight charges to and from the factory.

Our foundry has eliminated another source of expense and trouble. Mine repairmen do not always watch the journal brasses in their locomotives as closely as they might, with the result that they sometimes wear out, letting the journal run on the cast box. Of course this injures the journal, frequently cutting into the axle to such an extent that a new axle has to be installed. We have succeeded in eliminating a lot of this trouble by making the journal boxes at our foundry, casting them from scrap bronze. This metal has proved to be amply strong for the purpose and does not cut the axle if the brass is allowed to wear out. Incidentally, the cost of these boxes is much less than the factory cost.

R. R. Schellenger,
Electrical Engineer.
Elkhorn Coal Corporation,
Wayland, Ky.

## Lights and Power Supplied By Battery

The big game in the coal industry today is to operate efficiently whenever the mines have an order to fill. There is, however, another side to the problem and it presents itself when the mine is shut down. The main thought then should be: operate efficiently all the time, for a mine must "operate" even though idle. Water must be pumped, props must be set too and repairs must be made to keep the equipment in working condition or better its efficiency when a coal order is to be filled.

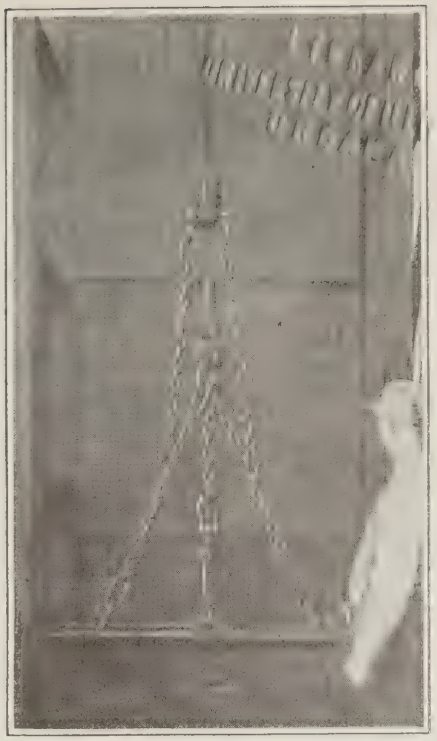
The accompanying illustration shows how the Madison Coal Corporation at Glen Carbon, Ill., operated efficiently last summer when some of its mines were idle. A storage battery taken from a mine locomotive is used to drive the machinery in the electric repair shop. By this arrangement the power plant at this mine did not have to be kept in continuous operation to generate power for the repair shops or lights used at night. Only when the storage battery became nearly discharged was the power plant put in service. The labor savings made at the power plant and the fact that the storage battery was kept in better condition by working it, helped materially in lowering the shutdown expenses.

**Storage Battery Supplies Lights and Power During Idle Period**

Because overhead charges during periods when mines are shut down eat up the small profits made on few orders every reasonable means should be employed to reduce costs when the mine is idle. Here is a storage battery from a locomotive, which permits the boiler plant to be shut down.

## Special Clamp on Cable Makes Hoisting Safer

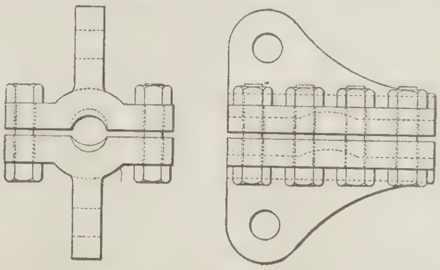
A marked characteristic of most of the equipment installed at the Pennsylvania Coal Co.'s mines is the extra safety features embodied. The accompanying illustration shows how the hoisting cable at one of the mines is attached to the shaft cage.



**Extra Clamp Holds Cable**

The upper of the two clamps will come into use should the regular attachments break.

It will be noticed that in addition to the usual attachments used for this purpose an extra clamp is fastened farther up on the cable. In the picture a loose chain extends on each side of the clamp to separate attachments on the top of the cage.



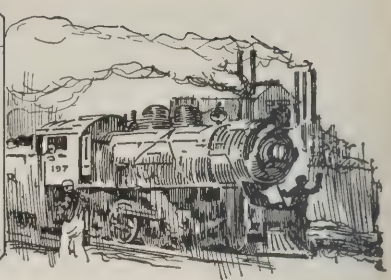
**Design of Special Clamp**

This clamp is designed to hold the cage from breaking away if an accident occurs. The cable is held more securely by means of a kink or bend put in it by the clamp.

In ordinary service the cage is suspended on the short pieces of chain secured by means of a clevis to the end of the hoisting cable. Should the clevis or attachments connected to the end of the rope break, the auxiliary clamp together with its chain come into service, thus serious accidents are made remote.

The design of the clamp is such that it grips the cable and also provides lugs to which the chains can be fastened. The accompanying sketch shows the important features of the clamps used with a 1½-in. hoisting cable.

# Production And the Market



## Reaction Continues in Bituminous Coal Market; All Sides Sit Tight on Hard Coal

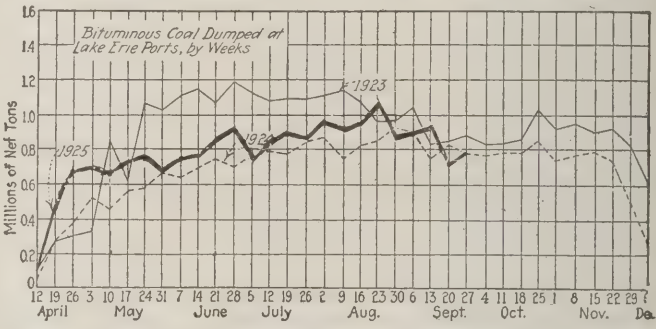
The reaction which set in a few weeks ago in the soft-coal market showed no sign of abatement last week; if anything, it was somewhat more marked. The flurry of buying that set in when the anthracite suspension began, which was expected to last at least as long as the hard-coal miners remained out, has fallen far short of expectations; as a matter of fact thus far the cessation of operations at the anthracite mines has had scarcely any appreciable effect on the bituminous coal trade.

The easing tendency has been quite general, demand having tapered off, accompanied by a shaving of prices, in practically all the principal markets. The sag continues to be most striking in the case of smokeless coal, though this is no more than natural considering the sudden and striking increase in production and prices a few weeks previous. Movement has slackened in Kentucky also, with a resultant paring down of quotations, save for western Kentucky screenings, which are much stiffer and not offered freely, producers expecting better prices.

Aside from belated shipments to the lakes, which continue in good volume, and railroad coal, orders are slow in the Middle West. Producers are having trouble in moving screenings and are catching up on lump orders. Many Illinois mines are getting shorter working time and conditions in Indiana are none too good. Production is gradually increasing in Ohio, though business reflects no striking change. Trade is perking up at the Head of the Lakes, in Kansas, Utah and Colorado, with little change in Arkansas and Oklahoma. The tendency to moderate is in evidence in New England, New York and Atlanta, while Philadelphia and Baltimore are maintaining slight gains.

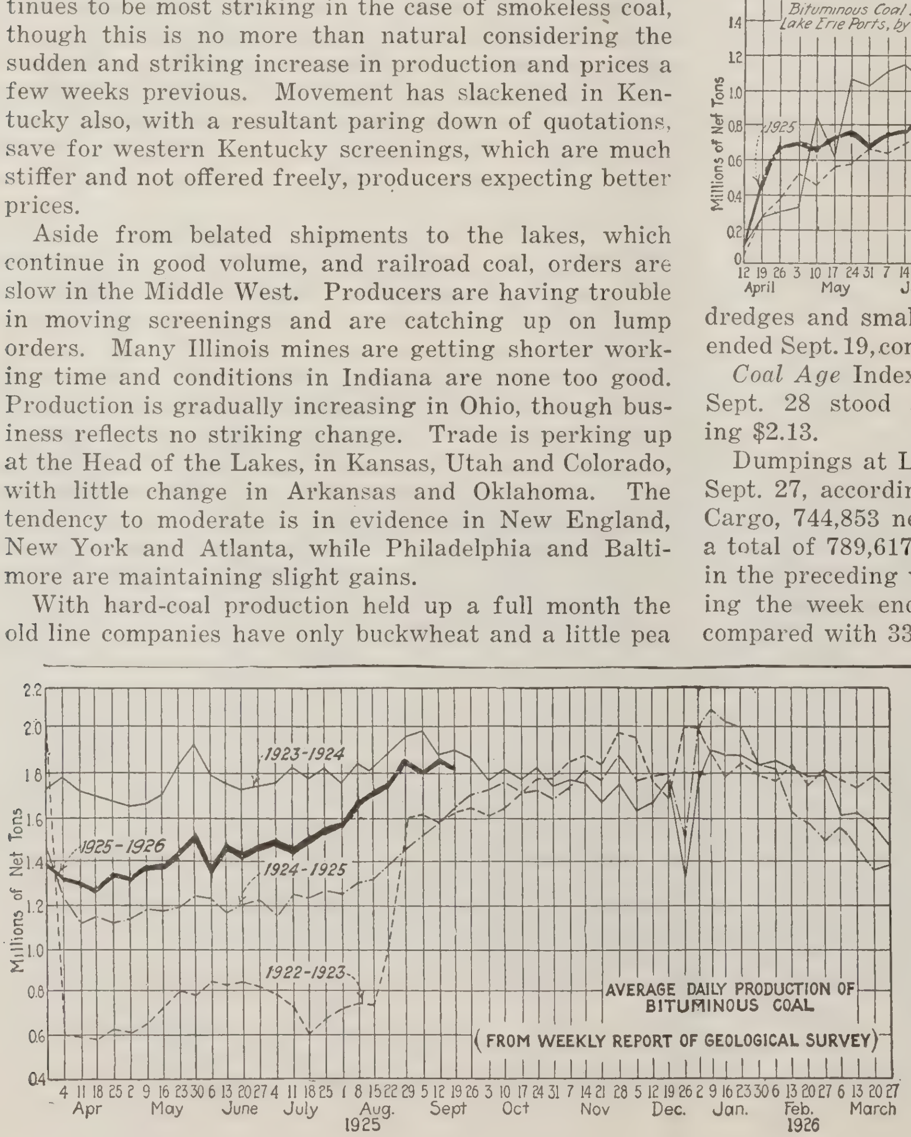
With hard-coal production held up a full month the old line companies have only buckwheat and a little pea to offer. In the wholesale trade only a few cargoes of independent coal are available, and these are being held for $15@$16 alongside for chestnut and $17@$18 for egg and stove. Most dealers are reluctant to pay such prices, however. Retailers are still well stocked with chestnut, pea and steam sizes, but stove and egg are getting scarcer.

Bituminous coal production during the week ended Sept. 19 is estimated by the Geological Survey at 10,867,000 net tons, compared with 9,983,000 tons in the holiday week, preceding, as shown by revised figures. Nine thousand tons of hard coal, presumably from dredges and small washeries, was shipped in the week ended Sept. 19, compared with 5,000 tons the week before.



*Coal Age* Index of spot prices of bituminous coal on Sept. 28 stood at 176, the corresponding price being $2.13.

Dumpings at Lake Erie ports during the week ended Sept. 27, according to the Ore & Coal Exchange, were: Cargo, 744,853 net tons; steamship fuel, 44,764 tons—a total of 789,617 net tons, compared with 754,122 tons in the preceding week. Hampton Roads dumpings during the week ended Sept. 24 totaled 427,363 net tons, compared with 332,097 tons in the previous week.



### Estimates of Production

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Orders Slow in Middle West

During the past week in the Western markets orders have come in slowly, and the surplus accumulated in the past two weeks will be cleared up soon. From all appearances lump coal will be offered freely again within the next few days; while large lump sizes are still in fair demand, the operators have plenty of the smaller prepared sizes to offer. Operators still have considerable trouble in moving screenings because large buyers hold back. Though conditions in the Illinois fields have been fairly good for some time, the situation in the Indiana fields is rather poor. A large number of mines are still closed on account of no business in sight, but what hurt most right now are the strip operations where coal can be produced at such ridiculously low prices that the operator with union wages cannot compete.

West Virginia coal has been freely offered to the Chicago trade for what it would bring. On Pocahontas, which ten days or two weeks ago brought \$5@\$5.25 on some orders, the market has dropped to such an extent that coal is freely offered at \$4@\$4.25.

The cool weather of the last few days has not materially affected demand; dealers seem to have plenty of stock on hand to cover whatever orders they get, and from all indications they are not inclined to place new orders until surplus stocks are cleaned up. Demand for domestic coal has almost ceased, and if it were not for surplus orders on file, they would have to go out and scout for business.

Williamson, Franklin and Saline counties still show the effects of the warm spell and domestic sizes move slowly. The mines are catching up on lump orders, egg is slow and nut is worse. There has been little activity in steam sizes. Mines are getting shorter time by a day and some have knocked off two days in the last week. Railroad tonnage is quiet at the shaft mines and good from strip mines. The latter are working full time and are making a price in order to move their product, and preparations are going on throughout the field for other mines to open up about Oct. 1. There has been no change in prices in this field.

In the Duquoin and Jackson County field the movement of coal is light and working time has dropped off one day a week. There is no railroad tonnage out of this field to speak of excepting a little from strip operations. The Mt. Olive district has gone back almost to summer schedule. Business is unusually light and a large number of "no bills" await colder weather. Steam is about equal to demand and contracts. Working time is about three to four days a week. The Standard field is unusually quiet. Coal is still being sold at about cost of production and all mines have "no bills" of all sizes with the exception of screenings, which seem to move freely. Railroad tonnage is light and working time is practically back to summer schedule. Prices are unchanged.

Domestic deliveries at St. Louis are light although they

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Sept. 28 | Sept. 21 | Sept. 14 | Sept. 29 |
| Index | 176 | 185 | 178 | 170 |
| Weighted average price | $2.13 | $2.24 | $2.16 | $2.06 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

---

are better than they were a week ago, despite continued warm weather. Buying has been in smaller volume this year than in the past two years. Demand still continues principally for the middle grade coals although southern Illinois is holding its own. Standard is not moving and the demand for anthracite, smokeless and coke is easing. Wagonload steam is beginning to pick up. Local wagonload is fairly good and country steam is inclined to be quiet. Country domestic shows a little improvement on the cheaper coals and a noticeable tonnage is moving from the different refineries of petroleum coke.

## Kentucky Trade Easier

Demand for coal in Kentucky appears to have eased off a trifle. The anthracite situation has had very little general effect so far, and there appears to be no fear of non-union workers in West Virginia or Kentucky going on a sympathetic strike.

Domestic sizes are in slower movement and at weaker prices. Steam demand is largely for screenings, which are firm to stronger. Mine-run is not showing much demand and no improvement in price. Lake movement continues good, but a good many more mines are in operation and offering coal.

Generally speaking, industrial consumption is good and consumption by railroads is heavy.

In eastern Kentucky block coal is a shade weaker at $2.75@$3, with some off-grade coal as low as $2.50. Other prices are steady, with lump, egg and nut $2@$2.50; mine-run, $1.50@$1.75, and screenings, $1.10@$1.40.

Western Kentucky has received a setback due to inability to move block or prepared sizes along with more coal being offered. Block is $1.85@$2, lump and egg are $1.65@$1.85; nut, $1.40@$1.60; mine-run, $1.25@$1.50; and screenings, much stiffer, at 80c.@$1 for pea and slack, and 90c.@$1.10 for 2-in. nut and slack.

Western Kentucky screenings are not being offered freely, some operators holding on track for application against contracts or expecting stronger prices.

## Trade Speeds Up in Northwest

A material speeding up has been in evidence in the coal trade at the Head of the Lakes during the last few days. An impetus was furnished in the first touch of cool weather and for the first time this fall retailers were kept on the run in meeting the rush of buying by household consumers.

Twenty-nine cargoes of coal, including two of anthracite, were unloaded at the docks last week, and fifteen cargoes, including one of anthracite, were reported en route. It was regarded as interesting that hard coal should be still trickling up to this market three weeks after the miners' strike had begun. Approximately 3,800,000 tons of bituminous and 200,000 tons of anthracite are on the docks.

The market in prepared sizes of Pocahontas remains where it was placed a week ago, at $8.50, while mine-run and screenings are unchanged at $5.25 and $4.25 respectively.

While the anthracite market is distinctly firm, no advances in quotations have been announced lately, contrary to expectations in some quarters. Growing shortage of stocks of pea and stove sizes was noted. Demand for domestic coke is seasonably quiet at $8.50 but the trade is looking forward to a run in it later as an anthracite substitute. Briquets are unchanged at $9.

Demand at Milwaukee is light for the season, according to dock men, but some retailers report betterment, owing to cooler weather. The anthracite situation seems to cause little worry among consumers, although there is a shortage here. Receipts of hard coal by cargo this year up to Sept. 24 total 84,420 tons less than during the corresponding period of 1924. Receipts of bituminous coal by cargo up to the 24th aggregate 455,205 tons more than for the same period of last year. The total amount of coal received here this year to the date named is 2,531,649 tons, against 2,160,864 tons last year during the same period.

## Southwest Notably Improved

A marked improvement in the Southwestern market last week cleaned up all "no bills." Kansas screenings are a little easier, but there is no surplus. Kansas mines are disposing of all sizes as fast as brought to the surface. Screenings, on contract, are selling in some instances at $2.35, while the car lot quotation remains at $2.50.

The situation is little changed in Oklahoma from last week. Little coal is being produced around McAlester and at Henryetta output is about as it has been the last two months. In Arkansas, production is picking up in the Greenwood field and is unchanged in the other fields, with a wide spread of prices. Semi-anthracite lump is quoted all the way from $4.25 to $6.50, depending on the field and the demand.

In Colorado there has been a substantial increase in the demand for domestic lump coal, but it is disappointing with respect to the nut coal, that being a drug on the market at the present time. However, that situation will undoubtedly be relieved as soon as colder weather sets in. As a result of increased orders for lump and steam sizes the mines are working practically at capacity. Prices are unchanged.

Utah coal operators and dealers describe business as "good." Quite cold weather has set in for this season and orders for coal are larger and more numerous than they have been in many months. All grades are selling well. The car situation on the Rio Grande Western R.R. is still causing inconvenience, but the situation is far from critical so far. Prices are unchanged, and the labor situation was never better. The trade from every angle is in better shape than it has been for a long time.

## Cincinnati Trade Trims Sails

Strike talk and the shifting around of unionists in West Virginia have had little effect upon the Cincinnati market. Production took a slight drop, but apparently as long as there is enough tonnage to go around and no concentration of buying, there will be no tilt upward.

Smokeless business has been floundering a bit. The price was too high in comparison with high volatile and especially coals from the Elkhorn and other good domestic districts and too many producers have been on a week to week basis of sale. Even brokers have had to go fishing in the market with lump and egg around $4.50 and a trifle lower to move some of their tonnage. Shipments carrying a $5 price were still going forward but from that down to $4.25 "to the trade" was the spread. Automatically stove sizings slipped to $3@$3.25, mine-run to $2.25@$2.50 and screenings to $1.75@$2.

In the high-volatile list Elkhorn and Hazard prices were trimmed a little and while most Hazard shippers were holding out for $2.75 there was a shaving here and there down to $2.50 for block. The heavy Logan County (W. Va.) shippers, who have been holding at $2.50, stabilized these offerings. Mine-run was a trifle easier with the bulk of the steam movement around $1.50 and the gas still ranging up to $1.75 according to quality. Slack, too, was a bit easier with the heaviest part of the tonnage running around $1.10 and from that up to $1.25 for preferred stuff.

River business is tapering down because of low stage.

Softness in domestic grades is appearing in the Columbus market, due to rather warm weather and the fact that many mines were opened when the anthracite strike began. Dealers as a rule bought heavily at that time and have failed to move as much as they expected, as householders refused to be stampeded by strike news. A considerable retail business was done, however, and dealers are still busy delivering orders booked several weeks ago. Retail prices are rather steady at the higher levels which have prevailed for several weeks.

Steam business showed no particular change in the past week. Buying is mostly from hand to mouth as most of the larger consumers have fair sized reserves. Railroads are taking a pretty good tonnage and the same is true of public utilities. Manufacturing plants are not showing much activity in fuel buying, however. About 225,000 tons of coal is to be supplied to various public institutions under the Ohio government. Some free coal in steam sizes has been offered on the local market, due to the curtailment of the domestic demand, but the amount is not sufficient to have much effect on general market conditions.

Some of the lake shippers find their tonnage contracted for not sufficient and are picking up the excess of domestic sizes in this market, which has helped to keep the trade in good shape.

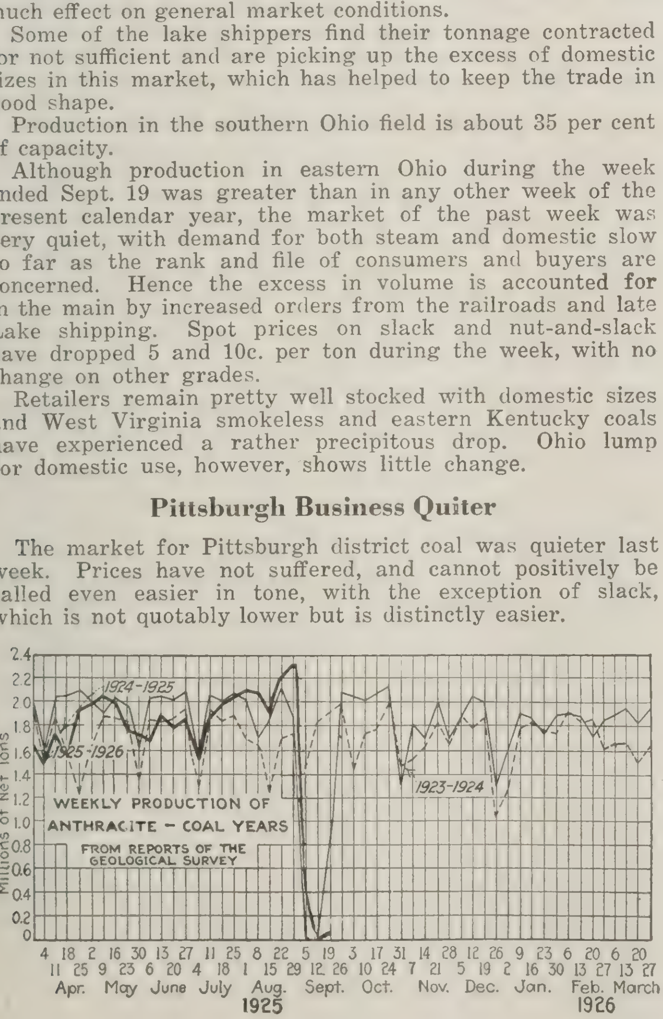
Production in the southern Ohio field is about 35 per cent of capacity.

Although production in eastern Ohio during the week ended Sept. 19 was greater than in any other week of the present calendar year, the market of the past week was very quiet, with demand for both steam and domestic slow so far as the rank and file of consumers and buyers are concerned. Hence the excess in volume is accounted for in the main by increased orders from the railroads and late Lake shipping. Spot prices on slack and nut-and-slack have dropped 5 and 10c. per ton during the week, with no change on other grades.

Retailers remain pretty well stocked with domestic sizes and West Virginia smokeless and eastern Kentucky coals have experienced a rather precipitous drop. Ohio lump for domestic use, however, shows little change.

## Pittsburgh Business Quiter

The market for Pittsburgh district coal was quieter last week. Prices have not suffered, and cannot positively be called even easier in tone, with the exception of slack, which is not quotably lower but is distinctly easier.



Industrial activity has reached as high a stage as can be expected. Steel buying and production have been in balance lately, with virtually no change in the past three or four weeks, since the recent speeding up. The labor outlook remains complicated and uncertain.

At Buffalo there has been no advance in soft coal outside of smokeless and that does not amount to much, for the demand is small and does not show much prospect of picking up right away. The supply is good and the output is equal to any sort of demand that can develop, even on a scare, for the consumers have most of their storage room occupied. Quotations remain at $1.60@$1.75 for Fairmont lump, $1.40@$1.50 for mine-run and $1.25@$1.40 for slack; $2.25@$2.50 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump, and $1.30@$1.60 for slack; $1.75@$2 for Allegheny Valley mine-run.

## Trade Rather Dull in New England

In general, the New England market is again rather dull, with buying interest developing more among retail dealers than among industrial users. Accumulations are again a characteristic of Pocahontas and New River at Hampton Roads, and in consequence prices let down further last week. Agencies again seek orders coastwise, and offers close to $5 as a flat price per gross ton f.o.b. vessel are rumored. No. 1 Navy standard has not yet declined to that extent, but practically no shipper today holds his coal for higher than $5.25. The Western market is not the sustaining influence that was expected, and some producers are eager to try their fortunes in New England all-rail when the new through rates go into effect.

Anthracite stocks here are beginning to show signs of depletion, especially in the larger cities. Already certain distributors are announcing their inability to accept orders for egg, stove and chestnut, and are restricting their sales energies to pea, buckwheat and bituminous. The gradually increased interest in anthracite substitutes will be interesting to watch as the season advances, but thus far the urgent warnings of the public authorities have not shown any appreciable result in the form of increased receipts of bituminous. There is, to be sure, a certain amount of buying by retail dealers, especially of screened coal from the central Pennsylvania districts, but the volume is not large.

On cars for shipment inland also the price level has receded; in some cases $6.75 has been shaded to $6.25, and $6.25@$6.40 for high-grade smokeless coal seems about the range. Both at Providence and at Boston there have been increased arrivals in the past week, owing to pressure at Hampton Roads, and factors apparently will be obliged once more to store coal in anticipation of a market.

A few of the Pennsylvania coals all-rail have brought better prices recently, but for the most part there has been no demand sufficient to influence quotations more than 15c.@25c., except for prepared coal.

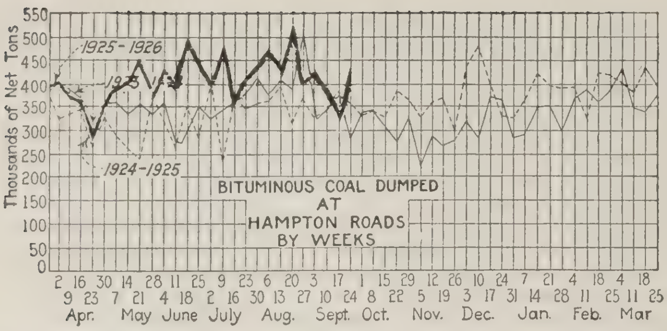
## Business Moderates at New York

New York bituminous shippers report only a moderate amount of new business, but the movement is holding up well because of shipments on orders previously placed. Deliveries on contracts also are heavy, as consumers who have arranged for their winter's requirements are anxious to get stocked up before the arrival of cold weather. Quite a few contracts running to April 1 have been closed during the past two months by consumers who failed to avail themselves of this protection during the regular contracting season. Others are contenting themselves with accumulating good-sized reserve supplies at current prices and taking a chance on the market going higher before they are in need of additional tonnage.

The price trend is not upward but rather the reverse, although no sharp slump has occurred except in West Virginia smokeless coal, which had a much greater advance than the Pennsylvania grades. The latter went up 10 or 15c. on an average, and are being fairly well maintained on the higher level, with here and there an operator willing to shade quotations slightly when necessary to keep his mines running steadily.

A little more free coal is reported at the local piers, but the surplus is not large enough to unsettle the local tidewater market.

The Philadelphia market is in good condition, inasmuch as consumer interest continues to be maintained. There have been no noticeable price increases and the market is



firm at last week's quotations. The railroads are not losing any opportunities to buy when they consider prices right.

There is increased screening of high volatiles, due to better domestic demand for sized coal, particularly for shipment westward. The increased tonnage of screenings is moved without a ripple and the buyers are still looking for more.

The pier business at tide continues to be discouraging and there is no indication that any improvement can be hoped for. Bunkering at least holds its own, with occasional small spurts.

The early part of last week saw a sudden upward trend in the Baltimore market. Stocks at tide became depleted under a rather urgent call for immediate delivery and prices moved up 10c. to 15c. in many cases for spot coal. Quotations on future deliveries remained about the same as for the past three weeks, and this confidence was quickly borne out by a rush of shipments. At present there is a surplus here and spot prices are at the average level that existed just before the flurry of two or three days. The export movement continues in some measure, three vessels having cleared the past week with a total of 8,168 tons cargo.

Buying of domestic coal is proceeding very slowly at Birmingham. There is no worth-while spot demand as yet and hold-ups on contracts are still in order, causing considerable effort by sales agents and brokers in moving current output. Dealers who have moderate stocks are taking coal from the mines about in proportion to the volume of retail sales, which are still abnormally small. Some yards are still without any reserves worth mentioning.

The spot steam market is fairly good, sufficient business being booked to prevent any serious accumulation. Demand for good grades of washed fuel is showing the greatest strength. The medium and lower grades of mine-run and washed product are being taken fairly well. The unbroken drought is still furnishing disposition for a large tonnage to steam power plants, while the extreme heat which has prevailed for some weeks is causing peak operations at ice plants. Other industrial activities are consuming about a normal tonnage. There is little stocking by industrial plants, railroads or other utilities, most of the carriers taking the minimum weekly quotas. Improvement in the bunker trade is slight, if any.

Steam prices are without change. Present quotations on domestic sizes will remain in force in October to a great extent, though some producers will make slight advances in mine prices next month.

Production is on a basis of around 400,000 tons per week. Car supply is adequate and labor is plentiful.

## Healthy Hard-Coal Stock at New York

Retail dealers in Greater New York still have good-sized stocks of chestnut and pea coal, as well as of the steam sizes of anthracite. Their supplies of stove and egg are becoming depleted, but will not be totally exhausted at most yards for some little time to come. The filling of large orders has been discontinued, but consumers have no difficulty in obtaining all the coal they need for current use.

The tonnage available for replenishing retail stocks is limited. Storage plants of all the large producing companies are bare of everything except pea and buckwheat coal, according to local sales agents, and the amount of pea in reserve is small.

Only a few cargoes of independent anthracite in the domestic sizes remain in the hands of wholesalers. These are being held for $15 to $16 alongside in the case of chestnut, while the asking prices on stove and egg range from $17 to $18 in most cases. Wholesalers also have a comparatively small tonnage of pea, buckwheat and rice. Their quotations on pea are $6.50@$8, mine basis; buckwheat, $2.50@$3; rice, $2.25@$2.75.

Odd cars of independent domestic sizes are being offered dealers in all-rail territory on the basis of $14@$16 at the mines. This tonnage is being absorbed slowly, as most dealers are unwilling to pay the prices asked.

There is no semblance of a rush by Philadelphia consumers to get coal, but those who are coming find that they are unable to get the most wanted sizes. Dealers with connections on the P. & R. Coal & Iron Co. are filling up with storage pea. As yet there is little call for pea, but when the cold days come to stay consumers will be glad to get it. A light tonnage of coke and sized soft coal was sold during the week.

Buckwheat continues easy with the companies. Some independents able to sell this coal are asking $2.75, or about 25c. above company price. The companies have a fair stock of rice and are shipping it to regular customers. Barley is out of the market.

A cool spell last week at Baltimore brought an increased demand from householders for delivery of fuel. Dealers for the most part were able to quickly supply this demand, which has again fallen off. It looks as if most of the retailers can continue an average fall supply for three or four weeks longer from stocks on hand. Some independents are asking premiums of $1 to $1.50 over August prices, but local dealers are ordering little of this premium coal. Retail prices for September are the same as in August.

The anthracite trade at Buffalo is confined to a limited movement of the small sizes. Some of the companies have not even that. The actual demand is light, though some consumers are hard to convince that there is not some conspiracy against them to hold the coal back for higher prices. The assurance that there is enough coal to last till there is more seems to be accepted.

There is a small trade in coke, but the handlers of it seem to be anxious to spoil it by trying to get more for it than has been asked up to this time. Instead of waiting for the demand to set in they are asking all the way from 50c. to $2 advance, though some are modestly asking only $9.50 for it at the curb. The slow handling of it is the worst thing against it.

## Connellsville Coke Market Easier

Eastern buying in the Connellsville coke market has been light of late. The Jones & Laughlin Steel Corporation, noted last week as inquiring for 20,000 tons of coke a month over the fourth quarter, bought more than that and at prices lower than expected. There were operators who insisted they would not sell for October under $4 and not beyond October unless at an advance, but no reports on prices for Jones & Laughlin are over $3.75 and in some quarters it is said the average was nearer $3.50. The purchases were made with a wage clause. The sales in part represent the starting of additional ovens, despite talk of labor supply being poor and of the possibility of additional strikes. One plant, just reopened, is already offering its first drawings, which generally go as heating coke.

The spot and prompt furnace coke market probably remains quotable at $3.75@$4, but there are rumors of some coke being offered at down to $3.50.

The starting of so many Frick ovens in August aroused fears as to labor, but the Frick company lately has been reducing production slightly. The independent scale is about 30 per cent under the Frick scale and operators are strong against making any advance, as the iron industry could not stand an advance. There are chances of small operators, not counting on operating afterwards, advancing wages so as to make some money during the anthracite suspension.

## Car Loadings, Surplusages and Shortages

# Foreign Market And Export News

## Demand Quiet and Prices Weak In British Market

Dullness and idleness are the predominant features of the Welsh steam coal trade. Though inquiries have increased during the past week they are still insufficient to absorb output and keep the pits working regularly. Though stoppages are frequent, output is much in excess of demand. Prices have reached their lowest point for two years, though this does not attract business.

The Swedish State Railways are in the market for 40,000 tons of coal to be delivered this year, but it is feared that this business will all go either to Germany or to the north of England. The French Navy, which was inquiring for 45,000 tons of Welsh coal or patent fuel, is reported to have placed the order with French briquet manufacturers.

The idle loading berths at the South Wales docks average 30 to 35 a day, while the vessels in process of loading are delayed by intermittent colliery working. Thousands of trucks are held up under load because of the scarcity of business.

The Newcastle market shows some signs of improvement, which has led some operators to think that the depression has passed its worst stage. It is possible that the situation here is affected by the depression in the German coal industry, which has led importers to believe that prices have reached their lowest level and that further "bearing" tactics are useless. Though inquiries have improved, due no doubt to the approach of winter, actual business is slow in materializing.

Production by British coal mines during the week ended Sept. 12, according to a special cable to *Coal Age*, totaled 4,110,000 tons, compared with 4,255,000 tons in the preceding week.

### Coal Demand Revives Slightly In French Market

A slight revival in demand has taken place in the French coal market since the beginning of the month, judging by shipments from the North and Pas-de-Calais. Expiring contracts are being renewed in most instances.

Interest is largely centered on home fuels, on which summer prices will cease to be applicable at the end of this month. Among the French collieries and Belgian producers for the French market some are inclined to maintain present quotations while others favor an increase, as sized dries and anthracite descriptions are in lively demand from consumers. Semi-bituminous sized grades also are much sought. With regard to industrial fuels electric and gas works are expediting the putting in of winter supplies; but the sugar industry is acting more slowly.

The French wage agreement having expired on Sept. 15 the men seek an increase to 40 per cent in the allowance for the high cost of living, which, a few months ago was reduced to 20 per cent.

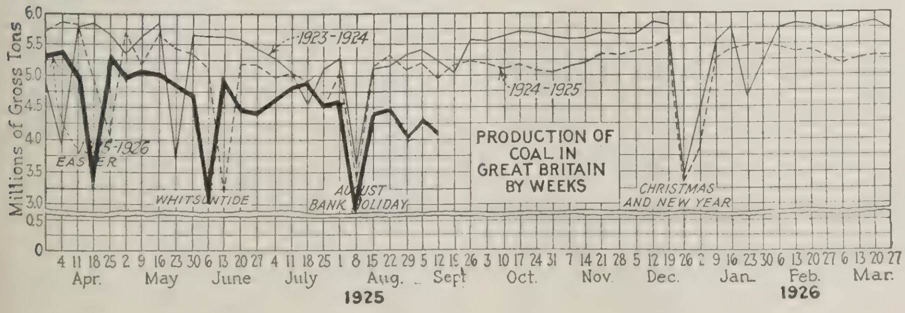
Certain Lorraine mines, those of the Sarre-and-Moselle and of Petite Roselle raised their prices 3 fr. per ton on Sept. 1.

During the first nine days of September the O.R.C.A. received from the Ruhr 65,568 tons of coke, a daily average of 7,330 tons. Indemnity coke has been advanced 0.25 fr. per ton to 145.95 fr. due to an increase in management expenses of the O.R.C.A.

### Market Develops Weakness at Hampton Roads

The market at Hampton Roads was weaker last week with supplies at the terminals increasing and demand falling off slightly. Foreign business was on the decrease, largely due to settlement of labor difficulties in the British mines.

Inquiries at tidewater were practically normal and many mines were reporting full-time operation. Some were cutting down their forces, which had been increased when the anthracite strike began. Domestic business has been retarded to some extent by unusually warm weather. Many concerns formerly using anthracite were preparing to use soft coal this year, dealers reported.



### U. S. Domestic Fuel Exports in August

# News Items From Field and Trade

## ALABAMA

The Atlanta, Birmingham & Atlantic R.R. has sold to the Woodward Iron Co. for $200,000 a branch line approximately 13 miles long which leaves the main line near Bessemer and extends to the Mulga coal mines of the Woodward company. This spur will be used in connection with the Woodward company's own railroad, which is used in transporting coal from the Mulga and Dolomite mines to the furnaces and byproduct ovens of the company at Woodward. A portion of it has been operated under a lease for some time. The railroad company has not used this branch since about 1912.

A number of the most important commercial mines in the Walker County field are now operating on much better schedules than obtained a few weeks back. The Galloway Coal Co. mines at Carbon Hill are on a six-day schedule, those of the Brookside-Pratt Co., near the same point also working full time. Other operations working five and six days per week are the Calumet mines of the Brilliant Coal Co., and the Parrish mine of the Railway Fuel Co. Schedules have been increased also at operations of the DeBardeleben Coal Co., some of its mines now operating full time; the Pratt Fuel Corporation and the stripping operations of the Manchester Coal Co. at Manchester and Saragossa and those of the I. O. Drewery Contracting Co. at Sunlight. All the larger companies still have mines on the idle list, but these will be started up as soon as market conditions warrant.

## COLORADO

Sale of the International Fuel Co. to Arthur Ponsford, Denver attorney, said to be acting for P. J. Quealy, wealthy Wyoming coal operator, for $71,297, was approved Sept. 16 by Frank McLaughlin, federal referee in bankruptcy, after a hearing in the federal building, Denver. The International Fuel Co. went to the wall with the crash of the Italian-American bank. The International owns a mine and 400 acres of coal land in Routt County.

Roy E. Mann and H. W. McLauthlin, stockholders of the National Fuel Co., filed a petition in the District Court at Denver, Sept. 16, asking the removal of H. Van Mater as receiver of the company, contending that his continued retention as receiver is highly prejudicial to the interests of the petitioners and others similarly situated. Van Mater, president of the company, was appointed receiver July 16 last, following the institution of an action in the District Court by the International Trust Co. The petitioners charge that Van Mater, while acting as president, in several transactions took advantage of his position to reap profit to himself and his friends, relatives and associates at the expense of the company.

The copper industry in Arizona is about to turn to the use of Colorado steam size coal, and will take about 150,000 tons per year.

The state coal mine inspector's report, just issued, shows an increase of 60,000 tons in output for August contrasted with the same period a year ago. The lignite fields in northern Colorado show an increase of 32,000 tons, Fremont and El Paso counties 2,000 tons, Gunnison County (anthracite district), 7,000 tons; Huerfano County, in southern Colorado, 40,000 tons; Las Animas coking coal shows a decrease of 55,000 tons and Routt County bituminous shows an increase of 25,000 tons. A total of 11,419 men worked in and about the mines compared with 12,109 in the same period a year ago.

## ILLINOIS

August earnings of the Chicago & Eastern Illinois R.R., which draws much of its traffic from union soft-coal fields, will show an increase over August of last year, T. C. Powell, the president of the road announces. "Although the movement of coal in our territory," added Mr. Powell, "is 50 per cent below normal, the movement of freight is showing a steady increase. I am trying to work out a policy which will help diversify the nature of our traffic, which is now mostly mine products."

Mining operations have been resumed at Franco No. 3 mine, at Marion, giving employment to 300 men.

The Illinois Central R.R. handled out of the Herrin district 5,000 cars of coal during August, 1925, and 2,000 cars out of the Benton district. The Herrin district showed an increase of 40.3 per cent over the business done during August, 1924. The increase at Benton was 20 per cent and at Christopher it was 141.1 per cent.

C. C. Pervier, deputy internal revenue collector of Sheffield, while on a vacation recently put in his time supervising the sinking of a new coal shaft on the Pervier estate at Indian Hill. Lamb & Pollock did the work and a fine bed of coal was reached at a depth of 48 ft. there being a strip of rock 38 ft. deep to be blasted which will provide a good roof. Hoisting equipment is being placed and coal is to be hoisted within two weeks. Mr. Pervier's time is completely filled with his work as a deputy internal revenue collector and he plans to lease the mine when everything is set for operation.

## INDIANA

The Pike County Coal Co., which owns and operates the Atlas No. 1 and No. 3 mines, in Petersburg, has issued orders that No. 3 mine, which has been idle since April 1, will start Oct. 1 with a full force of men. Work of cleaning the mine preparatory to resuming operations has been started. The No. 1 mine has operated almost every day since Aug. 1. It is the largest mine in Indiana south of the Baltimore & Ohio R.R.

A threatened strike of miners in the Terre Haute field using the Big Four R.R. miners' train to mines west of that city, was averted Sept. 22 when it was agreed that the railroad thereafter would permit miners to board and leave the train at the customary points. About 340 miners were idle Sept. 21 when the train failed to stop at two points where previously it had been customary to pick up men. A strike had seemed imminent when the railroad announced that in the future miners would have to board and leave the train at the Terre Haute station, discontinuing two stops used about fifteen years. The miners in a mass meeting Sept. 20 decided to meet the train at the usual places. The miners' train committee made immediate efforts to bring about an agreement with the railroad company and a written agreement will be in effect soon.

## KANSAS

Val Mendichi, Mulberry merchant, who recently leased mine No. 14 of the Sheridan Coal Co., near Gross, signed an agreement with District 14, United Mine Workers, on Sept. 22, and work of cleaning up the mine preparatory to operating began immediately. Previously the district board of the union had published a warning to members to stay away from the mine, alleging that the lessee was seeking to employ men at less than contract scale.

Walter B. Greek, of Croweburg, charged with burglary and larceny for the alleged theft of dynamite from the magazine of Sheridan Coal Co. mine No. 12, was discharged at his preliminary hearing in the Pittsburg City

Court Sept. 23, when Andrew Allen, a representative of the Sheridan Company, the complaining witness, could not testify that any dynamite had been stolen, as other employees did the checking which showed a case of the explosive missing. Greek is under bond to appear for trial at the October term of the Crawford County District Court on a charge of attempting to dynamite the steam shovel of the Dunkirk Coal Co. near Croweburg several weeks ago. Bloodhounds trailed from the shovel to Greek's home and fingerprints on one of the sticks of dynamite correspond with Greek's the authorities assert. Fuses to the dynamite under the steam shovel had been lighted but went out before reaching the explosive.

Mark Knott and Frank Cumiskey, who have been independent operators of smaller properties, have leased No. 49 mine of the Central Coal & Coke Co., northeast of Frontenac. This mine, which employs 300 men, has been idle for three years and will have to undergo extensive repairs before production is resumed.

Chapon & Westerlin will reopen their mine near Chicopee early this month. It employs 125 men. The tipple at this mine burned a few years ago while the fight between the Howat followers and the international union was at its height. The cause of the fire was never determined. The tipple is being rebuilt preparatory to operating.

The Central Coal & Coke Co.'s mine No. 51, in the southeastern Kansas field, began loading coal Sept. 16, after having been closed down since last spring. The mine employs 350 men, when working at normal capacity. The company expects to have a full crew working within two or three weeks. The Central has one other shovel now operating in the field.

Mine No. 14 of the Sheridan Coal Co., in the southeastern Kansas field, which has been idle two years, will be reopened under lease before the end of September. Val Mendicki, of Mulberry, has leased the mine, and it is understood that three other miners of the district may take shares in the lease before production begins. The mine will employ between 150 and 200 men.

## KENTUCKY

The Dawson Daylight Coal Co., near Dawson Springs, has virtually completed its new tipple, burned some weeks ago, and is now installing motors, screens, conveyors, etc., and will soon be able to go ahead with full preparation. During the interval a temporary loading arrangement has been in use.

The White Star Coal Co., White Star, has been sold by the American Light & Traction Co., of New York, to John L. Phillips, Ray B. Moss and W. L. Hammond at a cash price in excess of $100,000. The property, which has been closed for a year, will be reopened immediately, affording employment to about 200 miners. The coal property embraces about 1,300 acres of fine quality coal in the Mason-Harlan and Wallins Creek seams. The offices of the company will be moved from New York to Pineville immediately and the management of the company will be decided on at the first meeting of the new owners.

**D. E. A. Charlton**

Appointed manager of mining sales for the Goheen Corporation, of New Jersey, paint engineers, he assumed his new duties on Sept. 21. After several years of mining experience Mr. Charlton joined the editorial staff of *Engineering and Mining Journal-Press* in 1917, and assumed the post of managing editor in 1919. In August, 1922, he was transferred to the business department, becoming business manager in 1923. Charlton is a member of the A. I. M. E. and has been active in the affairs of the Institute. He also enjoys a reputation as a raconteur, his "Cousin Jack" stories being familiar to a wide circle of friends and acquaintances. Mr. Charlton makes his new headquarters at the New York office of the Goheen Corporation, at 331 Madison Avenue.

The Madison Coal Co., Central City, suffered the loss of three dwellings by fire early this month.

## MINNESOTA

The Berwind Fuel Co. is completing the installation of additional equipment at its briquetting plant at Superior that will nearly double its capacity. The management of the company is looking forward to marked expansion in demand for briquets from over the Northwest this fall and winter.

Thomas B. Harlan, representing the Fifth and Ninth district coal-mine owners of Illinois, is to hold a conference in St. Paul soon regarding the establishment of a coal barge line on the Upper Mississippi River. Major General Harry Taylor, head of the engineering corps of the army; Major Williams, district engineer, of St. Paul, and representatives of St. Paul interests will be in the conference. It is hoped to make some real progress in the matter. A coal barge line from the Twin Cities to a point about 75 miles south of St. Louis is proposed. The Minneapolis River Terminal Commission has made a report for a proposed harbor pool on the Mississippi to lock past St. Anthony Falls to a point some 12 miles north, giving a channel from the city to lower river points. It would be available for any boat that could use the 6-ft. channel now available to the government dam. Coal could be brought up the river from Ohio River points at a saving of $2, it is asserted.

## NEW YORK

S. A. Wertheim, vice-president of Burns Bros., New York City, recently announced that directors are working on a plan for employee, ownership of Burns Bros. stock.

## OHIO

Two mines of the Massillon, Belmont & Rosemary Coal Co. in the eastern Ohio field resumed operations Sept. 22 after several months of idleness. The plants employ about 500 miners. The mines are in the Flushing district. The Meister mine at Lafferty, is reported as being prepared for resumption.

While the Southern Ohio Coal Exchange has passed out of existence as a functioning organization, Walter D. McKinney, the former secretary, with a small office force, is still on the job gathering statistics and sending out information to operators in the southern Ohio field. Liquidation of the affairs of the association has been going on by W. W. Metcalfe, who was named receiver several months ago. Figures collected by Mr. McKinney show that the output in the entire southern Ohio field during May was 15 per cent; in June 14 per cent; in July 15 per cent and in August 19 per cent of capacity. During August the Hocking Valley R.R. hauled 12 per cent of the capacity of mines on its line while the New York Central hauled 31 per cent of the capacity of mines on that road.

In the past six months there has been a large thinning down in the ranks of coal jobbers and brokers in Cincinnati. At the beginning of the year there were about 110 offices doing business on this side of the river and the other—in Covington, Ky., in particular. These have been reduced by about 25. Including members of firms and office employees about thirty have joined the Florida "gold" rush.

Mine No. 281 of the Ohio Collieries Co., located near Madoo, has been opened following an idleness of months. About 300 men have been given employment as a result. The mine is loading railroad fuel exclusively.

## OKLAHOMA

Officials of District 21 (Oklahoma) United Mine Workers, wired officials of District 14 at Pittsburg, Kan., on Sept. 22 that Oklahoma operators had sent agents to Columbus and Scammon, Kan., to recruit men to work in Oklahoma mines on the open-shop plan. The District 14 executive board replied that Kansas will not work in other than union mines. It then sent a circular to all locals warning against accepting employment in Oklahoma.

Fire of undetermined origin on Sept. 17 destroyed the wash house and engine room of the Thomas Coal Co.'s mine near Blanco, 13 miles south of McAlester. Three men in the mine at the time of the fire escaped through the manway after they had detected the odor of smoke while inspecting the workings. The damage has been estimated at approximately $4,000. Company officials decided to start repair work immediately and expected to have the mine working again within a week. About 50 men have been employed at this mine lately, though it is capable of employing 100 men.

The office of the Milton Coal Co., Milton, was destroyed by fire the first week in September.

## PENNSYLVANIA

Garwood mine of the Etna Connellsville Coal Co., along the Monongahela Ry., near Allison, resumed operation on Sept. 25.

Tony Pezzi and Michele Bassi, convicted in the Cambria County Court of the murder of James Garman in a hold-up near Colver on Oct. 11, 1924, were electrocuted in the Rockview penitentiary, Sept. 21. The two men, members of a gang of notorious robbers, held up a Cambria and Indiana train at Concrete Bridge, shot Garman, who was acting as an express messenger, and carried off the payroll of the Ebensburg Coal Co., amounting to $33,000. Neither Pezzi nor Bassi made a confession. Both were said to be implicated in the robbery of the West End Coal Co. in Lackawanna County, July 20, 1923, when a messenger was killed and $75,000 taken. Tony Burchanti and John Torti were electrocuted at Rockview for this offense on June 1, this year. Others of the gang are still at large.

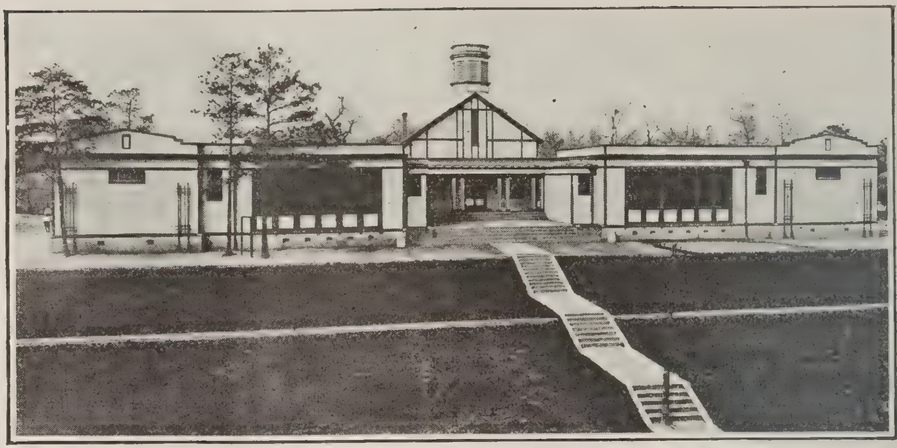
In the Connellsville coke region there seems to be a growing unrest among mine laborers due to an impression that the price of coal has advanced $6 or $7 a ton, on account of the anthracite strike. This impression is created by propaganda spread by agitators from the United Mine Workers of America and from the I. W. W. The two miners of the Jamison Coal & Coke Co. near Perryopolis, that struck last week for restoration of the high peak wage scale, are still out and were joined Sept. 17 by most of the men at the Washington Coal & Coke Co. No. 1 plant at Star Junction, near Dawson.

The Eleanor mine of the Stern Coal & Coke Co., at Fairbanks, resumed operation last week, according to reports. The mine is located along the Monongahela Ry.

The Ontario Gas & Coal Co. has closed its mine in the Pigeon Creek Valley, near Bentleyville. Production through all this district, a strongly unionized section, is now down to practically nothing.

William Diamond, superintendent of the Davis Coal & Coke Co., of Boswell, has severed his connection with that concern and is now superintendent of Shaft No. 2, Buffalo Susquehanna Coal & Coke Co., of Du Bois.

The Penn-Lackawanna Coal Corporation has just closed leases taking over the Watt & Scurry mines adjoining its Simpson breaker, at Carbondale, on the New York, Ontario & Western R.R. Extensive inside developments have been undertaken and these mines have been fully equipped with the latest standard mining machinery. Upon resumption of mining operations at the Watt & Scurry mines the company will materially increase the output of its breaker at Carbondale.



**School for Colored Children at Edgewater, Ala.**

This picture was taken before the grass was planted in the yard or on the terraces. It is a good example of the neat, clean, orderly, businesslike way in which industrial companies in the "New South" are solving the problem of educating future citizens.

## UTAH

Industrial conditions in Utah are declared by conservative leaders—bankers and others—to be better now than they have been in many years. Some say they are better than they have ever been since Utah became a state. The crops are the heaviest in years with excellent markets and strong prices.

## VIRGINIA

Directors of the Clinchfield Coal Corporation declared a dividend of $1 a share on the common stock on Sept. 17. The last dividend paid was $1.50 a share.

A Chicago syndicate is said to have leased for an indefinite period the properties of the Empire Anthracite Coal Corporation, located eight miles northwest of Pulaski, in southwest Virginia, and will take charge in October. It is understood that the output of about 400 tons daily will be doubled, necessitating the employment of more men in all departments. This is one of the few anthracite mining operations in south west Virginia, having been opened several years ago. The mines are connected with the Norfolk & Western Ry. by a narrow-gage road, the loading tipple being located in town. In connection with the tipple, a briquet plant is under construction and it is expected to be ready for operation soon.

The Chesapeake & Ohio R.R. is now engaged in locating the proposed branch line between Gilbert in Logan County and the Stonecoal branch of the same road in Raleigh County, the location having reached a point on the Guyandotte River three miles above Pineville. The C. & O. has appropriated $20,000,000 for expansion and development.

Judge A. Barley, of Alexandria, represents a Pennsylvania syndicate, the name of which is being withheld for the present, which is said to be prepared to spend $300,000 or more in tests to determine the amount of semi-anthracite coal in the immediate region of Pulaski. In the event coal is found in sufficient quantities to justify the expenditure, the syndicate, Judge Barley says, will spend several millions of dollars in the development of this industry. Judge Barley has obtained options on property adjacent to Peppers Ferry and Blacksburg and is having a map made of the territory from the crest of Cloyds Mountain to Peppers tunnel, an area embracing about forty square miles.

M. C. Bartholomew, residuary receiver of the L. R. Steel Company, is preparing to put on a night shift at the Merrimac mines, Montgomery County, and to take them out of bankruptcy, as they are doing exceedingly well. When the first receivers of the Steel company finished their work the coal mines and some Florida property were left in bankruptcy and most of the stores were put into a solvent company.

## WASHINGTON

Development of the Hi-Carbon Coal Co.'s mine, a mile and a half east of Morton is under way, A. L. Patterson, chief owner and general manager of the company having made arrangements to rush work on the property. Operations at the mine are in charge of D. W. Watkins, superintendent of the Everett-Fisher Coal mine, two miles north of Morton. A double shift is installing machinery and completing a road for trucks to bring the output of the mine to the railroad. Preliminary development has gone to the extent of driving several shafts to prove the extent of the bed and the quality at different points. A tunnel 9 ft. wide at the bottom, 7 ft. at the top and 6½ ft. high is being driven.

## WEST VIRGINIA

A slight mine fire occurred Sept. 24 in mine No. 2 of the Cleveland-Morgantown Coal Co., in Scotts Run, but it was promptly extinguished by state mining men and others. Little lull in working time was experienced. A fall of coal broke an electric wire and caused a short-circuit.

In a deal closed in Buckhannon on Sept. 17 William N. Satterfield, of Green Spring, sold to A. W. Bigler of Clearfield, Pa.; W. M. Burns, of Houtzdale, Pa., and Ben Ellis, of Houtzdale, Pa., and associates 7,500 acres of coal land, including five seams. A tract of 1,500 acres consists of low-sulphur coal, it is reported. The tract fronts on the Pickens branch of the Baltimore & Ohio R.R. A mining town, tipples and other improvements, it is said, will be built within a short time. It was rumored that $75,000 cash was the purchase price.

M. Benton Mitchell, manager of the Marion Division of the Bethlehem Mines Corporation, resigned that position recently, according to newspaper reports. A general shake-up has been made in the general office force, according to reports.

It is reported that E. S. McCullough, labor commissioner of the Pittsburgh (Pa.) Chamber of Commerce recently declined to accept his former position as labor commissioner for the Consolidation Coal Co. in connection with the new miners' organization. Mr. McCullough went to Pittsburgh about a month ago.

With an output of 561,000 tons of coal in August, mines of the Island Creek Coal Co. operating in the Logan field exceeded any month's production in the history of the company, the July output amounting to 535,000 tons. There was one day in August when the company loaded 23,700 tons of coal, likewise a record tonnage.

J. M. Turner, of Huntington, has leased the mine recently purchased by the Eastern Coal & Export Corporation, of Richmond, the lessee planning to reopen the mine and start production. The mine formerly was known as the V. S. Veasy mine and is on the Glen Jean & Eastern Ry., which connects with the Virginian at Paz.

In order to take care of the heavy coal movement through Williamson the Norfolk & Western Ry. has started a two-year construction program in the local yards at Williamson, which when completed will have cost two million dollars. The company plans to build a new round house, filtering plant and to make extensive trackage improvements.

New companies organized in West Virginia in August had an aggregate capitalization of $1,150,000, there being five resident and one non-resident companies so organized. The new concerns are the Coalburg Colliery Corporation, of Charleston, capitalized at $25,000; Betty Ann Block Coal Co., with 500 shares of no par value; War Ridge Smokeless Coal Co., of Clarksburg, with an authorized capital of $100,000; Elk Garden Big Vein Coal Co., of Elk Garden with an authorized capital of $15,000; Guardian Coal Co., of Webster Springs, with an authorized capital of $1,000,000; Sheridan Coal Co., of Columbus, Ohio, with an authorized capital of $10,000.

The Wise Pocahontas Coal Co., has increased its capital stock from $50,000 to $100,000 and the Coal Run Coal Co. from $300,000 to $500,000.

The following West Virginia coal concerns have surrendered their charters to the Secretary of State: Camp Block Coal Co., Hager Coal Co., Slack's Branch Coal Co., Rivesville Coal Co. and the D. K. R. Coal Co.

Development of the Pond Creek Coal Co., with a plant on the Waters of Dry Fork, McDowell County, in the Tug River District, has been practically completed, and the company has been steadily increasing its output. Production in August was 47,000 tons, an annual rate of something over half a million tons, which is about one-half of the planned capacity. This company was organized in February, 1923, following the sale to the Ford Motor Co. of the Original Pond Creek Coal Co. The new company began to produce coal in July, 1923, and in that year produced 69,000 tons and the next year 190,000 tons. It is stated that by the early part of 1926 the company should be up to its planned capacity of one million tons per year.

State Tax Commissioner Hall's tabulation on the sales tax returns for the last fiscal year shows that the coal industry paid a total tax of $735,418.61, while the manufacturing industry paid $727,842.82. In 1924 coal paid $1,093,782.87 and manufacturing $780,013.03. While the revenue from the coal industry decreased 32.76 per cent the manufacturing returns showed a loss of 6.69 per cent. The taxes collected for the last fiscal year were on the old rates. The Legislature of 1925 having revised the schedule of rates, heavier revenue is expected during the current fiscal year, with coal paying a slightly higher rate.

Production at the fifteen mines of the New River company in Fayette and Raleigh counties amounted to 208,000 tons in August, as compared with barely 200,000 tons in July, the August output being the largest monthly production of the company in the last two years. The company in August made a moderate profit. Since early in the year it had been operating at a loss. There is every indication that September will prove to be even a better month for production and returns.

It is reported that A. J. O'Neal, of Beckley, has leased the Neal Coal Co. at Lester, and will soon start operations. This mine has been closed for two years on account of the depression in the industry. Mr. O'Neal formerly was superintendent for the Ingram Branch Coal Co.

July saw another substantial increase in the shipments of smokeless coal, bringing the total for the first seven months of the year up to 24,530,118 tons, or an increase of 3,608,017 tons over the corresponding months of 1924. The increase in July of this year alone over July, 1924, amounted to 804,062 tons, all smokeless fields showing a substantial gain but with the Pocahontas district leading, the net gain in that field amounting to 359,135 tons.

## WYOMING

Kemmerer Coal Co. mines Nos. 1, at Frontier, and 5, at Sublet, have adopted rock dusting to reduce danger of explosion to a minimum. Several cars of the dust arrived recently from Devil's Slide, Utah, where it is pulverized. No. 6 mine, which opened Sept. 16, also is rock dusted. Recently the company experimented with a dust made locally, but it proved unsuccessful.

## CANADA

The coal output of the Province of British Columbia for the first seven months of this year was 1,373,923 gross tons, as compared with 1,193,848 tons in the corresponding period of last year. The increase was due to greater activity in the Crow's Nest Pass field, which yielded 511,050 tons, as compared with 190,041 for the first seven months of last year, during four of which the mines were closed by a strike. The Vancouver Island mines produced 772,056 tons, as compared with 847,586 tons, and the Nicola-Princeton field 129,221 tons, as compared with 90,817 tons for the first seven months of 1924. The coke production of the province up to the end of July of this year was 200,843 tons, as compared with 146,217 tons during the corresponding period of last year.

Sigurd H. Burnstad, coal operator, of Round Hill, Alta., has assigned and the Canadian Credit Men's Trust Association is appointed custodian.

# Traffic

### Attack Rates to Bluefield

The Appalachian Power Co. and a number of other coal consumers and retail coal dealers in Bluefield, W. Va., and Glyn Lyn, Va., have joined in a complaint before the Interstate Commerce Commission attacking rates from the Pocahontas, Tug River, Thacker and Clinch Valley districts on the Norfolk & Western Ry. The petitioners ask for the establishment of commodity rates which shall not exceed certain distance tariff charges now published by the defendant carrier. The distance rates in question range from 23 to 73c. per ton less than the commodity rates assailed.

Members of the coal committee of the Indiana Chamber of Commerce met recently in Indianapolis with officials of the traffic department to prepare counter-proposals in the case to be presented to the carriers in the Indiana freight rate case. The carriers and the committee have each presented proposals, but no agreement has been reached. In case no decision is reached, the matter soon will be turned over to the Interstate Commerce Commission.

## Coming Meetings

**Illinois Coal Operators' Association.** Annual meeting Oct. 6, at Chicago, Ill. Secretary, C. E. McLaughlin, Fisher Bldg., Chicago, Ill.

**Alabama Mining Institute.** Annual meeting, Oct. 6, Birmingham, Ala. Secretary, J. L. Davidson, Birmingham, Ala. The Seventh Annual First-Aid Field Meet also will be held on this date.

**American Gas Association.** Annual meeting, Oct. 12-16, at Atlantic City (Steel Pier), N. J. Secretary-manager, Alexander Forward, 342 Madison Ave., New York City.

**National Conference of Business Paper Editors.** Annual meeting, Oct. 14 and 15, at Congress Hotel, Chicago, Ill. Secretary, D. G. Woolf, 334 Fourth Ave., New York City.

**Kanawha Coal Operators' Association.** Annual meeting, Oct. 15, at Kanawha Hotel, Charleston, W. Va. Secretary, D. C. Kennedy, Charleston, W. Va.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting, Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal. Que., Can.

**Illinois Mining Institute.** Fall meeting, Nov. 6 and 7 at West Frankfort, Ill. Secretary, Frank F. Tirre, St. Louis, Mo.

**Harlan County Coal Operators' Association.** Annual meeting, Nov. 18, at Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering.** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## Obituary

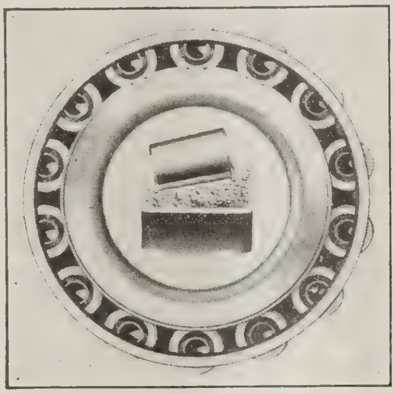
**Jabez B. Hanford,** 61, for more than twenty years a leader in the coal industry in the Monongahela Valley, died at his home in Morgantown, W. Va., Sept. 22, of sarcoma. Mr. Hanford, who was born at King's Chapel, Staffordshire, England, had held nearly every sort of position in and about the mines. He took charge of the Elkins interests in 1905 in Monongalia and Preston counties and when those properties were disposed of in 1919 he became one of the organizers of the National Fuel Co. He served as executive officer of the concern until illness prevented further activity on his part. He served as a member of the executive board of the Coal Mining Institute of America, was one of the organizers of the Coal Mining Institute of West Virginia and was for three years its first president. He was also a member of the American Institute of Mining and Metallurgical Engineers.

**Lewis A. Hayden**, president of the Hayden Brothers Coal Corporation and for forty-one years a resident of Colorado, died suddenly of a heart attack at the company's office, 708 Tramway Building, Denver, Colo., Sept. 22. He leaves a wife, three sons and a daughter.

# New Equipment

## Continuous Axial Alignment In New Roller Bearing

Improvements are often possible even in equipment of well established merit. The improved type of anti-friction bearing shown in the accompanying illustration has recently been introduced by the Timken Roller Bearing Co., of Canton, Ohio. This differs from the well known design of bearing of this kind in certain major details, yet retains all the advantages that characterized its predecessors.



**Self-Aligning Bearing**

The rear flange of the cone is slightly undercut and the large end of the roller is made perpendicular to the roller center line. This renders the rollers self-aligning and admits of higher rotational speeds than were before possible.

In the new designs the roll is so formed that the surface of the larger end is at right angles to the center of the roll. The contact between the roll end and the rib of the cone which is slightly undercut thus lies in two areas, assuring continuous perfect axial alignment between bearing and roller. Similarly perfect line contact is maintained between the roller and both cone and cup.

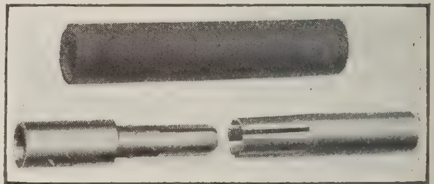
Together with the cone and roller the cage has likewise been improved. Instead of the roll pockets being punched out one at a time resulting in slight misalignment due to metal stretching, all openings in the new cage are punched simultaneously. An inwardly turned flange at the small end of the cage further guards against distortion. The lateral edges of the cage are swedged inward so that the contour of the pocket sides conform to the contour of the roll. This process, known as winging, assures a perfect fit and smooth operation of the rollers.

Although the predecessor of this bearing built along the same general lines, had low frictional resistance, the improved type has still less. The self-aligning properties of the roll and cone admit of much higher running speeds and the hardness and excellent wearing qualities of the parts in contact reduce wear to such an extent that it is seldom necessary to disturb the original adjustment. These refinements render the new bearing particularly adaptable to all industrial applications especially those involving high speeds.

## Protected Connector Assists In Making Changes

An insulated plug and socket type of phosphor bronze connector supplied with a protecting sleeve of tight-fitting rubber tubing was recently placed on the market by the Ohio Brass Co., of Mansfield, Ohio. The connector is made so that cable ends can be soldered into the two parts. When the connector is thus arranged, the insulation on the cable is back-cut so that the rubber tubing which is slipped over the connector forms a continuous protecting surface. A ring on the plug end of the connector slips into a corresponding groove in the socket. In this manner the connector forms a tight contact that cannot easily be pulled apart in service.

This connector is expected to be a labor-saver for connecting cable ends which must occasionally be separated. Greater utility will be found for it, however, on the terminals of motors, switch leads, headlights and circuit appliances which must be removed from time to time for repairs or inspection.



**Cable Connector Makes Quick Changes Easy**

A strong spring contact and a holding ring make this connector a serviceable device on cables and electrical devices.

## New Companies

**The Le Flore Coal Co.,** Kansas City, Mo., capitalized at $12,000, has been incorporated. The company is to mine, buy, sell and deal in coal. The incorporators are: W. L. Johnson, L. W. Johnson, and L. M. Johnson.

**The Chelsea Coal Co.,** Pittsburg, Kan., capitalization $25,000, was granted a charter Sept. 22 by the Kansas Charter Board. The company has purchased the coal rights on 600 acres near Chelsea, Okla., and has ordered a steam shovel to place on the tract. The incorporators are: L. E. Compton, W. O. Myers, and J. F. Dowis, of Pittsburgh, and J. A. Holland, of Mulberry, Kan. Sale of the coal will be handled by the Security Coal Co., with which Mr. Holland is connected, and which has sales offices in Kansas City, Mo.

**The Royalty Coal Co.** has been incorporated in Madisonville, Ky., with a capital stock of $20,000, by Jesse Diamond, Jack Dozier and others.

**The Carman Coal Co.,** 123 Sixth Street, East Liverpool, Ohio, has been chartered with an authorized capital of $50,000 to deal in coal and coal mining equipment and machinery. Incorporators are Terry O. Carman, Alice G. Carman, La Pash Carman, James M. Haun and Charles W. Ferguson.

A charter has been granted to the **John-Ames Coal Co.** of Wilkes-Barre, Pa. The incorporators are E. D. Ames, Ralph Rymer and Paul G. Collins.

**The Bernard Coal Co.,** Cambridge, Ohio, has been chartered, with a capital of $5,000, by Thomas R. Bernard, Ernest Larrick, R. R. Noble, Hewey Bailey and Arthur A. Olden.

## Passing It Up to the Boss

IN MANY CORPORATIONS, the company president does not leave the solution of disputes between the manager and his subordinates to be determined between them, but takes a hand himself and frequently overrules the former to the advantage of the latter. After a while the manager realizes he is a mere figurehead and leaves all matters which are in dispute to the president.

The manager feels he is not the court of last resort, that the employees can always appeal against his judgment and he conforms to the condition thus presented to him. The president, who thus interferes, is no longer able to delegate matters, even though he protests vigorously against being drawn in. The manager is never satisfied that his judgment will not be overruled, and the subordinates are always hopeful that they can obtain a decision in their favor.

Ever since Theodore Roosevelt shook his big stick and settled an anthracite strike, both parties in anthracite labor disputes have left the decisions largely in the President's hands. Even if he refuses to undertake a settlement, both sides anticipate that the time will eventually come that he will compel one, and the appeals, as the public has noted, are not so much from operators to mine workers and mine workers to operators as from both operators and mine workers to the president and the public.

If the mine workers realized that the operators had the final power of decision, if they felt that the public would not interfere, they would be less disposed to wait patiently for such action. But they have learned that the public intervenes, that settlements are made on the basis of giving the least the mine workers are willing to accept, so they waste no time on the operator.

The administration declares, it is said, that this practice of passing the dispute up to the boss has to stop and really seems disposed to insist on that attitude; but if, in the end, the President is going to act, and we hope he will not, it would be better that he do it by an arbitral decision made in the absence of immediate peril rather than by a settlement dictated by the mine workers and based merely on opportunist considerations. Shall the difference be decided on its merits or shall the party most ready to submit itself to the exigence of public need be asked to make a patriotic sacrifice? The mine workers are hoping for the latter, being assured that if that is the final settlement they will receive at least a part of their demands. Let up hope that the resolution of the administration will be upheld, so that the union will be convinced that, not political exigence, but the economics of the anthracite industry will be the final basis of decision.

"Soft-Coal Interests are heartened by the possibilities of consolidations," says Archer Wall Douglas, eminent business observer. "There should be no difficulty in procuring the necessary funds. It must be clearly shown, of course, that the general public will not suffer either in service or in unduly high prices." With the country full to overflowing with developed coal properties, a recurrence of prolonged high prices is the one thing that does not make us insomnious.

## Keeping Up-to-Date

NO ONE COULD JUSTLY suggest that mine officials, especially purchasing agents, should treat too politely a salesman who approaches with an irritatingly presumptuous air; but certainly many mine officials—purchasing agents, and engineers—would do well to listen awhile when a good salesman calls.

Much of the equipment installed at mining properties today has been designed and introduced to the industry by salesmen and due to this fact it is the manufacturer's representative who knows most about it. Even coal-company records of service of machines are usually incomplete and when the operator wants to know anything about his equipment he frequently turns to the manufacturer.

The salesman has a specific job. He generally sells but a few lines and thus has greater opportunity to learn more about them than anyone else. His experiences with his equipment and the modifications which can be made to it are sometimes of great value to a coal company.

Few mining men have the time or opportunity to visit the other properties in their field but often the salesman does. And thus he obtains ideas regarding his product which will be helpful to his prospective customer. After all, if each of us had to depend upon his own ideas this would be a small world.

## Where Fires Are Anticipated

IN SOME PARTS of the world, spontaneous combustion of the coal bed after partial extraction or during the process of mining is provokingly common. Two general causes are given for this ignition—ventilation and the presence of water. Where the water comes from the surface and where the area is stopped off and thus not ventilated through other parts of the mine, a partial cure for the water and a complete cure for the ventilation is furnished by filling or at least closing all holes where water or air may enter.

This should be done before any fire occurs. As fires eat away pillars and breed falls and falls breed fires wherever the coal has been incompletely extracted, it is better to fill up the holes that caving causes before a fire occurs, for otherwise new holes will be formed later, and the work will be only increased by delay. However, in some cases, where the crops have fires dating back perhaps to prehistoric time, the workings may enter such burning outcrops and so cause the extension of the ancient fires, which have been known to extend for a distance of more than a mile from the outcrop.

In some cases the driving of a tunnel in the rock to meet the dip of the seam far beyond the point where the coal is burning may prevent much fire trouble, but just where the fire area ends is a large question. Unfortunately, that is rarely known, and so this expedient is difficult of accomplishment; but if the engineer cannot avoid entering fire areas he can do something at least to prevent their creation, for the closing of surface holes is not difficult. If done persistently it is calculated to prevent any bed, prone to ignite spontaneously, from indulging in that habit, and of reducing the difficulty in supressing the fire in a seam if the ancient fires should, perchance, be disturbed.

## Finish the Job

WITH A BLIND FAITH in the savings which will result from proposed changes, many mining companies have made large investments in improvements. To the man or men directly responsible for these changes there is rarely a doubt regarding the wisdom of such expenditures. The results obtained and the savings effected are so apparent to them that they often forget the necessity for collecting such data as will convince the other fellow.

As a result, modernization plans often go slowly because definite and positive information is not available to prove that work already done has brought about the desired results. Sooner or later some one denies the fact that certain changes have proved successful or asks for proof. Then, unless the evidence is presented, new developments are retarded or stopped.

Thus only half the job is done when an appropriation is obtained for new work; and only two-thirds of it when the improvement is completed. Performance data must not be forgotten. Many a coal company today is backward and unprogressive, not because it wishes to be so, but, because it fails to sell itself on its own improvements. Every coal mine operating man and engineer ought to do his level best to keep his company out of that classification.

## One Job—Three Jobholders

IT IS USUALLY CONCEDED that the electrification of coal mines is economical. However, union labor can sometimes upset the nicest calculations. When the last general suspension in the anthracite region took place a certain operating company used steam pumps to drain one of its operations, two pumpmen being employed, each working 12 hours per day. Since then, not only has this pumping station been enlarged in capacity and electrified but all pumpmen have been put on 8-hour shifts. Under present conditions it is only necessary to operate this pumping station eight out of each 24 hours in order to drain the mine.

Now, here comes the rub. The agreement with the miners provides that maintenance conditions are to be the same as during the last suspension. The miners have, therefore, insisted that *three* pumpmen be employed to keep the water out of this operation during the present strike, although only one shift is pumped and only one pumpman is employed during normal operation. In order to avoid all argument, unpleasantness and friction the company now pays three men to do one man's work, those employed on two of the three shifts having practically nothing to do—except, possibly, to look wise. Such is the reasonableness of the United Mine Workers.

## Haphazard Methods

EVERY MINE has its peculiarities. The coal, the floor and the roof and the depth of cover vary, but comparatively little effort is made to ascertain exactly what are the characteristics of each and how they should modify mining methods. In many mines almost every item is left to the judgment of the miners. Ask what the system is and after you have heard how wide are the rooms and how thick the pillars you learn no more.

You are unable, quite often, to learn how the shots are placed, just how much coal is left in the roof or in the floor and other important details. These matters are quite generally left to the miners, and with the large turnover so customary in the mining regions, it is not possible to believe that every miner is a fit person to decide how the work shall be done as usually he has not been long enough on the job to develop a system. Long, painstaking study and experience is needed to find the best methods. Not only does the miner not give the matter careful consideration but usually he is not employed long enough to gain any proficiency.

The Phelps Dodge Co., Copper Queen Branch, has carefully formulated its standards of drilling and shooting, and it trains all its new men in these plans. It is careful not to give its instructions arbitrarily. It explains that the miner's own methods may be all right as applied to conditions in the Cœur d'Alenes, Butte, Globe or any other region from which he has come, but these are the methods the management has determined are best for the Copper Queen mines and for the conditions the miners at these mines have to face. When he is new to the job and so open to suggestion and not prejudiced by any experience in those workings they require him to perform every operation once under supervision.

Cannot coal mines do as much? At one mine with heavy cap pieces two feet long the props forced their way into the roof. What preparation for working in such mines would a man have who came from mines with a hard roof or with a floor where the weight had to be distributed over the "pavement" instead of over the roof? At another mine the shots were fired by electricity. Was any care given to show a man who entered the mine for the first time that the magneto must be actuated with a quick stroke and whether the shots should be in parallel or series and which shots should be fired by ordinary fuse and which by first-delay fuses, where such are used? Did the men know a parallel arrangement from one in series? Did they understand the method of connection? Did their shots fail from a lack of such knowledge and were they secretly relying on current from the trolley because they failed to use magneto and fuses correctly? Was the percentage of slack excessive because they went to their work without training? Worse yet, in some mines a few of the men have had so little instruction that it has been found that they do not even know how to "sound the roof."

WELL-KNOWN ECONOMISTS are prophesying that a settlement more permanent than usual will come out of the anthracite strike if outsiders will leave the situation alone. These experts do not know coal as does John Lewis. Without outside influence—skillfully and politically directed by John—how could the miners be assured of victory 100 per cent of the time regardless of the justice of their case? We pause for answer.

# Three-Ton Scraper Pulls Coal from Face Swiftly

## Moves Two Carloads Each Trip—Roof Control Greatest Difficulty but Triple Shifting Will Speed Up Extraction—Nine Rows of Props Maintained

**By R. Dawson Hall**
Engineering Editor, *Coal Age*,
New York City

LARGE SCRAPERS, like large cars, apparently have come to stay. Certainly, it is probable that the small scrapers that must come and go two or three times to take away a single ton of coal are about to be superseded by those which move more than a ton every time they travel from the face to the road or to the conveyor-way.

At the No. 4 mine of the Union Pacific Coal Co., Rock Springs, Wyo., a scraper is being operated that has an actual and regularly attained capacity of 2.7 tons. It brings that quantity of coal every trip to the chute, whence it is loaded into two cars, each of 1.35 tons capacity, the scraper pushing the coal along the chute and stopping while the cars are being shifted, so that part of one scraper load goes into one car and part into another.

It should be explained that the work so far done is purely experimental. This applies not so much to the scraper itself as to the action of the roof in the scraper workings. This constitutes the real unknown factor in the operation of mechanical loaders where long-face methods are practiced, yet George B. Pryde, vice-president and general manager and A. W. Dickinson, general superintendent, are certain that, as this experiment has succeeded, even greater success will be attained hereafter, for two important wherewithals were lacking in the trials. These were speed in extraction and a proper disposition of the break line in relation to the slips of the roof.

Good practice would require that the work be rushed not only daily but day and night, the cutting and shooting being performed during one shift, the spotting and erection of props during another and the scraping and loading during a third. It may be contrived to place the props during the cutting and shooting shift, and if that can be managed only two shifts will be necessary, but at least that number should be provided in order that rapid progress may be made.

Speed in operation also would demand either that each car be large enough to hold one whole scraper load or that a conveyor be placed below the chute, so that it will not be necessary to keep the scraper waiting for the filling of cars as is now the practice. These two methods, in which great speed might be attained —increasing the number of shifts and shortening the time the scraper remains at the chute—would so decrease the time of extraction that there would be far greater assurance that all the coal would be saved and that the face would not be closed in.

Another helpful factor in attaining complete and safe extraction would be afforded if the face of the working was arranged to parallel the natural break lines or slips of the roof. In this long-face operation the face line has reached a direction immediately at right-angles to the slips. Were the face parallel to the natural cleavage the breaks would be less likely to over-run the timbers. Another difficulty that future development will not have to face is that the work has been started without the advantage of any initial break.

---

The headpiece shows No. 8 mine of the Union Pacific Coal Co., at Rock Springs, Wyo., which is really part of No. 4 of the same company, where the other scraper experiments described in this article are being made. The big rock on the right with large holes eaten into it testifies to the sand-blasting powers of Wyoming winds. This is the rock over the coal. It has to be broken in the longwall work.

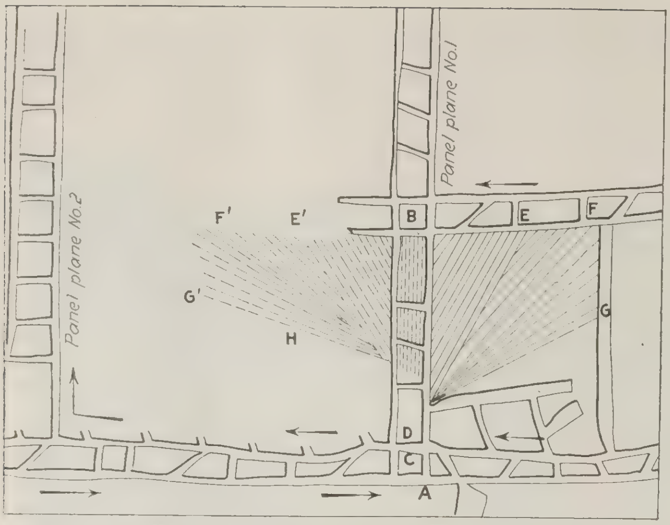

**Fig. 1—Plan of Scraper Workings**

On the right-hand side a slant face was developed between parallel headings making available a large tonnage of coal for each undercut made. On the opposite side of the scraperway similar long falls (*G'*. *F'*. *E'*.) will be produced by taking successive slant cuts from the corner of the solid pillar *H*. The chief difficulty encountered in this process was the control of the roof.

The roof had to be fractured and caused to fall for the first time, if possible along the edge of the timbered area with props 8 ft. long and of not over 12 in. in diameter. This somewhat difficult operation of fracturing the roof was performed, not without losing timbers and some of the coal face but it was eventually accomplished and that gives assurance.

Because the conditions in the experiment have been so adverse Mr. Dickinson is more than hopeful that, when favoring conditions are arranged, no coal will be lost and no men or equipment imperiled. Even if the market should cause irregular working, it will not prevent the entire removal of the coal which will be achieved without any adverse circumstances.

The scraping and return hoists, one of 75 hp. and the other of 45 hp., were placed at *A* in Fig. 1. A double hoist was not available or it would have been used. Such a machine will be provided in future development. The scraper commenced operations by nibbling at the undercut corner *B* and was pulled by the scraping hoist down to *C* for unloading. Here a chute was placed about a foot above mine-car height, and the coal was dumped into cars as described, each taking 1.35 tons without any topping or careful arrangement of the car's contents.

### METHOD OF CUTTING

The line *AB* is on the full pitch of the bed and is inclined at about 8 deg. After the corner had been removed cuts were made consecutively along lines such as are shown in Fig. 1, until the line *DE* was reached, the coal being removed by the scraper as soon as it had been shot down.

As fast as progress made it possible, posts from 8 in. to 12 in. in diameter were erected 10 to 12 ft. in the clear from the face, these posts being set on 3-ft. centers and in nine rows spaced 3 ft. apart.

After the line *DE* was reached the direction of cutting was deflected until the line *DF* was attained. It was about this time that a good break was effected which reached in places to the face, occupying about the area shown in Fig. 1. For this reason a thin rib had to be left, after which scraping was resumed. It will be continued until the line *DG* is reached. The small pillar has been shot, and every evidence favors the idea that it will succumb under the roof weight, and any further breaks will not destroy timber. The greater part of the posts are recovered and used over again making the costs for this item by no means as great as it would otherwise be.

### SCRAPER HELPS REMOVE CHAIN PILLAR

The intention is to remove the chain pillar between *B* and *C* with the aid of the scraper and then to proceed to undermine, shoot and scrape away the large unbroken pillar to the left of the area now occupied by the chain pillar, making cuts in the manner indicated and proceeding with the cutting upon lines bearing to the left of the chain pillar at an angle equal to that used in cutting to the right, but in the opposite direction.

In that manner it will be possible to remove a large portion of the coal without moving the hoist to another position and without making it necessary to change the position of the chute or of the sidetrack by which it is served.

With all the work, of undercutting, of spotting the props and placing them and of scraping away the dislodged coal, being done in a single shift, it has been possible to maintain an output of 150 to 200 cars a day or 200 to 270 tons in each 8 hr. except when the roof fall occurred and distributed the regularity of the operation. A greater tonnage will be attained, doubtless, when a conveyor is installed and a heavier hoist provided. A still larger output is assured when both cutting and shooting are done on the night shift.

### SIX MEN ON SINGLE SHIFT

At present two men are employed at the chute and three at the face. A sixth man handles the two hoists alternately. Of course, a double- or triple-shift operation will make it necessary to employ four or five more men—a cutter, a bugdust shoveler, two timbermen and perhaps a man to run the scraper, not to drag coal from the face, for that will be done only during the day, but to move posts from the heading to the point where they are to be set.

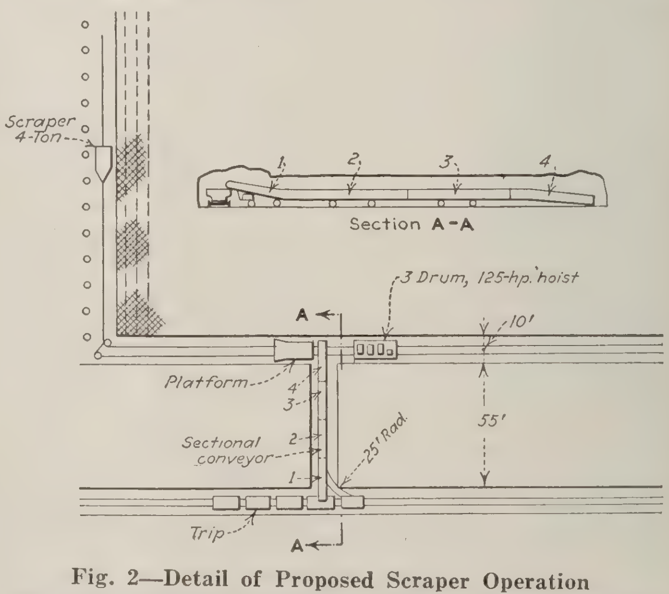

**Fig. 2—Detail of Proposed Scraper Operation**

Use of a big scaper in conjunction with small cars necessitates the employment of a conveyor. This will permit cars to be loaded during the time that the scraper is traveling to and from the face.

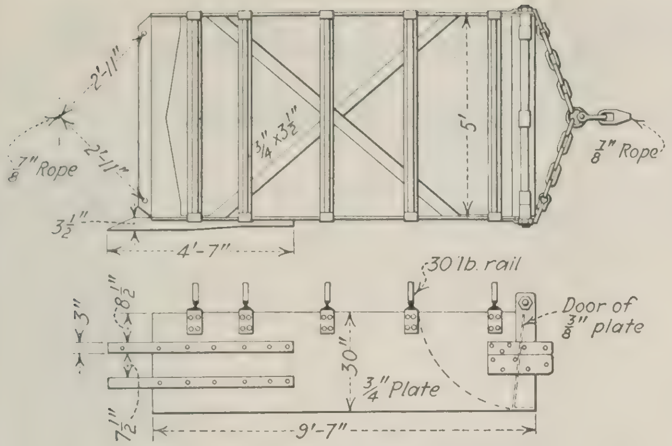

Fig. 3—Detail of New Scraper

This scraper is built heavy and strong, intended not only to move a large tonnage, but also to withstand for a long time the rough usage to which underground equipment is invariably subjected.

The depth of the cover where the scraper is working is about 500 ft. and from a drill hole sunk at a nearby point the roof immediately over the coal appears to be, either of mingled or of interstratified shale and sandstone presumably of no great strength. At a point about 82 ft. above the coal occurs a stratum of solid sandrock 81 ft. thick. This seems to be the measure from which the roof gains much of its strength. Above it the material is interstratified and free from beds of any such thickness. It is probably weak, therefore, from the massive sandstone bed upward. Whether this sandstone has broken in the recent falls cannot, of course, be ascertained and on its fracturing doubtless success greatly depends.

The mine cars, it is conceded, are altogether too small. They have only a 36-in. track gage and are but 50 in. wide. The side and end boards reach up to a point 44½ in. above the rail. The bottom is not set down around the wheels but is flared out to overhang them. In order to make loading convenient, the track for loaded cars is raised at the chute about 18 in. above the main track in the entry, and the hump is so arranged that the cars tend to run past the chute being retarded or stopped at pleasure by the application of sprags.

### Coal Is Not Disturbed

The scraper is provided with runners curved at both ends so that it passes over the coal without disturbing it unduly, entire dependence being placed on the gate for the transference of the coal to the roadway. This gate is pushed into place when the coal presses against it. Little coal is carried back by the scraper in returning to get a load, and what is thus disturbed is thrown back into place by the men working at the face.

It is the intention to place a Goodman scraper of from 4 to 5 tons working capacity in mine No. 8, which is really a part of No. 4, though the coal is taken to another tipple. This will be operated straight up and down the pitch, which is the direction of the slips, the double-drum hoist being moved forward with the face. This corresponds with the method of operation which Glenn Knox has adopted at the Gunn-Quealy Coal Co.'s Sweetwater Mine. A large or "Type B" scraper has recently been ordered and is now being constructed. It will be used in the No. 8 mine where the coal is from 6 to 9½ ft. thick.

In this mine the entries are from 9 to 12 ft. wide and from 5 ft. 8 in. to 7 ft. 6 in. high. Fig. 2 shows the proposed plan of adapting this loader to the conditions encountered Parallel entries about 55 ft. apart will afford faces approximately 300 ft. long.

The new winding engine or hoist will have three drums and be fitted with a 125-hp. motor. It will be mounted on a truck and so arranged that it may be held in any desired position by means of jacks. The drums will spool 800 ft. of ⅞-in., 1,200 ft. of ¾-in. and 1,700 ft. of ¾-in. rope, respectively.

The loading chute or platform will be mounted on detachable wheels so that it can be either dragged along the bottom or transported on the mine track. The scraper itself is approximately 10 ft. long, 5 ft. wide and 2½ ft. high. By means of the "automatic rope" this scraper can be made to negotiate the corner and deliver its load onto the loading platform. It is estimated that it will not be necessary to move the winding engine oftener than about once every ten days.

### Design Special Sectional Conveyor

In order to transport the coal from the loading platform to the cars a special sectional conveyor has been designed. This is of the standard drag type and consists of four sections all of which are mounted on mine car wheels except the last one or No. 4. Section No. 1 will be the power unit driving the conveyor. For this purpose it will be fitted with a 30-hp. motor which should be amply strong to move all the coal with which the conveyor will ever be loaded during normal operation.

In order to allow of switching the four segments into position it was necessary to so arrange the machine that the fourth section can be jacked up and slid onto section No. 3. Sections Nos. 1, 2 and 3 may be disconnected and are so arranged that they can be moved from place to place by a locomotive by means of radial drawbar couplings. On section No. 1 the conveyor is so pivoted that its end, which normally extends over the car, can be lowered to clear the roof when moving.

In most cases where a 125-hp. hoist is used a conveyor such as this will be unnecessary. It is essential in the instance above outlined, however, because of the system of parallel entries employed.

**Safety Headquarters at a New Mexico Mine**

This home-like little cottage houses the safety station at Mine No. 5 of the Gallup American Coal Co. at Gamerco, N. M. L. M. Kuhn is the safety engineer in charge of this important part of the coal mining operation in Gamerco.

# Synchronous Motors with Magnetic Clutches Are Successfully Applied to Breaker Machinery

### They Start Heavy Loads Without Shock or Strain—Power Factor Is Improved and Peak Demands Reduced so That Penalty Charges on the Bill Are Avoided

**By Edgar J. Gealy**
Associate Editor, *Coal Age*
New York City

When the Chauncey Breaker of the George F. Lee Coal Co., near Avondale, Pa., burned down a few years ago it presented a good opportunity to build upon the old site a new breaker which would contain some of the most modern equipment available. From the way other companies have sent their representatives to visit and carry on tests at this plant, one is certainly assured that the aim of the management has been attained.

Even though the time allotted to build and equip the new structure was limited, Paul Sterling and A. J. Kutchera, who worked out the engineering features of the breaker with the management of the company, decided to install synchronous motors for the main drives.

An anthracite breaker, because of the enormous quantities of machinery employed in the process of preparing its product, usually requires a great deal of power. Whether this power is purchased or generated at the mines the power factor of the load becomes an important item. Consequently, the synchronous motors were used in the new breaker.

In spite of the fact that the installation of these motors necessitated some novel ideas in breaker construction and arrangement of machinery, the new $124,000 breaker was put in operation 54 days after the building was started.

All the breaker motors are supplied with energy distributed from a fire-proofed, inclosed, switchboard room located approximately in the middle section of the breaker. The largest motors are two 75-hp., 150-r.p.m., 440-volt, synchronous units, connected to their loads by belts. From the main switchboard room, circuits also extend to one 50-hp., two 30-hp., and two 25-hp. motors which drive small groups of equipment or individual machines.

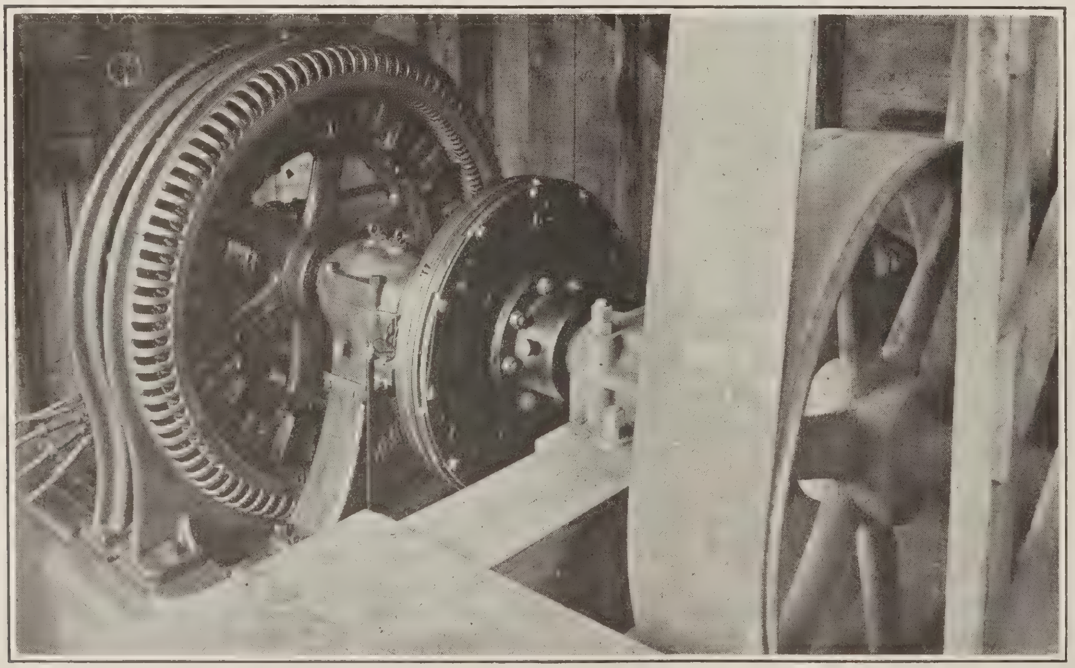
Each of the synchronous motors is equipped with a magnetic clutch. By means of this device the load can be accelerated smoothly and easily whenever the machinery is started. Control buttons are conveniently located near the motors or where a workman can see the equipment being driven. For slow-speed work, such as is required to unload a screen or clear a chute, a separate control lever is provided. Whenever new belts or ropes are installed inching is also easily accomplished.

Direct-current energy for the fields of the synchronous motors and also for the magnetic clutches connected to them is supplied from a 10-kw. motor-generator set located in the switchboard room.

## Automatic Control of Motors

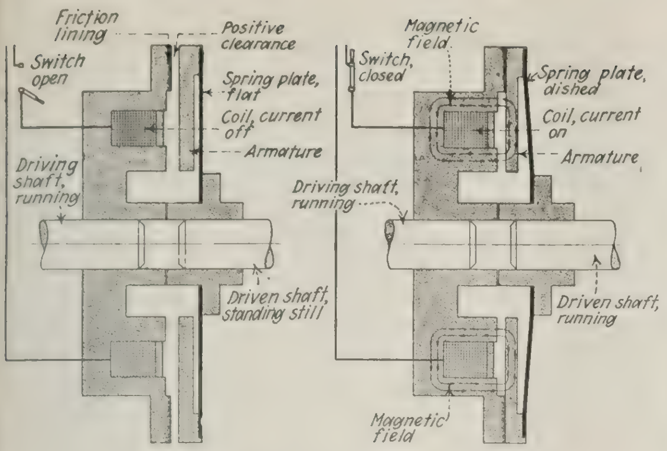
Automatic speed control and acceleration of the other motors is accomplished by means of operating panels having contactors connected to suitable resistance grids mounted behind them. These motors are also started or stopped by means of push buttons located near the machinery.

The application of synchronous motors to breaker



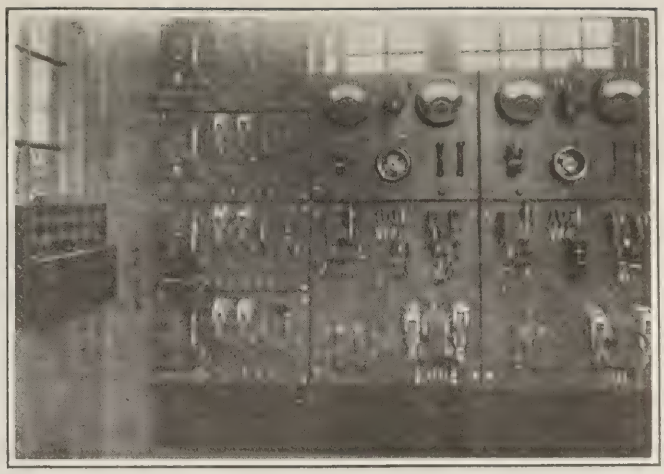
**Motor and Clutch**

Each synchronous motor is equipped with a magnetic clutch which makes it easy for the motor to start its load. This motor drives nine shakers through two belt and two rope drives.



**How the Magnetic Clutch Functions**

The successful application of synchronous motors to machinery used at the mines almost invariably necessitates the use of a clutch. A magnetic clutch, such as shown here, not only permits the motor to start easily but also makes possible slow-speed operation and inching.



**Control Board Regulates All Motors**

This is part of the switchboard located in the breaker. Timed accelerating contactors control the starting operations of the motors. On the extreme left the push-buttons, with covers removed, are shown.

machinery is unusual, but, in keeping with the increasing necessity for more efficient operation of mining properties, they were selected and have since proved successful in this service. Electric power is purchased upon a schedule which contains a penalty for poor power factor. This was another reason for selecting synchronous motors for the largest power units.

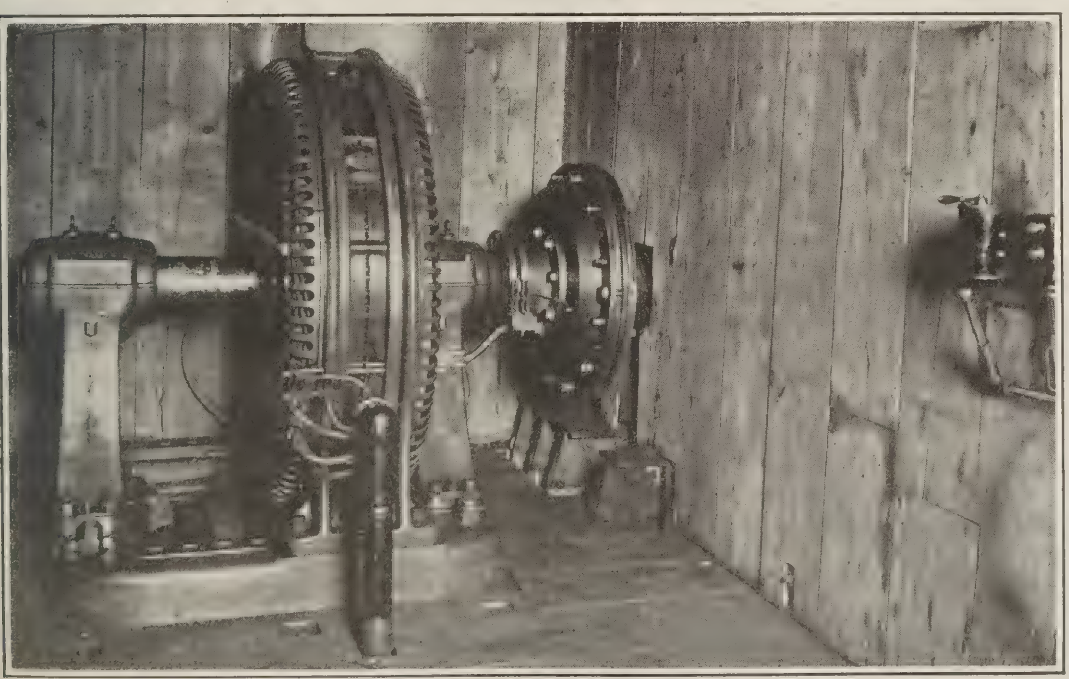
When a breaker is electrically driven the difficulty of operating at a good power factor always presents a serious problem. Heretofore induction type motors have been most generally used and often little or nothing has been done to counterbalance the high reactive currents which they necessitate. Relatively high efficiency at slow speeds is another advantage obtained by synchronous motors. Induction motors frequently require double-reduction gearing so as to permit the use of slow-speed apparatus.

No other device has contributed more to the successful application of synchronous motors than the mechanical or magnetic clutch. At this breaker magnetic clutches are used with the synchronous motors. They were selected because of their ruggedness, ease of control and safety. This type of clutch consists of two parts, one contains a magnet coil and the other a spring plate. When electric power is applied to the coil the second member is pulled into contact with the first. Thereafter, the friction between the two surfaces, which are held in contact with each other by the magnetic pull of the energized coil, grips the two parts together and prevents slippage.

### Low Full-Load Speed

It will be noted from the data of the motors that their full-load speed is unusually low. This fact, together with the smooth operation of the clutch, enables the loads to be started without jerk or sudden strain. By limiting the current supplied to the magnet coil of the clutch slow speeds and short movements of pulleys can be obtained at any time, especially when replacing ropes or belts. Dash-pot and magnetic timing devices govern the acceleration of the induction motors used to drive the coal-cleaning system, conveyors, pumps, etc., located in the breaker.

Another advantage obtained by the use of electric



**Inching Is Easy**

On the wall near each of the synchronous motors, a control switch is located to vary the magnetic field of the clutch and thus enable the workmen to turn the machinery short distances at slow speeds.

drives in this breaker is the safety with which the equipment can be operated. All machinery can be started from points where the workmen have full view of the apparatus. By merely pushing a control button any group of machines can be started or stopped without delay. Emergency stops can be made from several conveniently located stations.

High efficiency, good speed control, safety and satisfactory power factor have contributed in a large measure to the success of this breaker. The usual stresses and strains which most machinery is subjected to are almost entirely eliminated and breakage of parts is below normal.

Apparatus at this breaker rarely, if ever, creates high peak loads on the power company's lines because the synchronous motors, which are the largest units employed, start their loads slowly. Incidentally, the power company serving this mine has a clause in its schedule which penalizes consumers for highly fluctuating loads. Instantaneous peak demands, under this schedule are expensive because they constitute a factor which raises the 15-min. maximum demand upon which a part of the power bill is based.

# Does Scour Explain Why Gunite Clings Tight to Rock?

### That Blast Removes Oxidized Surface and Enables the Cementing Material to React with the Raw Rock Face, Is Theory Advanced

**By J. Drummond Paton**
Consulting Engineer, Manchester, England

THE EXCEPTIONAL strength of gunite concrete and the unusual results obtained with a cement projector has forced me to look for reasons, other than density, to explain these effects.

Doubtless the particles of material in flight from the nozzle to the surface at which they are directed take up the usual "tadpole" formation and impinge with an "arrow-head" directness and action that causes the gaseous material to leave in a "tadpole tail" at the surface under treatment. This determines the assembly and growth of the structure formed. There is, however, still another action to be considered.

If we consider first principles even in the simplest of metal-joining operations—soldering—the first requirement for success is a clean surface on which the "flux" used to produce the amalgamation effect can operate directly. Such a surface may be described as a "nascent" surface with which flux not only can come in contact but with which it can even react. Just as an elemental atom when liberated appears to have ability to combine with other atoms, that atoms long free do not have, so these surfaces freshly made appear to be more ready to react with other materials than surfaces that have been long exposed.

## Passage Causes Cleaning

In the passage of the sand through the "gun" chambers there is much surface attrition or what one might term cleaning. It is probable therefore, that in passing from the storage hoppers to the nozzle the particles become burnished—i.e., nascent. If such particles were again submitted to air reactions alone their oxidation would commence, and the result would be an oxide film forming probably a highly insulating covering which would prevent a speedy reaction of the particles with others with which they might later come in contact.

Certain classes of rock are much more liable to this oxidation effect, and it would be interesting to establish results based on the time between the initial crushing of large stone to ⅛-in.-to-0-dust and its use by a cement projector at the point of deposition. This change in rock with time is well known to mining men who have to maintain tunnels and roads in coal mines.

In many instances after a tunnel has been driven, air penetrates the interstices in the laminae of carboniferous rocks with a rapidity that is discouraging and the effect it has of "slaking" the roof and causing large portions of it to fall is only too well known.

## Gunite Protects Rock

In other cases a form of efflorescence coats the face of a tunnel a few days after it is driven, with what is almost a protective dust, and the service which this dust gives to the rock suggests the value of gunite protection, the gunite acting in the same way as nature in coating, and thus defending the rock from the ravages of disintegration.

In a somewhat limited experience of concrete and its particular properties, I have found that it showed evidences of special strength under conditions throught by the unobservant to be entirely normal, for example: (a) At a granite quarry an excellent concrete is obtained on an 11:1 ratio. This material a few weeks later when used on a public contract work with the standard 4:2:1 conditions did not give any such evidences of unusual strength. (b) In a process for the manufacture of slabs, blocks, etc. the molds are pressed till the final volume is one-half of the bulk of the mold when first filled and before pressure is applied. The exceptionally high tensile strength attained, would be attributed possibly to the absence of voids. (c) In cases where cements are blended, where lime and silicate of soda are added or similar means of obtaining a strong concrete are adopted an unusually strong cementing material is obtained due to special cementitious properties attributed to the admixture.

## Observer Sets Forth Theory

I hold that the results are due: (a) To "nascent" surfaces characteristic of freshly crushed rock, which have not been allowed to oxidize sufficiently to insulate the surface from desirable cement reaction; (b) to the disruption of the rock and the production of "nascent surfaces" as much as to the density of the resultant concrete; (c) to the reactions that destroy the oxide insulation, merge the oxides in the eutectic and leave the nascent surface for adhesive reactions.

I can conceive a condition of aggregate where the surfaces are not integral to the core and where the coating adheres to the mass of material much as a walnut shell adheres to the core.

To test my theory, a rock of known characteristics may be taken that has been crushed to suitable aggregate size and exposed for one, two, three or four weeks to six months, and from that sample concrete test pieces may be prepared. Put the same parent rock fresh mined into a large crusher, then with the correct cement and water, crush the aggregate in the absence of air or under water, and eject into molds for comparative tests. The result will show whether the theory as to the value of nascent surfaces should be regarded as established or worthy only of rejection.

*Banning No. 2 mine of the Pittsburgh Coal Co. operating on 1917 wage basis*

# Efforts to Break Mine Union's Grip on Central Competitive Field Make Slow Progress

**By Sydney A. Hale**

Special Contributor, *Coal Age*,
New York City

THREE SEPARATE MOVEMENTS to break the grip of the United Mine Workers of America in the Central Competitive Field have been started within the past few months. Indiana; southern Ohio, particularly in the Pomeroy Bend district; and most recently, the Pittsburgh Coal Co. in western Pennsylvania have led the revolt. Indiana's attempt to avoid the penalties of the Jacksonville agreement has been through the medium of co-operative mines. Genuine co-operative mining, of course, has been tried off and on for years—generally on a very small scale. Many of the country banks are ventures of this type. The Indiana experiment which provoked the wrath of the union involved larger operating units. One mine which came under the ban was producing 1,100 tons a day.

The Indiana system began to attract attention early in the year when several mines in Knox County were "leased" to groups of miners and former subordinate officials of the operating companies that had been in control. The terms of one of these leases provided that the former operators (the lessors) sell sufficient coal to enable the lessees (the miners' group) to operate four days a week and to hoist at least 900 tons of coal a day. The sales agent of the lessors was to receive 10c. a ton for handling the coal. This particular lease is not cited as typical. Possibly no one lease could fulfill the specifications of a typical case as the arrangements offered full scope for the display of ingenuity. The core of the situation was that the arrangement, whatever, its terms, relieved the lessor operating company from the obligation to pay the union scale. That obligation presumably was passed on to the co-operative lessee organization or group. The lessor or his agent handled the coal, usually at whatever price he could obtain in the open market, and was compensated in sales commissions, royalties or depletion payments.

Although these co-operative mines ostensibly paid the union scale, in reality, so the United Mine Workers insisted, such was not the case. "An exhaustive examination of the financial and operating problems of each leased mine," declared an official circular to officers and members of District No. 11 (Indiana), warranted "the most severe condemnation of this system of mining. It appears that in many instances the owners of certain mining properties were unable to operate their mines in accordance with the agreed scale in District 11 and induced their employees to jointly take over the operating of the properties. The original owners thus are freed from any financial hazards and derive substantial revenue from the payment of royalties and commissions

---

Third of a series of articles describing the changes in the labor status of the different bituminous coal producting districts of the United States in recent years. Preceding articles appeared in *Coal Age*, Sept. 24 and Oct. 1, 1925. Another article will appear in an early issue.

on the sale of coal by the lessees. In order to produce the coal at the low price required by the owners of the property, the lessees are obliged to pay their monthly deficits in production costs with money derived from the sale of stock or through assessments levied against the earnings of each employee."

The more common methods of keeping costs within the limits of selling prices, however, were increased efficiency and the contribution of free labor for deadwork. The specialization under which the process of coal extraction has become a multiplication of segregated tasks performed by different individuals was supplanted by an era of despecialization in which each man would labor full time at the work which came to his hand. Something approaching the system credited to Henry Ford when he took possession of the Detroit, Toledo & Ironton R.R. came into vogue. Mr. Ford, it was said, could see nothing incongruous in having a locomotive engineer who had completed his run finish out the eight hours for which he was paid by hustling baggage or sweeping off the station platform if necessary. The new mine lessees were apparently of the same mind.

### Less Day Labor Required

Under the co-operative system the fine distinctions so jealously guarded by union precept and practice were no longer recognized. As a result, in some cases one man was able to do the work for which previously two men had drawn pay. In others, the functions of certain of the maintenance men were absorbed by the coal diggers. An efficiency committee at one operation dispensed with the services of three of the five blacksmiths employed and warned the two who remained that the same fate awaited them if they proved unequal to the smithing needs of the mine.

The union followed up its condemnation of co-operative mining in Indiana with a threat to revoke the charters of local unions whose members persisted in co-operative activities. A temporary injunction against the enforcement of this order was dissolved, largely on jurisdictional grounds, and the movement collapsed. For the most part, the men who were willing—eager in many instances—to work under the co-operative arrangement before it was banned by the United Mine Workers and who did not decry protection by injunction refused to jeopardize their union standing when the organization was in a position to make discipline an issue. Nor did the operators as a whole show any great desire to pursue the experiment further in the face of the determined opposition of the union.

### Indiana Sticks to Union

As a matter of fact, the operating association that has been the direct contact between the individual producers and the union declined to countenance the co-operative idea. According to an official of that organization, the producer who wished to try out the co-operative scheme had to withdraw from membership in the operators' association. At no time has it been suggested that Indiana as a whole expressed any desire to throw over the union. Indeed, only a few weeks ago Phil H. Penna, secretary of the Indiana Bituminous Coal Operators' Association, in an address before the Rotary Club of Terre Haute, declared that his organization would stick to the Jacksonville agreement to the end.

Nevertheless, the action of the union in threatening the revocation of local charters makes it plain that the movement was not regarded lightly by the labor leaders. At its height about a dozen mines were involved, some of which had been reopened after long shutdowns. Their daily capacity aggregated several thousand tons, and they were loading coal at a time when only a few of the strongest shaft mines and the low-cost strip pits were operating—and the shaft-mine tonnage was being produced at a loss. Union spokesmen asked how it was possible for these co-operative mines to work and pay the Jacksonville scale if the lessors of such operations, with all their experience, could not do it. The implication, of course, was that the scale was not paid. But it is not impossible that the revelation of what could be accomplished in cost-cutting by speeding up and lopping off was equally distasteful to the labor organization.

### Co-operative Idea Spreads

The co-operative idea, however, was not confined to Indiana, although the injunction proceedings referred to threw such a spotlight on the situation in that state that it is easy to overlook the fact that the same problem has presented itself in other parts of the Central Competitive Field. The 1925 district convention of the United Mine Workers in Ohio held the growth of co-operative mining in that state so menacing to the existence of the union that it adopted a resolution providing that workers employed in co-operative mines would be barred from union membership unless union officials were permitted to check the leases under which such mines were operated, examine the books of the companies "and take such other steps as might be deemed necessary to maintain union working conditions."

Doubtless this pronouncement of the union attitude has had some restraining influence upon the growth of the co-operative movement in the Buckeye state. Nevertheless, there has been a number of smaller operations which have continued despite the unfriendly stand of the miners' organization. Individual tonnages and the number of men employed at individual operations are small, but the mines in question are tipple, or commercial, collieries and not the local country banks the product of which, except in seasons of unusual demand, cannot enter into the general stream of coal traffic.

### Ohio Miners' Organization Active

In southern Ohio, a canvass made several weeks ago showed about twenty-five of these four- to five-car capacity tipple mines working on the Hocking Valley Ry. and loading an average of 75 tons per mine daily and almost as many operations on the Toledo & Ohio Central and Zanesville & Western railroads combined, with a slightly lower daily average loading. Since that time, however, the state miners' organization has been more aggressive in its campaign against the co-operatives. It has succeeded in forcing the suspension of a number of smaller operations in the Nelsonville district by threatening the expulsion of members working at less than the Jacksonville scale.

Another reason, perhaps, why the fight on co-operative mining in Ohio has been less spectacular than in Indiana has been the open flaunting of the union by a few operators in the Pomeroy Bend district. These companies, except at one mine, have not resorted to any co-operative arrangement to resume operations, but have boldly reopened on the November, 1917, scale.

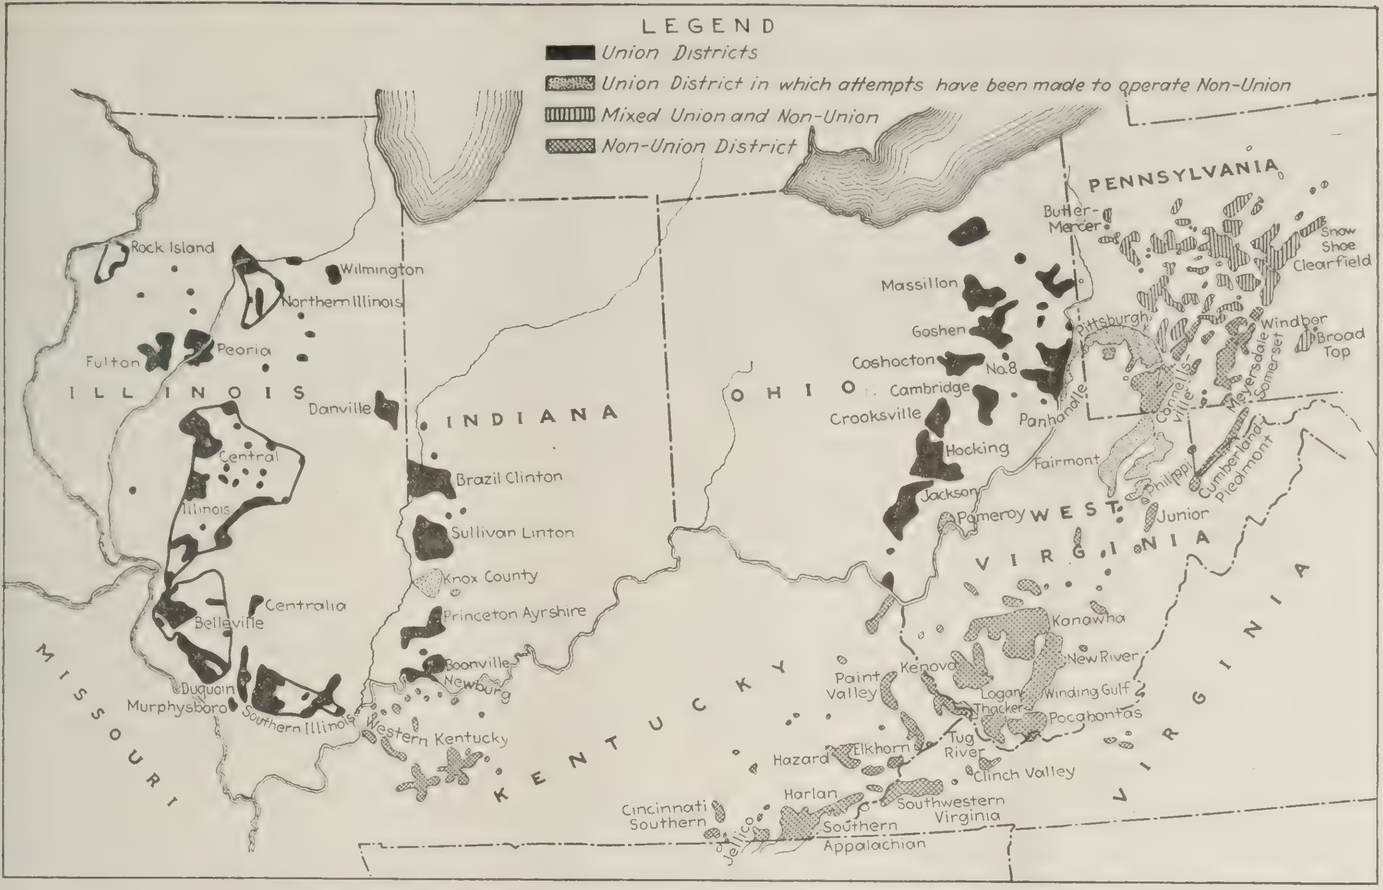

Fig. 7—The Central Competitive Field and Its Non-Union Rivals

The Central Competitive Field covers all of the coal producing area of Illinois, Indiana and Ohio. It also includes District No. 5 (western Pennsylvania), embracing not only the Pittsburgh, but the Butler-Mercer district. As related in the text, the solidity of union control was challenged in the Indiana co-operative movement and has been broken in the Pomeroy Bend district of Ohio and in western Pennsylvania. The economic reasons back of the struggle of Ohio and western Pennsylvania to shake off the union yoke can be visualized in the ring of semi-organized and openly non-union districts surrounding them.

This scale carries a basic day rate of $5, as compared with $7.50 under the Jacksonville contract, and knocks 24c. off the pick-mining rate. The posting of this scale, say the operators, was done after the miners had petitioned the companies to start up again.

### LEWIS CALLED TO CHECK REVOLT

The union considers this revolt so serious that John L. Lewis went into the Ohio fields to hold the workers to their union allegience by the power of a flood of defiant oratory. In this appeal, he reiterated his firm determination to insist that the Jacksonville agreement be recognized until the last minute of its term. How successful he was in checking the spread of the revolt cannot be told because nobody knows how many other members of the United Mine Workers in that part of Ohio were ready to accept the 1917 scale as the price of work.

Neither Mr. Lewis' vocal art nor the series of "accidents" which have befallen the Pomeroy Bend mines working on the 1917 scale, however, have been strong enough to force those particular operations back into the Jacksonville camp. Tipples have been burned, transportation facilities dynamited, power houses put out of commission, and the determined operators have rebuilt. Workers cut off from their connection with the United Mine Workers formed the Independent Mine Workers' Association, but have shown little interest in the substitute. The most recent reports available show for operations of the Pittsburgh Coal Co. at Dark Hollow, Forest Run, Syracuse and Thomas hoisting over 900 tons per day. The tipple of the Blackstone mine at Rutland—formerly known as Maynard No. 4—was burned on June 17, but reopened Aug. 20. The Stalter-Essex Co. also continued operations despite fires.

So fast had the movement spread that by the middle of August about 900 out of 1,800 men normally employed in the Pomeroy Bend district were working. More than half of this number (approximately 520) were working at the 1917 scale. A number of others were working on a co-operative basis. To say, therefore, that over 75 per cent of the men employed had abandoned the Jacksonville agreement is conservative. Since that time the quickening demand attributable to the disturbances in the anthracite region has enabled some mines which had been down for several months to make another attempt to run on the full union scale.

A record of the Pittsburgh Coal Co. operations in the Pomeroy field since the movement to operate at less than the Jacksonville scale started is shown in Table III.

### PITTSBURGH FALLS INTO LINE

The western Pennsylvania movement to operate on a cost-basis more nearly in line with that of directly competing fields is on all fours with the Pomeroy Bend experiment. It started on Aug. 20, when the Pittsburgh Coal Co., which on May 19 had closed down the last of its 54 mines which had been operating on the Jacksonville scale, reopened its Banning No. 2 mine, located 43 miles from Pittsburgh. On Aug. 24, the Boggs mine

* Average number of workers per day.

of the Montour & Lake Erie Coal Co., near Imperial, started up, but a few days later operations were again suspended. The district organization of the United Mine Workers of America threw scores of pickets into the Banning area in an attempt to stop the resumption of work under the 1917 scale. Notwithstanding this effort, production rose from 75 tons on Aug. 22, the first day coal was loaded, to 715 tons on Sept. 18, and the number of employees increased from 24 the day the mine reopened to 210 on Sept. 18. The normal working force is 400.

### Movement Makes Slow Headway

On Sept. 15 the company reopened Banning No. 1 with 31 men at work. The next day the number increased to 37; on Sept. 17 it was 105 and on Sept. 18, the first day coal was loaded, it had gone to 141. The quantity of coal loaded was 143 tons.

The record for Banning No. 2 to Sept. 19 is set forth in Table IV.

### Table IV—Record for Banning No. 2 to Sept. 19

Output and Number of Men Working at Banning No. 2

| Date | Men | Tons | Date | Men | Tons |
|---|---|---|---|---|---|
| Aug. 20 | 24 | ... | Sept. 4 | 197 | 558 |
| 21 | 39 | ... | 5 | 202 | 547 |
| 22 | 66 | 75 | 8 | 204 | 502 |
| 24 | 89 | 137 | 9 | 222 | 647 |

| 2 | 168 | 565 | 18 | 210 | 715 |
| 3 | 173 | 516 | 19 | ... | 800 |

In addition to these open departures from the Jacksonville scale, it is freely charged that many operators ostensibly running union are not living up to the letter of the agreement. That deadwork is performed without proper compensation is a common accusation. In one case it was said that mines worked 8 hr. for 6-hr. pay; in another, that no fines or bugdust was loaded out; in still another, that an average reduction of 6c. per ton was effected through failure to charge extra for narrow work. These charges are denied in toto by the union representatives in the district. The charges are denied in some cases, evaded in others by the operators. Some producers, however, frankly confess that it is the inability to get these advantages, rather than any keen desire to keep the strict letter of the contract which holds them to the straight and narrow path of unqualified adherence to the terms of the Jacksonville agreement.

### Union Far from Licked

The United Mine Workers, according to the latest information available, has been completely successful in stamping out the rebellion against its power in Indiana. The labor organization has been able to hamper and check the co-operative movement in Ohio. Illinois, which was accused of supporting Pittsburgh and southern Ohio in the 1921-22 fight against the preservation of the Central Competitive Field as a wage-making unit, has been quiescent. There, as elsewhere, operators have been hoping against hope that the international officers of the mine workers' union would consent to a downward revision in the Jacksonville scale, but they have made no attempt to break with the organization for its refusal to entertain such a change. Illinois has felt the pincers of non-union competition less than the other three districts in the Central Competitive Field, but even in that state the pressure has been growing.

It is only in the Pomeroy Bend and the western Pennsylvania districts that the rebellion against union domination remains uncrushed. True, neither the tonnage nor the number of men so far involved is large enough to leave any impress on the market. District No. 5 of the United Mine Workers of America—the western Pennsylvania area—has a membership of approximately 45,000, of whom, according to union figures, 23,000 are now employed in the mines of the district—

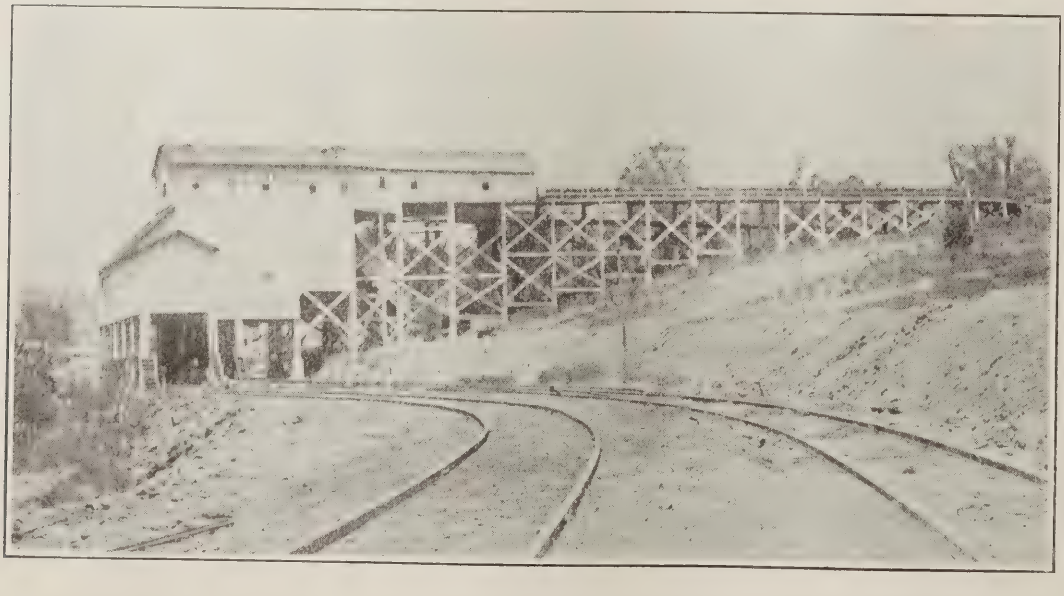

FIG. 8

**Holds the Line for 1917**

Mine No. 7 of the Stalter & Essex Coal Co. in the Pomeroy Bend district has been operating on the November, 1917, scale since May 27. It now employs over 200 men and loads approximately 1,200 tons a day. This is the largest average daily tonnage yet reached by any mine breaking away from the union in the Central Competitive Field.

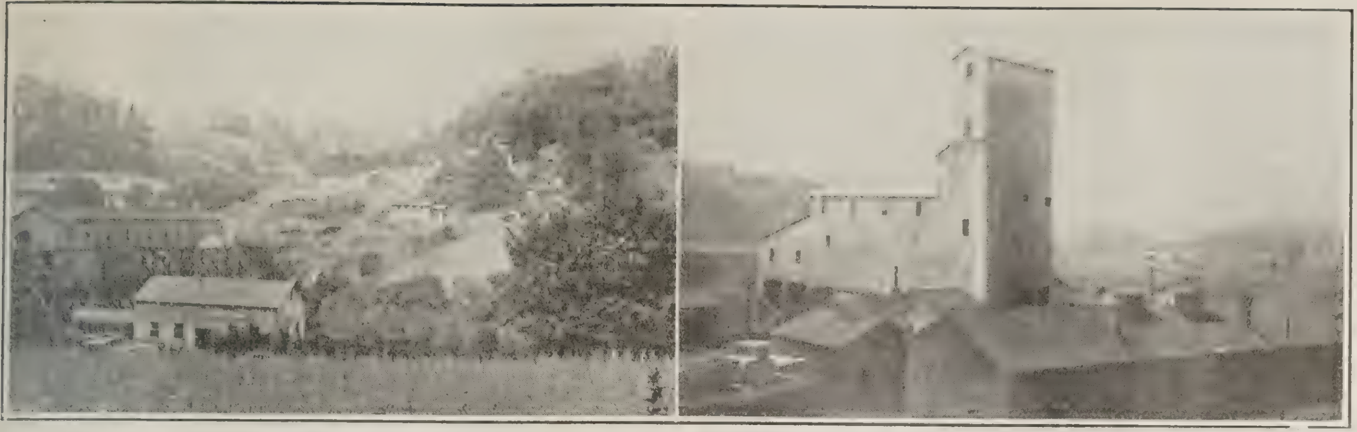

Fig. 9—Victims in the Struggle to Re-establish the 1917 Scale?

The warfare against the maintenance of the Jacksonville scale in the Central Competitive Field has not been without its casualties. Some of these have been recorded in the bankrupt courts, some in the files of insurance companies. The Stalter & Essex Coal Co. was a pioneer in reopening under the 1917 scale in the Pomeroy Bend district. Mine No. 5, shown on the left, was burned down before daylight on the morning of May 31. The tipple of mine No. 1, shown on the right, met a similar fate on Aug. 1. The tipple of No. 5 has since been rebuilt and the mine was reopened about two weeks ago with approximately 80 men at work and an initial tonnage of 300 tons. It has been working steadily since that time.

for the most part, on broken time. Less than 400 men have accepted the conditions of employment at the two Banning operations of the Pittsburgh Coal Co. The Pomeroy Bend group of mines are included in District No. 6. This district had a union membership of 48,000 at the peak of power in 1920; the most claimed for the 1917 scale and co-operative operations in the Pomeroy Bend area is less than 700. The combined totals in the two fields, when compared with union membership of over 220,000 in the Central Competitive Field as a whole, is pitiably insignificant.

If the number of men and the tonnages mined at the 1917 scale could be held at approximately their present figures, the union might close its eyes completely to the secession. Of course, both operators and miners recognize the impossibility of maintaining such a static condition. While today only one company has challenged the union in the Pittsburgh district, that company is one of the largest producers in the country. Back of it now stands the Pittsburgh Chamber of Commerce, convinced that the maintenance of the Jacksonville scale is spelling the doom of the coal industry in western Pennsylvania.

### PITTSBURGH COMPANY TAKES LEADERSHIP

The break with the union has been clear-cut, definite. Reliance is not placed on any boring-from-within process such as was tried by Myerscough and his fellows on the "International Progressive Mine Workers' Committee" in 1921, but in the frank recruiting of mine labor willing to abandon the shadow as well as the substance of United Mine Workers' control. To this end, the Chamber of Commerce has established a special department in charge of E. S. McCullough, former vice-president of the United Mine Workers and more recently labor commissioner for the Northern West Virginia Coal Operators' Association. His employment naturally has widened the breach. Neither the Pittsburgh Coal Co. nor the Pittsburgh Chamber of Commerce can now retire without a heavy loss of prestige.

The miners know this. The Addisonian sweetness with which labor leaders in Pittsburgh comment upon the venture is a pose which need deceive no one. If the movement gains further headway, it is most unlikely that the union will content itself with peaceful picketing and the sending of telegrams to Washington denouncing the Pittsburgh Coal Co. as a contract-breaker. The history of the recent past in the struggle of the union to hold what it has and to further enlarge its sphere of influence is against such a comfortable conclusion.

Up to the present time, the Pittsburgh Coal Co. has made its fight alone. But the other operators in the field are watching day to day developments closely. Some of the commercial mines still running realize that their ability to continue work under the Jacksonville scale is due to the fact that so many of their competitors in the district have suspended operations. Many of the latter group are growing restive. If it appears to them that the Pittsburgh Coal Co. stands a reasonable chance of making a financial and an operating success of its venture, they will attempt to follow its lead and cut loose from the United Mine Workers.

The success of the movement initiated by the Pittsburgh Coal Co. would mean the end of the United Mine Workers in western Pennsylvania—and the disruption would not stop there.

**Where Ford Coal Comes Out**

Drift mouth of the main haulage way, No. 4 mine, Fordson Coal Co., Stone, Ky. The Stone division is producing over 170,000 tons per month with but six of the nine mines in operation. Although the Fordson company is experimenting with loading machines, none are in use in the mines of this division. Of the total output of the Fordson Coal Co., only about half is consumed by the Ford industries.

# Southern Mining Co. Men Go Over Their Problems

## Discuss Mine Operating Questions in Third Annual Meeting with Manufacturers' Engineers at Williamsburg, Ky., Headquarters

By J. H. EDWARDS
Associate Editor of *Coal Age*

FEW, INDEED, were the Kentucky coal-producing companies able to "make their depreciation" during the past two years. The Southern Mining Co., with headquarters at Williamsburg, Ky., was one of the few. Some of the reasons for this were apparent during the third annual convention of the mining and electrical men of this company and its affiliations held at Williamsburg, Sept. 25 and 26. The four technical sessions and the get-together dinner brought out the facts that efficient personnel, up-to-date machinery and intelligent handling and maintenance of equipment combine in Southern service. But above them all is wide-awake interest.

Typifying the *esprit de corps* of his associates, F. A. Signer, electrical engineer, presided in a wheel chair over every session even though one leg was in a plaster cast and the other useless because of a sprained ankle. He had been hurt in a mine two weeks before.

More than sixty were in attendance. The coal company men were seated at tables and visiting engineers and salesmen along the "side lines" parallel to the tables. Chief electricians, mining engineers, and superintendents took part in the discussion, which, although it centered chiefly about problems of equipment maintenance and power cost, also included mining methods. On a wall blackboard near the chairman there was printed in large letters, "Our Slogan—Better Coal, Lower Cost."

The first subject, that of electrical department expenses, soon led to a discussion of the economical handling of supplies. L. A. Safriet, superintendent of the Gatliff Coal Co., which produces 1,200 tons per day, stated that by hiring a supply man to dispense material as needed, the supply expense was reduced 33 per cent. At the smaller mines where it hardly pays to keep a supply man, this work can be handled to advantage by the chief electrician. At one of the largest mines, that of the Southern Mining Co. at Balkan, Ky., G. L. Birch, chief electrician, buys and also distributes mechanical and electrical supplies.

Dirty tracks were cited as a likely cause for high power costs. At one of the mines the consumption dropped from 3.3 kw.-hr. per ton to 2.25 kw.-hr. per ton after the tracks were thoroughly cleaned. The importance of keeping one eye on the demand meter was indicated by an incident by which W. W. Troutman, chief electrician at the Golden Ash Coal Co., saved $120 on a power bill by getting into communication by phone with the power company, explaining that an accident in the mine a few minutes before had caused a high overload on the substation, running the demand meter to a figure far above normal maximum for that month.

As with most other subjects discussed, Mr. Signer, when taking up that of lubrication, called for a report from each chief electrician of his troubles and successes during the last year. These reports showed the general tendency to use higher quality lubricants, and to cut out the use of black oil entirely. The total cost of lubricants at the new operation of the Southern Mining Co. at Insull, Ky., during the period from October, 1924, to July, 1925, was 8 mills per ton.

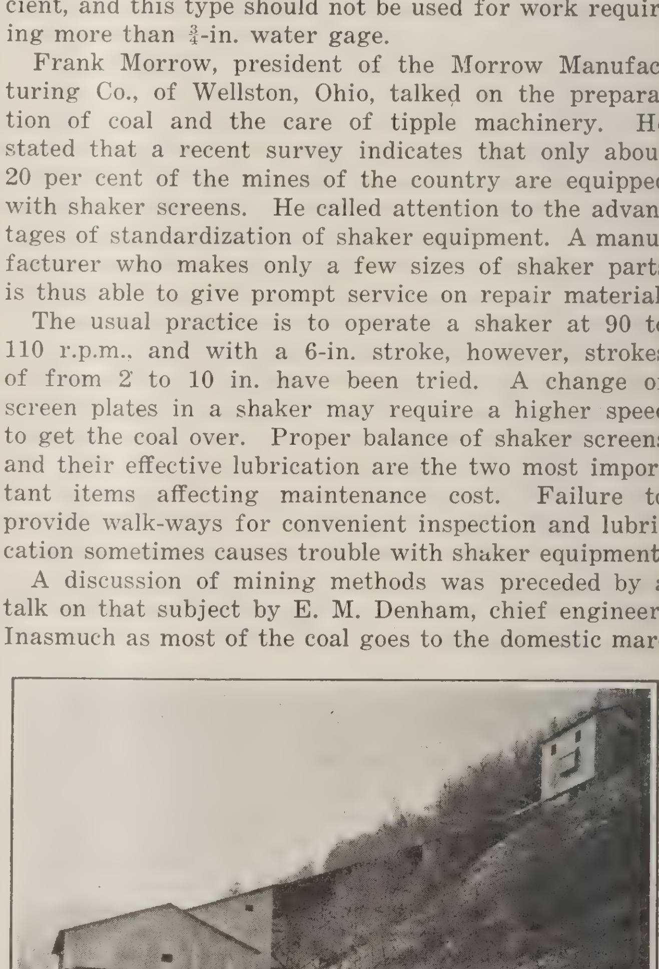
An excellent paper by T. W. Armstrong, general manager of the Fiskes Bros. Refining Co., on the production and "whys and wherefores" of good and poor lubricants was presented. The chief electricians then discussed their troubles with waste-packed bearings. It was brought out that the tendency for wool yarn to wrap around the journal can be overcome by using 15 to 20 per cent by weight of horse hair mixed with the yarn, instead of the usual 10 per cent. More time should be taken in packing a box. The yarn should be twisted into a loose rope and this worked back and forth in the box as it is put in.

Mine ventilation next came up for discussion. C. H. Trik, of the Jeffrey Manufacturing Co., read a convincing paper urging better airways in the mines and making plain the penalty in operating cost inflicted by cluttered air courses and by the use of inefficient fans. He explained the fallacy of depending on a water gage reading at the fan to indicate the condition of the airways. The anemometer is the only instrument which tells the true story. According to Mr. Trik, the best disk fans are not over 45 per cent efficient, and this type should not be used for work requiring more than ¾-in. water gage.

Frank Morrow, president of the Morrow Manufacturing Co., of Wellston, Ohio, talked on the preparation of coal and the care of tipple machinery. He stated that a recent survey indicates that only about 20 per cent of the mines of the country are equipped with shaker screens. He called attention to the advantages of standardization of shaker equipment. A manufacturer who makes only a few sizes of shaker parts is thus able to give prompt service on repair material.

The usual practice is to operate a shaker at 90 to 110 r.p.m., and with a 6-in. stroke, however, strokes of from 2 to 10 in. have been tried. A change of screen plates in a shaker may require a higher speed to get the coal over. Proper balance of shaker screens and their effective lubrication are the two most important items affecting maintenance cost. Failure to provide walk-ways for convenient inspection and lubrication sometimes causes trouble with shaker equipment.

A discussion of mining methods was preceded by a talk on that subject by E. M. Denham, chief engineer. Inasmuch as most of the coal goes to the domestic mar-



**One of the Southern Company's Tipples**

This is at the Perkins-Harlan Coal Co. mine, Ligett, Ky. The present daily producing capacity of this property is 800 tons.

**N. B. Perkins**

He is vice-president and general manager of the Southern Mining Co. and a chief official of several of the affiliated companies.

ket, percentage of lump dictates in many instances the method of mining. No loading machines are used, and most of the mines employ the room-and-pillar system. In one mine a modified longwall system which was being tried had to be abandoned because of the decrease in the percentage of lump.

Next in order Mr. Signer brought up the question of ordering repair parts. He emphasized the necessity of a small but well-selected and properly maintained repair stock, and called attention to the delays, mistakes, and high cost of ordering supplies by telephone or telegraph and shipping by express. E. L. Thomas, of the Sullivan Machinery Co., urged the chief electricians to use more care in specifying parts, giving the name, part number, catalog number, and the machine serial number. Mr. Davis, of the General Electric Co., described his company's new method of cataloging mine locomotive repair parts by photographs.

Steel terminal electric-welded bonds are standard at all mines of the companies represented at the meeting. Reports of tests on bonding at the various mines showed a marked improvement during the past year. In one mine every bond was found in perfect condition. In several others the showing was close to 100 per cent. Mr. Palmer, of the General Electric Co., described a four-weld bond which utilizes the angle bar as a part of the bond. A number of this type are now on trial at a Pennsylvania mine. The chief electricians reported excellent results with the new "A" and "B" electrode metals for welding cast iron and thin steel.

The discussion of mining machine troubles soon narrowed to the relative merits of the five- and seven-position chains for cutting coal which tends to "set down" and bind the cutterbar. W. J. Henry, of the Sullivan Machinery Co., explained that the ability to cut coal under such circumstances does not depend so much on the number of positions in the chain as it does upon the lacing. The seven-position chain with the old staggered lacing, which puts more bits in the top and bottom positions than does the V lacing, is best for the work because it will cut its way free. He recommended the use of sprags to hold up coal back of the machine, saying that one or two sprags to a place are sufficient.

Locomotive troubles proved to be an interesting subject. The loudest demand of the chief electricians was for a satisfactory puller for armature bearings. One man suggested the use of a looser fit of the inner race on the shaft, and a light key to hold this race from turning. Considerable trouble with broken pinions was reported on those locomotives equipped with electric braking, and operating on severe duty. Tool steel pinions are now getting a trial on this service. Many other electrical and mechanical matters also were discussed at the two-day meeting.

The companies represented at the conference have a total daily output of approximately 8,000 tons in Whitely, Bell and Harlan counties of Kentucky, working coal from 28 in. to 44 in. thick. In addition to the Southern Mining Co., which has mines at Balkan, Insull and Colmar, Ky., the affiliated group includes, the High Splint Coal Co., High Splint; Gatliff Coal Co., Gatliff; Perkins-Harlan Coal Co., Ligett; Perkins-Bowling Coal Corp., Anco; Golden Ash Coal Co., Kitts; Mahan-Ellison Coal Corp., Ligett, all of Kentucky, and the New Carryville Coal Co., Carryville, Tenn.

---

# Roberts Tells Engineers Why Mechanical Cleaning Pays

### Declares Sizing Alone Has Limited Value—Ash Content of Small Coal Is Excessive Unless Mechanical Cleaning Is Employed

THE CLEANING of nut coal on picking tables is a useless process which should be eliminated under any condition at any mine. Hand picking should be confined to larger sizes; nut and slack should be cleaned mechanically. These points were among the many brought out by Col. Warren R. Roberts, president of the Roberts & Schaefer Co., of Chicago, in a talk on "The Value of Improved Preparation of Pittsburgh Coal," at the bi-monthly meeting of the Engineers' Society of Western Pennsylvania (Mining Section), in Pittsburgh on Sept. 29. N. F. Hopkins, consulting civil engineer, of Pittsburgh, presided.

Colonel Roberts did not confine his talk to the Pittsburgh coal seam alone. He intimated that the value of coal from practically all seams can be greatly increased by improved preparation. Without going into details as to how such preparation can be effected, he told his audience why such practice pays, substantiating his statements by some cost figures.

Delayed progress in better preparation of bituminous coal is natural, Colonel Roberts believes. The vastness of our coal resources and general distribution methods have made us wasteful. Progress has been slowed by the general indifference toward quality coal on the part of the consumer who, in the past, bought coal on price alone. A change in this respect is taking place. Large consumers are now beginning to buy on analysis.

Unfortunately, it is often the sales department rather than the operating department which has to force the issue for better preparation. The operating department is slow in getting into action and recommendations from the sales department for changes in methods of preparation are pigeonholed until the sales manager convinces the other officials that the company is losing its markets. Then action is taken in which the operating department assumes the lead. Thus, it is the attitude of the engineer which decides, in large measure, the degree to which preparation is to be carried out. The old-time operators could not see the advantage of new preparation methods as do their younger successors.

Aside from any premium which might be commanded from coals by reason of advanced preparation methods, the mine owner retains his old markets and gains new ones, according to Colonel Roberts. His coal properly prepared draws a premium over coal from an identical seam which gets only haphazard preparation. He saves rebates on rejected coal. As he corrects facilities for preparation other improvements throughout the plant become more obvious and many faults are remedied with the outlay of little additional capital.

In speaking of the value of clean coal to the nation, Colonel Roberts showed the country-wide saving in freight which the bituminous industry could effect by reducing the average ash content by 3 per cent. This saving based on a yearly consumption of half a billion tons at an average freight rate of two dollars would aggregate $30,000,000.

Sizing without cleaning, as so generally practiced in Illinois, has limited value, he said. An operating company in northern West Virginia, wanting to find out whether this is so, carefully sized a carload of 1x2-in. coal which was passed over a table and picked by ten men. This coal was shipped to a testing plant where it was dry-cleaned. Analyses before and after showed that the dry-cleaning process lowered the ash content by more than 9 per cent.

Another West Virginia operator shipped to this testing plant a car load of 2-in. screenings which was sized, sampled, dry-cleaned and again sampled, displaying the following results: Ash content in 2x1-in. size reduced from 18 per cent to 8 per cent by dry cleaning; 1x½-in. size reduced from 15 per cent to 7 per cent; ¼x$\frac{1}{16}$-in. size reduced from 9 per cent to 5 per cent. The fines analyzed 6 per cent ash and, therefore, were not cleaned. A sample of the car before cleaning analyzed 12 per cent ash. The cleaned sizes when remixed had an average ash content of 7 per cent. This test showed that sizing alone would not help this operator to sell his coal and that it was the low ash content of the fines which helped him to sell the smaller sizes mixed.

This operator is working the Pocahontas No. 3 seam. The roof in his mine breaks into fairly small sizes but does not crumble, accounting for the freedom of refuse in the fine coal and the high percentage of refuse in nut and pea sizes. He contemplated a dry cleaning plant and on inquiry learned that a plant handling 206 tons per hour, or 400,000 tons in a 200-day year, could be erected for $120,000. The cost per ton of cleaning was estimated at 9c., figuring $7,200 for annual interest, $16,800 for operating and maintenance per year and $12,000 depreciation per year (plant written off in 10 years). In the cleaning 5 per cent of the coal or 20c. per ton (slack at $2) would be lost. The total charge to cleaning, therefore, would be 29c.

His coal as smokeless mine run was selling in Cincinnati on Sept. 24 at $2.50 per ton. If this same coal had been cleaned to permit its respective sizes to stand on their own merit, the sizes would have yielded the following prices: Lump (20 per cent), $5; egg (15 per cent), $4.50; nut (40 per cent), $3; and slack (25 per cent), $2. The average realization per ton from this coal, when sized and cleaned, would have been $3.37. Deducting the 29c. charge per ton for cleaning, his realization per ton of cleaned and sized coal would have been $3.08 as compared with the mine-run price of $2.50, a margin of 58c., Colonel Roberts figures.

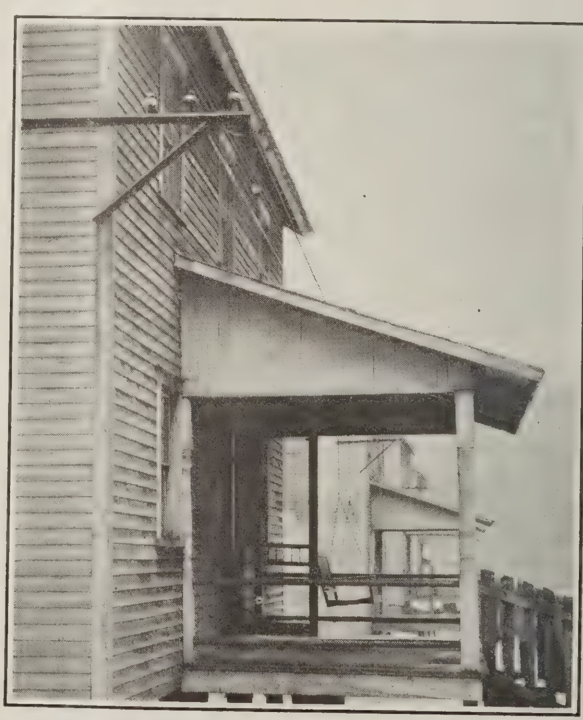
A brief discussion followed Colonel Roberts' talk. Graham Bright, consulting engineer, of Pittsburgh, emphasized the need of a uniform ash analysis of coal shipped from a plant. A uniform product will give a steady run to a mine and will, in most cases, enlarge its markets, giving lower production costs if not higher realization per ton. A uniform product cannot be obtained very well except by mechanical cleaning he thinks.

## House Brackets Displace Poles

After five to fifteen years of service wood cross-arms and wood poles begin to show signs of decay and unless they are given constant attention will present a rather unsightly appearance. Moreover, it is always difficult to keep small wood poles in proper alignment.

In certain streets of the town of Raleigh, W. Va., the Raleigh Coal & Coke Co. has taken out the original wood poles and placed the 110-volt secondary lighting circuits on steel brackets fastened to the houses. At first thought it might appear that this would hurt the appearance of the street. However, this construction is much neater than a line of poles in front of the houses with the necessary service lines to each house.

Conditions which make this method applicable on certain of the streets of Raleigh are that the houses are two-story, are of uniform design, and are built with the fronts on a straight line. It will be recognized that supporting the wires on brackets is much cheaper than supporting them on poles. Besides the saving in poles shorter service leads are used and maintenance is lowered.



**House Corner Serves as a Pole**

Formerly there was a pole line in the street in front of these houses. When the poles got into bad condition they were taken out and the line supported as shown for economy's sake.

# Coal Mining Men from Many States Talk at National Safety Council Meeting

By a Staff Correspondent

COAL MINE SAFETY received attention at the fourteenth annual congress of the National Safety Council held in four Cleveland, Ohio, hotels, Sept. 28 to Oct. 2. Mining men from a number of coal mining regions, and safety men from everywhere were in attendance discussing safety in industry and in the ordinary daily life of America. It was the Council's largest congress, indicating a growing importance of the organization. John Barton Payne, chairman of the central committee of the American Red Cross, at one of the meetings, said the Council's work is a bigger job than even that of the Red Cross. Rear Admiral Sims was one of the principal speakers at a general session. The Council elected as its new president, Charles B. Scott, of the Chicago Bureau of Safety. W. H. Cameron was re-elected managing director. B. C. Yates, general superintendent of the Homestake Mining Co., of Lead, S. D., was made chairman of the mining section for the coming year.

At the mining session of Tuesday under the chairmanship of R. Dawson Hall, two subjects, falls of roof and coal and "fear psychology," occupied attention, the debate being unusually active. E. A. Holbrook, dean of the School of Mines and Metallurgy, Pennsylvania State College, stated that much greater safety from falls of roof and coal might be attained if more shift bosses were employed. One engineer, he declared, had assured him that his own inquiries had led him to believe that if his company would appoint one shift boss to every twenty-five men the accident rate in his mines would so greatly decrease that greater economy in operation would result than was attained by having only one shift boss to about sixty men.

T. T. Read, safety service director of the U. S. Bureau of Mines, exhibited a chart showing that accident rates from all causes did not rise and fall with the rates for falls of roof and coal and that the latter rates did not correspond in any way with the production of coal per man per day.

### IS MORE TIMBERING THE CURE?

He stated that in Great Britain it had been found that the accidents from falls of roof and coal were more frequent where the roof was good than where it was bad, showing that the care under bad roof more than overcame its inherent danger. He deduced from that the idea that more timbering would be no cure—a statement which, strange to say, was neither approved nor challenged.

Rush N. Hosler, supervisor of compensation rating for coal mines, Harrisburg, Pa., declared that closer supervision would do much to correct the evils arising from bad roof, and R. V. Ageton, safety engineer, Tri-State Lead and Zinc Ore Producers' Association, declared that in the lead and zinc mines of the Joplin district it had been found that only 20 per cent of the accidents from roof falls occurred during the seven summer months, the rest happening during the winter.

To Francis Feehan, U. S. Bureau of Mines, it seemed a small matter to obtain greater safety. If the manager of a mine would declare that accidents must be stopped, stopped they would be. If the order were firmly expressed it would be obeyed and it would not be necessary to "fire" many foremen or discharge many workmen. The will to safety, said Mr. Feehan, has not been sufficiently exhibited at many mines, and accidents continue.

**Charles B. Scott**

New president of the National Safety Council who has served as vice-president and treasurer. He is a pioneer safety man and is now director of the Bureau of Safety in Chicago.

The chairman took exception to the inferences likely to be drawn from E. A. Holbrook's statement that falls of roof and coal formed much the same percentage of the total accident rate in the United States and Great Britain. Seeing that the rate for all accidents in Great Britain per thousand men employed is far less than in the United States, the similarity in the percentage rate of all accidents in the two countries for accidents due to falls of roof and coal, exhibits the fact that the falls accident frequency is less in Great Britain than in the United States. Anyone, said the chairman, who knows the immobility of labor in Europe, the tendency of laboring men to live and to die in one single village, will be convinced that it is a great adventure that brings a man to America, often, in the past, without a dollar to sustain him during his search for work.

### AGGRESSIVE AND CHANCE TAKING

Such an immigrant is a chance taker. It must seem, to those who remain in Europe, that he takes a long chance. Such a man is likely to take big risks and to regard family ties more lightly than those who stay at home. That being so, by this process of selection the people of America, all of whom have come from Europe, have ever been of adventurous type and in the same manner the chance takers of Europe have been eliminated. All sorts of fatalities—as from drowning and even from suicide—have been more frequent in the United States than in European countries.

F. C. Gregory, resident engineer, U. S. Bureau of Mines, Duluth, Minn., said that every man engaged by the Phelps Dodge Corporation was always obliged at the time of his hiring to perform every mining operation under supervision once and was required to do the work according to the "Copper Queen methods" which were explained to him carefully. As a result the company believes it has greatly reduced its accidents while increasing the effectiveness of operation.

The manager of the industrial relations department of the Davis Coal & Coke Co., Thomas, W. Va., C. A. MacDowell, declared that his company had established the rule that every man in its employ should have training in first aid from the U. S. Bureau of Mines, thus reducing the severity of accident and any man who violates safety rules gets a little note in his pay envelope—a hazard card—calling attention to his dereliction of duty. It is noted that the men are quite anxious not to find any such cards in their pay envelopes.

At the Wednesday session J. J. Forbes gave a brief outline of Daniel Harrington's paper on "The First Year of Utah's Drastic Coal Mine Regulation" regarding which the discussion was quite brief. Mr. Read remarked, however, that some question had arisen as to the constitutionality of attempts to delegate the legislature's powers to commissions. However, he added, no one had seen fit to test the legality of the Utah Industrial Commission's order, and, moreover, should it be tested it would probably be found within the fundamental law of the state and nation, the Industrial Commission having been given powers similar to those entrusted and used by state health boards. The latter have been found constitutional. Mr. Read declared that he believed that the legislature was not fitted to pass on a bill full of technical details such as a mining bill must be, nor was it advisable to leave such matters to a legislature which by its very nature must proceed slowly and might be out of session when action was greatly needed.

The conduct and value of mine rescue stations was the subject of a paper by K. T. Sparks, safety engineer, Central Mine Rescue Station, Wallace, Idaho.

### SEARCHLIGHT IS INDISPENSABLE

Responding to Mr. Read's query as to the value of searchlights in rescue work, Mr. Boardman declared that, in working in low places or amid fallen rock and in the presence of smoke from a fire, the searchlight was indispensable, as cap lamps are utterly unequal to the work, their light being adequate only in reasonably fresh air.

"An advanced course in fire fighting and rescue work" was Mr. Gregory's characterization of mine-rescue maneuvers. He believed that fresh-air methods of training the men using apparatus failed to beget confidence. Even with gas-chamber training the men are "not under the nervous strain that accompanies a trip of greater distance in gas," but that is better than outdoor practice, at least.

"Ordinary training methods," said Mr. Gregory, "do not teach discipline, develop leadership or train the men to do unaccustomed work under normal conditions with a minimum of supervision."

To Mr. Gregory it seemed that the work of a rescueman was one not to be entrusted to any man just because he was someone who could be most readily spared. The fact that he was not an essential part of the mine personnel, or could be readily replaced, was usually a poor recommendation for him. Careful and thoughtful selection should be expended on the men for the job or the money spent on training will be wasted. The men should be given a thorough medical examination by a physician, and their nervous reactions while wearing the apparatus should be carefully watched.

**C. L. Close**

A National Safety Council director. He heads the U. S. Steel Corporation's department of safety, sanitation and welfare.

The maneuvers described by Mr. Gregory were made in smoky but not irrespirable air. Much of the way the smoke was so thick that travel was by touch rather than by sight. In building canvas stoppings, however, nine teams traveled an average of 43 ft. vertically and 2,490 ft. horizontally in the smoke, carrying tools, canvas and light slats, but no heavy timber, built their stopping and were out in one hour and seven minutes. Hunting and bringing out a dummy took four teams an average of one hour and six minutes, during which the distances were 150 ft. vertical and 2,470 ft. horizontal. The rescue of a live man took an hour, and the team traveled 130 ft. vertically and 3,200 ft. horizontally.

The distances to be covered were purposely made long. In an irrespirable atmosphere the bureau recommends, said Mr. Gregory, that explorations under apparatus should not exceed 2,000 ft. for the round trip on a nearly level, unobstructed course with a height of 5 ft. or more and air clear enough that the vision of the rescue crews is not materially obscured. Exploration should never be undertaken on pitches exceeding 30 deg. unless there is reasonable assurance of saving life. These rules were not followed in this instance as the risks were eliminated and the purpose was to give confidence in the apparatus.

Mr. Forbes said that at one mine it was found that out of fourteen sets of apparatus only two were in condition and yet the apparatus was relatively new. Careful inspection was at all times necessary. The safety service of the U. S. Bureau of Mines was introducing an advanced course in mine rescue and fire fighting, the curriculum extending over five days and occupying 37 hours. At the Orient Central Rescue Station, Orient, Pa., fifty-eight men took this course.

It was expected that many men would drop out disheartened by the thoroughness with which the subject was covered, but fifty-seven men passed the examination.

The course deals with new equipment and practices. Instruction is given on gas analysis, pyrotannic methods of ascertaining the presence of carbon monoxide, self rescuers, all-service gas masks, barricades, their value and use, stoppings, lifelines, signals and surface-organization plans. Mr. Forbes said that long, dangerous trips in apparatus were not necessary and should be prevented. The fresh-air base can be moved forward so as to minimize the risk. He said that the Bureau had found that some canaries would outlast a man in carbon monoxide. He, therefore advised that three be carried by a rescue party in actual service instead of only one.

The two final days of the course were spent in actual maneuvers underground, the instructions to the men being marked on the stoppings in the mine, so that they found the work they had to do clearly indicated. The men entered into the sport of the occasion and relinquished the maneuvers only with regret.

### Fresh Air in Rescue Work

J. W. Reed said that not enough had been said as to the fresh-air end of rescue work, a matter that was most important. The bringing up of supplies, the furnishing of suitable headquarters, the inspection of rescue apparatus, the maintenance of communications, all these have much to do with successful rescue work. F. M. Correll declared, however, that there were too many men who preferred fresh-air work and some apparatus men when an emergency came were unwilling to make use of the training they had received.

At the close of Wednesday's session of the Council the following officials for the mining section were elected: B. C. Yates, general superintendent, Homestake Mining Co., Lead, S. D., chairman; B. F. Tillson, assistant superintendent, New Jersey Zinc Co., Franklin Furnace, N. J.; first vice-chairman, C. A. McDowell, Davis Coal & Coke Co., Thomas, W. Va., second vice-chairman; Robert E. Talley general manager, United Verde Copper Co., Jerome, Ariz., third vice-chairman; A. W. Dickinson, general superintendent, Union Pacific Coal Co., Rock Springs, Wyo., fourth vice-chairman; T. T. Read, safety service director, U. S. Bureau of Mines, Washington, D. C., secretary.

**W. H. Cameron**

Re-elected managing director of the National Safety Council at the Cleveland meeting.

**B. F. Tillson**

Chosen first vice-chairman of the National Safety Council's mining section for 1925-26. He is general superintendent of the New Jersey Zinc Co.

At the Thursday session A. W. Dickinson, general superintendent, Union Pacific Coal Co., not being present, Mr. Read briefly introduced his paper which detailed not only the ventilation practices but also the safety methods of the company. As the chairman pointed out, little was said in the paper as to the new fans which the Union Pacific is introducing wherever thereby the distance the air has to traverse can be greatly decreased.

For the most part the coal around Rock Springs is not of great depth and by taking advantage of the valleys it has been possible to construct shafts, not of excessive depth, that will do much to economize power, to increase ventilation and to shorten the distance which the germ-laden return air has to travel. In the old mines where the timber is highly infected with fungus, a shortening of its travel means a large saving in timber infection and a great reduction in the number of roof falls that have to be loaded out and timber sets that have to be removed. The new shafts also may be expected to aid in rescue work if any should have to be done.

Later the safety practices of the Cleveland-Cliffs Co. were described by William Conibear, safety engineer of that company. Mr. Conibear stated that his company intended to have the committees examine all accidents, whether trivial, serious or fatal. In many cases the triviality of an accident was due merely to chance, the accident had all the possibilities of being fatal and failed of that end only by a hair.

A. A. Bowden, safety engineer, of the Pickands Mather Co., objected to miners being allowed to close fire doors in case of a fire. He believed that as each mine has its characteristics the work of closing doors should, in general, be left to certain authorized persons.

In the final afternoon meeting a round-table discussion of the work of the section was held under the chairmanship of Mr. Yates. At the annual banquet, Cary R. Gray, president, Union Pacific R.R., was the principal speaker and the election of Mr. Scott president, and Mr. Cameron managing director, was announced.

# News Of the Industry

## Both Sides Seek Public Support As Hard-Coal Strike Drags On; Repeal of Certification Law Urged

The second month of the anthracite strike begins with neither operators nor union officials showing any signs of a willingness to recede from their respective positions. For the time being, at least, the conference chamber has been forsaken for the public forum and the daily newspapers in an attempt to capture popular support. The only known recent effort to bring the warring interests together again for a peace parley—that launched by the Scranton Chamber of Commerce—still suffers from malnutrition.

Spokesmen for the producers declare that, barring irresistible intervention, they are ready to hold out indefinitely to block increased prices to the consumer and to prevent a repetition of the present suspension. Union representatives are equally firm in announcing their unalterable opposition to the operators' proposals for arbitration.

If the producers' advertising campaign in the region papers designed to break down the solidarity of union allegiance has made any headway, that fact has not been dragged into the open. Personal appeals by the operators to industrial and political leaders in the anthracite region have led to some sharp exchanges of opinion in which several of the political heads, notably Mayor Durkan of Scranton, have expressed their sympathy with the union's claims.

### Extend Publicity Battle

During the past fortnight the battle of publicity has been waged in several sectors, including New York, Philadelphia, Boston, Buffalo and Coaldale, Pa. On Sept. 29, in New York City the Department of Industrial Relations of the National Civic Federation, under the leadership of V. Everitt Macy, heard the views of John Hays Hammond, chairman of the defunct U. S. Coal Commission; Adam Shortt, former chairman, Canadian Mediation Board; Matthew Woll, vice-president, American Federation of Labor, and William H. Taylor, president, St. Clair Coal Co.

Repeal of the Pennsylvania mine's certification law is the first step necessary toward a resumption of operations, declared Mr. Hammond, who denounced the strike as indefensible. The statute which requires a man to work two years as a contract miner's laborer before he is permitted to mine hard coal was characterized as discriminatory. There are many competent bituminous miners, asserted Mr. Hammond, who would be glad to accept the more regular employment in the anthracite fields.

"Furthermore," continued Mr. Hammond, "there is no doubt that many of the anthracite employees now on a vacation strike will be eager to return to work if the strike is long continued, and this despite the moral suasion of the leaders of the union. The fear of molestation in the different ways practiced at such times would undoubtedly deter many of them from returning. By the guarantee of the Commonwealth of Pennsylvania of immunity from interference the required complement of miners and other employees could be assured."

### Strike Indefensible: Hammond

Although Mr. Hammond was of the opinion that some anthracite workers "are underpaid and that there exist glaring inequalities in the payment of others, creating reasonable discontent," nevertheless he condemned the strike on the ground that "the grievances of either side could be redressed without adding to the cost of production, by following the recommendations of the Coal Commission."

The increases to the lower-paid workers and equalization of rates could be effected without increasing the price of coal, he intimated, if the miners would agree "to eliminate restriction of production, petty strikes and other unnecessary but costly annoyances to the company. "Certain it is," he declared a moment later, "that the demand for an increase of $1 per day for company men, with a flat increase of 10 per cent for tonnage miners and the check-off, is unreasonable."

Seizing upon statements of Mr. Hammond that certain mine workers were entitled to an increase and that some wholesalers and retailers profiteered, Mr. Woll attacked the preceding speaker for denouncing the strike and recommending the repeal of the miners' certification law. The main portion of Mr. Woll's remarks, however, were devoted to an impassioned attack upon government restraint and meddling with private business. He scored compulsory arbitration and political settlement of industrial disputes and pled for an amendment to the anti-trust act to permit freerer combinations in business. His misinterpretations of Mr. Hammond's statements drew the fire of Dr. Edward T. Devine, a fellow member of the U. S. Coal Commission.

Mr. Shortt described the workings of the Canadian mediation law. Mr. Taylor presented a "plan for final settlement of the questions involving the mining, shipment and marketing of bituminous coals," advocating the compulsory closing down of enough mines to permit others operating 285 to 300 days to supply the fuel demands of the country. Owners or lessees of the mines closed down would be compensated for their idle investment in a tax included in the price of coal sold by operating mines.

On the evening of the same day the New York section of the A. I. M. E. heard E. W. Parker, director, Anthracite Bureau of Information; R. V. Norris, mining engineer; Roderick Stephens, Stephens Fuel Co.; F. R. Wadleigh, former Federal Fuel Distributor; C. T. Starr, chief, Bureau of National Resources, Chamber of Commerce of the United States, and C. Kemble Baldwin, Robins Conveying Belt Co., discuss the future of anthracite and the issues in the strike. There was general agreement that the public need have no fear of a fuel famine, although it might soon have to forego the use of anthracite.

### Must Use Substitute Fuels

Reserve stocks of the larger sizes now in the retail yards of the dealers in Greater New York, explained Mr. Stephens, would not last much beyond Oct. 15, pea stocks might hold out a month longer and the first of the year would see the end of the supply of No. 1 buckwheat. Byproduct coke, the next most acceptable fuel in this territory, could not meet all the demands that might be made upon it, but that fuel, plus a liberal run of low-volatile bituminous, supplemented, if need be, by high-volatile coal, would see the consumer through.

Mr. Baldwin brought a more cheering word as to the development of byproduct coke production. Mr. Starr pointed out that New England, the section from which demands for government interference usually came first, was in an unusually comfortable position. On Sept. 1 domestic consumers had approximately 50 per cent of their normal supply of hard coal in their bins and retail yards were carrying enough coal to cover 33⅓ per cent of the requirements.

Speaking at a celebration at Coaldale on Oct. 1, John L. Lewis expressed himself as satisfied with the progress of the strike and again turned his oratorical guns on Mr. Hammond for the latter's attack on the miners' certification law.

## Safety Methods Discussed at Pittsburgh Institute

At the meeting of the Pittsburgh Coal Mining Institute, Oct. 3, J. J. Forbes, of the Safety Service of the U. S. Bureau of Mines, addressed the meeting on the work in which he was engaged. The bureau is giving a sort of extension course of five days' duration. Mr. Forbes delivered himself regarding the menu of the course but also gave some of the meat. He said that at one mine safety lamps perfectly assembled flashed when tested in gas.

Someone struck a match on the gauze of one of them. That lamp flashed when put lighted into gas, and the secret was solved. The firebosses had been using the gauzes of their lamps for the striking of matches, and enough phosphorus had been left in the meshes to convey the flame. A mine in the West was exploded by a disassembled safety lamp and another by a doubled gauze. Safety lamps, said Mr. Forbes, are safe only if proper care is taken of them.

Of 2,900 men killed in several explosions 1,500 had died of burns and violence and 1,400 of carbon-monoxide poisoning. The self-rescuer would have saved all these latter men.

The Bureau of Mines has approved these self-rescuers for one-half-hour service. If but one man ever comes out with a self-rescuer the idea will go over strongly, but meantime the device, which could be made of immense value, is practically unknown, said Mr. Forbes.

R. Dawson Hall, engineering editor of *Coal Age*, followed with an account of the Rocky Mountain Coal Mining Institute's meeting at Price and of the sessions of the Mining Section of the National Safety Council. This was followed by a question box with safety in pillar drawing a leading feature.

## Vancouver Island Teams In Safety Meet

The Crows Nest Pass Coal Co.'s Coal Creek team won the mine-rescue contest at the tenth annual field day of the Vancouver Island Mine Safety Association, held Sept. 7 on the Central Sports Grounds, Nanaimo, B. C. The winners, captained by John Caufield, had a score of 98.4 per cent. The Ladysmith team of the Canadian Collieries Co. (George Carson, captain) was second, with 92.4 per cent; Cumberland No. 1 third, with 91.6, and Cumberland No. 2 fourth, with 91 per cent.

The British Columbia Department of Mines cup for first aid was won by the Granby company's Cassidy team (A. McLauchlan, captain); second, Canadian Collieries Ladysmith team (G. Carson, captain). The latter team was composed of a father and his four sons. Cumberland team of the Canadian Collieries, captained by W. Beveridge, captured the W. L. Coulson cup for first aid, with Captain D. Simpson's Nanaimo team runner-up.

The V. I. M. S. A. ladies' cup was won by Cumberland, led by Mrs. Hudson. Captain L. Wharton's team from Nanaimo won the Juvenile cup; C. Wharton's team from Nanaimo took the two-man event, and Beveridge and Waterfield, of Cumberland, carried off the one-man trophy.

William Sloan, Minister of Mines, distributed the prizes.

**John Hays Hammond**

The chairman of the defunct U. S. Coal Commission has again provoked the wrath of John L. Lewis by his denunciation of the Pennsylvania miners' certification law. The repeal of that statute, declared Mr. Hammond in an address before the Department of Industrial Relations of the National Civic Federation last week, is the first necessary step toward a resumption of mining in the anthracite field.

## Banning No. 2 Output Hits 1,000 Tons in Day

Miners at Banning No. 2 mine of the Pittsburgh Coal Co., Whitsett Junction, Pa., have reached a goal toward which they have aimed since the pit was reopened Aug. 20 at the November, 1917, wage scale. Their objective was a production of 1,000 tons a day, and on Saturday, Oct. 3, the 225 men working made a day's run of 1,188 tons. Total output for the week was 5,225 tons. Production for the week at Banning No. 1 mine, Van Meter, Pa., was 2,472 tons, with 165 men working. The aggregate output at the two mines of the company in the Youghiogheny Valley was 7,697 for the week.

---

Shipping concerns are keenly interested in the forthcoming tests of pulverized coal as marine fuel which are to be carried out at the League Island Navy Yard, Philadelphia, under the joint supervision of the Navy Department, the Shipping Board and the Bureau of Mines. The Board has already authorized an appropriation for the purchase of 500 tons of coal to be used in the tests, during which several types of burners will be used in order to determine which of them is best adapted to merchant ship and Navy use. It is learned that one New York concern manufacturing a special type of burner has applied to the Shipping Board for the loan of a ship in which to give the burner a tryout with pulverized coal. The League Island tests are to begin as soon as the necessary appliances can be assembled.

## Triadelphia Mine Explosion Due to "Unknown Cause"

After a thorough investigation into the explosion in the Triadelphia (W. Va.) mine of the Elm Grove Mining Co., which claimed the lives of three workmen during the week ending Sept. 19, a coroner's jury on Sept. 24 failed to fix responsibility for the blast, the verdict being that it was due to "an unknown cause."

Two probable causes were given in the testimony of District Mine Inspector A. E. Lafferty. In his opinion the explosion could have been caused by sparks from a lighted cigarette or cigar alighting on the powder spilled from defective powder cans or by a spark from a defective trolley bell. It was shown that all of the cans had not exploded at once, which led the jury to believe that powder had been dropped from the cans to the floor of the motor trailer. The trolley bell introduced as evidence was burned by a high-powered electric current, small pieces having been torn away from the main insulating part of the bell.

Assistant Prosecuting Attorney Fred Brinkman was assisted by District Mine Inspector V. E. Sullivan, an assistant of R. M. Lambie, chief of the Department of Mines.

## $1,000,000 Coal Land Deal Closed in Ohio

Columbus, Ohio, Oct. 6.—The Hammerford Coal Co., being organized under Ohio laws, has purchased the stripping operations and coal acreage of the Kehota Mining Co. in Hocking and Perry counties at a consideration in excess of $1,000,000. The new corporation was formed by William S. Harman, of the W. S. Harman Coal Co., Columbus, and E. R. Meyer and John Winefordner, of Zanesville. The property just acquired consists of upward of 4,000 acres of coal lands, four miles of railroad, large stripping units and three tipples. The property is served by the Hocking Valley, Zanesville & Western and the Baltimore & Ohio railroads. The daily capacity is 3,000 tons.

## Big Muddy Hearing Starts

The government opened its hearing at the Federal Building, St. Louis. Oct. 1 for the purpose of getting facts and figures on the possible tonnage of coal that might be moved on the Big Muddy River from the Williamson and Franklin County (Ill.) field in the event that an appropriation of $5,000,000 asked for was obtained for making the Big Muddy navigable to a point about ten or fifteen miles above Murphysboro. Several witnesses were heard, but with the exception of W. K. Kavanaugh, of St. Louis, none had anything tangible to present or seemed to be familiar with the possibilities of river navigation.

---

The Chicago & Northwestern Ry. has announced a reduction in coal rates from Hudson, Wyo., to Mitchell, S. D., giving a $4.70 rate on bituminous, a reduction of 64c.

### Deplores Delay in Printing Coal Commission Report

"With the mining of anthracite coal completely stopped, the delay in publishing the report of the late U. S. Coal Commission furnishes an object lesson in disservice to the public that is likely to have serious consequences when winter comes," declared Thomas L. Chadbourne, president of the American Association for Labor Legislation in a statement on Oct. 3.

Mr. Chadbourne says that during the negotiations between miners and operators which preceded the strike newspapers had called attention to the fact that the delay in publishing the coal commission's findings had deprived the President and the public of a "weapon" that might have been used to protect the consumers.

Mr. Chadbourne criticizes the delay as "unreasonable" and a blow at the principle that the work of a fact-finding commission is not completed until its full report of all the facts is published to guide law makers and the public.

### Bell Indicted on 14 Counts

John A. Bell, coal magnate and former president of the closed Carnegie Trust Co., Pittsburgh, Pa., is to be placed on trial at an early date for alleged irregularities in the financial affairs of the trust company. Bell was indicted Oct. 1 by the Grand Jury on fourteen counts, charging embezzlement of $1,161,995.64 of the funds of the institution, and District Attorney Gardner said the case probably would be called within a month or six weeks.

The indictments charge Bell with embezzlement and abstracting moneys and with making false entries on the books of the bank in connection with "withdrawals" by county officials and the Carnegie Coal Co., of which Bell formerly was president. A new development was a charge in the true bills that Bell had misappropriated nearly $200,000 more than was contained in the information on which he was arrested on Aug. 4.

### *Success Due to Hard Work, Not Luck, Says Hammond*

Defining "success" before the twelfth annual National Business Conference at Wellesley, Mass., Oct. 3, John Hays Hammond, chairman of the Harding Coal Commission, advised his hearers to get out of their minds that luck is the determining element of a successful career. "It is welcomed, but is not dependable," he said. "The real crop must be sown and reaped by the sweat of one's brow.

"There are many adventitious aids to success. For example, a pleasing address; this may seem a small consideration, but often it is a most important aid.

"It is likewise of advantage to be by nature a good mixer, not, however, an artificial kind of 'glad-hand artist,' who endeavors to win popularity by selfish purposes and at the sacrifice of principle and self-respect. Popularity of the latter kind is of short duration. The born good mixer is one who has tact, and tact comes from a kindly nature.

"What is inelegantly, but aptly, termed a 'grouch' is a very unfortunate obsession. Do not undermine your resolution, nor waste your energy in proclaiming that the 'time is out of joint' and that the world is going to the dogs. On the contrary, it is getting better and better every day."

### Northwestern Goes to Oil

The Chicago & Northwestern Ry. has decided to shift over all its locomotives on the Nebraska and South Dakota divisions to oil from Wyoming, calculating that this fuel will be cheaper than Illinois and Iowa coal produced under the Jacksonville wage scale. The Northwestern has coal mines in both states.

### Fair Price Coal Commission Revived in New York

The Fair Price Coal Commission established by Governor Smith of New York following the 1923 hard-coal strike has been revived. At the request of the Governor, Major General Charles W. Berry, N. Y. N. G., chairman of the local committee, has called together his former associate commissioners, Dr. Frank J. Monaghan, New York City Commissioner of Health, and George W. Eltz, commissioner, Coal Merchants Association, to determine upon procedure to be followed in handling any situation which may arise as the result of the present strike. In addition, the Governor has specifically requested the commission to investigate the status of the proposals to establish rates from West Virginia to New York and other northeastern points and to advise the Governor what action, if any, New York should take on the matter.

The state commission, of which Major General Berry is also head, met at the Hotel Biltmore on Oct. 5 to perfect its organization. Two vacancies were filled by the appointment, by the Governor, of W. C. Capes, Albany, secretary, State Mayors' Conference, and Major Charles B. Staats, president, New York State Coal Merchants' Association.

### Orders Lower Rates on Slack

Reductions in rates on slack coal from the Bevier (Mo.), Pittsburg (Kan.) and Henryetta (Okla.) districts to Superior, Neb., have been ordered by the Interstate Commerce Commission in its mimeographed decision in Nebraska Cement Co. vs. A. T. & S. F. Ry. Co. et al. The complainant alleged unreasonableness and a prejudicial relationship in favor of Omaha and Lincoln, Neb. The Commission found that the existing rates of $2.86 from Bevier, $2.55 from Pittsburg and $5.35 from Henryetta were unreasonable to the extent that they exceeded $2.25, $2.45 and $3.45 per ton.

## Production of Mining and Industrial Electric Locomotives In 1923, 1924 and 1925

| | Quarter Ending | | Six Months Ending June 30, 1925 | Quarter Ending | | | | Year Ending | |
|---|---|---|---|---|---|---|---|---|---|
| | March 31, 1925 | June 30, 1925 | | March 31, 1924 | June 30, 1924 | Sept. 30, 1924 | Dec. 31, 1924 | Dec. 31, 1924 | Dec. 31, 1923 |

| Storage-battery type* | 11,331 | 101,716 | 113,047 | 105,463 | 49,902 | 20,755 | 18,231 | 194,351 | 199,739 |
| Total | $42,811 | $136,894 | $179,705 | $252,602 | $200,014 | $35,325 | $180,791 | $668,732 | $260,681 |
| Grand total | $693,724 | $663,335 | $1,357,059 | $898,526 | $810,903 | $669,330 | $849,363 | $3,228,122 | $5,713,031 |

* The data for storage-battery locomotives has been revised to show only the value of the locomotives, exclusive of the value of batteries, charging equipment, and the like.

---

This table was prepared by the Department of Commerce, Washington, D. C., from reports made by ten manufacturers who comprise practically the entire industry.

# Washington Notes Inconsistence In Lewis' Address at Fairmont; Hard-Coal Intervention Distant

**By Paul Wooton**
Washington Correspondent of *Coal Age*

Washington has not failed to note the inconsistency in the position of the United Mine Workers revealed in John L. Lewis' speech at Fairmont, W. Va., Sept. 26. In that address he urged the federal government to take a hand in the bituminous situation, where the union is weak, when at the same time his position is one of unflinching opposition to arbitration or public intervention in the anthracite situation, where the union is strong.

Mr. Lewis addressed a group of mine workers from the Fairmont district but his remarks really were intended for federal officials and union operators. The fact that the text of his speech was furnished the press in advance for release at the time of its delivery lends color to the view that it was intended primarily for other ears than those of the Fairmont miners. It is not customary for the union to issue mimeographed press releases to its own membership. Such an address as that delivered at Fairmont takes on all the characteristics of a speech from the throne.

### Would Force Federal Aid

The address is the most direct indication yet given by the union that it hopes to force the federal government to intervene in the protection of the Jacksonville agreement. There was no effort made to convey the point by inference, for Mr. Lewis said:

"The federal government has an obligation in the premises. The Jacksonville agreement was negotiated and executed with the aid and co-operation of high government officials. By the same token the industry has a right to expect that the moral influence and power of those same government officials will be utilized to preserve the integrity of the agreement and to maintain in the public weal the tranquility of the coal industry. There can be no misunderstanding or beclouding of the issues involved in this question. The mine workers simply ask that those coal operators who executed the three-year wage agreement with the United Mine Workers of America be compelled to live up to their contracts."

It even is said that the renewal of the strike call in West Virginia is designed to influence the federal government. In spite of these efforts it is apparent that federal intervention is more remote than before. The anthracite strike is more than a month old and none of the consumers has called upon the federal government for protection. New England, through its official spokesman, John Hays Hammond, chairman of the committee appointed by the governors of the states in that section, breathes confidence in its ability to take care of itself. Mr. Hammond not only expresses lack of fear for the winter but feels that sentiment among the anthracite workers is not strong for continuing the strike. He is quoted to the effect that many men already would return to work were they confident that police protection could be furnished.

About the last thing any administration would undertake is an attempt to enforce a labor contract. It has been suggested that before asking help from the federal government the union should make use of the means within its own reach. The Jacksonville agreement, as Mr. Lewis is fond of saying, is a contract in writing. If it is as binding on the Pittsburgh Coal Co., for instance, as he maintains it is, the contract should be enforceable at law. If the injury done is as serious as he alleges, it should be a proper subject for damages.

A review of court decisions will show many that uphold the side of labor. The Kansas Industrial Court decision is a recent reminder to labor that the courts are the same bulwark to its vested rights and contract guarantees as corporations have found them to be.

Mr. Lewis concluded his speech with this sentence: "It is the purpose of the organized mine workers to exercise their strength and influence to preserve the honor of their wage agreement and to demand that under its provisions fair treatment be accorded them."

Before this the union has exerted its "strength and influence" in the form of strikes. Does Mr. Lewis mean that if necessary to enforce the contract obligation he is preparing to call a general strike? Such as act, at least, is not disavowed in the Fairmont address.

---

## Locomotive Fuel Costs Decline Slightly in July

The cost of coal used by Class 1 railroads in locomotives in transportation train service was slightly lower last July than during June, according to figures prepared by the Bureau of Coal Economics of the National Coal Association.

The average cost of the coal per net ton to the railroads, including any freight paid on it, in the Eastern district in July was $2.72; in the Southern district, $2.18; in the Western district, $3.01, and for the entire country, $2.68.

These averages are 1c. per ton lower for the Eastern and Southern districts than in June; 3c. per net ton lower for the Western district and 2c. for the entire country. Compared with July of a year ago there is a decrease in the averages of 31c. per net ton in the Eastern district; 30c. per ton in the Southern district; 23c. per ton in the Western district and 30c. for the whole country.

## *Retail Coal Reserves At New York Dwindle*

Reserve stocks of domestic anthracite in the yards of the retail coal merchants of Greater New York are rapidly dwindling, according to a careful canvass completed a few days ago. By Nov. 1, it is estimated, there will not be 1,000 tons of the sizes above pea—if the scant supply now on hand lasts that long. Pea will be among the missing by the middle of November or the first of December if the strike continues that long. Stocks of No. 1 buckwheat probably will hold out until the end of the year. The comforting side of the picture is that many consumers laid in full stocks before the suspension began.

New England's position is in marked contrast to that of New York. Approximately 50 per cent of the normal winter's supply was in the consumers' bins on Sept. 1. Retail yards at that time were carrying a supply sufficient to carry over for several weeks. It is estimated, therefore, that winter would be flirting with spring before there was a pinch in the Northeast.

There is no danger of freezing or even of discomfort, however, as the combined supplies of byproduct coke, low-volatile bituminous coal and high-volatile fuel will be more than sufficient to cover any requirements of the domestic consumer who has emulated the foolish virgin.

## Industrial Coal Stocks Gain

Industrial consumption of anthracite and bituminous coal in August was 22 per cent larger than during July, according to the monthly report of the National Association of Purchasing Agents. The August consumption in industry, exclusive of coal used in heating buildings, is estimated at 35,776,000 tons, as compared with the total of 29,300,000 used in July. This is the greatest estimated monthly consumption since January of this year. Coal stocks in industry were greatly increased during August in anticipation of the anthracite strike, the association reports. Industry on Sept. 1 had an estimated stock on hand of 54,487,000 tons of anthracite and bituminous combined, sufficient to last 46 days based on the daily consumption in August.

---

The committee on waters of the Conservation Council of Pennsylvania has approved the tentative draft of an anti-stream pollution bill which the council proposes to have introduced in the Legislature of 1927. Changes providing for wilful stream pollution as a penal offense were agreed upon at a recent meeting of the committee at Harrisburg. After the bill has been rewritten in parts it will be sent to thirty-eight organizations affiliated with the council. Each of these will be asked to use its influence to have local legislative candidates agree to support the bill if they are elected.

# Blame Squirrels for Lower Output In Strike Region of West Virginia; Says Rockefeller Decries Abrogation

While the strike call issued by the United Mine Workers to non-union miners in northern West Virginia Sept. 25 cut down production somewhat last week, it was not a potent factor, according to coal operators. In the first four days of last week the non-union mines produced 6,088 cars, a decrease of 600 cars compared to the previous week, but part of the decrease was attributed by the producers to the lull over pay day and the opening of the squirrel season. A number of large producers assert that they did not lose a single miner by the strike. The union mines produced 1,105 cars of coal in four days.

Few coal operators take the strike very seriously, declaring that the union has lost out in northern West Virginia. The failure of the price of coal to come back has automatically killed them off, operators declare, and nothing short of a runaway market can breathe life into the organization.

The strike call seems to have affected the Monongahela Ry. mines the most, there being a drop of 301 cars in the first four days of last week compared to the corresponding period of the previous week. The Monongah division, B. & O., dropped off 251 cars.

### Non-Union Labor Shortage?

In a statement issued Oct. 2, Van A. Bittner said "there is a well founded rumor that John D. Rockfeller, Jr., who is one of the largest stockholders of the Consolidation Coal Co., is not in sympathy with the policy of that company in abrogating its agreement with the United Mine Workers." Bittner asserts that non-union operators are beginning to feel a real labor shortage and he predicts that it will become more acute as the weeks go by.

The union miners are putting forth another furious drive, holding scores of meetings in the field. Large meetings were held in Clarksburg and at Rivesville on Oct. 4. For almost a year quiet reigned at Brady, Monongalia County, and no gatherings were held there since the new miners' hall was dedicated more than a year ago, until Oct. 1, when another big gathering of striking miners along the Monongahela River front met and resolved to remain firm until the terms of the Baltimore agreement were agreed to by coal operators. The miners' officials say they will make further efforts to organize the Brady mine of the Brady-Warner Coal Corporation and the plants of the Clark Coal & Coke Co.

Fifty-three union miners were hailed into court Oct. 5 for violating an injunction granted to coal miners employed at New England Mine of the Consolidation Coal Co., which forbids picketing. Ignoring the injunction the union miners picketed a few hours before appearing in court.

A new stunt was pulled by the union miners in appearing without counsel, presuming that the court would appoint attorneys and the county would pay the bill. Judge Winfield Scott Meredith, in the Marion Circuit Court, did not do so, but thundered: "The orders of this court must be observed, if it takes the entire man power of the county, the state and nation to enforce them."

The miners say they are picketing in conformity with what Governor Gore has determined as legal picketing. It may require the greater portion of the week to dispose of the cases.

In a statement issued Oct 1 Bittner charges tampering with jurymen in connection with the trial of Milan Kreweski, a Grant Town miner, charged with being implicated in dynamiting the Wood's Run bridge of the Baltimore & Ohio R.R. on June 17. The trial was held in the Marion County Criminal Court, in Fairmont, last week. The jury failed to arrive at an agreement and the case will be retried later.

"I am confident," said Bittner, "that if any member of the United Mine Workers had attempted to tamper with jurymen during this or any other trial he would have been exposed, and rightfully so, and made to suffer the full penalty of the law. But I doubt if the gentlemen representing the Baltimore & Ohio R.R. who were attempting to tamper with jurors in this case, will ever be brought to trial for their unlawful acts or the facts in the case given to the people of West Virginia."

The union strike headquarters of the United Mine Workers of the Panhandle section has been removed from Wheeling to Sixth Sub District Ohio headquarters in Bellaire, Ohio.

## Whipple Team Triple Winner In New River Co. Meet

The sixth annual first-aid meet of New River Co. employees, held at Scarbro Ball Park, Scarbro, W. Va., Sept. 26, was one of the most successful in the history of the company. The Whipple team, David Bryce, captain, took first prize in the main contest, scoring 100 per cent in each of the three problems. The same team also won first prize as the neatest appearing team and in the best captain drill contest.

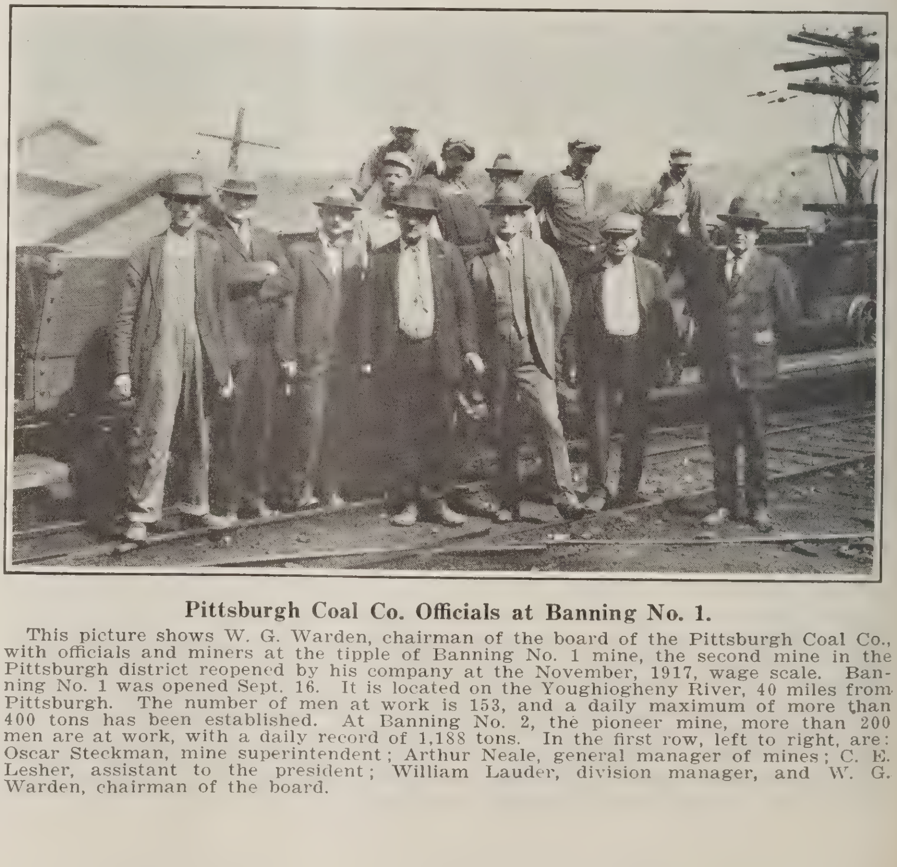
Second prize in the main event was awarded to the machine shop, which made 98 per cent and also won a prize as the second neatest appearing team on the field. In the main contest Scarbro and Mabscott tied for third place with 97.3 per cent. Scarbro won when a special problem was given to break the tie.

Six teams tied for first place in the artificial respiration contest, each having a score of 100 per cent. This contest was finally won by Prudence.

R. M. Lambie, chief of the West Virginia Department of Mines, introduced Dr. T. T. Read, chief of the safety department, U. S. Bureau of Mines, who presented the prizes to the winners.

---

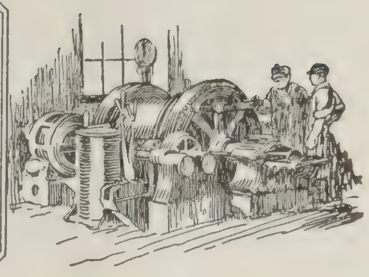
Latin America during the first six months of 1925 used more than 500,000 tons of bituminous coal exported through the ports on Hampton Roads, according to statistics compiled by the Hampton Roads Maritime Exchange and issued by the Virginia State Chamber of Commerce. The imports by countries follow: Argentina, 49,909 tons; Brazil, 323,856 tons; Canal Zone, 183,903 tons; Chile, 10,151 tons; Colombia, 1,269 tons; Guatemala, 2,519 tons; Mexico, 11,435 tons; Peru, 5,138 tons; Uruguay, 7,796 tons; Venezuela, 250 tons.



**Pittsburgh Coal Co. Officials at Banning No. 1.**

This picture shows W. G. Warden, chairman of the board of the Pittsburgh Coal Co., with officials and miners at the tipple of Banning No. 1 mine, the second mine in the Pittsburgh district reopened by his company at the November, 1917, wage scale. Banning No. 1 was opened Sept. 16. It is located on the Youghiogheny River, 40 miles from Pittsburgh. The number of men at work is 153, and a daily maximum of more than 400 tons has been established. At Banning No. 2, the pioneer mine, more than 200 men are at work, with a daily record of 1,188 tons. In the first row, left to right, are: Oscar Steckman, mine superintendent; Arthur Neale, general manager of mines; C. E. Lesher, assistant to the president; William Lauder, division manager, and W. G. Warden, chairman of the board.

# Practical Pointers For Electrical And Mechanical Men



## These Well-Designed Brake Shoes Do Not Grind Wheel Flange

Long experience in the use of carborundum or an equivalent abrasive as an agent in brake shoes for grinding down false flanges on tires on mine locomotives has enabled the Island Creek Coal Co. to get good results. In Fig. 1 are shown an end and an under-side view of the brake shoe. The end view shows that an unusually deep and wide channel on the brake shoe is provided. This channel is 2 in. deep and will accommodate the flange of a locomotive tire even after the latter is worn considerably. This feature of the design is such as to rob the shoe of the braking effectiveness of the channel area but at the same time it insures over-all rub on the tire tread.

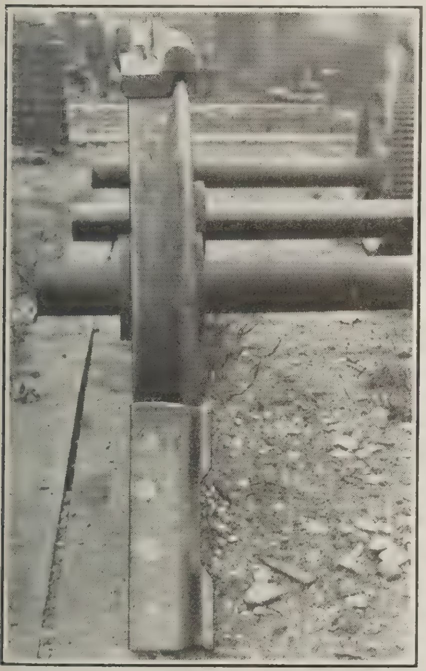


**Fig. 1—Abrasive-Lined Brake Shoe**

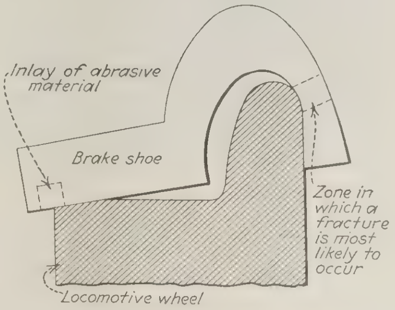
Here is shown the brake shoe designed by the Island Creek Coal Co. for the more effective use of abrasive inlays. The location of these inlays is shown in the underside view of the shoe leaning against the locomotive wheel. No attempt is made to use abrasive material for grinding down the flange of the tire. The end view of the shoe resting on top of the wheel shows how deep and wide the channel for the flange is made to accommodate the true flange even after the tire has been subjected to considerable wear.



Inlay of abrasive material
Brake shoe
Zone in which a fracture is most likely to occur
Locomotive wheel

**Fig. 2—Effect of Improperly Setting Brake Shoe**

When a narrow and shallow channel is incorporated in the design of a brake shoe it rides in a tilted position, resting on two points. Excessive wear occurs on the outer rim of the channel, and in this part of the shoe a fracture will most readily develop.

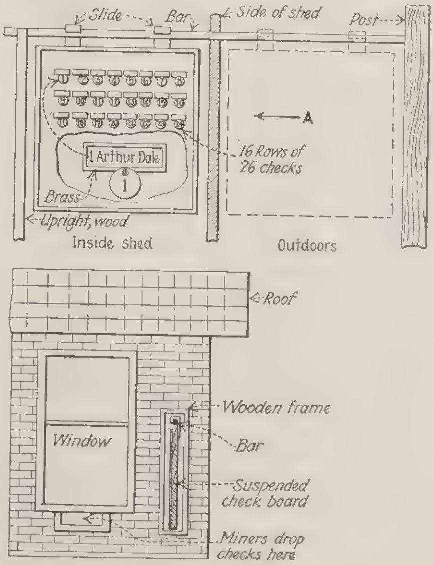
Many types of abrasive brake shoes are provided with shallow channels in which the flange of a tire rubs after the tread is worn only to a slight extent. The reason sometimes given for the adoption of this feature is that about 20 per cent of the braking power can be obtained by letting the flange of the tire rub in the channel of the shoe. But this is not true and the disadvantage of this provision is clearly shown by the simple sketch in Fig. 2.

The brake shoe rides on the flange of the tire as one point of support and on the outer side of the tread as the second point of support, leaving a part of the tread out of contact with the flat surface of the brake shoe. Because the shoe is tilted the flange of the tire in a short time wears through the outer rim of the channel. This wear occurs at the wrong point and necessitates frequent replacements of shoes. Consequently no advantage is derived from this old design.

The coal company has found that while inlays of abrasive material on the outer side of the brake shoe are effective in preventing the occurrence of false flanges—in fact so much so that this application is standard on practically all of its locomotives—yet it discourages the use of abrasive material in the channel of a brake shoe as a means to take off any increased height in the true flange. Shoes provided with inlays of abrasive material in the channel have been tried and have failed. The greatest trouble came from inopportune fracturing of the brake shoe along some part of the channel. Another disadvantage noted was unequal wear of the false flange and the true flange.

## Checkboard Loaded Indoors Slides Out for Men's Use

At the mine of the Gunn-Quealy Coal Co., Quealy P. O., Sweetwater, near Rock Springs, Wyo., is a checkboard mounted on a bar over which two hangers are passed which enable the board to be pushed through the side of the building into the open. Each man after leaving the mine deposits his identification check in a slotted box on the outside of the shed. The check is then hung on the appropriate hook. In the morning when the men go to work the board is pushed out, and each man



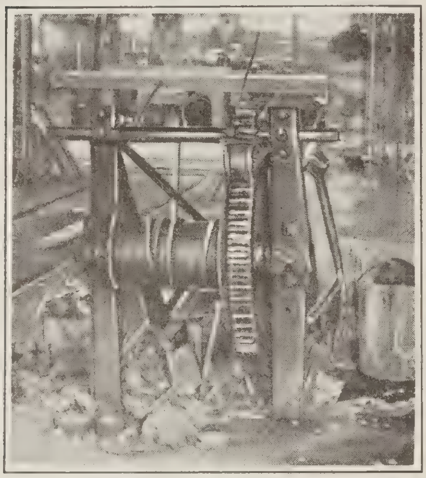
**This Check Plan Works Well**

The checkboard is slid out through the wall in the morning and each man takes his brass identification tag. In the evening the checks are dropped into the slot under the window.

takes his check and puts it in his pocket. In this manner is kept a record of who is in the mine and who has come out. The identification tag above the hook on which the check is hung contains not only the number but also the name of the holder of the check. As arranged, the board is convenient and orderly.

## A Light but Effective Home-Made Winch

For use about the mine, particularly in the shops, or for facilitating the construction or building work that the shop force is often called upon to perform, a small winch or crab is almost indispensable. The accompanying illustration shows a machine of this kind that forms part of the regular equipment in the No. 4 shops of the Kingston Coal Co., Kingston, Pa.

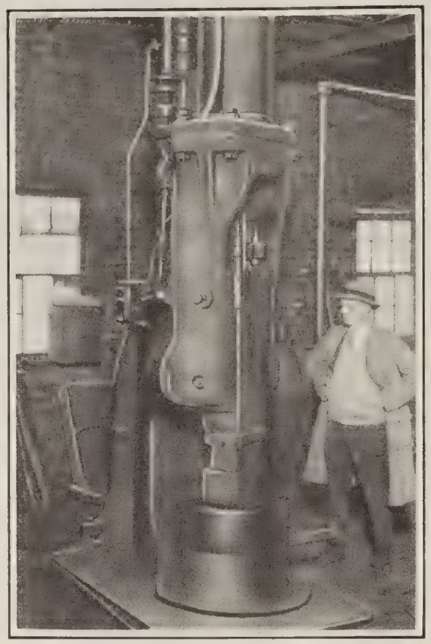


**Useful in the Shop and Elsewhere**

This little winch was built up from odds and ends by the shop force and has long been used by the car repair gang to lift mine cars or to turn them over. The pawl on this machine is particularly ingenious.

This machine is extremely simple in design, consisting of a triangular frame built up of old structural shapes chiefly angles, together with a necessary drum and a countershaft which is turned by means of cranks upon either end. In building up this winch, a suitable gear and pinion were first salvaged from the scrap heap. These were keyed to suitable shafts, mounted between bearings. The cable drum on this winch was turned from a piece of hard wood and mounted between flanges.

A suitable pawl to hold the drum in any desired position is attached to the pinion shaft. The end of this member is split and straddles the pinion, the split ends being bent around the shaft completely encircling it. The opposite end of this pawl is bent at such an angle that it may be dropped between the teeth of the drum shaft gear in which position it will hold the drum from turning in either direction. The bottom and the inclined edges of the triangular frame are suitably cross-braced with scrap iron holding the two parts rigidly together. As here mounted in the shop, the whole frame is bolted to the floor, but it might with equal facility be mounted on skids for ready transportation.



**Large Steam Hammer at Mine**

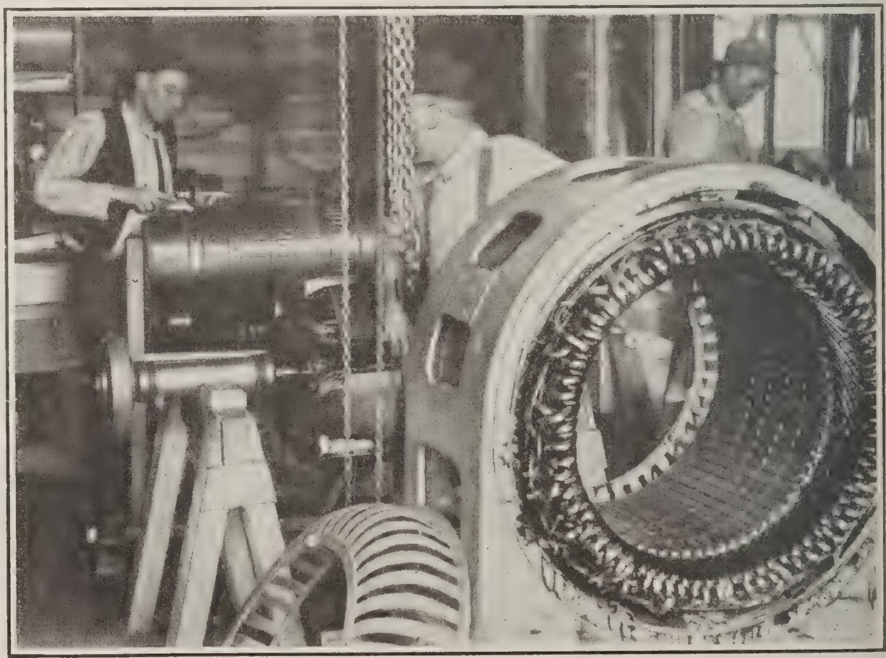
It is unusual to see a steam hammer of this size in use at a coal mine repair shop. No doubt this one at the Barrackville (W. Va.) mine of the Bethlehem Mines Corp., was transferred from one of the Bethlehem steel plants to the mine.

## Arresters of "M-G" Sets Need Close Attention

Synchronous converters seldom are damaged by lightning or by line surges due to other causes. This, however, does not hold true for motor-generator sets. The difference is explained by the fact that converters are protected by the transformers, which must necessarily be used between the machine and the line. A transformer has such a high reactance that the surges are reduced, ordinarily, to harmless intensity before reaching the converter. Moreover, the insulation to ground in a transformer is such as to withstand much higher potentials than can be withstood by the winding of a motor.

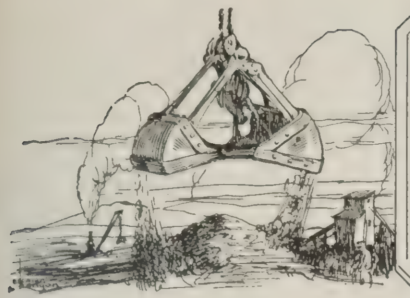
While it is important to protect a converter with arresters, it is more important to protect a motor-generator set. The very best type of arrester should be used and high-reactance choke coils installed on the machine side. Special attention should be given to the ground connection. If the substation is located on a dry, rocky ledge, the ground wire should be carried to some point where earth is always moist.

Next in importance is the protection of the ground wire from damage. A large wire should be used and this installed so that there will be little chance of mechanical injury. In addition, regular inspections, probably in April and July, should be made of the ground connections.



**A Rewind Job on a 225-Hp. 2,300-Volt Synchronous Motor**

In the foreground of the photograph, snapped in the repair shop of a large coal company, is the stator of a motor-generator set. Damage to motor-generator sets by lightning is too common. Closer attention to the arrester equipment would prevent much of this trouble.



# Production And the Market

## Increasing Softness Marks Soft-Coal Market; Anthracite Unresponsive to Strike

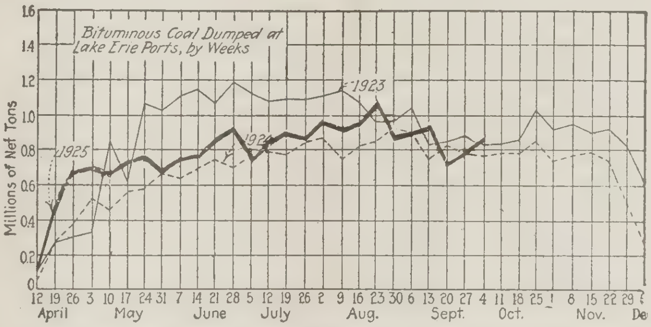
Precedent has been set at naught in the soft-coal market to the extent that despite the fact that production of anthracite has been at a standstill for more than five weeks, conditions in the trade give but slight indication of boom or runaway characteristics. On the contrary, the market has experienced and still feels the inevitable reaction that follows overplaying and hasty running up of prices such as were in evidence when the hard-coal suspension began. In haste to be on the "safe" side, large consumers and dealers alike stocked up generously and prices started to climb, but the promise of a rush market was short-lived as demand soon simmered down to normal proportions while idle mines began to resume operation and production mounted.

The tendency to softness in smokeless coal is still quite marked, prices showing a drop of 10c. to 15c. in some instances. Demand for practically all grades declined in the Midwest market last week, though prices remained fairly firm except for some shading to move tonnage. Screenings prices are unsatisfactory, however, consumers professing to be well fixed for supplies. More mines are resuming in Kentucky and the market held firm last week, the general demand for steam fuel being good. The sharp advance in prepared sizes of a few weeks ago has disappeared, however, due to keen competition and heavy output.

Cincinnati saw a buying flurry by lake shippers last week, more buyers being in evidence than at any time since spring. Slack is very active, but the domestic market suffers from adverse weather conditions. Business at the Head of the Lakes continues to improve and the same is true of Kansas. Trade in southern and eastern Ohio and at Pittsburgh is rather quiet. A slowing tendency prevails in New York and the other seaboard markets, especially in New England.

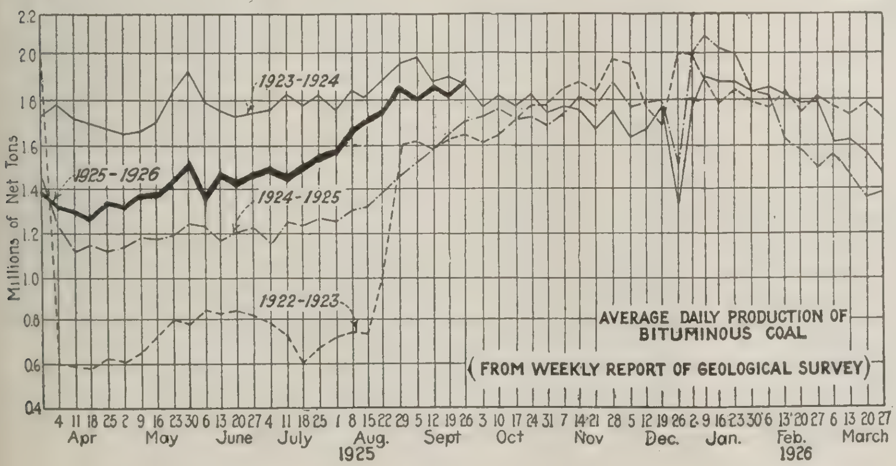
Regardless of the approach of colder weather, hard-coal consumers preserve an attitude of comparative indifference as the strike enters its sixth week. Stock coal largely makes up the offerings of wholesalers, the larger sizes being pretty well cleaned up. Stray cargoes of domestic sizes at New York bring $17.25 alongside for egg, $19 for chestnut and $20 for stove. Pea and buckwheat are still being shipped by the companies, one company having added 25c. to the price of pea and 10c. on buckwheat last week. Retail yards have fair stocks of domestic sizes, demand for stove being strongest.

Output of bituminous coal during the week ended Sept. 26 is estimated by the Geological Survey at 11,199,000 net tons, compared with 10,881,000 tons in the preceding week, as shown by revised figures. Anthracite production, presumably from dredges and small washeries, totaled 13,000 net tons.



*Coal Age* Index of spot prices of bituminous coal on Oct. 5 stood at 175, the corresponding price being $2.11.

Dumpings at Lake Erie ports during the week ended Oct. 4, according to the Ore & Coal Exchange, were: Cargo, 792,975 net tons; steamship fuel, 44,435 tons—a total of 837,410 net tons, compared with 789,617 tons in the preceding week. Hampton Roads dumpings during the week ended Oct. 1 totaled 458,996 net tons.



### Estimates of Production

(Net Tons)

| | 1924 | 1925 |
|---|---|---|
| **BITUMINOUS** | | |
| Sept. 12 | 9,835,000 | 9,983,000 |
| Sept. 19 (*a*) | 10,156,000 | 10,881,000 |
| Sept. 26 (*b*) | 10,458,000 | 11,199,000 |
| Daily average | 1,743,000 | 1,867,000 |
| Cal. yr. to date | (*c*) 339,027,000 | 360,314,000 |
| Daily av. to date | 1,492,000 | 1,583,000 |
| **ANTHRACITE** | | |
| Sept. 12 | 1,820,000 | 5,000 |

| Cal. yr. to date | (*c*) 7,380,000 | 7,090,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

## Midwest Demand Declines Sharply

The demand for practically all grades of coal fell off sharply in the Midwest market during the past week. As a fairly general rule, prices on the better grades and better known coals remained firm, but in some cases quotations were shaded materially in order to move the tonnage.

In southern Illinois the demand for 6-in. lump coal is still strong enough to hold the price firm at $3.25; 6 x 3-in. furnace coal is in fair demand, but concessions have been made in some instances. This is true also of the 4 x 2-in. small egg. The same situation prevails in the Clinton and Linton Fourth Vein districts in Indiana. Pocahontas prepared coal continues to slide in the Chicago market, as a large tonnage of it, and first class coal too, was offered during the week as low as $3.75 to the wholesale trade. It was extremely plentiful at $4, though the circular price to the retail trade appeared to be around $4.35. Good smokeless mine-run sold at $1.90@$2.25, the general average being around $2.15. West Virginia operators who offered splint coal in this market had to shade their prices as low as $2.25. In some cases West Virginia 4-in. block sold at $2.

Not much progress is being made toward establishing better prices on screenings from any of the fields depending on the Chicago market. Buyers appear to be independent, saying they have enough coal in reserve piles to last for some time. The Franklin County operators, as is usually the case, maintained prices firmly at $1.65@$1.90 for 2-in. screenings, with 1¼-in. approximately 10c. less. Saline County screenings went at about the same levels. West Kentucky screenings were offered freely at from 80c. up and Fifth Vein Indiana screenings could be had in any quantities at $1.35@$1.60.

Last week saw a slight improvement in the movement of domestic sizes from the Carterville and Williamson and Franklin County fields as well as the Harrisburg district. Lump moved freely but egg and nut have been rather slow. There has been a slight increase in demand for steam sizes because production slowed up. Railroad tonnage is light at shaft mines and fairly active from strip mines. Shaft mines get three or four days a week—occasionally a day better—while the strip mines work pretty nearly full time.

In the Duquoin district conditions have improved in the last few days and working time as well as movement of all sizes is better. The Mt. Olive field has been hit hard by the slump but is gradually getting back; some railroad business is now moving. Three days a week seem to be the limit for working time and coal generally is hard to move on account of the price. Standard district coal is still selling at cost and the mines are working haphazardly, some getting two days a week and some four days a week. All sizes are difficult to move, with no hope that conditions will improve until cold weather sets in. Railroad tonnage is fairly good. There has been no change in prices in any of the fields.

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Oct. 5 | Sept. 28 | Sept. 21 | Oct. 6 |
| Index | 175 | 176 | 185 | 171 |
| Weighted average price | $2.11 | $2.13 | $2.24 | $2.07 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

---

Slightly colder weather in St. Louis has improved domestic demand for all coals, especially middle grade, although the high grades and lower grades are still moving slowly. Anthracite, smokeless and coke are below expectations. Country demand is picking up and is fairly active on middle grades. Price is becoming a serious factor on account of the low prices of eastern Kentucky coals, with which dealers who handle Illinois coals find it hard to compete. Western Kentucky also seems to be getting a better hold all the time. Local wagonload steam is coming along unusually well. Carload is fairly active on account of the supply, while country steam has showed little improvement. Prices are unchanged.

### Market Firm in Kentucky

The Kentucky market continued quite firm over last week, especially in steam coal, which was in good demand. The only weakness was in 4-in. eastern Kentucky lump, which dropped to around $2.50@$2.75, due to heavy offerings and lack of strong demand.

Industrial, utility, railroad and general demand for steam fuel is good. Eastern Kentucky has no difficulty in moving screenings at $1.10@$1.35 and there is a fair movement of byproduct coal on a mine-run basis at $1.50@$1.75. Nut, egg and small lump can be had at $2@$2.50. In western Kentucky 6-in. block is $1.85@$2; lump and egg, $1.65@$1.85; nut, $1.40@$1.65; mine-run, $1.25@$1.50; screenings, 80c.@$1.10.

More mines are resuming after being down for months. Car supply and general movement are quite fair, but competition is keen, production heavy and the sharp advance in prepared coal of a few weeks ago has ceased, due in part to the anthracite strike having failed to materially affect output west of Pennsylvania so far. Eastern Kentucky operations are on a fair scale, but western Kentucky could take much additional business without being rushed.

### Northwest Still Gaining

Progressive improvement continues in the coal trade at the Head of the Lakes. Cooler weather brought an influx of orders to dock operators for both anthracite and bituminous coals from a wide territory, including the agricultural districts of western Minnesota and eastern North Dakota, sections that had been little heard from since the war adjustment period. Municipalities and public utilities hereabout have been buying more steam coal lately than for several months and have been ordering on contracts placed some time ago. Interest in coal in industrial quarters, including furnace plants over Minnesota and Wisconsin, has been more marked in the last ten days. Retailers also are taking fair quantities in preparation for the cold-weather rush. Some of the docks have been working overtime lately for the first time since early last spring.

The market is stiff in all lines of bituminous coal. One of the docks issued a list advancing everything except screenings all along the line, but as the other docks have failed so far to follow suit the market may be said to be unchanged. One of the docks announced an advance in Kentucky screened lump to $6.50, but the general average remains at $6.25, with stove at $6, dock-run at $5.75 and screenings at $4.25. Pocahontas lump, egg and stove are $8.50; mine-run, $5.25@$5.50, and screenings, $4.25.

Twenty-nine cargoes, including one of anthracite, were unloaded at the docks last week, and eleven cargoes, all bituminous, were reported en route. Dock men expect a run of coal in sufficient quantities to take care of full requirements up to the opening of navigation next spring. Stocks of bituminous coal on commercial docks at Duluth and Superior are about 3,600,000 tons and anthracite 250,000 tons. The United States Steel Corporation has over 1,000,000 tons of steam coal stored at the Duluth, Missabe & Northern R.R. docks for the use of its nearby subsidiaries.

Business in the Milwaukee coal market is exceptionally quiet for this time of the year. Prices remain unchanged. Although anthracite has practically ceased coming in by lake, receipts of bituminous coal are heavy, totals to Oct. 1 being 488,234 tons of anthracite and 2,109,515 tons of bituminous coal, or 2,597,749 tons in all. Last year Oct. 1, 572,654 tons of anthracite and 1,640,310 tons bituminous, a total of 2,212,964 tons, were received by lake.

### Kansas Lump in Better Demand

Improved demand for Kansas lump resulted Oct. 1 in stabilizing the price for this grade at $4.50. While some operators have been asking $4.50 for the last month, others asked $4.25. With the increased production of lump to fill the growing demand a slight surplus of screenings has begun to accumulate, a situation that is being balanced by discontinuing the crushing of coal except in those shovel mines whose product is too soft to screen. And these are being closed down.

In Colorado continued warm weather has caused a slump in the demand for domestic sizes of coal, which has reduced mine operations about 3 per cent in the last week. There has been no change in prices, however. Local anthracite operators are receiving orders from territory which they have never reached heretofore. The mines are operating without any labor trouble or transportation difficulties. To increase the use of nut coal, which apparently has been a drug on the market, operators are advertising for a slogan that will encourage the use of this size by householders.

The coal business in Utah continues satisfactory and output is greater than at any time since last January, but it is not heavy enough to offset the low production of practically every intervening month since. Prices remain steady and the labor situation is good. The mines served by one of the principal railroads lost considerable time last week through a shortage of cars, but taking the state as a whole the industry is not yet suffering seriously from a car shortage, though it may do so soon as the result of coal cars being taken to move the sugar-beet crop.

### Buying Flurry at Cincinnati

At Cincinnati the lake situation has held much interest of late as more buyers have appeared in the last ten days than at any similar period during the spring and summer. It appears that replacements at the docks at the head of the lakes have caused the flurry in buying. Two months ago 2-in. stuff had a price which the lake buyers made almost arbitrary, but with most of the choice West Virginia and Kentucky coal placed, buyers are now in the market with a price said to range from $2 to $2.25.

Activity in slack continues strong. Late buyers of smokeless, finding that this has been pretty well taken, were eager to get what tonnage was loose with the opening of the new month. Only low grades could be bought in the high-volatile line-up around $1.15 during this week. All better grades had jumped to $1.25; high gases were worth even as high as $1.35@$1.40, with the same range for Harlan and good Elkhorn.

Again the weather has hit the domestic market. The best Hazard block is $2.75 asked, with some as low as $2.50. This is on a parity with the Logan County (W. Va.) lump price named by some of the biggest producers from that section. High grade Big Sandy and Elkhorn have a range of $2.75@$3.25 and some specialized coals from West Virginia are still quoted at $2.75@$3, though sales at the top are infrequent.

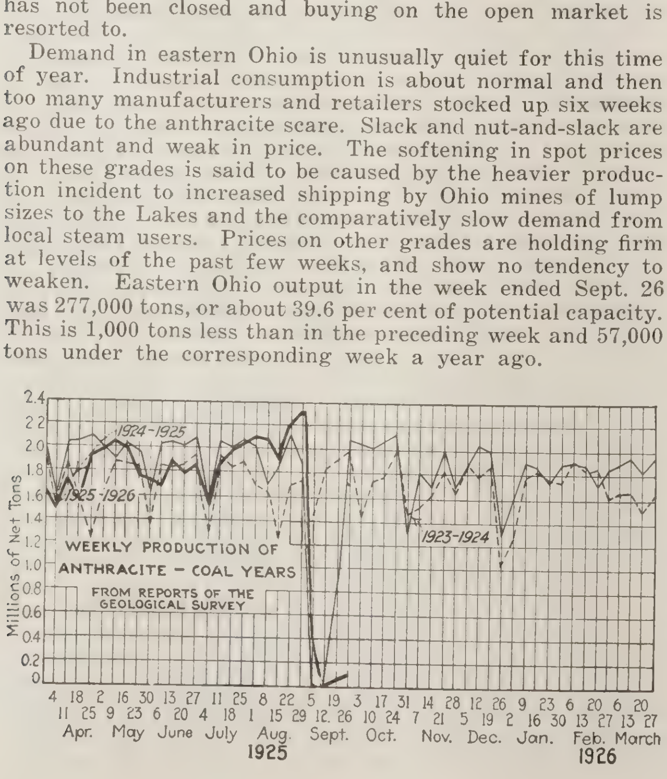
In the smokeless market, prices are still in the process of "finding themselves." The run-up to $5 and over was too hasty, some of the operating concerns now admit. One big company's October circular is $4.25, another at $4.50 for lump and egg, and the spot market is somewhere in between. Stove sizings are $3.25@$3.50; mine-run, $2.25@$2.50, and slack, $2.

Car reports show that 14,175 loads went through the Cincinnati gateway last week, a decrease of 132 from the preceding week but an increase of 2,873 over the corresponding week of last year. Of these, 2,595 were en route to the lakes, a decrease of 207 from the week before.

Trade at Columbus is still rather quiet, as the weather has been warm and dealers stocked up heavily during the spurt of a month ago. Householders are still coming in to a certain extent but the large majority covered their early winter needs by earlier orders. There is a small amount of free coal on the Columbus market, but the amount is not sufficient to cause any concern. Shipping on consignment has been stopped as a rule and only the smaller operators indulge in the practice. Prices at the mines on all domestic grades have been fairly firm.

Steam business shows practically no change. Buying by manufacturing concerns is limited as a rule, as steam users show little concern over the situation outside of wanting to make contracts after holding off for several months. A considerable tonnage used in this section is under contract and thus little price change is expected in the near future. Screenings are rather firm at recent levels. Mine-run is holding its own and other steam sizes are unchanged. The large state contract to supply the various Ohio institutions has not been closed and buying on the open market is resorted to.

Demand in eastern Ohio is unusually quiet for this time of year. Industrial consumption is about normal and then too many manufacturers and retailers stocked up six weeks ago due to the anthracite scare. Slack and nut-and-slack are abundant and weak in price. The softening in spot prices on these grades is said to be caused by the heavier production incident to increased shipping by Ohio mines of lump sizes to the Lakes and the comparatively slow demand from local steam users. Prices on other grades are holding firm at levels of the past few weeks, and show no tendency to weaken. Eastern Ohio output in the week ended Sept. 26 was 277,000 tons, or about 39.6 per cent of potential capacity. This is 1,000 tons less than in the preceding week and 57,000 tons under the corresponding week a year ago.



### Interest Flags at Pittsburgh

Pittsburgh district coal is quieter and a little less activity is reported from surrounding districts. The explanation seems to be that there is less stocking now. Prices are no weaker in tone, with the possible exception of steam slack, which is doing better than expected, remaining quotable at $1.30@$1.35. The general labor outlook is improved, with the Pittsburgh Coal Co. increasing output at the two Banning mines working at the 1917 scale and with the two strikes in the Connellsville region waning slowly.

Production in the central Pennsylvania field continues to increase. In the week ending Sept. 26 the loadings were 16,145 cars, as compared with 15,208 in the previous week. The loadings for the month to the 26th were 57,506 cars, compared with 50,562 for the same period of August. Included among the fields in which production is on the increase is the Broad Top region, where there was practically no production during the summer. This district is now producing practically 50 per cent of normal.

Buffalo coal men are still waiting for something to move in the trade. There is not the slightest stir in ordinary bituminous and smokeless and coke are up only a little. The advance in smokeless (Cambria County and Pocahontas) is hardly more than 50c., but it is expected to go higher. Slack is very dull, having lost all its former advantage, and is selling close to bottom quotations.

Business at Toronto has been quieter than usual at this season owing to the rush of orders just before the anthracite miners' strike. While some of the dealers still have considerable stocks of anthracite on hand others have little or none, the total being estimated as about two or three weeks' supply. Many consumers are buying substitute fuels, more especially Pocahontas smokeless and coke. Bituminous is moving slowly, as many industrial plants have laid in stocks in anticipation of possible trouble in the soft-coal fields.

### Business Slack in New England

The market for steam coal in New England is admittedly quite slack. Purchasing agents scoff at predictions of possible shortages later and the course of prices in the past four weeks has not been of the kind to inspire confidence. Accumulations are heavy at Hampton Roads, and only a renewed policy of restricted output will save the smokeless operators from further reductions of the f.o.b. price. On No. 1 Navy standard Pocahontas and New River only a few of the agencies profess to hold their coals at the $5 level, and there have been repeated efforts in the past few days to place demurrage coal at $4.75@$4.80 per gross ton on board vessels for the coastwise trade. In no direction do the industries seem disposed to buy in any volume.

The special news of the week should include the recent award of a 900,000-ton contract by the Boston & Maine R.R. to C. H. Sprague & Son, of Boston, on Island Creek coal. The deliveries are to extend to a year from next April 1, with certain options for a further period of five years. The price has not yet been made public, but it is the consensus of the trade that the successful bid was around $5.10 per gross ton alongside Boston, or 25c. more than was paid by the N. Y., N. H. & H. R.R. some months ago.

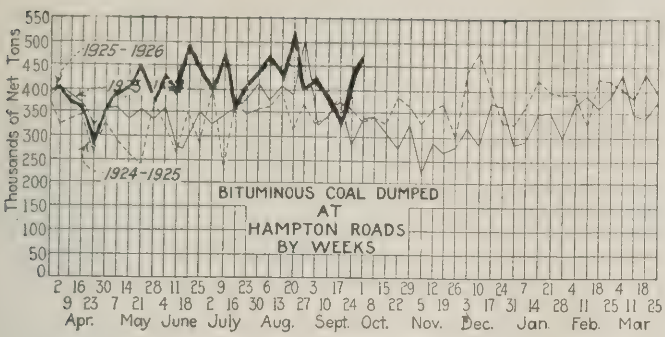
There are further indications that anthracite stocks are dwindling. In smaller communities, especially along the seaboard, where retailers are accustomed to store coal for the winter months, present supplies appear to be ample for months. The larger cities are by no means so well off, but not yet is there any pronounced demand for substitutes.

Shippers of Pennsylvania coal all-rail are quite active and prices of lump, egg and nut have been advanced several times in response to moderate demand. Quotations on prepared coal range from $3.50 to $5 and even higher per net ton at the mines.

For shipment inland from tidewater discharging plants the various factors have modified prices to $6 and less on cars, Boston or Providence. Most mine-run from the Virginia terminals is coming so slack that there is no interest in them for eventual household use. Tidewater retailers are turning to screened coal all-rail and to coke in cases where they are beginning to feel pressure from the public.

### Trade Slower at New York

The easing tendency in bituminous coal at New York continues. Demand as well as prices fluctuate somewhat, with the result that shipments are not moved as easily as



a few weeks ago. It is said that some heavy buyers are so well stocked that they will be out of the market in the next few weeks unless there is a decided change in temperature. Much will depend also on the continuance of the anthracite strike, operators and salesmen expecting important developments if the suspension continues another four or six weeks.

Consumers are taking full shipments on standing orders but in general show no desire to increase their receipts. It is said that some of the railroads are stocking heavy tonnages.

There is a fair tonnage of free coals at the piers but not enough to affect prices or to force sales at lower than current market quotations.

At Philadelphia the market seems to be hesitating. No ground has been lost, but inquiry for coal is slower. Demand for screened low-volatile coal for domestic use is strengthening, especially since some producers of byproduct coke are sold up.

At tide there is a slight improvement in cargo movement offshore, with some business still coming along. Bunkering is fair to good. Prices remain unchanged.

Oct. 1 brought little change in the soft-coal market at Baltimore. Loadings on the railroads continue unusually heavy, and there is a surplus at tide, created by shipments above the immediate absorption point. Prices remain stationary, and there is no real snap to the market, although some seasonal buying for stocking up has encouraged the trade. There was an increase of more than 100 per cent in the export fuel trade from Baltimore during the third quarter of 1925 over the entire first six months of this year.

Light showers and cooler temperature at Birmingham have heartened the domestic trade to some extent, though there has been no very material improvement in buying and movement in the past week. The market is still extremely laggard for this season, both in wholesale and retail channels, and orders are coming in very slowly.

Steam coal is being bought on a fairly satisfactory basis, demand being good for the better grades of mine-run and washed product, on which prices are firm, slight advances being obtained on some grades. Medium and lower grades, while not especially active, are moving with a fair degree of promptness at quotations which have held for several weeks. Due to insufficient rains steam power plants are consuming a large amount of fuel. Spot sales are somewhat heavier, with deliveries over a more extended period. Cessation of work in the anthracite field has not been felt materially in the local coal market so far but has served to stimulate the buying of domestic coke in the North and West, the movement from this section being heavier than usual, egg being quoted at $4@$4.25 ovens and nut at $3.50@$3.75 per ton. Foundry coke is selling somewhat better, prices ranging from $4.75 for byproduct to $5 for beehive product, f.o.b. ovens. Some gas-house coke is moving at $3.50@$4 per ton.

Coal production is around 400,000 tons per week or slightly better.

## Hard-Coal Trade Not Upset

Neither the strike nor the nearness of colder weather has affected the anthracite market at New York. There is no semblance of a rush by consumers and retail dealers show no inclination to pay the prices asked for stray lots of coal. Local retail yards hold a fair supply of all sizes, with the demand for stove heaviest.

Stock coals predominate in the offerings by wholesalers. The largest sizes are pretty well cleaned up. Pea and buckwheat are most in evidence and it is said the latter size is being gradually absorbed for use by mining and railroad companies.

One of the large producing companies has increased its price of No. 1 buckwheat to $2.60, an advance of 10c. over the September price.

Quotations for stray cargoes of domestic coals are around $17.25 alongside for egg, $20 for stove and $19 for chestnut. Stock chestnut is $15@$16 f.o.b. mine and pea $9@$9.50. No. 1 buckwheat is $2.50@$3.15 f.o.b. mine and rice $1.90@$2.25. Barley is practically out of the market, only a small tonnage being offered.

Coke is in fair demand with quotations ranging around $11 alongside.

Supplies are beginning to shrink in Philadelphia retailers' yards. The only family size running is company storage pea and dealers complain that this is not arriving in accordance with the amount ordered. The companies are holding this strictly to regular customers, and one producer on Oct. 1 advanced the price 25c. a ton. Cool weather last week caused pea to move well at retail at last, and it won't take long to use up stocks on hand.

Of substitute fuels coke is in the lead, of which a fair volume of byproduct is for sale. The principal size offered is nut, and the price varies from $4.50 to $7 a net ton.

In steam coals, rice is off the market, except for some river coal. There is plenty of buckwheat to be had, but this size is fast picking up in demand. Of course, there is no barley, as this was all moved some time ago.

The hard-coal supply at Baltimore continues to dwindle, as cooler weather is causing more consumers to place orders, but dealers are not willing to pay premiums for independent coal in any quantity. An effort is being made to pass a city ordinance to allow dealers to sell hard coal on the net-ton basis of 2,000 lb. instead of the gross ton as the law now requires. Dealers state that the reduction in the ton requirement would be met by a proportionate cut in price.

At Buffalo there is still a supply of pea and buckwheat coal and the demand is moderate. It is expected to last till there is mining again. The demand is good enough to make a market for a good many sorts of so-called smokeless coal, the price running all the way from $6 to $8 at the curb. More coke is being burned than formerly. Prices vary with an upward tendency.

## Quiet Envelops Connellsville Coke Market

The quietness that stole over the Connellsville coke market a forthnight ago is becoming more marked in contrast with the way the market stiffened in August, when various Eastern buyers were picking up tonnages at advancing prices. The last important Eastern buying was at around $3.40 or $3.50, not much being done above $3.50, but somehow operators got the market up to a quotable level of $3.75@$4 and some maintained two or three weeks ago that little if any coke could be had at less than $4. But in the past few days coke could be bought at $3.75 without difficulty, producers taking the initiative in offering it, and it has been a question whether a buyer might not be able to do $3.50. The opinion expressed in some market circles in August that the price movement was coming fully 30 days too soon in relation to the anthracite suspension seems to be fully confirmed.

Blast furnaces show no interest. Those operating are covered to the end of the year and no idle furnaces, such as use purchased coke, are likely to go in. The Port Henry (N. Y.) furnace is going in, but it is covered by a long-term arrangement.

Spot foundry coke has been particularly dull in the past week, remaining quotable at $4@$4.50.

The labor scare is largely past, as the Washington and Jamison-Bethlehem strikes have been waning slowly and no trouble has developed elsewhere.

## Car Loadings, Surplusages and Shortages

# Foreign Market And Export News

## British Coal Trade Steadier But Far Below Normal

The Welsh steam coal trade seems to be steadying, though there is an almost entire absence of any material improvement. The slight expansion of business reported last week still leaves the industry at less than two-thirds of that required to give full-time employment to the Welsh collieries. In many cases pits are forced to suspend operation on account of the lack of empty cars, these being held up on railroad and dock sidings with full loads, waiting for buyers.

The chief improvement in the business is due to a better demand for larger coals, it being still difficult to find buyers for the lower grades of large coal. Small coal does not sell at any price, as the market for this quality seems to be practically dead.

Altogether, the Welsh anthracite collieries are operating full time, though in the other classes few pits are engaged more than half time and many cannot work more than one or two days a week.

The tone of the Newcastle market is steady and the outlook for early October is distinctly better. Business matures very slowly and German competition is keenly felt.

Output by British collieries during the week ended Sept. 19, according to a special cable to *Coal Age*, totaled 4,435,000 tons, compared with 4,110,000 tons in the preceding week.

## French Market Changes Little; Russian Coal Still Coming

On the whole, there is no change in the French coal market. Quiet is still the prevailing note in industrial grades while there is a gradual increase of activity in house coals.

Belgian producers have, we are assured, fixed the price of ovoids for sale in France, from October to March, at 85 fr. and, if this information is confirmed, the price of French ovoids will be raised to 101 fr., in order to preserve the usual margin between the prices of the Belgian and French products.

The Russian anthracite which arrived in Rouen was sold locally or in the Paris area; its price f.o.b. Rouen was 300@310 fr. per ton, which is 50@60 fr. less than the Welsh anthracite of corresponding description. A cargo of Russian anthracite also has arrived in Marseilles, comprised, as the first one, of nuts and cobbles.

During August France received from the Ruhr 703,000 tons of indemnity fuels, including 432,200 tons of coal, 242,700 tons of coke and 28,100 tons of lignite briquets, as against a total of 671,500 tons in July.

## Business Continues to Slacken At Hampton Roads

Business at Hampton Roads slowed up last week, the market being weak and demand falling off. Only the bunker trade was normal, with a fair demand. Heavy buying at the time the hard-coal strike began apparently had overstocked much of the trade, which, combined with continued and unexpected warm weather, has had a tendency to cut down movement.

Supplies at the piers were heavy, no foreign business was being developed and New England trade was very light. Coastwise movement has fallen off, and movement to Canadian territory is below the average of the last three or four months.

## Belgian Producers Glum Over Industrial Fuel Outlook

Except for domestic coals, the Belgian market lacks animation. Anthracitic and other sorts of house coals, including ovoids, are in a quite satisfactory situation, a further rise of 5 fr. per ton having just been announced in Brussels for the prompt delivery of small tonnages of anthracite. Output of the latter sort of fuel is much restricted, and its consumption is increasing.

Industrial fuels, on the other hand, remain dull, though there has been a slight improvement in demand, which includes coke, due to the restarting of a few works and foundries. It is still far from what it should be, however, as important iron works are still idle. Besides, competition of German and British coals is becoming more acute and France is purchasing less from Belgium, even in the eastern area.

Therefore, the prospects of the Belgian industrial coal market are by no means bright.

# News Items From Field and Trade

## ALABAMA

E. E. Ellis, for many years general land agent for the Tennessee Coal, Iron & Railroad Co. and its subsidiaries, in the Birmingham district, has been transferred to the New York Offices of the United States Steel Corporation, where he will be connected with the general land office department. He was succeeded at Birmingham by Ted Joy, who has been assistant land agent there for the corporation.

The St. Louis & San Francisco R.R., which recently purchased the Muscle Shoals, Birmingham & Pensacola R.R., which has been in the hands of a receiver for several years, now has a corps of engineers in the field surveying the proposed extension of the line from Kimbrough, where it makes connection with the Mobile Division of the Southern Ry., to Glen Allen, where it is planned to make a connection with the main line of the Frisco. The line now extends from Kimbrough, south to Pensacola, Fla., a distance of 143 miles, and the distance from Kimbrough to Glen Allen will be 146 miles. Confirmation of the sale is pending before the Interstate Commerce Commission. The extension, if authorized, will penetrate the coal fields of Walker County and give the Frisco R.R. a direct connection with the port of Pensacola, where it is understood the purchased line owns valuable terminal facilities.

W. F. Hull, of New York, a stockholder and director of the DeBardeleben Coal Corporation, was in Birmingham recently on a tour of inspection of the properties of the corporation and attended a meeting of the executive board. He also is a stockholder in the Pratt Fuel Corporation.

## ARKANSAS

Mine No. 18 of the Western Coal & Mining Co., at Jenny Lind, opened Sept. 28 under the 1917 wage scale, according to J. T. Buckner, of the Consolidated Sales Co., at Muskogee, Okla., which has leased the property. The mine had been idle for several months. The mine is the largest in the Jenny Lind field and was producing 500 tons of coal daily at the time it closed. About 125 men were employed. A few small mines have been in operation in the field, but there was little activity.

Union miners have lost their fight against a receiver for district 21, United Mine Workers, and must see their funds pass into the hands of State Senator J. F. Brewer, designated some time ago as receiver for the union. Chancellor J. V. Bourland ruled that there was no reason why the receivership should be set aside, recognized the need for such a state and ended the controversy which has been raging for some time between union miners and mine operators. The receivership was granted Aug. 31 by Chancellor Bourland upon petition of the Greenwood, Mammoth Vein and Backbone Coal companies, alleging the union to be bankrupt and endangering the operating companies.

A temporary injunction enjoining members of District No. 21, United Mine Workers, from interfering with employees or the properties of the Bernice Anthracite Coal Co. and the Bernice Investment Co. at Russellville, Bernice and other points in western Arkansas, was issued Sept. 22 by Judge Jacob Trieber in the U. S. District Court at Little Rock. Judge Frank A. Youmans, at Fort Smith, previously had issued a temporary restraining order to await the return of Judge Trieber. The order is directed against 32 locals of the miners' union in Sebastian, Franklin, Logan, Johnson and Pope counties, which revolted against employment under the wage scale of 1917 recently placed in effect at the expiration of the 1924 scale.

## COLORADO

The State Supreme Court has overruled Governor Morley's recess appointment of Carl DeLochte as member of the State Labor Industrial Commission in place of W. I. Reilly. Mr. Reilly will hold his position as member of that commission for the term ending Jan. 1, 1928.

## ILLINOIS

W. H. D. Gibson, who has long been prominent in the coal trade, has been elected vice-president of the J. K. Dering Coal Co. of Chicago, with which concern he has been associated since its organization. In this capacity he is the official in charge of sales.

Voting trustees for the common stock of the United Electric Coal Companies, Danville, have declared a dividend of 50c. payable to certificate holders of record Oct. 3, 1925. This marks the resumption of dividends upon the stock of this company, and it is believed that the company's production will justify increased dividends in the near future.

The Indiana and Illinois Coal Corporation's two large mines, No. 12 and No. 14, located at Witt, in Montgomery County, will open in the near future, it was announced by the mine officials. Present plans of the company include a union of the two mines by the construction of a new steel tipple at mine No. 12, and the use of that shaft for the new consolidated mine in connection with the completion of the immense power plant now in course of construction by the company. The old tipple at Mine No. 12 is being torn down and will be replaced at once by a modern tipple of the best possible steel construction. When running at capacity the new consolidated mine will employ 800 miners.

## INDIANA

Announcement has been made that work is to be resumed at the Wabash mine, in the Terre Haute field. Operation has been suspended for some time on account of gas leading through a cut made into the old workings of the Speedwell mine. The Eagle mine, in the same field, has been reopened, as has the Vermillion mine, in the Clinton field. At Bicknell only one large mine remains idle. From the Petersburg field and other points along the E. I. & T. H. R.R. come favorable reports. All of the large stripping mines in this territory are working to full capacity and most of the deep-shaft mines now are working. The railroads are putting more crews to work each week.

## KANSAS

T. F. Brown, of Pittsburg, for ten years a mining engineer with the Clemens Coal Co., in the southeastern Kansas field, entered the service of the U. S. Bureau of Mines Oct. 1 as a first-aid and mine-rescue expert, assigned to Car No. 10, operating in Iowa and Missouri, out of Mason City, Ia.

Mine No. 7 of the Girard Coal Co., near Radley, idle since the spring of 1924, has been electrified and was reopened Sept. 25, under lease by Mike Wagner of Kansas City, Mo., and William Hudson, of Radley. The mine was leased by the two men a year ago but opening was delayed a year by weak demand. It is on 200 acres of coal land and employs eighty men.

Mine No. 14 of the Crowe Coal Co., near Croweburg, has been leased by William M. Curley, one-time auditor for the United Mine Workers, of Pittsburg, and John O'Donnell, of Arma, and was reopened Oct. 1. The operating company is known as the Croweburg Coal Co. The mine has been idle since February, this year. It will give work to between 100 and 150 men.

Coal is being uncovered by the new steam shovel of Ed Brennan and others near Mulberry, and loading will be started soon.

## KENTUCKY

Jack Boucher, 46 years of age, owner of several small mining properties, and one or more mines at Fredonia, Ky., is likely to die as a result of four wounds received when Bryan Bennett, an employee, became enraged over Boucher's refusal to meet wage demands, and started shooting. Bryan Bennett surrendered to officers at Princeton.

Excellent rains over the latter part of September have improved water conditions at some of the mines which were short of boiler water, and transportation is again near normal on the upper Ohio River and the Kentucky River. Boats are able to navigate again also on the lower Ohio River, and river coal movement, which was practically at a standstill, is getting under way again.

The Columbus Mining Co., at Allais, near Hazard, has started rebuilding about a dozen miners' homes which were recently destroyed by fire.

Negotiations are in progress for the sale of the property of the Alma-Thacker Coal Co., which had offices in Columbus, Ohio, and which operated four mines on Tug River. E. F. McClure was named receiver about a year and a half ago and in July D. N. Postlewaite, of Columbus, representing the creditors, bought in the property. Now outside parties are negotiating for the property, which consists of about 2,000 acres of excellent coal lands in addition to four tipples. The mines have not been operated since the receivership.

Except for a few boats powered with gasoline or oil-burning engines, boats on the Ohio and Mississippi rivers have been operated by coal-generated steam power almost exclusively up to the present time. Cheap fuel oil in the lower Mississippi River, however, is said to be responsible for an experiment now being made by the Mississippi and Warrior River Federal Barge lines, which placed the steamer Wynoka on the marine ways at Paducah, Ky., and fitted it up with oil burners to make a test of oil fuel for handling barge service in the district. The boat has been revamped and has been waiting for higher water to go South.

## MINNESOTA

The State of Minnesota has placed contracts for about 110,000 tons of coal for the ensuing year. The Berwind Fuel Co., Minneapolis, received the order for dock coal, at $1,600; Saline Coal Corporation, Minneapolis, for Illinois coal, amounting to $201,000; Chicago, Wilmington & Franklin Co., $7,800; North Western Fuel Co., St. Paul, $238,000; Northern Coal & Dock Co., St. Paul, $255,000; Pittsburgh Coal Co., $38,000; C. Reiss Coal Co., $5,300.

## MISSOURI

Kansas City coal dealers will not advance coal prices this fall or winter, according to H. S. Mitchell, manager of the Coal Credit Bureau, speaking for the largest coal concerns of the city. Coal prices will be lower than they were last winter, in all probability, said John Sargent, vice-president and general manager of the Central Coal & Coke Co.

The new shaft being sunk by the Western Coal & Mining Co., near Minden, to be known as the company's mine No. 23, has reached coal at a depth of 60 ft. Main entries are now being worked, and production is expected to begin within a few weeks.

## NEW YORK

The P. J. Conway Coal Co., Inc., has been incorporated under the laws of New York and has opened offices in the Woolworth Building, New York City, to carry on a general business in the mining and shipping of anthracite and bituminous coal, as well as coke. The company owns extensive soft-coal properties in West Virginia. The officers of the company are P. J. Conway, president; Joseph McDonough, first vice-president; J. W. Sullivan, second vice-president; John F. Conway, secretary; J. Clyde Lewis, treasurer.

## NORTH DAKOTA

Lignite mine owners anticipate an increased demand for their product as a result of the hard-coal strike. They are prepared to double their output.

The Northern Lignite Coal Co., of Minot, is preparing to develop a new mine at Benedict, south of Minot, where 330 acres have been purchased.

## OHIO

Dumpings at the Hocking Valley Ry. docks at Toledo up to Oct. 1, 1925, totaled 6,219,986 tons as compared with 5,015,548 tons up to Oct. 1, 1924. The T. & O. C. Docks at Toledo, operated by the New York Central Lines, loaded 790,443 tons originating on its lines up to Oct. 1, as compared with 45,315 tons last year to the same date. The T. & O. C. docks in addition have dumped 23,584 cars, or 1,165,030 tons, originating from the Big Four and L. & N. railroads. The total dumpings at the docks to Oct. 1 were 1,955,366 tons.

The Clarkson Coal Mining Co. is operating No. 1 mine at St. Clairsville with a shift to handle excess coal loaded during the day. Loaders shovel into the mine cars more coal than can be taken care of by the regular day shift, so a special force was put to work nights getting the fuel up the shaft and over the tipple screens. The situation is unusual in the eastern Ohio field. The company's Dunglen mine is operating steadily.

After being idle for almost three years the Wilbern mine, located near Crooksville, has resumed operations, giving employment to about 75 miners. The mine is loading considerable railroad fuel.

Mining conditions in the Crooksville field of southern Ohio, which embraces Muskingum, Perry and Morgan counties, have greatly improved during the past month or six weeks. F. J. Bender, secretary of Subdistrict No. 6 of the United Mine Workers, reports only one of the larger mines in that district not in operation. In all approximately 2,500 miners have more or less steady employment.

William A. Lama, who was formerly secretary of the Consolidated Mining Co., of Columbus, has resigned to accept a responsible position with the Preston-Morgan Coal Co., a jobbing concern with offices in the Atlas Building.

## PENNSYLVANIA

Vandals are using dynamite in certain parts of Clearfield County to intimidate operators paying the 1917 scale. On the night of Sept. 30 an explosion destroyed the fan house at the Betz mines and the previous night fire destroved the mule barn at the Davis mine. Both these operations are owned by B. Swoope, of Merion and Curwensville.

Twelve acres of coal, bordering on a mine fire which has been burning for the last 30 years, are to be mined through a slope 220 ft. long which is being constructed into the Davidson mine, near Connellsville. About 20 years ago brick walls were built to cut off the fire. More stoppings will be built where necessary. The slope will be 10 ft. wide and 8 ft. high. Three months will be required in construction. It will be driven under the ovens at the Davidson plant.

The Bertha Consumers Co., Chamber of Commerce Building, Pittsburgh, has called a special meeting of stockholders for Nov. 10 to act upon a contemplated increase in the indebtedness of the company from $2,000,000 to $2,500,000.

The Nebo Coal Mining Co., one of the concerns affected by the decision in the mine drainage case which went against the coal operators of the Indian Creek Valley, has found a way to surmount its difficulties. The company has pumped the drainage water from the mines into an old fireclay working—a lake of considerable size. Much of the water is lost by evaporation and seepage, and in this way the company expects to continue operations.

It is reported that the United Mine Workers will make another attempt to organize the miners in the Connellsville coke region this fall and winter.

The capital stock of the Acme Gas Coal Co., which has mines at Shannon and Rimersburg, has been bought by Joseph J. Eagan, Buffalo coal shipper, and Charles E. Buckholz, formerly vice-president of the Rochester & Pittsburgh Coal & Iron Co., but now president of the Bowersville Coal Mining Co. at Punxsutawney. Mr. Buckholz will be president of the Acme company

**Steel Span Over Big South Fork, Cumberland River**

Electric mine locomotives haul the coal across this bridge and dump it at the Worley or No. 4 tipple of the Stearns Coal & Lumber Co., Worley, Ky., the sidetrack being located on the Kentucky & Tennessee Ry.

and Mr. Eagan, vice-president. The mines have a daily capacity of 2,000 tons, most of the output of which will be sold in Buffalo.

M. C. Stoner and William H. Speer, Chambersburg, have recently purchased from the Pilling Co., of Philadelphia, a tract of land containing 285 acres on the Broad Top mountain, underlaid with three seams of coal. This is the property that was leased by the Joseph E. Thropp Co. to the Louise Coal Co. The Broad Top Fuel Co., with a capital of $100,000, has taken over the personal property of the Louise Coal Co., and is preparing to resume operations. The offices of the Broad Top Fuel Co. will be at Chambersburg. W. H. Speer & Son will act as selling agents, with offices at Chambersburg.

The Valley Camp Coal Co. has reopened its Soudan mine at Van Voorhis, near Monongahela, after being idle for 10 months. The Jacksonville scale will be paid, it was said. Normally, 500 men are employed at the mine and coal will be produced after cleaning up some time this week. It is understood the company will have monthly pay days, which will help keep down the overhead to some extent. It is likely other economies will be put into effect.

Robert Y. Stuart, Secretary of Forests and Waters, has sent a letter to the district presidents of the United Mine Workers in the anthracite region of Pennsylvania asking their co-operation in preventing forest fires. The head of the state department in charge of forest protection asks the miners' officials to call the attention of the miners now on strike to the fact that the fall forest fire season is here and to ask their aid in preventing and checking such fires.

The Penn-Pitt Coal Co. plans a number of changes at its river tipple near Greensboro, on the Monongahela River. The loading pier will be raised 8 ft., ice breakers will be enlarged and new mooring piers will be erected.

## UTAH

Lester D. Freed, prominent Salt Lake City capitalist and owner of coal properties in Huntington Canyon, near Huntington, obtained samples of coal from these properties recently with the view of having them tested for coking qualities. Fifty sacks of the coal have been shipped to Los Angeles for this purpose. It is believed that coking qualities of the coal will prove entirely satisfactory, in which case, it is understood, the properties in question will be developed.

The United States Fuel Co. has just awarded prizes for the best lawns and vegetable and flower gardens at Hiawatha, Heiner and Mohrland. The contest was in the interest of a movement for worth-while hobbies started by the company. Officers and salaried employees were not permitted to compete for prizes, but some of their gardens and lawns were highly commended by the committee.

Utah mines produced 385,413 tons of coal in August compared with 386,192 tons in the corresponding month last year and 479,000 tons in August, 1920.

The National Coal Railway Co. has been granted permission by the Interstate Commerce Commission to construct 8.5 miles of railroad in Carbon County. The line will develop a coal field not at present served by a railroad.

A runaway coal train the other day on the Kenilworth branch line of the Denver & Rio Grande Western R.R. in Carbon County stopped all hauling operations from that line for about 36 hours. The train wrecked itself at a curve. Seven hundred and fifty tons of coal was being brought from the mines to the switching yards near Helper when the brakes failed to act. It is estimated that the tie-up affected the output of the Independent Coal & Coke Co. to the extent of about 4,000 tons.

## VIRGINIA

The Norfolk offices of the West Virginia Coal Co. will close Nov. 1, it has been announced, and A. F. Jakeman, the manager, has not decided where he will go. The company has maintained offices at Norfolk and Newport News and the tidewater business has not been sufficient to maintain both places. The company's main offices are in Richmond.

## WEST VIRGINIA

In a statement issued by the State Department of Mines attention is called to the large labor turnover in the state, the largest in its history, according to Robert M. Lambie, chief of the department, who cautions officials to look after safety features more closely.

The Algonquin Coal Co., on the main line of the Virginian and the Widemouth branch of the Norfolk & Western Ry., which has been down for a year, has resumed coal shipments. It is owned by the M. E. Kinsley interests, of New York city, but has been in the hands of a receiver for some time. Roy T. Wright, of Matoaka, the receiver, is credited with getting things in shape for resuming operations.

Because of labor troubles the Consolidation Coal Co. did not have a special observance of Fire Prevention Week, Oct. 4-10 in northern West Virginia. Under ordinary conditions the company usually has special exercises in schools at the mining towns, displays in the company stores, and shows motion picture films on the subject.

Coal movement has been increasing recently on the B. & O. R.R. over the Alleghany Mountains, east of Grafton, according to reports. Seven hundred loads of coal are moving eastward daily, officials say.

Colonel and Mrs. W. D. Ord, of Landgraff, plan to leave the Pocahontas Coal field to make their home near Washington, D. C. They have purchased a part of the Mount Vernon estate and expect to make their home in the house that was built by George Washington for his overseer—a house which is about 150 years old. The house will be left intact until some time next year, when it will be remodeled. Colonel Ord, who is president and general manager of the Empire Coal & Coke Co., one of the larger producing companies in the Pocahontas district, and is president of the Smokeless Coal Operators Association of West Virginia, has been a resident of the Pocahontas field for about 30 years.

The resignation of William Roy, vice-president of District 6 and one of the leaders in the strike campaign now being waged against non-union mines in the Panhandle, has given rise to reports of a wrangle with Lee Hall, district president, although such reports are not confirmed. There also are rumors of a change in policy in the district, as a result of the resignation, especially toward the federal court injunctions now protecting the non-union operators and their properties. Roy had been identified with the union in District 6 for more than 15 years as a sub-district and district official. He gives ill health as his reason for resigning.

## WYOMING

Production in the Rock Springs field is increasing materially, several groups of mines now working four to six days a week. This increase is reflected in the re-employment of many men on the rip track forces of the Union Pacific R.R. in Rock Springs and in the camps.

The Union Pacific Coal Co. has taken another step in the safety field. Acting upon recommendations in the report of engineers who made the annual inspection of that company's properties, this corporation has announced that it is putting into effect a daily morning inspection of all of its mines. It is hoped by the company's officials that by such an examination prior to the men going to work every morning the number of accidents will be materially reduced. In the past year the U. P. has taken several important steps in the safety field, among which are the introduction of permissible powder for shooting, copious rock dusting of all workings, electric cap lights and the safety patrol system.

Rock dusting is gaining favor in the southern Wyoming district. Recently the Central Coal & Coke Co., of Kansas City, which operates a mine here, ordered a carload of shale dust from the Union Pacific plant in Rock Springs and is experimenting with the dust. Arthur Vaile is superintendent. Several weeks ago the Quealy interests purchased shale dust from the U. P. for use near Kemmerer and at Sweetwater, near Rock Springs. This company is using a combination pulverizer-blower. The latest company to evince interest in dusting is the Colony Coal Co., which has extensive workings at Dines. Recently Chief Engineer Pierce, of the Denver offices of that company, spent several days in Rock Springs studying the methods used by the U. P., and it is understood that this company will have rock-dusting operations under way soon.

Three thousand seven hundred and twenty-four miners were employed in 65 active mines in the State of Wyoming during the second quarter of 1925, according to the quarterly report of the state mine inspector, Hugh McLeod, made public last week. More than half, or 1,877, of these miners were in the employ of the Union Pacific Coal Co.; the Sheridan-Wyoming company was second with 420. These figures are only for men employed underground. Fourteen of the active mines were wagon mines. Fifty-four non-fatal accidents were reported, all of which occurred in the southern district, which includes the Kemmerer and Rock Springs fields. Four fatal accidents occurred, two in Superior, one in Hanna and the fourth at Owl Creek, in the Northern district.

State Mine Inspector Hugh McLeod, of Rock Springs, spent September in making an inspection of the mines of the northern Wyoming fields. The state inspector's offices are now at Rock Springs. John L. Dykes is the deputy for the southern district, having his office with Mr. McLeod.

## CANADA

Coke production in Canada in August totaled 95,297 tons, as against 89,221 tons in the preceding month. This rise of 7 per cent, according to a statement by the Dominion Bureau of Statistics, was due to increased blast-furnace activity and the settlement early in August of the five months' strike of Nova Scotia coal miners which commenced in April and continued for a period of approximately five months.

Peat Fuels, Ltd., a Montreal company, which has been manufacturing standard peat fuel at Alfred, Ont., during the past summer, is offering through Capital Investment, Reg'd., $75,000 7 per cent cumulative preferred shares, with a bonus of common stock. The company controls enough raw material at Alfred to produce 25,000 tons annually for twenty to thirty years. It is purposed to bring the capacity of the plant at Alfred up to 250 tons per day and plans are under way to establish similar plants in other favorable localities in the acute fuel areas of central Canada.

Southern Okanagan Collieries, which has acquired title to 1,280 acres of coal lands between Princeton and Fairview, in the Nicola-Princeton coal field, is floating a 15-year 7 per cent bond issue, to provide funds for the further development and the equipment of the property. Diamond drilling indicates the existence of six seams of a good grade of bituminous coal under the area owned by the company. The authorized capital of the company is $750,000, of which $457,150 is outstanding.

## Association Activities

**The Baltimore Coal Exchange**, composed of retailers, held its annual meeting on Sept. 27, when the following officers were elected: Hugh C. Hill, president; Benson Blake, Jr., first vice-president; L. C. Wilcox, second vice-president; J. E. Waesche, treasurer, and J. F. Palmer, secretary. The directors chosen were Mr. Blake, John J. Bauer, Graham Eckel, Charles Gross, Albert F. Gross, Mr. Hill, D. L. Harrison, Horace Isaacs, John J. Kelly, B. F. Lucas, O. P. McComas, William Magee, C. N. Parkinson, H. S. Reinicker, John J. Reahl, H. G. Von Heine, E. A. Watts, J. Harry West, Mr. Wilcox, Mr. Waesche and J. H. Wailes. The executive committee will consist of Mr. West, chairman; Mr. Von Heine, Mr. Wilcox, Mr. Hill, Mr. Blake and Mr. Waesche.

**The Smokeless Coal Operators Association of West Virginia** held its second annual "rodeo" meeting at White Sulphur Springs, W. Va., Sept. 15-18. Ways to take the fullest advantage of the opportunity presented by the establishment of an all-rail rate to New England, which becomes effective Oct. 15, were discussed. The members also made an analysis of the work of the Holly Stover Statistical Bureau, of Chicago, and named a committee to study the national advertising campaign for smokeless suggested by Mr. Stover. The event came to a close with a banquet, over which W. D. Ord, head of the association, presided. Among those who delivered addresses were F. M. Whitaker, vice-president of the Chesapeake & Ohio Ry.; A. R. Smith, vice-president of the Louisville & Nashville; W. J. Jenks, vice-president of the Norfolk & Western; William C. Atwater, John Laing, C. H. Mead and G. H. Caperton. On behalf of the association, E. E. White presented a silver loving cup to Robert H. Gross, who was president of the association in 1923-24. Trophies also were presented to P. M. Snyder of Mt. Hope, who won the invitation golf tournament, defeating J. B. McCahey, of Chicago, 3 and 2, and to Isaac T. Mann, of Washington, winner of the operators' tournament, who defeated Rodman Page, Jr., of Philadelphia, 4 and 3. Ralph Knode, of Philadelphia, won the Tierney Cup, and the Holly Stover trophy was won by W. J. N. Jenks.

**The West Kentucky Coal Bureau**, meeting on Sept. 8, at the Seelbach Hotel, Louisville, Ky., for the first time since June, handled some routine matters, named K. U. Meguire, of the Dawson Daylight Coal Co., a member of the Executive Committee, and wound up the meeting without much of interest developing.

## Obituary

**E. R. McClelland**, for many years identified with the Caperton interests in the New River field and superintendent of the Brooklyn mine of the Scotia Coal Co., at Finlow, in Fayette County, W. Va., was killed in an accident at the mine during the last week in September. He was accompanying General Manager Gaston Caperton on an inspection trip through the mines at the time of the accident. Observing the approach of a motor trip of mine cars and fearing for the safety of Mr. Caperton, Mr. McClelland was too late in reaching one of the safety holes along the entry and was struck by the motor and killed instantly. He was 34 years of age.

**George B. Beatty**, head of the Beatty Bonanza Coal Co., Kansas City, Mo., died at his home in Kansas City, Sept. 26. Mr. Beatty operated mines at Higginsville, Mo., and in Arkansas, and had been in the wholesale and retail coal business in Kansas City forty years. He was born in Georgetown, Ky., seventy years ago. He is survived by his wife, two daughters and two sons.

## Coming Meetings

**American Gas Association.** Annual meeting, Oct. 12-16, at Atlantic City (Steel Pier), N. J. Secretary-manager, Alexander Forward, 342 Madison Ave., New York City.

**National Conference of Business Paper Editors.** Annual meeting, Oct. 14 and 15, at Congress Hotel, Chicago, Ill. Secretary, D. G. Woolf, 334 Fourth Ave., New York City.

**Kanawha Coal Operators' Association.** Annual meeting, Oct. 15, at Kanawha Hotel, Charleston, W. Va. Secretary, D. C. Kennedy, Charleston, W. Va.

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting, Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Illinois Mining Institute.** Fall meeting, Nov. 6 and 7 at West Frankfort, Ill. Secretary, Frank F. Tirre, St. Louis, Mo.

**Harlan County Coal Operators' Association.** Annual meeting, Nov. 18, at Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering.** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## You Cannot Browbeat an Economic Law

OF COURSE, the anthracite operators seriously fear a possible wage increase or any change in working conditions which will raise the price of anthracite coal. They are having trouble now in holding their market. Oil, coke and bituminous coal are coming in where they never came in before. Any increase in price will make anthracite still harder to sell and will narrow its market. The public will buy the cheaper article when the price goes low enough to offset, in its opinion, the advantages of hard coal.

In other words, the operators are up against an economic law. Moreover, they know that they are "up against it." How long before the miners wake up to the fact that they too are up against the same economic law? Its operation is inevitable: Less sales, less mining; less mining, less work. And eventually the result will be, if prices continue to rise: no sales, no mining; no mining, no work.

Even under present conditions, without any new increase in wages or additional burdensome working conditions, the operators, in order to hold what markets they have, must secure the utmost economies in operation. But the major economic law that stares the industry in the face is the thing that cannot be escaped and must be appreciated by both parties to the industrial partnership—operators and miners. The operators have an appreciation of it. The miners need to wake up.

Labor unions may be able to force exemptions from legislative bodies, but they cannot browbeat an economic law.

## Day Wage and the Public

WHENEVER COAL STRIKES agitate the public, as well they may, the question asked is: What do miners receive? The answer is not any too satisfactory. The inquirer is told that the lowest day wage is $4.62 or $7.50 as the case may be, but he becomes suspicious when the informant cannot give actual daily wages for the most numerous bodies of workers—miners, mine laborers and loaders. "There is something queer about this," he feels. "I know the wages of bricklayers and plasterers, why this difficulty in ascertaining miners' wages?"

So he is quite greedy to hear what Mr. Lewis, the mine workers' champion, has to say. Mr. Lewis quite plausibly bases his statement on the U. S. Coal Commission report, overlooking the fact that this Commission was unable to follow the miner from job to job and so shows far more men at work in mining than the mines contain and the wages per man per year much lower than the mine workers actually receive.

If each man had a day wage there would be less dispute and that is what we are coming to, as machines are being introduced. When the mines are mechanized so as to make the work easy all men will be paid, it is to be hoped, a day wage. When any one is asked what is the wage, the answer will be forthcoming without any dubious note or lengthy explanation.

Some have doubted whether a day-wage mine can be made successful, but the attempt to run a mine that way has been tried, and both men and management are enthusiastic. Not a tonnage man is on the job, and every man employed is sure that whether the mine cars come or fail to come promptly he is assured of a certain day's pay. The operator has accepted the uncertainty in place of the miner, and there is no sign that he regrets his choice.

## Clean Up Airways

IN MINES where men are allowed to travel the haulageways, the other air passages, whether intake or return airways, are permitted too often to become cluttered with fallen rock, making the burden on the fan unduly heavy. In many cases this rock is removable only with difficulty because the rails have been lifted, and concrete stoppings make the airways relatively inaccessible. They become unsafe and difficult to travel so that after a while no one cares to traverse them. Eventually their condition becomes so bad that the fan has to be speeded up.

It would be more profitable to keep such places properly cleared. The falls being removed, the airway would be enlarged, and ventilation would be aided rather than hindered. Many a mine becomes progressively difficult to ventilate because of the continued decrease in the capacity of the airways owing to falls and to the heaving of the floor. As the cleaning of such air passages is expensive the work on them is delayed in time of low coal price so as to cut cost. When there is a demand for coal, the job already has become too large for any one to attempt without risk of running up the cost unduly. Moreover, the handling of rock requires the labor of men who might otherwise produce coal and absorbs the capacity of cars that might be used for the haulage. Furthermore, the rock cars absorb the capacities of the haulageway, shaft, and motive power and cause delays on the surface. So the job is again delayed and in the end is never performed.

Cleaning up airways is a part of normal operation and should be so regarded. Delay in performing such work should not be tolerated unless either there is a prospect that a new shaft will be sunk that will make the airway useless or there is a likelihood that the airway will shortly be dispensed with and the pillars drawn. Even then a clear airway will make the pillar drawing easier and will enable the coal to be removed free of pieces of broken débris.

Ventilation is a continuing operation, a constant drain on the operator's pocket, and should be met by persistent vigilance. In most mines few see the condition of air courses. They are not places that managers or executives visit, and it is in them, often, that hundreds of dollars of wasted power are concealed in the interest of temporary and fancied economy. Cleaning up airways is one of those longer-visioned economies that subordinates are apt to overlook in their efforts to keep down the charges on the daily cost sheet. "Men come and go," say they, "why worry about future ventilating problems?"

With instruments that measure water gage and power consumption, however, the progressive wastes in airways which become cluttered with rock can be watched and appropriate action taken.

## Small Cars, Low Profits

NO NIGGARDLINESS is more expensive than to use cars smaller than roof conditions make necessary. A railroad using the equipment of twenty-five years back would be in the bankruptcy courts, but many mines are still struggling along with the equipment that was modern a quarter century ago, when cars were built, high, short and narrow. A modern car reduces gathering charges, gives the miner a better opportunity for loading and lowers main-haulage costs. A mine with a narrow gage can make no better investment than to relay the track, scrap the cars and locomotives and buy standard equipment, large enough to justify introducing the new constructional improvements such as housed wheels, spring draft rigging, roller bearings, etc., that go with such cars.

There are limits, of course, especially in gaseous mines and in those with weak roof. Where brattice cloth is used at the face of entries a wide car may leave insufficient room for the intake or return current and for the posts by which the brattice is sustained, particularly where the roof is such as to make the entry and crosscuts narrow. But it is evident that small cars are often used where there are no such reasons for keeping their size down to existing limits.

Where a company has a narrow gage all its newly purchased equipment as well as its old must conform with standards out-of-date, unduly expensive and unprofitable in operation. Hence a change must be made sooner or later in the interest of economy, so why not make it now? By not delaying, the advantage can be obtained at once. Surely if the mine is going to continue producing for years under present methods it does not pay to delay making the change, thus deferring the profit and making the revision, when it does come, the more expensive. Unless methods of mining are radically changed never will the trackage be shorter than now, never will the number of cars, frogs and switches be less than today.

With mechanical aids comes a demand for larger cars and an opportunity for concentration. The latter assures a reduction of trackage, and when that is made it is a good time to change gages if they are too narrow. No one who tries out mechanical aids in loading, whether loaders or conveyors, really knows what these can do if the tests are made with inadequate cars.

Some years back, Samuel Dean, an English engineer, long domiciled in America, said to his British friends in a technical paper delivered in England that the reason for American efficiency could be found in the large car. His suggestion is still good, though he has been dead many years. Why trifle with problems of loading, transportation, hoisting and dumping by using cars of inadequate size?

## Pooling Experience

THE annual meeting of the West Virginia-Kentucky Association of Mine, Mechanical and Electrical Engineers will probably not be held this year. This cancellation is to be regretted. In a time like the present, when rock-bottom costs are essential, conferences of mine mechanics and electricians are of their greatest value.

Operators are depending on developments of mechanical and electrical equipment to reduce production cost. Selection, installation, inspection and maintenance of that equipment are all highly important factors contributing to the overall net result—lower cost per ton. Theory is valuable but experience is absolutely necessary, although sometimes costly. Men who must learn everything first-hand instead of profiting by the failures and successes of their neighbors are limited in the service they can render.

Meetings of virile associations of technical men offer them opportunities to increase their value to themselves and their employers. Operators the country over should see to it that such associations *are* kept virile. They can do this by sending one or more men from each mining company instructed to contribute freely of the company's experience—and to bring back worth-while ideas. The cost of sending these men should be a sound investment.

## Put Yourself in His Place

OPPOSITION TO MACHINERY is not unnatural. The miner who sees a machine which enables one man to do two men's work naturally anticipates that one man is likely to be dropped and is opposed to the improvement. Clever managers arrange that this shall not happen.

At most mines men are drifting away all the time. As a rule these drifters are not the most desirable men, and if no attempt is made to hire new employees the force gradually decreases automatically. Men, in fact, soon cease to apply for work. The word goes around that none are being hired, and they look elsewhere, perhaps in some other promising industry.

Now, with the force already decreased, so that machine operation is necessary to fill orders, the machines can be introduced without opposition. No one sees them as a threat but as a promise of steadier work, because of the low-cost production they assure. The machines are started without an excess of men being employed on them, and they work at maximum efficiency. The psychological conditions consequently are right. Because of the way it is introduced there is no antipathy to the machine and as it insures steadier work and lightens toil everyone is pleased.

Every operator should put himself in the miner's place. What would he do if he handled pick and shovel? He then will use excellent judgment in making innovations and see that they help instead of harm the employee.

In fact, would it not be well at times of low production to decrease the number of miners? It is true a large force of men insures a speedy loading of cars and less delays in transportation, but on the other hand it increases the area that must be kept under development and it destroys morale. After all, that latter factor is not to be undervalued. One may as well run a machine without lubricant as to handle humanity without morale.

# Face Conveyors Work Better in Longwall Mining Than with Half-V Plan at Sweetwater

CONVEYOR HAULAGE of coal from face to entry is getting an interesting trial in the Sweetwater mine of the Gunn-Quealy Coal Co., in Wyoming. For a year conveyors have been used under several experimental systems, getting 100-per cent extraction. A modification of the V system was tried first, and lately, a plan of longwell mining. Roof troubles, handicapped the first scheme because the half-V's could not be worked fast enough. The longwall method, however, cleared up roof difficulty because of greater concentration of mining and swifter progress. About 10 per cent of each fall is shot directly onto the conveyors, thus lessening hand work. The company is still perfecting its system. Glenn A. Knox, superintendent of the company's operations, at the last meeting of the Rocky Mountain Coal Mining Institute described his experiments thus:

"The coal in this mine has an average thickness of 6 ft., 3 in., and lies on an average pitch of 5 deg. The roof is a sandy shale of medium hardness and has been generally considered as good top for the room and pillar method of mining.

"When our company became interested in conveyors, I visited most of the mines in the East where conveyors and other methods of mechanical mining are in use, and decided that a modification of the V-system in use at the Norton, W. Va., mine would be the most feasible for our conditions. We installed 300 ft. of conveyor as an experiment to see whether our roof could be handled on long faces. This 300 ft. was installed as two separate conveyors, one as a face conveyor 100 ft. long, the other as a heading conveyor delivering coal into mine cars on the main entry.

"This face, shown at *A* in the accompanying drawing, was worked directly on the strike and down the pitch. This did not prove to be a success as the caving of the roof carried over to the working face and necessitated propping between the conveyor and the face. It was also necessary to shovel coal onto the conveyor up the pitch. After working this face for 200 ft. we installed two conveyors at a place adjoining the worked-out block, but on a half V-shaped face as shown at *B* on the drawing. This block of coal was 60 ft. wide. This method proved to be successful. We cut a place, moved the conveyor against the face before shooting and carried two rows of cribs between the conveyor and the cave. The roof was caved every second cut.

"After working out this block we were satisfied that this system was feasible for our mine. We then ordered 1,200 ft. more conveyor of the same type as the trial section with a few modifications. We then installed this 1,500-ft. unit on the four faces, *C*, *D*, *E* and *F* on the sketch, with approximately 100 ft. to each face, 200 ft. on each heading and 300 ft. on the main conveyor lines that delivered the coal into the pit cars at the points *G* and *H*. We also had a head section and a rear section for each of the four advancing places shown.

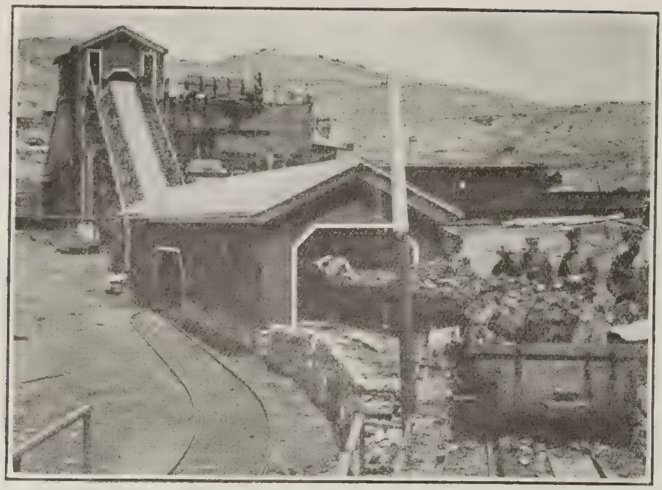
"As sections were taken out of the heading conveyors they were installed on the face conveyors, and, when the faces approached it, the main conveyor was taken out and installed in the next uphill or main-conveyor place. The roof caved very well in the straight line of the points and was broken about every 20 ft. We encountered no trouble unless we permitted one of the points to get behind.

"The maximum possible production by this method was estimated at 725 tons a day, assuming that all places were cut and cleaned up in one shift, and this we attained for several consecutive days.

"While this was a success from a cost standpoint, we felt that we could get a greater tonnage from the same length of conveyor if we changed over to a longwall method, using one face 250 ft. long with not more than

---

The headpiece shows Sweetwater village, south of Rock Springs, Wyo., where conveyor history is being made. The coal comes to the tipple by a long endless rope, where it is lifted by an apron conveyor to the requisite loading height. For use at this mine the superintendent, Glenn Knox, invented the box-car loader which goes by his name. It was described in *Coal Age*, July 2, 1925, page 17. This loader is an ordinary picking and loading boom lying between the railroad tracks which can deliver to open cars, if necessary, or to another boom resting between the tracks and so designed that it can in turn deliver the coal through the open door of a box car into the hopper of a box-car loader which duly delivers the coal on the car floor.



**Tipple and Screen House at Sweetwater**

Coal is dumped over an end dump onto a bucket conveyor. Many of the cars now have end and side plates, so that the tonnage they will carry when machine-loaded is increased 33 per cent or from 3,000 to 4,000 lb.

500 ft. of conveyor in use. We have been working on this plan for the past four months.

"We started this method at the point *J*, and tried to keep the cave from 20 to 25 ft. from the face. This did not prove to be a success and after we had gone only about 50 ft. the roof rode over the cribs to the face, forcing us to abandon it. We then installed two face conveyors of 250 ft. each in the place marked *K*, one face working out to *L* where some coal had to be abandoned and the other moving in the opposite direction to *M*. We adopted the plan of caving the roof every second cut and have been working on that plan ever since with good success with the roof.

"We set a row of breakers with props 8 in. or larger in diameter, about 18 in. apart in a straight line the entire length of the face. Cribs made of rejected railroad ties were placed about 15 ft. apart the entire length of the face. This gives us a crib 2 ft. 8 in. square. These cribs are set on about 6 in. of bugdust. It is seldom that they take any weight. They are used only when some unusual condition causes the roof to ride over the props to the face. In such cases they are employed only to protect the machinery and men. We have produced an average of 359 tons every working day for the past month and the mine has worked every day except Sundays. One long face with necessary development work operated every day has yielded enough coal to take care of our business.

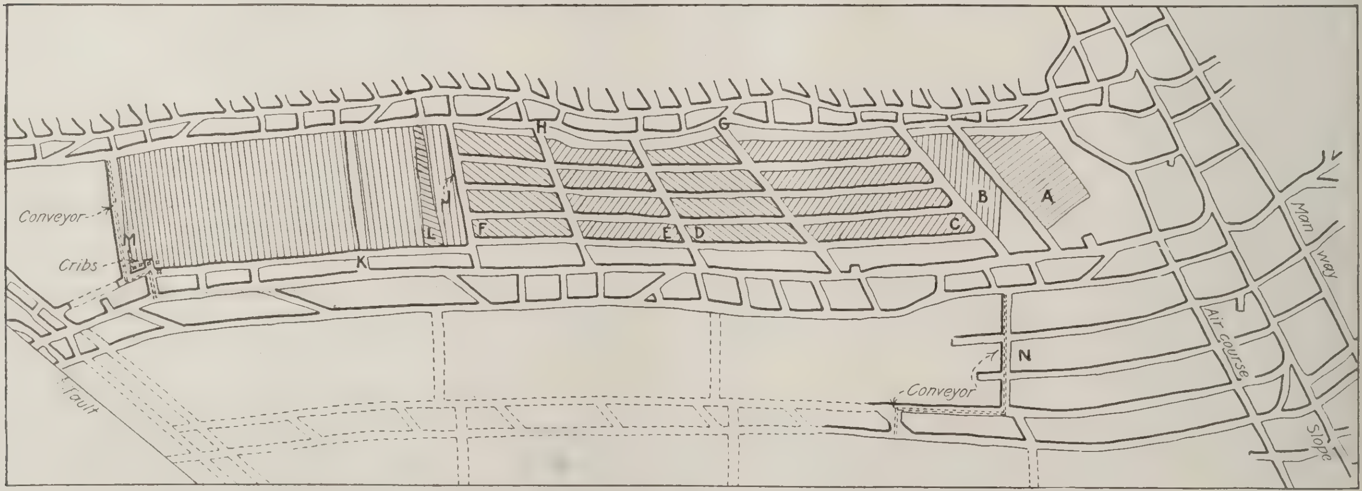
"It is my opinion that this method of mining should be kept going every day if possible. If it is permitted to stand still for a few days the roof will gradually settle and break along the face. This is true also of the half-V method. We did not get along well by working it only two or three days a week. The longwall system is a more flexible proposition, for either one or more faces, as the market may dictate, can be worked continuously.

"We have 1,000 ft. of conveyor temporarily out of use while it is being installed in two other places, one of which is shown on the sketch at *N*.

"We first began producing coal from the trial conveyor on Sept. 6, 1924. Since that time we have produced a total of 64,804 tons without hurting a man. The recovery has been 100 per cent, as we have aver-

**Apron Conveyor Brings Coal to Required Elevation**

Returning run can be seen beneath the conveying run. All sizes are carried up together ready for sizing on the tipple.



**Mine Workings Where Sectional Conveyors Are Being Tried**

Trials were first conducted on a small scale to test roof action. After working two places shown at *A* and *B* it was believed that the roof could be controlled successfully. Accordingly, more conveyor was procured and mining with it started on a far more ambitious scale, four faces, *C*, *D*, *E* and *F* being worked. These were worked out, all but some small stumps, and a longwall face was tried at *J*. At present a longwall face is being worked at *M* and another similar face made ready at *N*.

**The Tipple Has Four Load Tracks at the Sweetwater Mine**

The principal commercial sizes in the Rock Springs area are 8-in. lump, 8-in. mine run (all below 8 in.); 5-in. or 3-in. lump coal; 5 x 3-in. stove coal, 5 x 1½-in. and a 3 x 1½-in. nut coal; 1½-in. slack and 1½ x ¾-in. pea coal or prepared slack and ¾ x 0 dust. The dust goes to smelters.

aged between 1,600 and 1,700 tons per foot per acre. The expense of maintaining these conveyors has been practically nothing.

"Each face, heading and advancing conveyor is run at a speed of 30 ft. per minute and driven with a 15-hp., high-starting-torque type motor, the speed of which is 900 r.p.m. The speed is cut down by a right-angle speed reducer. The main conveyor, when used on the half-V method, was driven at a speed of 90 ft. per minute and with a 50-hp. motor of the same type. The conveyors are made up of 6-ft. sections and all sections in heading, face and main conveyors are of one type and are interchangeable.

"In shooting a long face, we begin at the upper end. The holes are placed 10 ft. apart and we then start the conveyor and fire the shots one minute apart, keeping the conveyor running continuously. We find this practice to be highly satisfactory. When working it on the half-V system, we shot the coal down onto the conveyor the full length of the 100-ft. face while the conveyor was standing still. We had no trouble in starting the conveyor with this load. Under our present longwall plan approximately 10 per cent of the cut is loaded out without being handled with shovels. The conveyor is placed directly against the face before shooting.

"The conveyor now in use is constructed along rather heavy lines and will withstand a reasonable fall. We never have damaged a section by shooting the coal onto it. We are working this system under 500 ft. of cover. The surface has shown no displacement or sign of settling.

"I do not believe the percentage of the different grades of coal produced by our various methods varied much, as the advantage in shooting or working the long faces is overcome by the breakage in handling it with the conveyors."

---

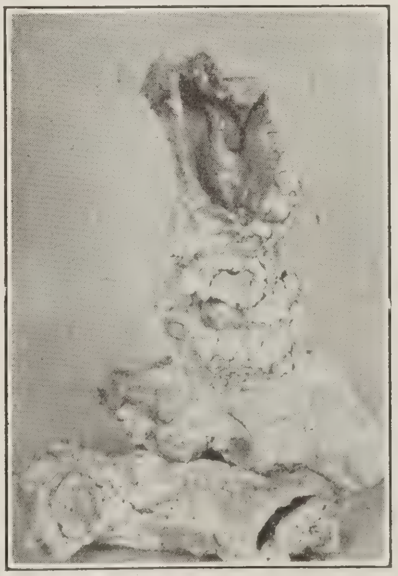
## Freak Results from a High-Tension Ground in Illinois

The accompanying illustration shows the result of one phase of a high-tension line coming in contact with the ground. During a thunder storm in August, 1923, one wire of the 33,000-volt power line extending between mines Nos. 11 and 16 of the Old Ben Coal Corporation, located at Christopher and Sesser, Ill., respectively broke at an insulator allowing both ends to fall to the ground. The current seemed to pass from the end of one wire through the earth to the end of the other and thence on through the line.

At several points each of the fallen wires rested on small tree stumps that thus formed a connection between them and the ground. These stumps proceeded to burn out and the peculiar formation here shown was the result of the sand and soil fusing at its contact with the stump roots. As far as this fused formation extended into the earth the roots were completely burned away. Below this point the wood was badly charred while still farther down it appeared to be little harmed, retaining its woody characteristics.

The material of which this formation is composed is an impure glass or slag somewhat resembling the fulgurites sometimes formed where lightning strikes in sand. The soil, doubtless, acted as a flux for the sand it contained thus assisting the fusing process.

Incidentally, after the storm was over and the line was being repaired, an opossum was found dead between the points where the wires touched the ground. To all appearances, being inexperienced in the manipulation of high-tension transmission lines, he came out to investigate what all the fuss was about. And, like the inquisitive dog who once smelled of a third rail, he "got a nose full of information."



**"Juices" Wild Did This**

When a high-tension power line broke, each end fell on a little tree stump. The current apparently passed through the ground from stump to stump for a period until power was shut off. Each stump with most of its roots was burned out and sand in the soil was melted into strange shapes such as this, the dirt acting as a flux.

# Large Electric Hoist Has Air-Operated Contactors

## System of Control Is Similar to that Used in Railroad Electrification —Switches Are Closed by Compressed Air Acting Against a Powerful Opening Spring — Has Complete Set of Protective Devices

**By J. E. Borland**

General Engineer, Westinghouse Electric and Manufacturing Co.,
East Pittsburgh, Pa.

For many years electric drive has been generally recognized as the most satisfactory and economical method of operation for mine hoists, and there are now hundreds of electrically driven hoists of all capacities in service. For new installations the electric drive has become most common and many existing steam hoists have been advantageously remodeled to use electric power. It is only under exceptional conditions that any advantage can be found for other possible forms of drive.

This general use of electric hoists has been brought about largely through the extension of power service, and the resulting widespread use of electric power in the mining industry. Improvements in methods of control, also, have contributed greatly toward the prevalence of electric operation of hoists.

The three general systems of electric hoisting are: (1) the wound-rotor induction motor with rheostatic control. (2) The direct-current motor with variable voltage control and supplied by a synchronous motor-generator set. (3) The direct-current motor with variable voltage control and supplied by an induction motor-generator set provided with a flywheel for load equalization.

The induction motor with rheostatic control is the simplest type of equipment for an electric mine hoist, and under ordinary conditions the most economical in operation. Magnetic control equipment has proved successful in the capacities for which it has been developed. For large motors, however, variable voltage control, with the added expense of a motor-generator set, often has been considered necessary because of the magnitude of the main currents, even though other conditions favored the use of an induction motor. Such conditions will generally be found with large capacity hoisting cycles with a heavy load per trip from a deep level. In such cases the accelerating and retarding periods are a comparatively small part of the total hoisting cycle. On hoists of this chracter, motor ratings of from 1,000 hp. to 2,000 hp. often are required, and contactors of high capacity are necessary if the main motor currents are to be controlled directly.

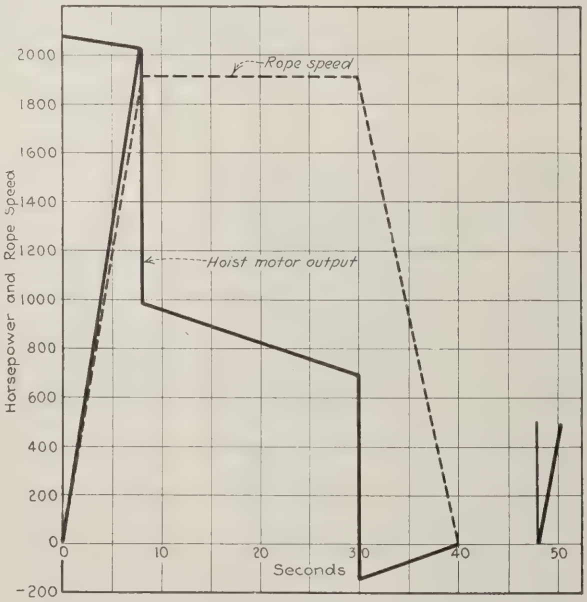


**Fig. 1—A Fast Hoisting Cycle**

Although the hoist is operated in balance the horsepower required is large. The depth of the shaft is 989 ft. and the maximum drum speed 60.5 r.p.m.

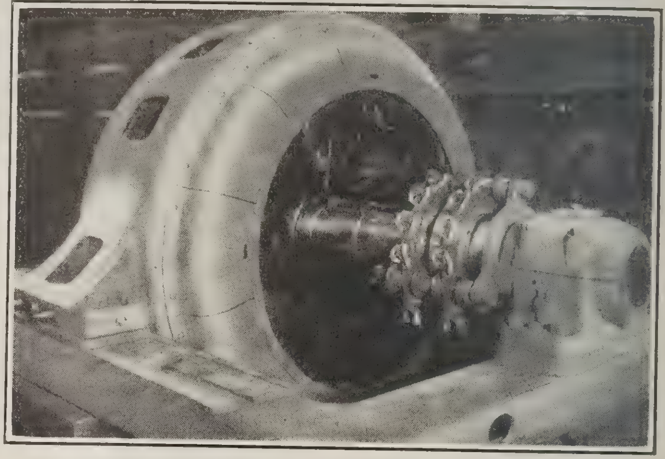

**Fig. 2—Pedestal Type Hoist Motor**

The shaft of the rotor is made long so that inspection of the rotor or stator winding can be made readily by moving the stator in an endwise direction.

A novel and interesting application of control for a large mine hoist is the equipment recently installed at Shaft No. 4 of the Lehigh Coal and Navigation Co. The duty cycle upon which the capacity of the electrical equipment was based is shown by Fig. 1.

For this service a wound-rotor induction motor having a continuous 40-deg. C. rating of 1,200 hp., 300/293 r.p.m. was selected to operate from a 2,200-volt, three-phase, 25-cycle power supply. The motor is of the pedestal bearing type, similar to that shown in Fig. 2, and was supplied with two pedestal bearings but without base; being mounted on an extension of the hoist bedplate. The frame of this motor is a single casting and provision is made for shifting it in a direction parallel to the shaft a sufficient distance to uncover the rotor winding and facilitate inspection or repair. The motor is provided with a shaft extension which is connected through a flexible coupling to the pinion shaft of the hoist.

This installation is of interest mainly in the application of the electro-pneumatic system of control for the 1,200-hp. induction motor. Electro-pneumatic control has been used for many years on heavy traction, street railway and subway service, and has gained high reputation through its strong construction, positive operation and low maintenance. This type of equipment is well adapted to control of large induction motors on heavy-duty service.

The main circuit switches of the hoist controller are electro-pneumatically operated, each switch being closed individually by air pressure acting on a piston opposed by a powerful spring. Compressed air is admitted to and exhausted from the switch cylinders through electrically operated valves which are governed by the master controller in conjunction with automatic current limiting and protective relays. Strong forces are exerted which insure positive and rapid action of the switch, with a quick break on opening and heavy contact pressure in the closed position. The movement of the switch contacts is such that arcing occurs mainly on the tips of the contacts and on the arcing horns, thus leaving the current-carrying surfaces relatively smooth and clean.

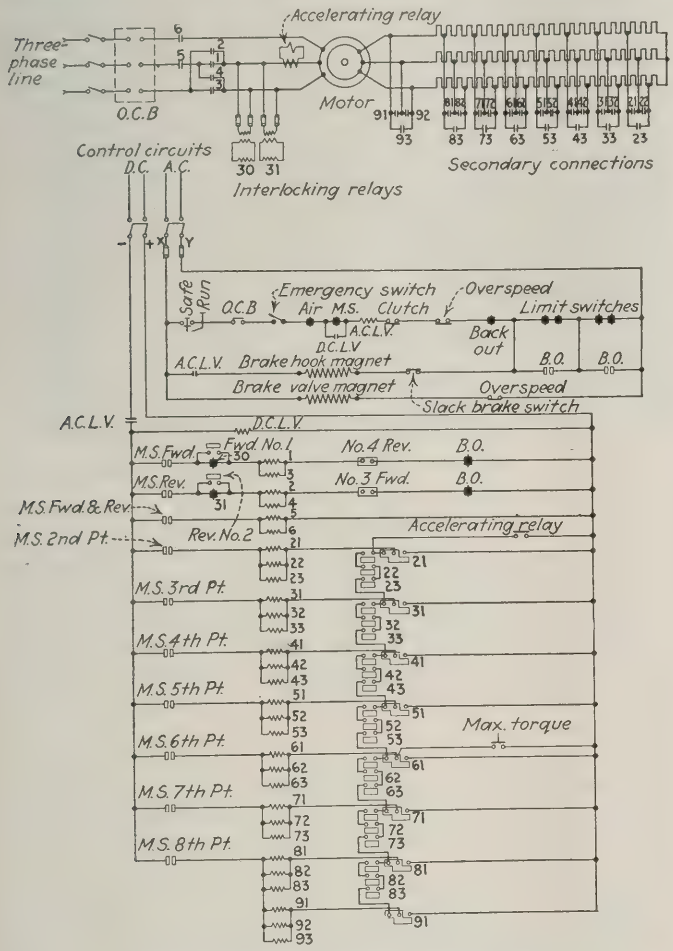

**Fig. 3—Control Wiring Is Simplified**

Many features designed to make possible safe and quick control of the hoist have been incorporated here. Accelerating relays, limit switches, overspeed relays and other necessary devices which have made electric hoists so efficient and safe have also been included in the control system.

The main control circuit providing excitation for the magnet valves of the main switches is taken from a separate source of direct-current energy at low voltage. The magnet valves are small and the power consumed is negligible. Operation of the electro-pneumatic switches is entirely independent of any variation of voltage on the main alternating-current line, and reliable operation is obtained over a wide range in air pressure.

Each electro-pneumatic switch is a unit in itself, and may be removed independently from the supporting structure without disturbing adjacent units. All parts subject to wear are located so as to be readily accessible for inspection or replacement.

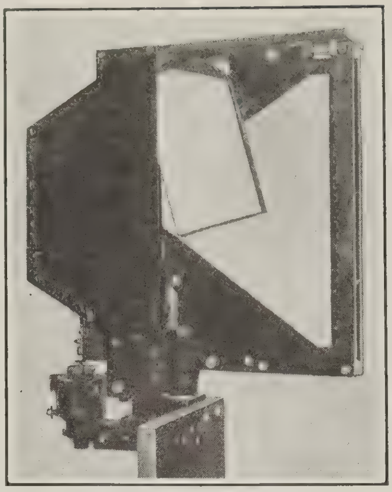

FIG. 4

**Electro-Pneumatic Switch**

Normally the switch is held open by means of a spring and is closed by compressed air pressure. The primary switch is provided with arc chutes and blowout coils.

For reversing the direction of rotation of the hoist motor six primary unit switches are used. The detailed construction of these switches is shown in Fig. 4. Each primary switch has a rating of 500 amp. and is insulated for 3,000-volt service. A correctly proportioned blowout coil, pole pieces and arcing horns on each switch insure positive rupturing of the arc. Each switch is equipped with an arcing chute of heat-resisting material in which the arcs are extinguished.

The primary reversing switches are mounted in a substantial structural steel framework as shown by Fig. 6. The six switches are arranged in three two-pole elements, the two units of each element being mechanically connected together so as to operate simultaneously. One two-pole element is closed at every opera-

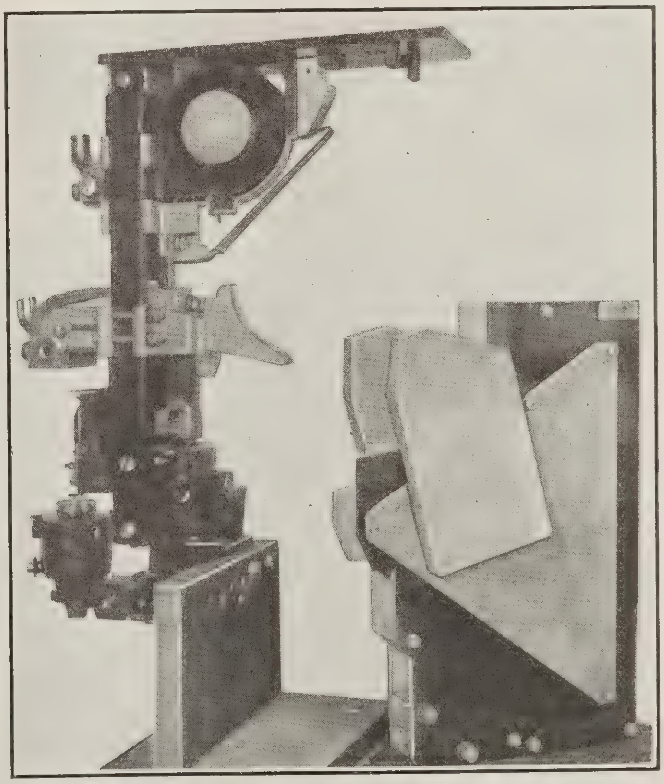

**Fig. 5—Arc Chute Removed from Primary Switch**

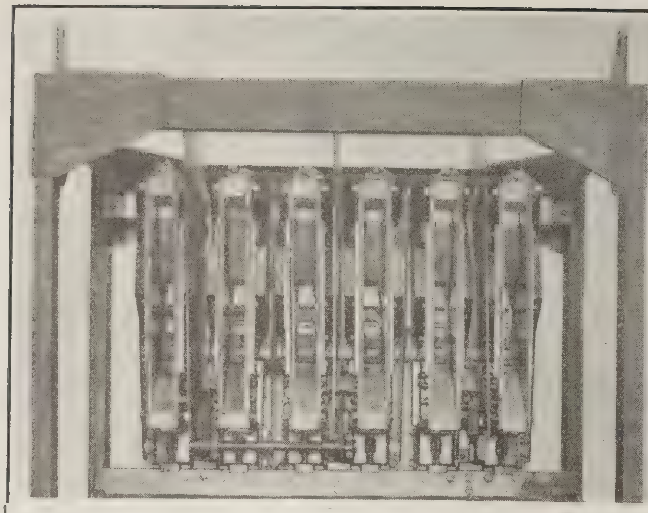
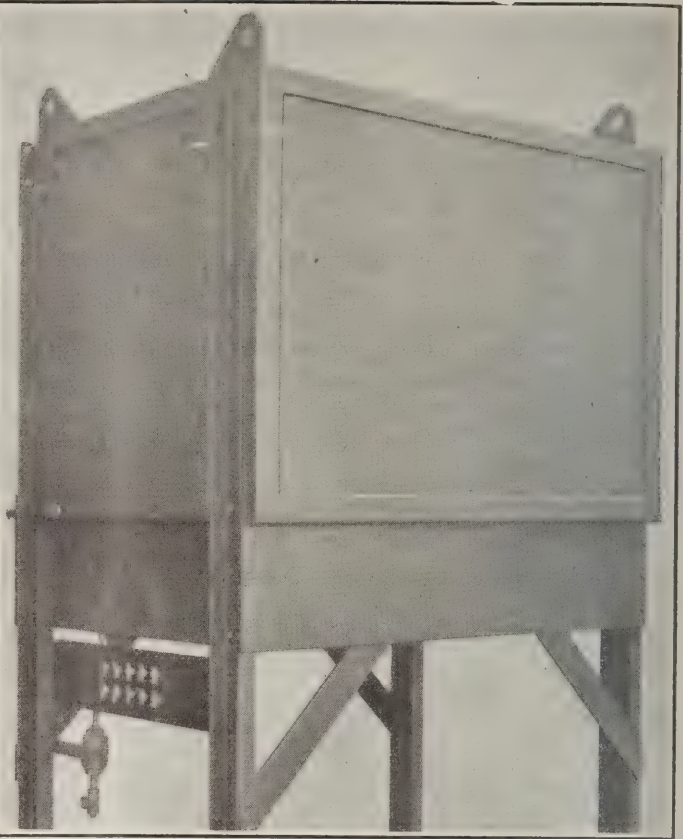
Long troughs made of insulating material hold the arc from damaging adjacent parts or other switches and yet cause the arc to break quickly.





**Figs. 6 and 7—Primary Reversing Switches**

These illustrations clearly show how the high voltage switches are grouped and protected. An air pipe extending underneath the switches connects to the air cylinder which closes the power circuits.

tion while the other two elements are used to reverse one phase of the primary, and are closed alternately, for the two directions of rotation.

A strong mechanical interlock is provided between the two two-pole switch elements used for reversing, and in addition a system of electrical interlocking is used as shown by the controller diagram. This consists essentially of two small transformers having their high-voltage windings connected across one phase of the primary circuits, between the reversing switches and the motor, and the low-voltage windings connected to the operating coils of two normally closed relays designated as Nos. 30 and 31 in the diagram. The normally closed relay contacts are connected in series with the operating coils of the reversing switches, so that if an arc tends to hang on after opening of a primary switch, the relays remain energized as long as potential exists on their coils, and as the relay contacts are held open under this condition the control circuit to the reversing contactors is broken. These features effectively prevent the closing of one set of reversing contactors until the opposite set has opened and the arc has been completely extinguished.

Special inclosing covers are used on the primary switch group to muffle the noise which is characteristic of all high-voltage air-break contactors. The appearance of the primary switch structure with covers in place is shown by Fig. 7.

Twenty-four unit switches are provided for acceleration of the motor by short circuiting sections of grid resistor connected in the rotor circuits. These switches are of the same general construction as the primary switches, but are insulated for 1,500 volts and are furnished with arc chutes only, blowout coils being unnecessary, as the switches do not open the circuit. Each secondary switch has a rating of 800 amp., and as the switches, in groups of three, are connected in delta on each step, an effective capacity of 1,200 amp. is obtained. Eight steps of resistance are used.

The secondary switches are assembled in three structural steel frames as illustrated by Fig. 8. Inclosing covers are not required with these switches as the only noise attending their operation is the escape of air from the cylinders upon opening.

Operation of the hoist is controlled by means of a small reversing master controller mounted on the operator's platform. By manipulation of this master controller the closing of the main primary and secondary switches is controlled under the automatic protection of the interlocking and current-limiting features previously described. The motor is thus reversed, accelerated in either direction, retarded or stopped, and when operating under load accurate control is readily obtained.

As indicated on the diagram of connections, the magnet valves of the main switches are energized by successive points of the master controller, closing of the secondary switches being automatically controlled by a current-limit accelerating relay, the contacts of which are connected in series with the magnet valves of each step of secondary switches by interlocking contacts on the preceding step. This relay is adjusted to hold its contacts open until the current has decreased to a predetermined value, so that if the master controller handle is moved too rapidly the hoist is automatically accelerated at the proper rate, the relay delaying the closing of successive secondary switches until the current has decreased to the desired value.

To permit starting the hoist under exceptionally heavy loads without changing the setting of the accelerating relay, a foot-operated switch is located on the operator's platform. Closing of the switch short circuits the relay contacts so as to permit closing of the proper secondary switches to obtain the maximum motor torque at starting.

The 2,200-volt incoming line to the hoist equipment is brought through disconnecting switches to a switchboard panel of standard construction consisting of three slate bases with black marine finish supported on 92-in. pipe framework with a channel-iron sill. The panel is provided with a coverplate and operating handle for a manually operated remote controlled oil circuit breaker, which is mounted on the wall at the rear. The oil circuit breaker is rated 500 amp., 7,500 volts, three-pole, single throw.

Overload protection of the hoist equipment is provided by two transformer trip coils on the oil circuit breaker coverplate, and inverse time limit attachments are used to prevent the circuit breaker from opening on high overloads of short duration required to accelerate exceptionally heavy loads. The circuit breaker is arranged to open also in case of low voltage. The switchboard is provided with a polyphase watthour meter showing the power consumption of the hoist.

A simple scheme of control connections is used and the usual safety features are readily included. For protection of the hoist equipment in case of power failure, a double-pole alternating-current low-voltage relay is provided, one pole being wired in series with the direct-current control circuit and the other pole in series with the brake hook magnet so that opening of the relay causes all main control switches to be de-energized and the brake set. A reset contact on the master controller is so connected to this and the direct-current low-voltage relay that the master controller must be returned to the "off" position before operation can be resumed, following a failure of power. This prevents an accidental start of the hoist upon return of power as the master controller must be in the "off" position to reclose the low-voltage relays.

### SAFETY DEVICE PREVENTS OVERSPEED

Protection against overspeed or overtravel at the hoisting limits is furnished by a safety device driven from the hoist drum. Contacts of this device are connected in the alternating-current low-voltage relay circuit so that opening of any safety contact will stop the hoist. A small drum "back-out" switch is used to permit operation of the hoist in the reverse direction only, in case of overtravel and opening of any of the limit switch contacts.

A protective relay is used to prevent operation of the hoist controller if the air pressure should fall below the lowest point in the desirable range of pressure for the electro-pneumatic switches. This prevents closing of the main switches unless strong air pressure is present, and obviates the possibility of faulty operation under insufficient closing forces.

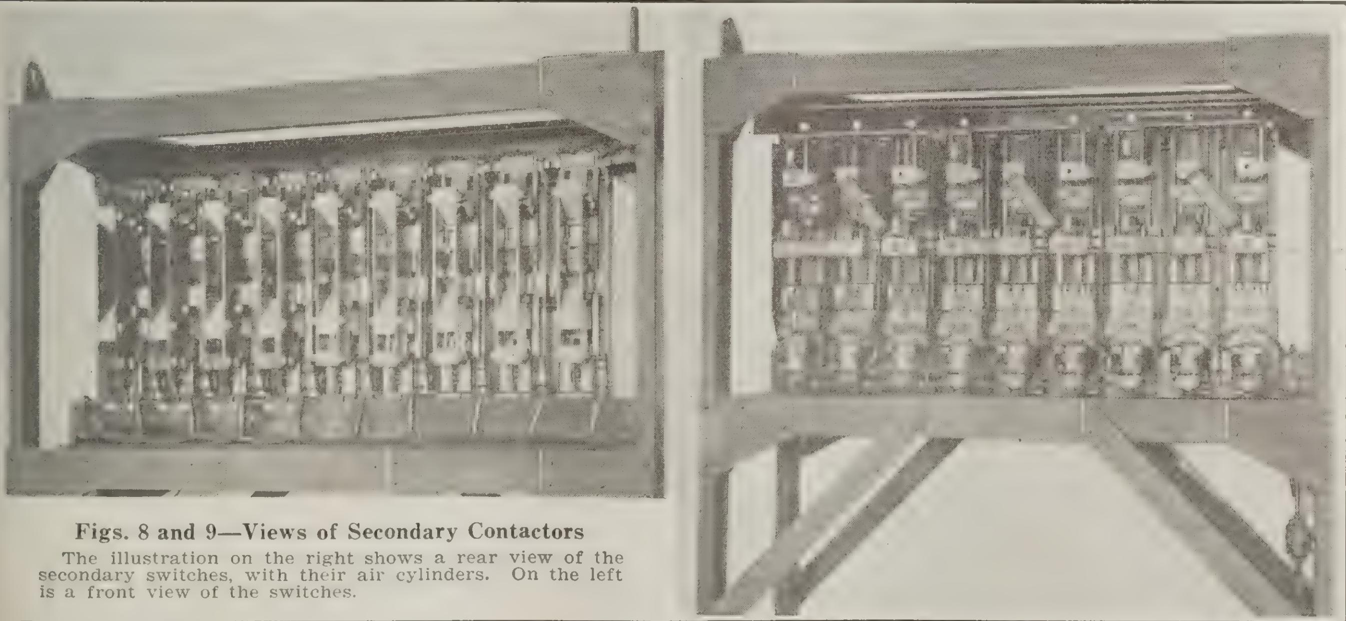
A means of stopping the hoist quickly in an emergency is provided in a safety push button mounted on a panel on the operator's platform. This panel also carries starting buttons for the exciter set and air compressor motor, pressure gages and meters indicating operation of the hoist equipment.

The controller includes grid resistors designed for low torque on the first point with properly proportioned accelerating steps. Resistors of sufficient capacity are used to avoid undue heating during acceleration or speed control of the motor.

### ADVANTAGES OF AUTOMATIC CONTROL

From the foregoing description it may be seen that electro-pneumatic control embodies a number of features desirable in heavy duty service. Reliability in operation and low maintenance costs are insured by the use of main control switches, interlocks and auxiliary parts of substantial construction, following designs that have been proven under severe operating conditions. Operation of the electro-pneumatic switches is rapid and positive and is unaffected by ordinary variations in line voltage. The unit switches are assembled in compact groups supported on steel framework. This form of construction leaves all parts readily accessible, and at the same time simplifies installation of the control equipment. Operation of the electro-pneumatic switches is quiet, as there are no weighty moving parts. The noise which accompanies the breaking of arcs of the primary switches is characteristic of all high-voltage contactors and special covers are provided on the reversing switch group to muffle this noise. With this provision both the primary and the secondary switch groups may be located in the hoist room which avoids the necessity of constructing a separate control room and may result in a material saving in building construction.

The selection of this type of control by the engineers of the Lehigh Coal & Navigation Co. undoubtedly marks a step forward in the practice of controlling large induction motor mine hoists.



**Figs. 8 and 9—Views of Secondary Contactors**

The illustration on the right shows a rear view of the secondary switches, with their air cylinders. On the left is a front view of the switches.

# Triple Shifting Makes Big Stripper Profitable

**By Frank H. Kneeland**
Associate Editor, *Coal Age*
New York City

ABOUT FOUR MILES, as the crow flies, northeast from the Court House in Boonville, Ind., lies a body of coal land half a mile square which attracts attention because stripping takes place there on a three-shift basis that has resulted in marked economy of operation. It is the Sunlight Coal Co.'s plant. This is one of the few coal operations in southern Indiana or in the Middle West, for that matter, that worked regularly six days per week most of the summer. The big electric shovel removing the overburden runs day and night. The small loading shovel, however, can load out as much coal in one shift as the stripper can uncover in three.

Two factors are mainly responsible for the operating economy which has enabled this strip mine to keep working in a time when most neighboring plants ran part-time or not at all. First, triple shifting keeps the stripper busy throughout the entire day, thus cutting to one-third the hourly overhead charge entailed by the cost of this machine. Second, the use of electric power greatly reduces the cost of labor necessary for this shovel's operation.

The overburden stripped in this operation consists of sandstone, shale, slate and surface soil. It ranges in thickness from approximately 25 to 50 ft. The coal uncovered is from 6 to $7\frac{1}{2}$ ft. thick, is free from partings and lies approximately level, that is, without any general dip.

To facilitate the operation of the stripper, the overburden is drilled with two gasoline and one electric churn drills. Six-inch holes are put down to within about 1 ft. of the coal. Each of these is cleaned out and slightly sprung with one stick of 4x8-in. 40-per cent dynamite. They are then loaded with about equal weights of this dynamite and *FF* black blasting powder, from 25 to 50 lb. of each explosive being used in each hole according to the depth of overburden encountered. Firing is done with electric detonators.

The coal is drilled by means of compressed air and shot with the same grade of dynamite as the overburden. In this case, however, the sticks of explosive are 1x8-in. while the holes into which they are loaded are 2 in. in diameter. Air cushioning to some extent is thus obtained and the shattering effect of the explosive on the coal is lessened accordingly. After shooting, the coal is loaded direct into railroad cars by a steam shovel fitted with a dipper of $1\frac{1}{4}$ cu.yd. capacity. The railroad cars are run directly into the pit.

The stripping shovel works back and forth along the face taking a width of about 40 ft. of overburden at each cut. The total length of the pit is now about 2,500 ft., this face extending roughly diagonally across the tract from corner to corner—that is, from northeast to southwest.

The stripper is operated by two men: a shovelman and an oiler. The full crew, however, consists of six men and an electrician who works on it only part time. One man gives his entire attention to keeping a record or log of the stripping shovel's operation. He thus records the linear feet of the shovel's advance per

**Uncovering Coal**

*Illustration A shows the big electric stripper of the Sunlight Coal Co. It runs three shifts a day exposing coal for the $1\frac{1}{4}$-yd. steam loading shovel, B.*

**Power by Wire**

*At the left is the end of the 4,000-volt pole line. The sled carrying fuses and an oil switch advances with the workings. The shot-hole drill is shown also.*

**Dumping to the Spoil Bank**

This is a general view of the strip pit showing, in addition to the stripper, the cut made by the loading machine. The track on the coal berm is of standard gage as railroad cars are run in to the pit and filled by the loading shovel.

shift, the number of moves it makes during the shift and the number of dips it takes. He also records the time lost and the reason for any delays. His log is extremely valuable, not only as a record of what actually has been accomplished, but also as a guide as to what may be expected in any depth of overburden encountered.

In order to stimulate the interest of the men in their work, the log man each day chalks up on the side of the underframe of the machine the record of the previous day's accomplishment. Thus on July 17, the record shown in the accompanying table was chalked up, referring to the work of July 16. This shows that the first shift made six moves and advanced the machine 52 ft. The second shift made nine moves and advanced 106½ ft., while the third shift made ten moves with a machine advance of 111 ft. The total for the day was twenty-five moves and 269½ ft. of advance.

**Table I—Machine Log for July 16**

| Shift No. | Moves Made | Distance Advanced, Ft. |
|---|---|---|
| 1 | 6 | 52 |
| 2 | 9 | 106½ |
| 3 | 10 | 111 |
| Total | 25 | 269½ |

Not the least interesting detail of this stripping is the method of surveying employed. The surface is laid out in rectangles 50 ft., each way. Thus every 50 ft., both north and south, and east and west, a stake is driven in the ground upon which is painted the coordinates of this particular station and the elevation of the surface at that point. In the office in Boonville a corresponding plat of the area is kept.

At each advance of the machine, the brow of the cut is measured from at least two of these stakes, a measurement from a third usually being taken as a check upon the other two. The exact position of the machine and its movements for each shift may thus be plotted on the plat in the office. These measurements are taken whenever the machine moves up. Once a month a check survey is made and the approximate results obtained by this method are then corrected.

Interest in this operation largely centers in the big stripping shovel. While this is of a type that is not perhaps strictly new, as several machines of a similar character are already employed in various parts of the country, it is, nevertheless, of a design that will unquestionably be employed far more extensively in the future than it has been in the past.

This stripper is a Marion "350" full revolving electric machine, mounted on four, four-wheel trucks. Ward-Leonard full voltage control is employed on all of the electrical equipment.

Some of the chief dimensions of this machine are as follows: Length of boom, 90 ft.; capacity of dipper, 8 cu.yd.; length of dipper handle, 56 ft.; maximum height of dump with boom at 45 deg., 67 ft. above the rail; maximum radius of dump at maximum height, 97 ft.; maximum radius of dump, dipper handle horizontal, 101 ft.; height of dump, handle level, 47½ ft.; radius of cut at grade (1 ft. below top of rail) 69 ft.; radius of cut at 40 ft. elevation, 106 ft.; extreme height of boom above top of rail, 80 ft.; extreme radius of boom from center of shovel, 97 ft.; approximate working weight, with ballast, 890,000 lb.; ballast for upper frame, 180,000 lb.

The extreme height of the A-frame from top of rail is 51 ft. 10 in.; length of upper frame, 46 ft. 10 in.; width of upper frame, 21 ft. 8 in.; clearance radius of rear end of upper frame from center, 33 ft.; diameter of roller circle, 30 ft.; size of lower frame, center to center of girders, 30 x 30 ft.; center to center of trucks, 26 ft.; center to center of truck wheels, 3 ft. 3 in.; diameter of truck wheels, 2 ft. 6 in.; capacity of hoisting motor (60 min. rating) 175 hp.; rotating motor, 105 hp.; crowding motor, 85 hp.; hoisting generator, 250 kw.; rotating generator, 75 kw.; crowding generator, 50 kw.; diameter of hoisting cable, 1⅜ in.; of boom hoist cable, 1 in.; number of rollers under revolving frame, 78.

### PLATE GIRDERS FOR OUTER MEMBERS

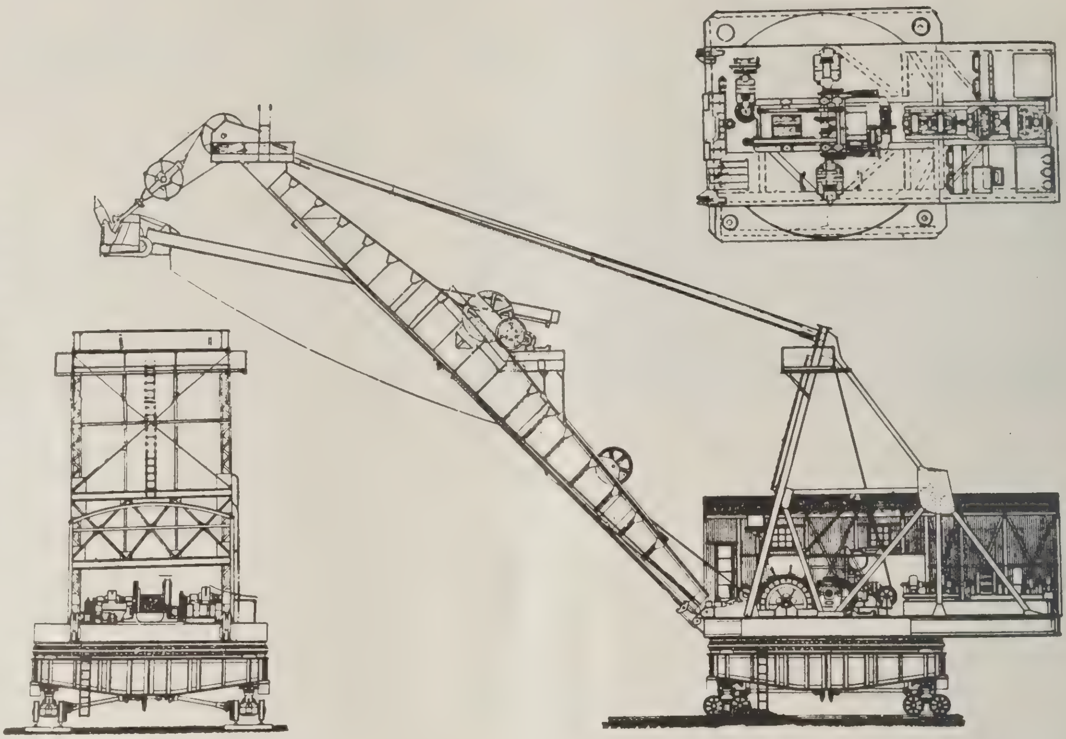
The outer members of the lower frame are composed of plate girders, 56 in. deep at the center. These are braced at the corners with diagonal girders 37 in. deep. Each corner of the frame is also fitted with a heavy steel casting connected to the side, end and diagonal frame members which extends the full depth of the frame. This casting is also arranged to carry a cylinder of the hydraulic leveling device.

The lower frame is mounted on four swiveling trucks, each consisting of an open-hearth steel, frame casting, carrying four double-flanged wheels. All four wheels in a truck and all four trucks are drivers. Each truck is provided with an adjustable chain. This prevents the trucks from becoming totally disengaged from the pistons in the equalizing jacks on the lower frame. The truck castings are provided with bushed bearings for the propelling shaft and the inside wheels are fitted with spur gears engaging the driving pinions. Two sets of track, one at either side of the machine, are necessary.

A patented hydraulic equalizing device, consisting of four cylinders with trunk pistons, circulating pumps and the necessary piping and connections, are provided for the lower frame. These hydraulic cylinders are carried in the steel castings at the corners of the frame, each casting as well as its cylinder being so designed as to form a ball-and-socket joint. This joint permits the truck to traverse curved or uneven track. The cylinders are accurately bored to receive the pistons. Two sets of leather packing prevent leakage. The upper portions of the pistons are turned smooth,

THE BIG STRIPPER

*This gives an idea of the general outline of the machine, but can afford small conception of its size. When the dipper handle is level and thrust forward as far as possible, it is approximately 130 ft. horizontally from the front of the digging teeth to the rear of the shovel cab.*



while their lower ends are threaded to receive safety locking nuts. These may be easily adjusted by hand and are intended to be set up close to the cylinders while the machine is in operation, but to be moved away when it is being moved. In no case should they be set up tight against the cylinders as the machine operates on the fluid within them.

One power-operated and one hand-operated pump are conveniently located on the lower frame and connected to the cylinders with heavy pipes, valves and bypasses so that the fluid may be forced from one cylinder to another, or to the reservoir at the pumps. This equalizing or leveling device gives the flexibility of three-point suspension and permits the machine to be operated or moved over uneven track without subjecting the lower frame to torsional stresses arising from an unequal distribution of weight.

All the wheels of the four, four-wheel trucks are double flanged and all act as drivers. Propulsion is accomplished by means of a jaw clutch which may be thrown in or out of gear as may be desired. The turntable on which the upper frame revolves is of the roller type, consisting of two circles of 175-lb. rail, one fastened to the upper and the other to the lower frame. Between them revolve 78 double-flange rollers. These are of high carbon steel and are held between an inner and an outer strap each of which is rolled to a true circle. They are grease lubricated by means of hand compression cups.

This machine is equipped with a motor generator set, consisting of a three-phase, 60-cycle motor, suitable for connection to either a 2,300- or 4,000-volt line. This drives three 250-volt, direct-current generators; one actuates the hoist motor, one the swinging motor and one the crowding motor. Changes in the speeds of these various machines are secured by voltage control of their respective generators, a suitable rheostat being placed in each generator field. Provision is made for automatically limiting the current in each motor to such a value as will develop the maximum torque desired. Each motor is provided with its individual control panel, the master controllers being located at the operator's station at the front end of the revolving platform. The trip motor, or the one that discharges the bucket, is wound for 115 volts, direct current, energy for its operation being drawn from the exciter. This motor, like the others, is controlled from the operator's station by means of a small hand lever. This is mounted on the hoisting controller. All electrical equipment, such as motors, generators and the like, are grounded to the frame of the machine.

Three 7½-kva., single-phase transformers of 2,300 to 4,000 volts primary, and 110 to 120 volts secondary current, are installed for operating a direct-connected air compressor which in turn actuates the brakes on the hoisting apparatus. Three 1½-kva., single-phase transformers are installed on the lower frame for operating the hydraulic pump and to furnish current to the various lighting circuits.

Two open, mill type, 230-volt, direct-current, series-wound motors are located at the side of the hoist frame and compound geared to the hoisting drum through a friction brake. The intermediate or clutch shaft carries the gears for driving the hoisting drum, the boom hoist drum and propelling mechanism. Clutches provide for disengaging of the propulsion apparatus and the boom hoist drum when these are not in use.

The hoisting drum is grooved for 1⅜-in. rope and mounted loosely on its shaft. It is actuated by an outside air-operated friction band brake, the air cylinder being attached to the spokes of the gear wheel. The friction band is lined with wood blocks and provided with a long take up. The boom hoist drum, mounted at the rear of the hoist machinery frame, is driven by a clutch on the intermediate shaft through a worm and worm wheel, which locks the boom in any desired position without the use of ratchets or pawls.

The rotating or swinging motor is of the open mill type wound for 230 volts, direct current, and is compound geared to the vertical driving shaft.

The boom consists of two main members in the form of plate girders, trussed and braced together by means of bulkheads and top and bottom plates. The rounded boom foot casting is stepped into a foot casting of corresponding design, thus permitting a slight rolling motion of the boom without injury to any of the parts. Cable guys connected at the peak and center of the boom stay it during the start and stop of the swing. The crowding motor is of inclosed mill type, wound for 230-volt, direct current and compound geared to the shipper shaft. The dipper handle is of combination steel and wood type, composed of two wooden members with steel armor plates on both sides and steel bars on top and bottom. It is held to the shipper shaft pinion by means of a yoke or saddle block.

Both the dipper front and the bail are manganese steel castings. The sheave block attached to the bail carries a 60-in. open-hearth steel sheave provided with a finished groove.

All operating levers controlling the machine are located at the forward end of the revolving frame to the left of the boom and so arranged as to be within easy reach of the shovel runner who has a clear and unobstructed view of the work to be performed. The entire machine has been designed to assure ease in handling and speed of operation.

This shovel is operated on purchased current. An outdoor transformer station is located at one side of the property with feeder lines radiating from it toward the open cut. Several points are thus available at a comparatively short distance from the brow of the cut for attachment of the cable leading to the shovel. This cable is connected to the nearest available point and laid over the ground to the machine. Any surplus is wound on a reel at the forward end of the under frame. This cable is of the three-conductor, rubber covered, type and is, perhaps, 2 in. in diameter. Current enters the shovel through the center of rotation.

## Blending of Soft and Hard Coal Feasible

Blending of anthracite and bituminous coals is a matter of dollars and cents, Dr. O. P. Hood, chief mechanical engineer of the Bureau of Mines, states. It long has been done in special cases, he points out.

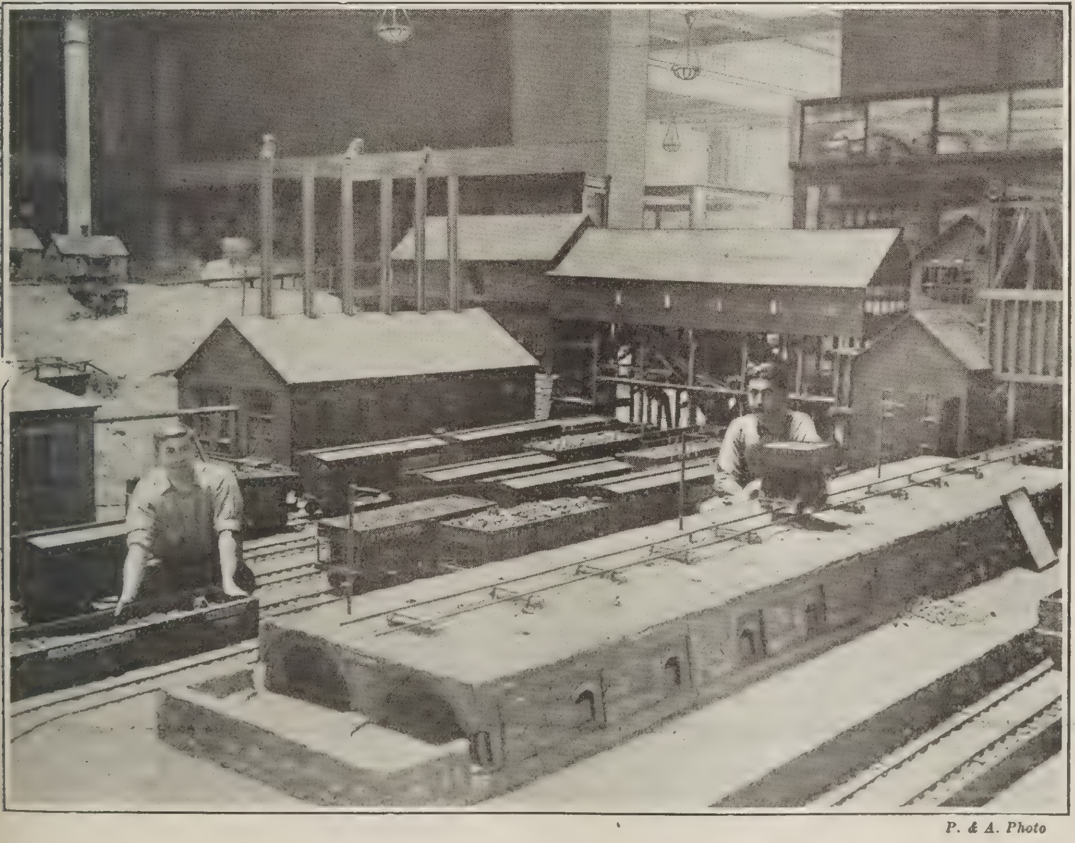
Tests which have come under Dr. Hood's personal observation indicate that no difficulty was experienced in burning 25 per cent of anthracite fines on an ordinary bituminous fuel bed. One shovel in four can be placed and it will make little difference in the control of the fuel bed. As the percentage of anthracite increases, Dr. Hood says, more and more skill is required. Tests indicated that a half-and-half mixture is the limit to which this practice can be extended reasonably. In these tests the blending was done at the furnace by firing from two available piles of coal.

The trouble in using a mixture, Dr. Hood explains, is that the ordinary grate bars adapted for bituminous coal cause holes to form in the fuel bed. A hole over the bare grate cannot be patched by anthracite fines.

Dr. Hood thinks the cost factor will control in the blending of coals rather than the advantages of smokelessness. Consumers of coal, as a rule, are not willing to pay much for that advantage. Much blending of anthracite now is done so as to equalize ash content, Dr. Hood says.

## Deepest Coal Mine in America

No mine in the anthracite region is deeper probably than the Auchincloss No. 1 Shaft of the Glen Alden Coal Co., near Nanticoke, Luzerne County, Pennsylvania, it being 1,697.4 ft. to the Red Ash bed. Coal is being mined at a depth of 1,673 ft. below the surface or at an elevation of 953 below tide. The Auchincloss coal is prepared at the Loomis breaker. This is probably the deepest coal shaft not only in the anthracite region but in the United States.

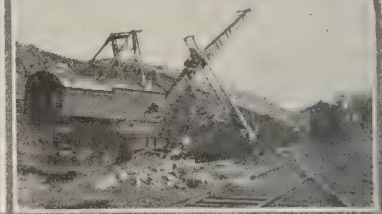


P. & A. Photo

**Big Mine but No Output**

However, it helps instruct the nation in what a coal mine top works and coke-making plant look like. It is a miniature modelled after a Consolidation Coal Co. plant near Fairmont, W. Va. and is now on exhibit in the National Museum in Washington. It is the largest model of a coal mine ever built. The gondolas in the foreground hold 40 lb. of coal each. This miniature, realistic even to the smoke issuing from power plant stacks, is usually surrounded by an interested group of the visitors in the museum which is a part of the Smithsonian Institution. The battery of coke ovens with their charging car extend into the foreground.

# News Of the Industry



## Lewis Seeks Executive Intervention To Forestall Hard-Coal Regulation By Congress, Washington Believes

**By Paul Wooton**
Washington Correspondent of *Coal Age*

What appear to be frantic efforts on the part of the United Mine Workers to bring about federal intervention lead some observers in Washington to think that everything will be done to force the administration to undertake to bring about a settlement before the convening of Congress. Apparently the mine workers sense the fact that regulation in some form is likely to result if Congress undertakes to compose the situation.

Organized labor is just as opposed to government regulation, many believe, as are the operators. William Green, when secretary of the Mine Workers, testified vigorously to that effect before the LaFollette subcommittee of the Senate Committee on Manufactures. Regulation probably would carry with it the fixing of wages by a federal board. This specter probably is responsible for the signs President Lewis is showing that he is apprehensive of Congress.

On the other hand, if he can bring about executive intervention, Congress may not interfere while Coolidge is running with the ball. At least this has been the case during previous strikes. Congress was in session during the strike of 1922, but took no action during the strike because the executive branch was taking active steps looking to a settlement. Congress also was in session during the strike of 1919, but deferred to the executive who had intervened.

### Administration to Keep Out

The apparent purpose of various moves the Mine Workers are making is influencing the administration to be even more determined to stay out. The more Mr. Lewis insists that the administration was responsible for the Jacksonville agreement the less likely it will be to take action which could be interpreted only as an acceptance of that responsibility and as an effort to require compliance with a labor agreement.

Of course it is understood that Mr. Lewis has not played all of his cards and that it is going to require no small amount of political courage for the administration to keep out when the pressure he can bring gets stronger. Just what form the pressure will take has not been revealed. It hardly is supposed that another march on Mingo will be tried, despite the fact that the marches in 1920 and 1921 were entirely successful in so far as arousing Washington was concerned. It is realized that the stage is being set for something and it is not supposed Mr. Lewis will allow the strike to stay much longer on dead center. This is mid-October. In less than seven weeks the gavels will fall at each end of the Capitol.

### Lewis Headed Toward Congress

Instead of involving the executive branch of the government it would seem that Mr. Lewis' tactics are calculated to push the controversy into Congress, where there will not be the same disposition to keep hands off, particularly if New England, New York and Pennsylvania, which will begin to experience inconvenience by midwinter, get nervous about coal supply. The delegations from the anthracite-consuming area have great influence in Congress. December probably will find them in a state of indignation because the people find themselves unable to replenish their anthracite supplies. These delegations are in a position to start consideration of legislative remedies.

There is an increasing feeling that it would be less difficult than heretofore has been supposed to obtain the enactment into law of some form of coal legislation. Coal legislation under circumstances such as are likely to prevail this winter would mean regulation. It might not be drastic in character but it would provide entry for the thin edge of the wedge, which then could be driven deeper and deeper at the whim of succeeding sessions of Congress.

---

A. W. Vogtle, traffic manager of the DeBardeleben Coal Corporation, Birmingham, Ala., has been appointed by President Gould, upon the recommendation of Director Yerkes, of Alabama, to the vacancy on the Foreign Trade Committee of the National Coal Association, created by the withdrawal of J. W. Whatley, formerly connected with the DeBardeleben Corporation, who has retired from the industry.

### *New Mine Has Wet Opening*

Memories of pre-Volstead days were vivid in the minds of many present at the recent formal opening of the Faraday Mine of the Pocahontas Fuel Co. Little Miss Jones, daughter of James Elwood Jones, first vice-president and general manager of the company, broke a bottle of fizzy liquid over the first 70-ton railway car loaded to capacity for shipment from the mine. A number of prominent officials of the company and of the Norfolk & Western Ry. gazed thirstily at the young lady during the hallowed ceremony.

Output at the mine is now limited to about four cars a day, as the coal is being shipped from a temporary tipple. Officials of the company state, however, that two new steel tipples will be ready in December and that by January shipments will be at the rate of forty-eight cars a day.

The town of Faraday straddles the West Virginia-Virginia line, lying partly in McDowell County, W. Va., and partly in Tazewell County, Va. The company has built a church, places of amusement and everything essential to livable community environment.

## Maintenance Men Called Out At Madeira-Hill Mines

C. J. Golden, president of District 9, United Mine Workers, issued an order Oct. 7 calling out all maintenance men in the employ of Madeira, Hill & Co., operating mines in the vicinity of Shamokin and Frackville, Pa. Withdrawal of the men was ordered because of the refusal of the company to cease loading stocks of surplus coal at the Natalie colliery, near Mount Carmel. An ultimatum threatening such action was served upon the company a week ago. About 400 men are affected by the order, which became effective last Thursday.

---

## French Acquire Rhine Coal Land

A French industrial group headed by the De Wendel Corporation purchased on Oct. 1 from the Krupp interests a large coal tract in the left Rhine district of Moers. The field, which has an area of 7,500 square miles, has never been worked.

## To Fight Lease of Virginian By Norfolk & Western

The Chamber Commerce of Norfolk, Va., has joined the City Council, and the State of Virginia in asserting strong opposition to the proposed lease of the Virginian Ry. by the Norfolk & Western. The basis of the opposition is the belief that the absorption of the Virginian, largely a coal carrier, would mean the elimination of competition in the coal handling business.

The City of Norfolk has underwritten a fund of $5,000 to pay counsel to fight the proposed lease before the Interstate Commerce Commission. Coal men are divided on the question, though many of the most prominent members of the trade oppose the proposed lease.

The two railroads parallel each other a considerable distance from the West Virginia coal fields into Norfolk. The Virginian has no Western connections, being largely a coal line from the mines to tidewater. Business agencies opposing the merger have put forth the opinion that the competition of the two lines now stimulates trade, in view of the fact that much of the Norfolk & Western business to this port is coal. They have expressed the belief that the merger would curtail the business of both lines to tidewater.

The Interstate Commerce Commission has permitted the following companies to intervene in the petition filed by the Norfolk & Western Ry. Co. for authority to acquire control of the Virginian Ry.; Alpha-Pocahontas Coal Co., Covel Smokeless Coal Co., Devils Fork Coal Co., Faith Smokeless Coal Co., Gulf Coal Co., Gulf Smokeless Coal Co., MacAlpin Coal Co., Micajah Pocahontas Coal Co., Miller-Pocahontas Coal Co., Monticello Smokeless Coal Co., Morrison Coal Co., C. H. Mead Coal Co., Nuriva Smokeless Coal Co., Bailey-Wood Coal Co., Low Volatile Consolidated Coal Co., Slab Fork Coal Co., Winding Gulf Colliery Co. and Wyoming Coal Co.

## To Import German Anthracite

German anthracite is to be imported to this country soon, the firm of J. P. Routh & Co., New York City, having made arrangements for the shipment of a quantity. Samples already received are said to compare favorably with Welsh anthracite received here. J. P. Routh, president of the concern, also heads the Riberena Fuel & Chartering Co., which is associated with the Rheinische Westphalian Coal Syndicate and the Deutsches Kohlen Depot. The office of the latter is at Hamburg and the company also has coal depots at seventeen ports on the Mediterranean in Europe and on the Atlantic coast of South America.

Twenty bids were submitted Sept. 30 to the Government Fuel Yards, Bureau of Mines, Washington, D.C., for supplying 20,500 gross tons of bituminous mine-run, principally for shipment to St. Elizabeths Hospital, located on the Baltimore & Ohio R.R. The tenders ranged from $1.40 per ton on 13,500 tons by W. H. Bradford & Co., Inc., to $2.52 per ton on 20,500 tons by the Burtner Coal Co.

## *Orders Wage Fixed Before Machines Are Put In*

Frank Farrington, president of the Illinois union, United Mine Workers, has addressed a letter to the operators announcing that machines must not be put in the mines of that state without prior arrangement with the union as to the scale to be paid. He states that the rate will be in accord with agreement arrived at after consideration of the earnings of the men under previous working methods. It is evident, therefore that settlements heretofore made may not be allowed to govern and that the union may try to make rates in one mine higher than those in another.

## Forty-four First-Aid Teams In Alabama Meet

Forty-four teams from mining and industrial plants in the Birmingham district participated in the annual first-aid meet at Rickwood Field, Birmingham, Ala., Oct. 6. First honors to white teams went to the Empire team of the DeBardeleben Coal Corporation, captained by J. R. McGowen, with a score of 91⅔ per cent. The Coal Valley team of the same corporation carried off second prize with 88 per cent. Third prize went to the Mulga team of the Woodward Iron Co., which scored 87⅓ per cent.

First prize for colored teams was captured by the Mulga team of the Woodward Iron Co., with a score of 84⅔ per cent. The Parrish Mine team of the Railway Fuel Co. took second prize, while third honors went to the Sipsey Mine team of the DeBardeleben Coal Corporation, with scores of 79½ and 76⅔ per cent respectively.

The Townley Mine of the DeBardeleben Coal Corporation won first honors for women's teams, making a score of 80 per cent, the Woodward Iron Co.'s Dolomite team coming second with a score of 73⅔ per cent.

Among the out-of-town visitors present and taking part in the meet were Dr. W. S. Welch, state health officer; James M. Adams, Standard Oil Co., Baton Rouge, La.; D. J. Parker, U. S. Bureau of Mines, Pittsburgh; Dr. R. R. Sayers, U. S. Bureau of Mines, Washington; Dr. David J. Yates, American Red Cross, Atlanta; Dr. F. B. Merriwether, U. S. Bureau of Mines; Dr. W. R. Crane, Bureau of Mines; W. T. Lacey, Columbus (Ohio) station; James M. Webb, Knoxville (Tenn.) station; Alex Miller, Vincennes (Ind.) station; George W. Groves, Pittsburgh station.

The prizes awarded the various successful contestants were donated by the Alabama Mining Institute, the success of the meet being largely due to the untiring efforts of secretary James L. Davidson and assistant secretary H. E. Mills, of the Institute, C. E. Saxon, of the local branch of the Bureau of Mines and Chief Mine Inspector Charles H. Nesbitt.

## $30,000,000 Coal Merger Closed in Tennessee

A merger of coal and iron companies said to represent approximately $30,000,000 was effected in Nashville, Tenn., Oct. 6 with the purchase by the Bon Air Coal & Iron Corporation of the properties of the Tennessee Consolidated Coal Co. and the Chattanooga Gas & Coke Co. The price to be paid for each of these properties will be $1,250,000, the sale of the Chattanooga Gas & Coke Co. being subject to ratification by its stockholders before October 20.

Other companies which will be a part of the merger are the J. J. Gray, Jr., Foundry at Rockdale, Tenn., already acquired by the Bon Air company, and the Southern Ferro-Alloys Co., owning plants at Chattanooga and Cleveland, Tenn. The deal for the latter company has not been consummated, it was announced, but it is expected that its properties will be acquired.

The deal for the merger was consummated by William J. Cummins, vice-president and general manager of the Bon Air company. Negotiations extended over a period of twelve months. In the new corporation Mr. Cummins will be chairman of the executive committee. This will mark another step in the financial rehabilitation of Mr. Cummins, former head of the Carnegie Trust Co., New York City. Cummins was convicted of grand larceny in 1911 in connection with the alleged conversion to his own uses of a fund of $140,000 deposited in the trust company.

Associated with Mr. Cummins in the new company are William Wrigley, Jr., of Chicago; Col. Jacob Ruppert, of New York, and John McE. Bowman, of New York.

The handling of chemical byproducts from the production of coal, it is said, will be one of the activities of the new corporation.

The West Kentucky Coal Bureau, traffic organization for the operators of western Kentucky, with headquarters at Louisville, has announced the October meeting is to be held at the Peabody Hotel, Memphis. All regular meetings have been held at Louisville for years.

The City Council of Minneapolis has had the proposed ordinance to license retail fuel dealers before it for some weeks, and the author has made several attempts to force consideration. It is due to come up for consideration soon. It proposes a fee of $50 a year and seeks to enforce a responsibility upon coal dealers.

Within the next sixty days, according to advices coming from Hazard, Harlan and other southeastern coal points, the Louisville & Nashville R.R. will commence actual work of hooking up its lines with those of the Carolina, Clinchfield & Ohio R.R. One piece of mountain work is said to involve about $20 000,000. Coal men are particularly interested because of the fact that this will give another outlet to the seaboard.

## Pittsburgh Coal Co. To Open Seventh Mine Under 1917 Wage Scale

Some time during the current week the Pittsburgh Coal Co. will start work at its third mine in the western Pennsylvania district on the 1917 scale. This announcement was made by company officials when preparations for resumption at Midland No. 1, three miles from Canonsburg, were revealed. This mine is in Washington County, the other two, Banning No. 1 and No. 2, being in Fayette and Westmoreland Counties, respectively. When Midland No. 1 is started the company will still have thirty-seven mines idle in western Pennsylvania.

Former employees of the company at Midland petitioned the company to return to work at the 1917 scale. The mine has been closed since November, 1923. The normal capacity is about 400 men. H. M. White is division manager in charge of operations there. A report said the company planned evictions at this mine, but officials of the company denied this report.

Midland No. 3 mine, near the one which is to be opened, was dismantled last spring and the tipple torn down. Midland No. 2 was worked out years ago.

When Midland mine is started the company will have seven operations at work on the 1917 scale with four working in eastern Ohio.

A mob of 100 men, women and children lined the road at the entrance to the Warden tipple of the Pittsburgh Coal Co., four miles from West Newton, one day last week and stoned 50 men as they were going to work at the mine. One man was injured. The men are doing construction work underground and are not engaged in mining. Protection was asked from Westmoreland County officials.

## Utilities Consume More Coal And Less Oil in August

Public utility power plants in the United States consumed 3,338,956 net tons of coal in August, according to a report by the U. S. Geological Survey. This compares with 3,166,703 tons in July, as shown by revised figures. Fuel oil consumption by utilities in August totaled 743,213 barrels, compared with 852,947 barrels in July as shown by revised figures.

The average daily production of electricity by public-utility power plants in August was 173,100,000 kw.hr., a little more than the average daily output for July.

The average production of electricity during June, July, and August was remarkably uniform and there was no marked decrease in July as in previous years. The average output for August was only 0.4 per cent larger than that for July, which is much less than the average of previous years for that month.

**Sending World's Series News Into the Mine**

The Phelps Dodge Corp., at Dawson, N. M., believes in keeping its men satisfied. One of the "little extras" is illustrated here. While the American and National League champions are battling for the baseball supremacy of the world, a clerk, upon getting the score by innings, inscribes it on the sides of cars on their way into the mine. Thus it is not necessary for baseball fiends among the miners to lay off and hang around an outdoor scoreboard.

## Approve Coke Rates in New York

The New York Public Service Commission has approved the following freight rates of the Buffalo, Rochester & Pittsburgh R.R. on coke (also breeze, dust and screenings) carload minimum weight 60,000 lbs. in open cars, from Buffalo, rates per net ton, to stations South Park-Lackawanna: To East Hamburg, inclusive, 80c.; West Falls to Glenwood, inclusive, $1.01; Footes to Edies Siding, inclusive, $1.13; Riceville to Ashford, inclusive, $1.26; Ellicottville to Salamanca, $1.39; (reductions from class rates); to Jewettville, $1.01, (reduction 38c.) effective Oct. 29, 1925.

Also of the Delaware, Lackawanna & Western on coke (also breeze dust and screenings), carload minimum weight 50,000 lb. in open cars, except when cars are loaded to cubical or visible capacity, when actual weight will apply: From Harriet to South Park-Lackawanna on Buffalo, Rochester & Pittsburgh, $1.13 per net ton (reduction from class rates); effective Oct. 28, 1925.

The U. S. Civil Service Commission announces open competitive examinations for engineer, $3,800; associate engineer, $3,000; assistant engineer, $2,400. Applications will close Oct. 20. The examinations are to fill vacancies occurring in the federal classified service throughout the United States. At present there are two vacancies for assistant electrical engineer, Bureau of Mines, for duty at Pittsburgh, Pa., and one vacancy for associate engineer (naval architecture) in the Bureau of Construction and Repair, Navy Department. Full information and application blanks may be obtained from the U. S. Civil Service Commission, Washington, D. C., or the secretary of the board of U. S. civil service examiners at the post office or custom house in any city.

## Coal Commission Report Ready in November

The first edition, numbering 6,500 copies, of the report of the U. S. Coal Commission will be ready for distribution in November, according to word from the Government Printing Office. The report will appear in five parts, one of which is composed exclusively of charts and tables. Interest in the report has been revived by the recent public utterances of John Hays Hammond, who, as chairman of the Fuel Committee of New England Governors, made frequent reference to the recommendations of this fact-finding commission which he headed and which ended its labors two years ago.

## Lignite Output in Italy Drops

Lignite production in Italy is decreasing, according to Henry C. McLean, American Commercial Attaché at Rome, now in Washington. Such coal deposits as the country affords have a high sulphur content and have only restricted use. Nevertheless the lignite, which was used extensively during the war, has greater possibilities, though foreign coal again is preempting the market.

Imports of coal into Italy now are at the rate of 10,000,000 tons annually. Despite the rapid harnessing of water power imports of coal are increasing.

British coal has a great advantage in Italy, Mr. McLean points out, partly because everyone knows how to burn it and partly because deliveries can be made so much more quickly than is possible with American coal. Despite these handicaps 537,000 tons of American coal was sold in Italy last year. The maintenance of even that volume of imports of American coal is dependent on the availability of very low ocean freight rates. These have not prevailed during 1925 so there has been a decided decrease in the amount of American coal absorbed.

# Output Resumes Upward Curve In West Virginia Strike Region; Miners' Band Arrested as Pickets

The second strike call of the United Mine Workers to the non-union coal miners in northern West Virginia seems to have little effect on the general situation thus far. In the week ended Oct. 3, the first full week following the strike, the non-union coal production was 9,146 cars, a decrease of 621 cars compared with the previous week. Non-union operators contend that the heavy pay day of Sept. 26 and the opening of the gunning season were the chief factors in keeping the miners out of the pits in the region. In the same week the union mines loaded 1,382 cars, or 5 cars less than in the previous week, which had but five workdays due to Sept. 26 being set aside as a holiday because of the visit of International President John L. Lewis.

Non-union coal production took an upward curve last week. In the first three days of the week the non-union mines in the 12½ counties of northern West Virginia loaded 4,978 cars of coal, compared to 4,564 cars in the corresponding period of the previous week. A slight increase was noted in union tonnage, 832 cars having been loaded in the first half of the week compared to 801 cars in the corresponding period of the previous week.

### Car Loadings Increase

The non-union coal loading in the region totaled 1,744 cars Oct. 7, the heaviest daily non-union production since Sept. 23, when 1,767 carloads was produced. On the same day the union mines loaded 301 cars of coal, the heaviest daily loading of union plants since April 10, when 309 cars was reached. With 212 non-union mines at work in the 12½ counties, more open-shop plants worked Oct. 7 than on any day since the strike began on April 1. Thirteen union mines are active in the whole region.

After listening to testimony for four days in connection with the fifty-four union pickets haled into court for alleged violation of an injunction granted to miners at the New England Mine of the Consolidation Coal Co., at Watson, Judge Winfield Scott Meredith, in the Marion County Circuit Court, on Oct. 8 dismissed Mayor Bennett of Monongah and three others, reserving decision in the case of the fifty others. Mayor Bennett is accused of being a member of the union as well as a sympathizer. Included in the picketers were the Monongah miners' band.

Under the injunction the union pickets are restrained from "picketing, patroling, establishing or maintaining any picket or patrol at or near" the mine for the purpose of "inducing, persuading, compelling or coercing, by insults, intimidation, threats, frightening, assaults" and other means men employed by the company to quit work.

One Italian practically refused to promise to stay off the picket line and the court held him under $200 bond in his own recognizance. The Italian said "he wanted to be a free man." Another Italian said he would rather go to jail 25 years than pay any attention to the injunction. One of the pickets entered a plea of guilty, but the judge did not accept the plea without the man having counsel. When he obtained counsel the plea was withdrawn. It developed that he was a member of the Monongah Band.

The miners' union contends that the picketing is within their constitutional rights as laid down by the higher courts. Some months ago Criminal Court Judge L. S. Schwenck laid down a decision on legal picketing, which is summed up in the following: "A single group of pickets, not to exceed three persons, is permissible, but picketing done otherwise is a violation of law."

### Pickets in Monongah

The pickets gathered in Monongah as recently as Oct. 9, but remained away from the mine entrance, and while this is a violation of the spirit of the injunction, it probably is not covered by the writ.

Announcement was made by the union officials on Oct. 7 that the Wright Coal Co. has leased the West Fork Coal Co. mine, near Monongah, and signed the Baltimore agreement. The mine began work the following day and hundreds of union miners sought jobs, but all could not be put to work. The mine has been idle two years, but it is announced that it now had orders to work steadily.

For the first time in its history the United Mine Workers has resorted to the injunction, which according to Frank McCartney, of Clarksburg, international representative, was obtained recently to restrain officials of the Fairmont Big Vein Coal Co. from interfering with John Patterson, a striking union miner, who lives in a coal company house at Two Lick. Coal company officials, McCartney says, tore the roof off the house while Patterson's wife was sick.

### Hold Many Mass Meetings

Miners' mass meetings continue to be held. Recent gatherings took place at Farmington, Rivesville, Worthington, Shinnston, Hilltop, Lowsville, Brady, Enterprise, Montana and other towns.

The Wheeling (W. Va.) office of the United Mine Workers, through Adolph Pacifico, in charge of the strike in the northern West Virginia Panhandle, announces that Joseph Angelo, international organizer working out of the office of Philip Murray, international vice-president, has been transferred to Fairmont. James McCormick, of Wheeling, has been appointed vice-president of Sub-District No. 6 of District No. 6, Cambridge, succeeding John Hone, who has been named president of Sub-District No. 6 in place of David Watkins, appointed vice-president of District No. 6 to succeed William Roy.

## *Eight Months to Locate Coal Man's Heirs*

After more than eight months' search word has been received from five heirs to the $55,000 estate left by Gould L. Saunders, of Saunders & Ashbaugh, coal dealers of Columbus, Ohio, who died eight months ago. In the will he specified that the residue of his estate after a bequest to the widow was paid was to be divided among his brothers and sisters. Neither the widow nor Mr. Saunders' business partner knew of the whereabouts of these heirs and it required a long search to locate three brothers and two sisters.

## Coal Output and Imports by Canada Higher in July

Output of coal from Canadian mines during July was 744,087 tons as against 736,851 tons in June, and an average for the month during the five preceding years of 1,033,097 tons. Production by provinces in July showed slight gains over June in Nova Scotia, Saskatchewan and Alberta; but in comparison with the five-year average outputs for the month only Saskatchewan and Alberta were higher.

Imports of coal from the United States and Great Britain in July amounted to 1,788,502 tons as compared with 1,470,416 tons in June and the five-year average of 1,747,492 tons. Receipts from Great Britain during the month amounted to 115,613 tons. For the first seven months of 1925 the total amount of coal imported into Canada was 8,389,650 tons, or 10 per cent below the preceding five-year average for the period.

Imports of anthracite totaled 558,873 tons in July. This was 151,352 tons above the tonnage imported in June and about 40 per cent above the five-year average for the month. Anthracite imported from the United States amounted to 450,262 tons while 108,611 tons came from Great Britain. The total anthracite imported during the seven months ending July, 1925, was 2,593,963 tons, an increase of 7 per cent above the previous five-year average.

Exports of Canadian coal in July were 38,634 tons; June, 43,296. Comparison of the July exports with the preceding five-year average showed a decrease of 76 per cent. Total exports for the year to date amounted to 333,498 tons, or 66 per cent less than the five-year average.

The total number of men employed in the coal mines of Canada during July was 14,702, of whom 10,421 worked underground and 4,281 on surface, as compared with a total of 18,611 in June, of whom 14,195 worked underground and 4,416 on surface. Production per man was 50.6 tons in July as against 39.4 tons per man in June. During July, the production per man-day was 2.3 tons, as compared with 3.3 tons in June.

## Bureau of Mines To Be Service Agency of Mining; Would Retain Committee

Reorganization of the Bureau of Mines so as to make it essentially the service agency of the mining industry and a central clearing house of information on matters pertaining to mines and mining in the interest of the industry and the public can be used as an argument against compulsory fact-finding or regulatory legislation. Congress almost invariably does things by law. The policy of Secretary Hoover is in striking contrast with that way of dealing with industry. He has been outspoken in his disapproval of any form of compulsion or regulation. The extensive fact-finding activities that he has initiated in his department are on a voluntary basis. He has put the whole matter of the reorganization of the Bureau in the hands of a committee representative of the major mining activities so that the reconstituted Bureau may be of and for the industry. Not only is the committee to advise on functions to be retained and functions to be added but he now plans to retain the committee as a permanent link between the Bureau and the industry.

The representative of the coal industry on this committee has been taking an active and helpful part. His expressions in connection with the work of the committee and the promise of former President Brydon, of the National Coal Association, to the Coal Commission give rise to the thought that the industry may be willing to make voluntary returns to the Bureau, which from now on is to be the out-and-out champion of those who go down in the earth in mines.

Such action would meet the charge that the industry will not furnish the basic figures necessary to diagnose its ills. It would render unnecessary the proposal of Senator Oddie's bill to withhold cars from those who refuse to make returns of basic facts and would pave the way for the voluntary adoption of the many helpful provisions of that bill.

Both the Calder and the LaFollette bills, designed to regulate the coal industry, provided for the collection of extensive statistical and economic data. This was pointed to as being in the interest of the industry itself, but these bills were by and for everyone except the coal industry. The milder Frelinghuysen bill, which followed, was characterized by the coal industry as an effort to treat the patient against his consent. Even the Oddie bill, which comes from a man of the mining industry, who simply has acted as a compiler of suggestions made by various persons who are regarded as being authorities on coal, is considered by the coal operators as something handed down from above.

Secretary Hoover apparently is in sympathy with the industry's attitude toward those bills. It is just as apparent that he does not agree with most of the recommendations of the Coal Commission. He doubtless has been deterred from expressing his disapproval in order to avoid a breach of etiquette toward a presidential commission. Instead of putting the great weight of his influence behind such things as federal licensing, graded taxation and control by the Interstate Commerce Commission he has worked to encourage the industry itself to learn its own mind and settle its own difficulties.

Secretary Hoover's experience with the Jacksonville wage agreement is thought to have increased his determination to go only so far as the industry desires.

The Reynders advisory committee probably will bring out a well rounded plan which will include some plan for furnishing essential facts concerning coal, using the channels of the coal trade for the purpose. This would be a complete answer, many think, to those who allege that the industry is not able or not willing to collect basic facts.

This illustration of coal is used because it happens to be the mineral which has figured most in the Congressional discussion. The contrast between doing things by legislation and doing things by and with the consent of the industry applies to the whole field of mining.

The search for a director of the Bureau of Mines, which really is a search for an under Secretary of Mines, since the eventual creation of the latter office is believed to be assured, also has been turned over to the industry's committee. The desire in that connection is to induce some broad-gaged man of the industry to take the place. It is known that Secretary Hoover prefers this type of man to the civil servant or the academician, but the chance of success in such a quest is known, from previous experience, to be small.

## Will Not Disturb Rate Relationship

Rates from mines in the Harrisburg district of southern Illinois over interstate routes to Hoopeston, Ill., are not unreasonable or unduly prejudicial in comparison with rates to Chicago, Indianapolis and Vincennes, Ind., declares the Interstate Commerce Commission in a recent mimeographed report dismissing the petition of the Hoopeston Grain & Coal Co. vs. Chicago & Eastern Illinois R.R. Co. et al. and related complaints.

"The conditions affecting the rates to Chicago, Indianapolis and Vincennes," says the opinion, "are not comparable with those affecting the rates to Hoopeston, and the record does not justify condemnation of the rates from the southern Illinois group to Hoopeston or the application to that point of lower rates from the points of origin named (viz., Harrisburg, Ledford, El Dorado, Carrier Mills and Norris City) than those from the group."

## British Miners Agree Provisionally to Join National Coal Inquiry

At a second conference in London, Oct. 9, the delegates of the British Miners' Federation reconsidered their previous decision and voted to participate in the royal commission recently appointed to inquire into the entire coal industry. The federation's participation is contingent upon further efforts to eliminate the cause of their grievances regarding wage reductions in certain regions and the refusal of the employers to grant unemployment benefits.

At the conference of Oct. 8 the delegates rejected participation in the Coal Commission by a card vote of 477,000 to 332,000. The conference was called to consider the situation arising through the interpretation of the truce terms. Two weeks ago Premier Baldwin, after lengthy consideration, accepted the contention of the mine owners in their dispute with the Miners' Federation of their right to reduce wages in certain regions.

The miners argued that this decision was at variance with the governmental subsidy granted to enable mine owners to maintain the current scale of wages pending an inquiry by a royal commission.

A majority of the miners' executives were opposed to drastic action, but the delegates themselves were sharply divided and a heated debate ensued. The miners' secretary, A. J. Cook, was absent through illness.

The voluntary organization for the maintenance of supplies in the event of a general strike was condemned at a conference of the Scottish miners at Glasgow, Oct. 8. In protest against such a body being formed in the United Kingdom, a resolution was passed expressing the view that such an organization would be used against the miners if an industrial conflict occurred in which the miners were involved.

Robert Smillie, Member of Parliament and president of the Scottish Miners' Federation, in an address said it was the government's business to protect the people and not the business of a private body of men. He regarded the "O.M.S.," as the organization for the maintenance of supplies is coming to be known, as a menace to organized labor and intended to help the capitalists "continue the enslavement of the workers."

---

Westbound coal movement through the canals at Sault Ste. Marie, Mich., and Ontario, in September, 1925, totaled 1,389,595 net tons of bituminous and 58,490 tons of anthracite.

## Strikes and Lockouts in Pennsylvania Anthracite Region, 1920-1924

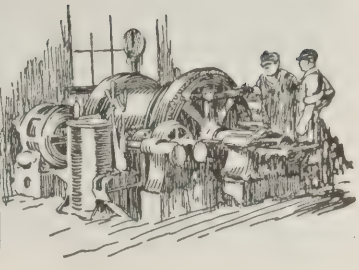
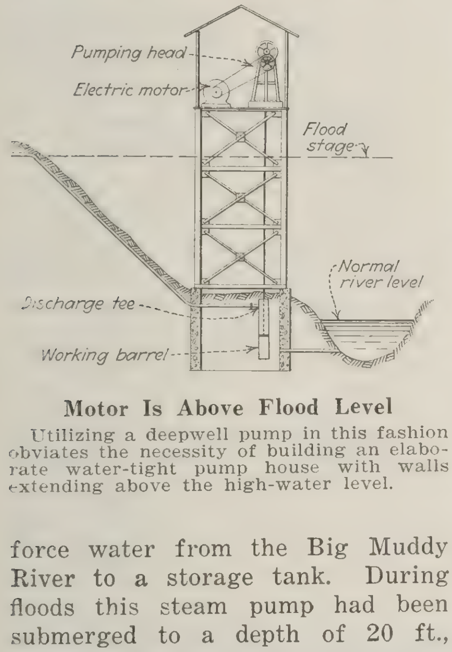
# Practical Pointers For Electrical And Mechanical Men



## Electric-Driven Deepwell Pump Installed on Top of Tower

Electrification of a mine often brings up interesting problems concerning the outside pumping equipment. A. W. Spaht, of Christopher, Ill., electrical engineer of the Old Ben Coal Corporation, solved one of these problems by installing an electric-driven deepwell pump in a rather unusual position.

At one of the Old Ben mines, about three miles from Herrin, a direct-acting steam pump had been used to force water from the Big Muddy River to a storage tank. During floods this steam pump had been submerged to a depth of 20 ft., which, of course, did no harm to such a pump. When the question of installing an electric pump came up for discussion, the first consideration was to provide protection from floods.



**Motor Is Above Flood Level**

Utilizing a deepwell pump in this fashion obviates the necessity of building an elaborate water-tight pump house with walls extending above the high-water level.

The usual but rather costly solution would have been to build a pumping station of water-proofed concrete, with the walls carried to a point well above the flood level. Instead, a geared, deepwell pump of the reciprocating type, with double-acting working barrel, was employed, and the pumping head and motor installed on the top of a 20-ft. steel tower.

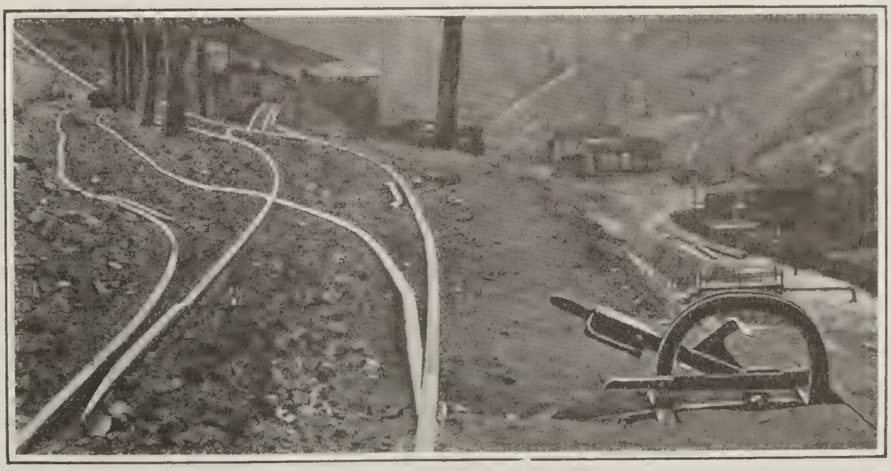
This arrangement has proven to be a satisfactory and economical method of protecting the motor, and in cold weather has the advantage that the water piping is protected from freezing. The latter feature is provided by having the discharge outlet located in the well several feet below the ground level.

### Hammer Blow Completes Throwing of Switch

Ten years ago, P. A. Tice, at that time the blacksmith, but now the chief electrician of the Hazard Blue Grass Coal Corp., Hazard, Ky., built the semi-automatic switch stand illustrated in the photograph reproduced here. This type of stand has since been copied for use at a number of mines in the Hazard field.

The weighted handle of the stand is pivoted so as to have several inches of play with respect to the operating lever. When a locomotive or mine car runs through the switch the movement of the rail points raises the weighted handle to a position beyond dead center. The handle then falls to the other side and the resulting hammer blow completes the throwing of the switch to the opposite position.

The weight of the handle continues to hold the switch points tightly. A distinct advantage of this switch stand is that the operating lever's range of movement is greater than that normally required. This feature automatically takes up any play and thus eliminates the necessity of frequent adjustment of the switch rod.

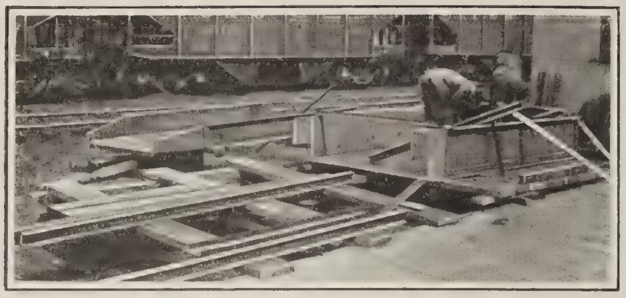


**The First Switch of Its Kind in the Hazard Field**

This home-made switch stand has been copied for use at a number of mines. A mine car or locomotive running through the switch raises the weighted handle to a point beyond dead center. The handle then falls to the other side hitting the short lever a blow which completes the movement of the switch points.

### How Arc Welding Proves Its Value

Arc welding has been used to a great extent, both for repairs and construction at our properties. The accompanying illustration shows a recent construction job which was a rush order for a shaker screen for one of our tipples that formerly had only plain bar screens. This screen has a capacity of more than 1,000 tons in 8 hr. of run-of-mine over $2\frac{3}{8}$-in. perforations and was made up of structural shapes and sheets. The fabricating was done entirely by means of arc welding. No bolts were used in any part of the equipment except to hold down the perforated sheets and to secure a removable end plate. The whole job



**Saving**

Nearly all this structural work was made by arc welding. Quick, inexpensive jobs save both time and money. When the parts are welded together there is no bother about different size drills and bolts.

cost only about half as much as a similar set of screens which were recently purchased.

When a chute is needed, or it is necessary to make alterations to existing chutes, the arc welding rheostat is a most satisfactory device for the job. It is only in cases of absolute necessity that we ever use bolts or rivets for such work. We are now building an automatic substation in a location rather difficult of access, and the framing of this building is entirely arc welded.

Another rather interesting application of arc welding is in the salvage of broken mine car wheels. In cases where the tread is broken out between two spokes it is a relatively easy matter to save the wheel. A short piece of flat iron is bent to the proper shape and fitted in between the spokes. It is held in position by a deposit of metal on each spoke and the broken part of the tread is then built up on this bar as a base.

R. R. SCHELLENGER,
Electrical Engineer.
Elkhorn Coal Corporation,
Wayland, Ky.

## Glass Guard Protects Eyes From Stray Particles

The adage, "Familiarity breeds contempt," applies well to the average mine mechanic. However, if he happens to be so unfortunate as to have an eye seriously injured when grinding at an emery wheel or when doing some other job where chips are liable to fly, then such close familiarity with the danger of losing his eyesight invariably turns his contempt into caution.

The wearing of approved goggles is the best way of protecting the eyes, but unfortunately few have been converted to this idea and even those who have will sometimes neglect to put on the goggles when there is but a short job to do such as a bit of grinding. For this reason there are advantages in equipping grinders with a plate glass guard.

An example of a convenient homemade guard is that in use in the shop of the North East Coal Co., Thealka, Ky. As shown in Fig. 1 this device serves as a lamp bracket as well as a guard. The pipe on which the lamp and guard are mounted is supported from the ceiling and can be swung into a position to serve either of two wheels. Fig. 2 is a close-up of the leather-lined friction disks, at the ceiling, which ordinarily hold the pipe in a fixed position but which will slip when a small force is applied to the lower end to change the location of the lamp and guard.

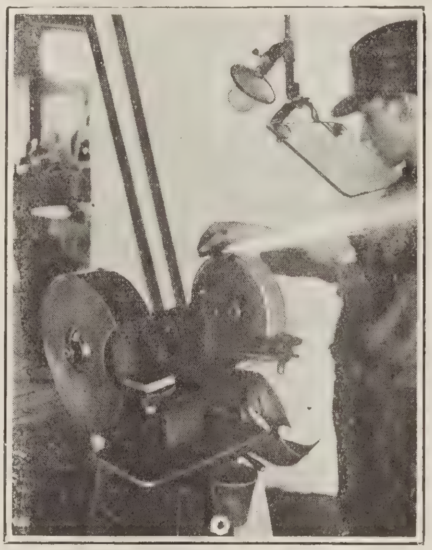


**Fig. 1—No Danger to the Eyes**

The plate-glass shield is adjustable to any desired position or angle and is high enough so as not to interfere with the work. It is a distinct advantage to have the lamp and guard combined in one.

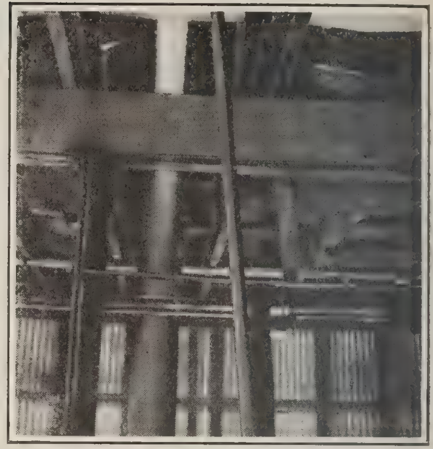

**Fig. 2—Friction Disks at Ceiling Hold Lamp and Guard**

A length of ¾-in. pipe forms the arm to which the lamp and guard are fastened. The leather-faced disks are clamped together tightly enough to hold the arm in any desired position.

Referring again to Fig. 1 it can be seen that the bracket supporting the piece of plate glass is mounted on the pipe in such a way that it can be rotated through a complete circle. A leather washer acts as a friction to hold it in a set position.

## Refuse Bank Retained by Cement-Filled Wall

One of many uses to which a cement projector might be placed is clearly indicated in the accompanying illustration. A fan house had been erected at the bottom of a refuse bank but the rock tended to slide down the slope of the bank and crowd around the building. What really is the equivalent of a concrete retaining wall was erected to prevent further encroachment of the bank on the fan house. Large pieces of slate were laid in a pack wall, the interstices of which were filled with cement discharged under pressure.

**Cement-Filled Wall Holds Bank from Sliding**

This pack wall of slate was strengthened and held by a cement mortar which was applied by machine.

# Problems In Underground Management

## In Double Freeport Seam, Clay Is Better Than Rock Dust for Stemming

By J. H. Zorn

Safety Engineer, Ford Collieries Co.,
Curtisville, Pa.

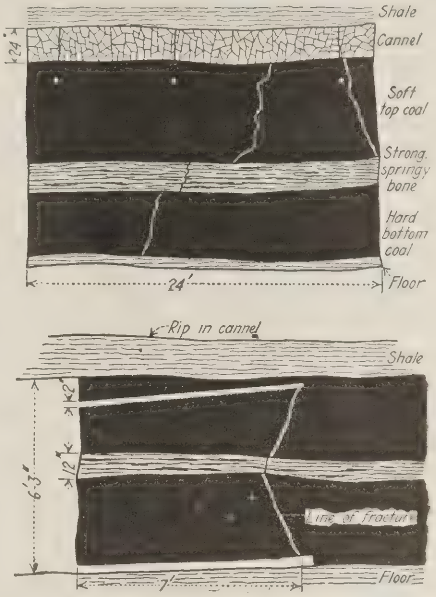
At the Berry No. 3 mine, of the Ford Collieries Co., tests with rock-dust stemming in the double Freeport seam proved that this method of charging powder was entirely unsatisfactory. The Freeport seam at that mine is about 6 ft. 3 in. thick with 12 in. of hard, tough, springy bone in the middle. The coal above this bone is spongy and that below is hard. Above the top coal is a 2 ft. layer of cannel coal which must be left in place in order to support the roof. Above that is a bed of shale.

The rock dust used was limestone pulverized so that 75 per cent of it would pass through a 200-mesh screen. It was packed in waxed-paper shells to form dummies measuring 1¼ x 9 in. The tests were made through a period of two weeks in fifteen rooms located in two sections of the mine. The boreholes were about 2 in. in diameter and 7 ft. long. The shots were made with the permissable powder regularly in use in this mine and the charges, which were of the customary size, consisted of from three and one-half to four cartridges, 1¼ x 8 in. in breaker holes and from one and one-half to two cartridges in rib holes.

In the course of the tests three different methods of tamping were tried. First, the dummies were pushed back to the powder, and the hole was filled to the collar, the last three dummies being firmly tamped. This gave about 8 in. of solid tamping at the mouth of the borehole. When the charges, tamped in this way, were shot, the rock dust was blown from the boreholes and was distributed over the floor for a distance of about 25 ft. back from the face. The paper containers, in which the rock dust had been confined, were found on the floor within the dusted area but minus the wax coating. These shots gave clear evidence of having blown out.

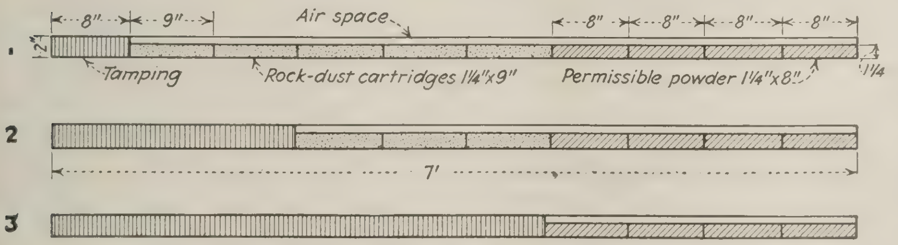
### Prevent Blownout Shots

Now such shots are dangerous whether rock dust stemming is used or not, and it is my theory that they always indicate poor blasting practice. Therefore, a second method of tamping was tried in an effort to prevent the charges from blowing out. The first dummies were pressed back lightly against the charges as before, but the later ones were tamped firmly to increase the length of the solid stemming to about 2 ft. With this method there were no blownout shots but the coal was improperly blasted. The strong bone and some of the coal hung at the back of the cut, so that much pick work was required in every place to square up the face for the next shot. This showed that there was still a tendency for the gases of the explosion to work forward toward the mouth of the hole instead of exerting their greatest energy on the back of the cut.



Method of Placing Shotholes at Face of Room

The illustration shows how the coal is ripped irregularly by the shot and the cannel is cut by the explosive. The fracture in the upper half shows the effect of the buster shot and of a rib shot, respectively.



Three Methods of Charging All of Which Gave Poor Results

In the first instance with 8 in. of tamping the shots blew out but scattered rock dust for a radius of 25 ft. In the second case with 2 ft. of tamping the strong bone and part of the coal back of the cut hung and had to be dislodged by heavy blows of a pick. In the last of the three cases, the results approached those with clay stemming but were always inferior to those obtained when clay was employed. In every case where rock dust was used, the cannel coal was badly ripped.

### Clay Stemming Best

Consequently, a third method was tried, in which the hole was tamped solidly from the explosive charge to the collar. This gave the best execution, coming nearest to the results obtained where clay stemming is used, but in no case were the results as satisfactory as are obtained when the hole is stemmed with clay.

In all these shots with rock-dust stemming, moreover, the cannel coal was badly damaged, a most undesirable feature. Although 2 ft. thick, the cannel ripped along the length of the borehole where the stemming was compressed by the explosion, the cutting in many cases being from 5 to 5½ ft. long. This weakened the roof alarmingly.

In every case the rock-dust stemming seemed to leave too much air space for the explosive to work effectively. In every shot the charge spent its entire force in the spongy top coal and cannel, allowing the bone and bottom coal to settle down in one big piece and leaving an irregular face. In consequence, the loader had to clean and square up the place for the next cut of the machine at the expenditure of much labor.

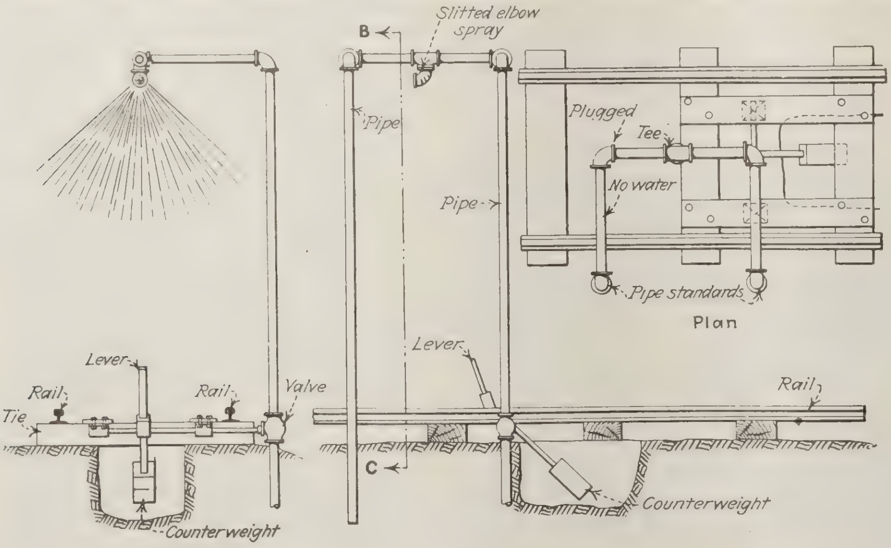
As a whole these tests indicated somewhat conclusively that the use of rock-dust stemming offers no advantages in the double Freeport seam. In the first place it proved not to be a practical means of dusting the face and thus it was not a safety measure. In the second place, it created in this seam a tendency toward blownout shots—a hazard which good blasting practice seeks always to avoid. Third, it did not decrease the quantity of explosive required. Fourth, shots with rock-dust stemming did not square up the face nor bring down the bottom coal in good condition for loading. And lastly, the shots thus stemmed so damaged the roof that the timbering expense and the danger of mining were increased. For these reasons, in the double Freeport seam the standard method of tamping shots with clay seems preferable to the use of rock dust.

**Keeps Him Thinking Daily**

To keep safety always uppermost in the thoughts of the mine worker seems impossible. The best that can be done is to jog his memory daily. This picture shows a bulletin of the Old Ben Coal Corporation posted conspicuously at the shaft mouth, just above the signal code. The messages which the bulletins carry are changed daily. It is the endeavor to keep them terse, concise and to the point.

## Car Operates Its Own Spray

At a mine of the Union Pacific Coal Co. at Reliance, Wyo., John Holen, the superintendent, takes good care of the watering of his empty mine cars. As they come up the grade from the tipple one or two at a time they strike a lever at a certain point in the road. This engages with the bumper of the car or cars and is held down till it or they have passed, when a counterweight brings the lever back into position. As the lever is rigidly attached to the stem of a water valve, its operation by the passing of a car projects a stream of water over the wagon, thoroughly wetting the bottom and what dust remains after dumping. That is why dust in the roadways of Reliance retains that grayish cast which is indicative of the presence of an excess of inert material. The flow of water is shut off as soon as the car has passed, which is an item of no little importance where all the water comes from deep wells and has to be pumped long distances.



**No Attendant Is Needed to Wet Down Cars.**

The automatic arrangement of operating this spray saves time as well as men and sends trips of coal out with a minimum of dust spillage along roadways and slopes.

## Steel Siding Adds Capacity To Mine Cars

Machine loading has brought home forcibly to coal operators in Wyoming, as elsewhere, the need for large cars. Small cars might be satisfactory so long as men had to push them, but where they are handled mechanically a larger unit is desirable, especially as machines will not top a car with coal as miners have been in the habit of doing. At the Sweetwater mine of the Gunn-Quealy Coal Co. the car sides have been raised in the manner shown in the accompanying illustration, a 12-in. girdle of steel plate being erected on four channels attached to the old wooden sideboards. In the front the girdle is only 6 in. deep and it is the lower 6 in. that is omitted, thus giving the large lumps an opportunty to escape without hindrance when the car is dumped. The addition of this girdle increases the capacity of the car from 3,000 lb. to 4,000 lb.

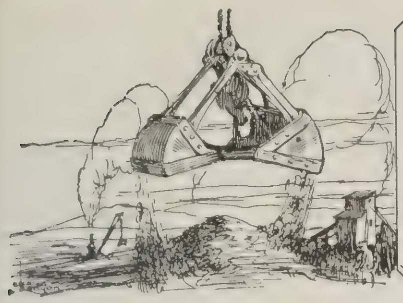
1½" Angles
No. 8 B.&S. gage
1½ Angle
2" Channel
12"
Rivets
Bolts
Flare board
Vertical side board, wood
Inside El. of side of car
1½" Angle
Side plate cut on angle 45°
Coal
Top of end gate
Detail of rack in front of car

**This Aids in Car Loading**

A steel "girdle" 12 in. high at three sides and 6 in. high at the car's dumping end makes it possible to use the old cars with mechanical loaders without a reduction in the average load.

## Use Grease Gun in Fall

So that a reasonably stiff grease and yet one which will flow freely from a grease gun may be used to lubricate mine cars, the Union Pacific Coal Co. greases its cars in autumn. Thus one application serves to keep the cars well lubricated during the winter. The heat resulting from the turning of the wheels and the mine temperature is sufficient to keep the grease of the proper viscosity. If this work is left until winter it becomes difficult.



# Production And the Market

## Soft Coal Market Feels Stimulus of Cool Weather; Anthracite Substitutes Catching On

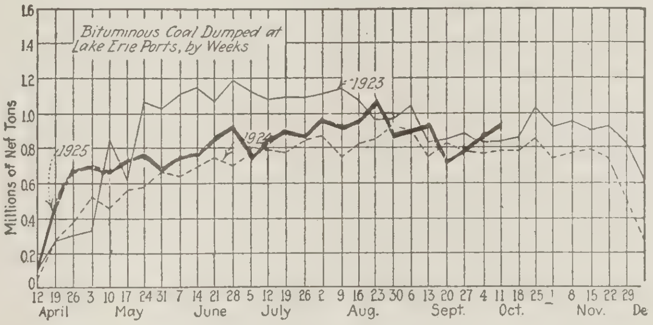
The soft coal market having practically settled down to a weather proposition a cool wave was perhaps the most pressing need to give stimulus to the trade, and, strange to say, this was forthcoming last week, and over a rather broad area, too. As a result the demand for coal has picked up noticeably after a distinct letdown following the spurt coincident with the suspension of work at the anthracite mines. A falling off in operating time at some of the mines has helped to bring about a notable firmness in West Virginia smokeless, except in the New England market, where indifference of steam coal consumers has made it difficult for shippers to place spot fuel. Introduction of the new all-rail rate on low volatile from West Virginia to the Northeast, on Oct. 15, is being awaited with interest.

The call for prepared sizes, especially 6-in. lump, has been quite brisk in the Middle West, but southern Illinois is having some trouble with steam coals, consumers being able to get all the 2-in. screenings they want at their own price. Business has been lively in the Northwest, coming from a broad territory and all classes of consumers. Unaided by seasonable weather, the trade in Kentucky has had a slight sinking spell, domestic being the weaker side. Demand is good in the Southwest. Utah has been handicapped by unseasonably warm weather, however.

A new record for October in the movement of coal to the lakes was made at Cincinnati last week, most of it at higher prices. Heavy domestic bookings also are a feature, smokeless egg in some instances bringing better prices than lump. The other Ohio markets likewise are doing better. Eastern markets as a rule are comparatively easy, having been but little affected by the weather.

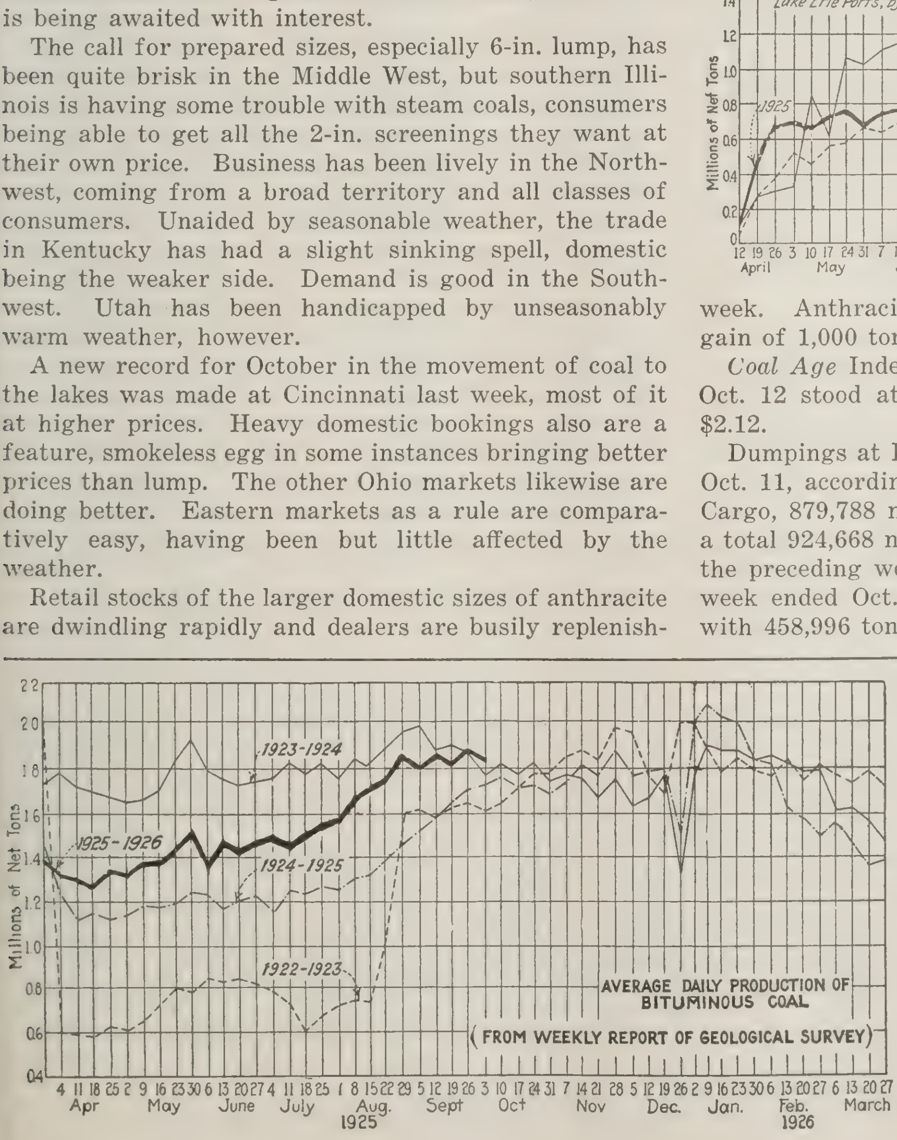
Retail stocks of the larger domestic sizes of anthracite are dwindling rapidly and dealers are busily replenishing stocks with substitutes. Coke is in such strong demand that a number of manufacturers are booked well into November. The call for screened bituminous coal has been comparatively light thus far. Domestic sizes of hard coal are virtually off the wholesale market except for a few boatloads of egg, stove and chestnut at New York, quoted up to $22.50 alongside. Quotations on stock pea are reported at $8@$9 f.o.b. mine and $11@$13 alongside; No. 1 buckwheat, $2.60@$2.85.

Output of bituminous coal in the week ended Oct. 3 is estimated by the Bureau of Mines at 10,979,000 net tons, compared with 11,211,000 tons in the previous week. Anthracite production was 14,000 net tons, a gain of 1,000 tons over the week before.



*Coal Age* Index of spot prices of bituminous coal on Oct. 12 stood at $1.75, the corresponding price being $2.12.

Dumpings at Lake Erie ports during the week ended Oct. 11, according to the Ore & Coal Exchange, were: Cargo, 879,788 net tons; steamship fuel, 44,880 tons—a total 924,668 net tons, compared with 837,410 tons in the preceding week. Hampton Roads dumpings in the week ended Oct. 8 totaled 423,430 net tons, compared with 458,996 tons the week before.



### Estimates of Production

(Net Tons)

| BITUMINOUS | 1924 | 1925 |
|---|---|---|
| Sept. 19 (*a*) | 10,156,000 | 10,880,000 |

| COKE | | |
| Sept. 26 (*a*) | 132,000 | 176,000 |
| Oct. 3 (*b*) | 138,000 | 185,000 |
| Cal. yr. to date | (*c*) 7,519,000 | 7,275,000 |

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

### Midwest Trade Feels Snap of Weather

Demand has picked up in Chicago and the Middle West in the last few days, with the appearance of some reasonably cold weather. Two or three weeks of warm weather had caused the buying spurt engendered by the anthracite strike to die a lingering death. The idea is firmly intrenched in the minds of Illinois operators that the market from now on will largely depend upon the weather.

The recent cold snap brought about a brisk demand for prepared sizes, with 6-in. lump, as usual, in the lead. Southern Illinois operators were able to maintain their prices uniformly at $3.25, and report they have enough lump business on hand to keep them busy two or three weeks. The demand for 6x3-in. furnace and 3x2-in. small egg was good, although not as strong as for lump.

Steam coals continue to furnish a vexing problem to operators, as buyers are able to procure all the 2-in. screenings they want and at a price they are willing to pay, namely, $1.65@$1.75 for a high grade 2-in. coal. It is thought that steam coal from southern Illinois is kept at this low level by pressure through lower prices on non-union coal from western Kentucky, and on strip coal from the central districts of Indiana and Illinois. Non-union coals appear to be spreading into this market in increased volume.

No one appears to be taking any interest in the anthracite strike, as retail dealers are devoting all their time and energy in pushing suitable substitutes. Low-volatile smokeless coals are in fair demand, with the market anywhere from $4 to $4.50, according to the grade. Smokeless lump is plentiful and can be had in almost any quantities. Smokeless egg coal appears to be scarce. High-volatile coals from West Virginia and Kentucky are moving in fair volume, but with prices not too firm.

A slight drop in temperature in southern Illinois has brought about some activity in the movement of domestic sizes, which had been lagging; as a matter of fact, egg and nut are still slow. Only a few mines are getting as much as five days a week and all mines have "no bills" of some sizes on track. Steam shows a little improvement, but the smaller nut sizes are slow. Railroad tonnage at the shaft mines is light. Strip mines get good working time when the weather permits, recent rains having interfered with stripping activities. There is an available market for their production although prices are pretty low.

In the Duquoin district work continues about three to four days a week with plenty of "no bills" on track, no railroad tonnage and prospects not good. In the Mt. Olive district working time is better on account of increased demand for middle grade coals; steam is going principally on contracts. Railroad tonnage is fair in this district and domestic prospects are better. In the Standard field conditions are bad; movement is below normal and prices are below cost. There

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Oct. 12 | Oct. 5 | Sept. 28 | Oct. 13 |
| Index | 175 | 175 | 176 | 174 |
| Weighted average price | $2.11 | $2.11 | $2.13 | $2.10 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

are "no bills" of all sizes every day at most mines, which get from two to four days a week with the usual exceptions. Prices in all these fields are unchanged since last week.

Colder weather has stimulated demand in St. Louis, principally for middle grade coals, although there is some activity in Carterville product. Anthracite, smokeless and coke are still slow. Country domestic shows a little improvement and will be a weather proposition. The report that buying is not up to normal is due to dealers not knowing that oil burners are going in at the rate from 100 to 150 a month in St. Louis. Country steam is quiet and local carload is fairly active. There has been a decided improvement in wagonload, which from now on will be fairly good. No change in prices.

## Weakness Appears in Kentucky

Kentucky coal markets are weaker as a result of inability to absorb prepared coal in the face of the heavy offerings and abnormally mild autumn, which has retarded stocking by retailers and domestic consumers. Demand for steam coal continues active, and a lot of screenings as well as some steam nut, mine-run and egg is moving. But 4- and 6-in. block and large egg are not showing much. In western Kentucky production has eased off on prepared and screenings are firmer. In eastern Kentucky screenings are about the only thing that have held firmly.

There has been an accumulation of "no bill" cars at mines, resulting in shading and price cutting to get cars moving. This situation has been especially bad in western Kentucky.

Western Kentucky 6-in. block coal is weaker by 20c. a ton, at $1.65@$1.85; lump and egg, $1.45@$1.60; nut, $1.35@$1.50; mine-run (from small mines) as low as $1.10 and running up to $1.50 for best grades; screenings, 85c.@$1.10, including both pea and slack at up to $1 and nut and slack at $1@$1.10.

In eastern Kentucky best block is around $2.50@$2.75; lump, egg and nut, weaker, at $2@$2.25; mine-run $1.40@$1.65; weaker by 10c.; screenings firm, at $1.10@$1.35.

The utilities, gas plants and industries continue taking a lot of coal, principally screenings, with some mine-run. Brick and clay working plants, cement plants, steel and automotive industries are all busy and taking on fuel and railroad consumption is picking up, with crops starting more active movement.

## Colder Weather Helps Northwest

Dock operators at the Head of the Lakes have had a good volume of business in the last ten days, orders coming from a wide territory and from commercial, industrial and domestic consumers. The late rush was due to colder weather over the Northwest.

Demand for Pocahontas and other smokeless is steadily increasing and the tonnage ordered by dealers over this territory is estimated to be 50 per cent larger than last year. Consumers show a greater disposition to order smokeless on account of the wide price spread between it and anthracite. Prices in both anthracite and bituminous are firm through the list, no changes being noted except that Pocahontas mine-run is up 25c. at $5.50. Shipments from the docks in September totaled 24,032 cars, as compared with 20,778 in August.

Receipts from Lake Erie ports in September were 968,658 tons of bituminous and 58,603 tons of anthracite. That brought bituminous receipts for the season up to 6,445,822 tons and anthracite to 786,848 tons. Hard coal receipts showed a falling off of 344,675 tons as compared with last year and bituminous receipts an increase of 1,334,244 tons. Thirty cargoes, all bituminous, were unloaded at the docks last week and 18 cargoes of bituminous coal were reported en route.

Supplies of anthracite on the docks now are estimated at 500,000 tons, of which more than half is held by one of the companies with docks at Duluth and Superior. Present supplies of anthracite are estimated to be ample to take care of the demand up till around Feb. 1 next.

Cold weather for a few days has served to start consumer demand in the Twin Cities at a faster pace. But steam buying is not following the weather to any extent, and buyers are in the market for as little as they can get along with. Those having water power, however, have not been able to make normal use of it because the dry season has kept down the head and the flour mills, after a prolonged period of dull business, are running heavier than for several years. The price situation is steady and fairly firm.

## Kansas Has Rush Orders

A drop in temperature has brought a brisk business to the Southwestern district in prepared sizes of coal. The market over several weeks had been showing the normal seasonal increase, but on the second day of the recent cold snap dealers, their stocks rapidly dwindling, began to put in rush orders. Mines in Kansas are working more than 85 per cent of normal time and there are many more mines open this fall than in recent years. Unsettled conditions in Arkansas and Oklahoma, throwing to Kansas much business ordinarily controlled by those two states, is largely responsible. Screenings are dragging a bit behind the market for prepared sizes, but as yet there is no threat of an embarrassing surplus.

In the Colorado market there is a good demand for steam sizes and domestic lump, the call for anthracite being abnormal. In fact anthracite mines are working full time and orders are booked thirty to forty days ahead. Nut sizes over 1¼ in. and through a 3-in. screen are a drug on the market. The mines are operating about 85 per cent and production is on the increase. The operators are preparing to take care of increased demands. Prices are: Walsenburg lump, $5.50; nut, $4.50; Trinidad lump, $4.25; nut, $3.75; Crested Butte anthracite, baseburner size, $9.50; chestnut, $7; Dawson-Raton domestic lump, $4; fancy egg, $4; fancy nut, $3.75; fancy pea, $3.25; coke, baseburner size, $6.

The coal market in Utah is weaker again, due to warmer weather. This has helped the car situation, which is generally described as easier. Mines are operating a little better than 50 per cent of capacity. Prices continue steady and the labor situation is excellent. The sugar companies are entering the coal market in a more serious way and the metal mining and smelting industries continue to consume considerable coal.

## Lake Movement Soars at Cincinnati

With 3,150 carloads of coal reported as en route to the lakes last week a new record was made for October. This was 555 more cars than the week before. Most of this is going at higher prices, egg and nut having risen to $2@$2.25. Current business has not changed much, but an outstanding feature of the market is the heavy volume of domestic coal booked for delivery in the last ten days of the month. It would appear that the free coal will be cut away down and the upturn of four or five weeks ago will be unescapable.

Heavier demand for egg is the feature of the smokeless market. Prices on this in some instances have been forced higher than lump. Where low-volatile lump has been obtainable at $4.25@$4.50, egg has taken on a price of $4.40@$4.75. Producers are watching to see the effect of the all-rail rate to New England which goes into effect Oct. 15. The demand for mine-run is just normal and for screenings it has fallen off just enough for the market to ease to $1.85@$2.

Immediate high-volatile business has been just "so-so," with supply easily taking care of demand. Some Hazard block eased as low as $2.50 and Elkhorns down to $2.65, but the general run of the market on the southeastern Kentucky stuff is $2.50@$2.75 with the specialized coals selling right on up to $3.25. Generally speaking, both this district and West Virginia have found it a little harder to keep mine-run moving and a slight concession was made on the steam, in that better grades could be had down around the minimum. Slack business for steam purposes continues strong.

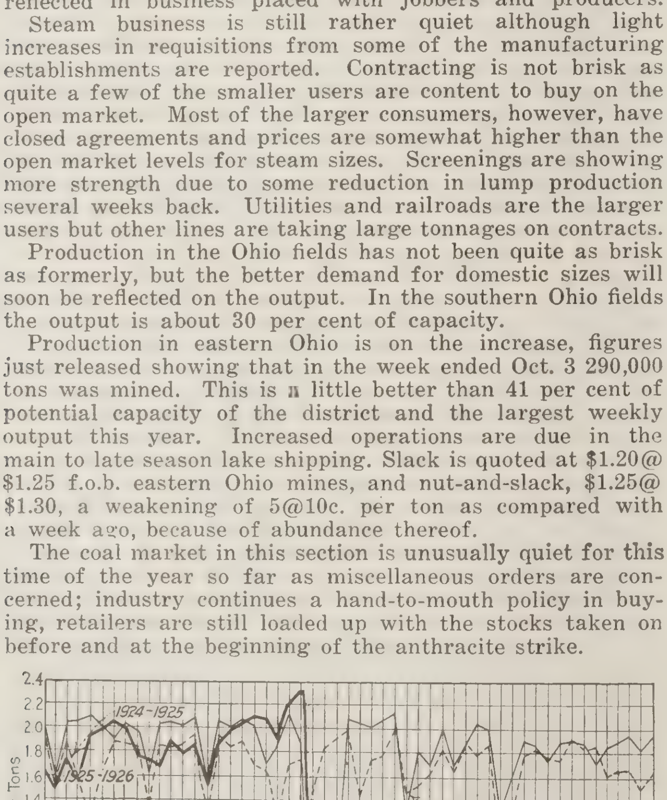
With the river stage bettered tows are again coming down with deliveries as far south as Louisville. No change in the retail situation.

With slightly colder weather at Columbus there is more activity in the domestic coal trade. Retailers have been able to move a portion of their heavy stocks and this is reflected in business placed with jobbers and producers. Steam business is still rather quiet although light increases in requisitions from some of the manufacturing establishments are reported. Contracting is not brisk as quite a few of the smaller users are content to buy on the open market. Most of the larger consumers, however, have closed agreements and prices are somewhat higher than the open market levels for steam sizes. Screenings are showing more strength due to some reduction in lump production several weeks back. Utilities and railroads are the larger users but other lines are taking large tonnages on contracts.

Production in the Ohio fields has not been quite as brisk as formerly, but the better demand for domestic sizes will soon be reflected on the output. In the southern Ohio fields the output is about 30 per cent of capacity.

Production in eastern Ohio is on the increase, figures just released showing that in the week ended Oct. 3 290,000 tons was mined. This is a little better than 41 per cent of potential capacity of the district and the largest weekly output this year. Increased operations are due in the main to late season lake shipping. Slack is quoted at $1.20@$1.25 f.o.b. eastern Ohio mines, and nut-and-slack, $1.25@$1.30, a weakening of 5@10c. per ton as compared with a week ago, because of abundance thereof.

The coal market in this section is unusually quiet for this time of the year so far as miscellaneous orders are concerned; industry continues a hand-to-mouth policy in buying, retailers are still loaded up with the stocks taken on before and at the beginning of the anthracite strike.



Since the arrival of cooler weather last week, certain plants have been putting in some fuel for heating purposes, but the volume on this account is small.

## Pittsburgh Relatively Quiet

Last week in the Pittsburgh district coal market was relatively quiet. Trade on the whole is considerably more active than for months prior to August, but the change from an improving market has given sellers quite a disappointment.

The steel industry is maintaining the high operating rate reached in August and railroad movement has increased. Demand for domestic coal is fair, but not altogether up to expectations.

Market prices are not quotably changed but possibly are a shade easier in spots. However, steam slack, which is subject to the depressing influence of more shipments of domestic lump, has not declined particularly, and that is easily the most sensitive line in the matter of prices.

The trend of production in the central Pennsylvania field is still upward, but the increase is not what might be expected under existing conditions. Gains are being made in the Broad Top region, where a number of the leading operations are almost on a normal running basis. About 400 mines in the entire district are still idle. The demand is stiffening, however, particularly for prepared sizes for domestic consumption in the Eastern states.

Not much change is discernible in the Buffalo soft-coal market, except that prices are weaker than they were when the hard-coal strike began. Slack is hard to get rid of and if there were not some interest in coke and smokeless coal the trade would be slow indeed.

## Trade Lags in New England Market

In New England the steam coal market shows no improvement. Buyers are quite indifferent, and the agencies are again canvassing in every direction to place spot coal. Coastwise movement is only fair, being restricted largely to shipments on contract, and accumulations at Hampton Roads continue heavy enough to make difficult anything like stable prices. The range therefore is from $4.65 to $4.90 per gross ton f.o.b. vessel at Norfolk and Newport News, with indications that the level will drop another notch during the current week.

On cars Boston and Providence also there is only moderate inquiry. While some factors are holding for $6.25@$6.40 others are selling at $6 and even less. A few rehandlers are now being pressed to take deliveries from Hampton Roads to such an extent that they are obliged to send coal inland to make room. Boston retail prices to the steam trade are now $8 per net ton, having been advanced from $7.50, but this is because of a situation purely local and does not reflect any improvement in demand. It means simply that the retailers are trying to recoup their losses of the summer months.

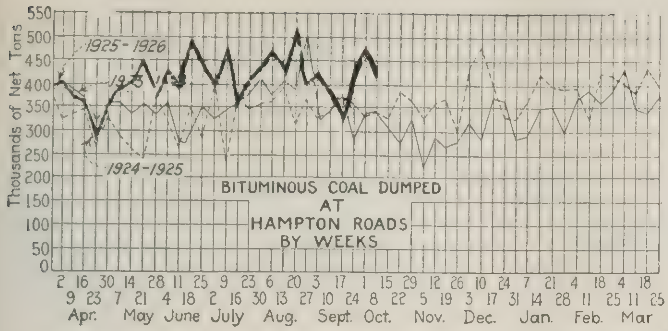
The absence thus far of any cold weather has very much relieved the pressure on retail dealers in anthracite. There is more and more talk of substitutes, and numbers of Pennsylvania operators are profiting by the moderate current demand for screened coal. Minimum prices for lump and egg are somewhat higher than last week, there being very little now offered at less than $4 per net ton at the mines.

## Trade Easy at New York

The bituminous coal market at New York remains practically unchanged from last week. Output is moving in fair shape, with the better coals in good demand, some operators reporting heavy bookings. Prices, however, continue on the old basis.

Soft coal dealers do not expect a big demand in this territory for prepared soft coals to take the place of anthracite users, the trend being toward coke. Increased buying usually attendant upon the approach of winter has been absent so far, although industrial consumers are taking the opportunity of adding small tonnages to their reserve stocks.

Local houses quote Preston County coals at $1.45@$1.50; some grades of Somerset County coals as high as $1.85, and Indiana County coal (Pool 15) at $1.70@$2.25. Stocks at the local piers have not been heavy and free coals move easily.



The Philadelphia market is disappointing to shippers, as cooler weather has made but little change in the situation. Producers of hard-structured coals are going strongly after the anthracite market, but not much progress has been made in inducing dealers to take in soft coal. In this section coke is first tried in an emergency and soft coal comes later.

Spot buyers are taking only ordinary quantities, but contract coal is moving in good volume to add to stocks. Prices remain unchanged and there is no immediate prospect for an increase.

At Baltimore the coal supply continues in excess of demand. Surpluses at tide are noted, and purchasers, knowing that competition is keen, play one supply point against another in order to get minimum quotations. Industrial demand continues light, and prices even for better grade coals are the football of an over-keen salesmanship. Contracting is not on a general scale, as many purchasers continue in the open market in carrying out a hand-to-mouth supply policy. The export situation is fluctuating and uncertain.

There has been no change of note in market conditions at Birmingham during the past week. Comparatively little domestic coal is being bought in the open market and hold-up orders are largely delaying movement against contracts. While there has been some moderation in the heat wave, midsummer temperatures still prevail and there has not been sufficient rainfall to have any material effect in breaking the drought.

Steam coal is being bought fairly well, there being a good demand for high grades of mine-run and washed from the Cahaba and Warrior fields. The volume of spot business being placed along with contract commitments is enabling the mines to operate from three to six days per week in the commercial field. The ice season is holding up to the peak longer than usual, while oil mills, cement plants and ginneries are running full time and requiring a good aggregate tonnage. Some of the rail lines are taking slightly above the minimum contract figure, but, generally speaking, there has been little fuel placed in reserve by year-around industrial plants and utilities as yet. There is no material change in the bunker situation.

Quotations are without change and within the range last quoted on the different grades.

Demand for foundry coke is about keeping pace with output, beehive being quoted at $5 per ton and byproduct 4.75 per ton ovens. Domestic sizes are in fair demand at $3.50@$3.75 for nut and $4@$4.25 per ton ovens for egg.

## Domestic Hard Coals Dwindle

New York anthracite users are not yet complaining of the lack of their favorite sizes. Supplies are dwindling rapidly, however, and retail dealers are already looking after their supply of substitutes. So far the preference seems to be for coke, which is in heavy demand, some manufacturers reporting heavy bookings through November.

There has been comparatively little call for screened bituminous coal, which had a good demand here during the last strike in the anthracite fields.

Domestic coals are practically out of the market so far as operators are concerned. Several loaded boats of egg, stove and chestnut are still available for those willing to pay the prices quoted, which range as high as $22.50 alongside. Stock pea coal was heard quoted at $8@$9 f.o.b. mine and $11@$13 alongside. Buckwheat No. 1 was quoted at $2.60 @$2.85. Rice and barley were not quotable.

Egg, stove and nut sizes of byproduct coke were quoted at $7.50@$8 and run-of-oven furnace at $6.50@$7.

Some Philadelphia retail coal yards present a rather bare appearance, few having anything but pea coal. Of this the supply is good and shipments from the leading company shipper continue to roll along in moderate volume to regular customers.

All dealers have numerous calls for the larger sizes and when pea is offered as the only available fuel, the would-be purchaser frequently declines to take it, but the number who ultimately come back is increasing.

Dealers have been offered stove at $16, nut at $15, and pea at $9.50 per ton, the understanding being that this is coal stored by a small producer near Sunbury, Pa. To make it profitable dealers would have to sell the stove and nut at close to $20 retail, and it is doubtful if any has been sold. The demand for coke is good and prices are advancing.

Demand for buckwheat is increasing, although there is no rush for it. This is the only steam size on the market.

Baltimore consumers are cutting into the supply to some extent, although there is no rush for fuel. Dealers have been advising customers in many cases not to take more anthracite than for immediate needs. The president of the Baltimore Coal Exchange also made a public announcement that he saw no grave danger in the situation to householders, as, even if the supply of anthracite ran out here, there would be no difficulty in getting high-grade soft coal, which could be burned in the majority of heating apparatus in this city.

At Buffalo a little anthracite above pea size is to be had, but the customer has to put up a pretty strong plea to get any and some companies are running short of pea.

Meanwhile coke runs up in price, with different quotations in every office. The sale of smokeless has not run up very fast yet, but that is merely because the people do not know how to use it. When they do there is going to be a sharp competition between it and anthracite.

## Connellsville Coke Trade Gains Slightly

The turnover in furnace coke at Connellsville has undergone an increase in the past ten days, after a marked lull. The market is not yet nearly as active as might have been expected from the little rush of buying recently, which came so early as to lead to expectations that when the anthracite suspension had lasted a few weeks coke would be in heavy demand.

Eastern makers of water gas, who bought in August for short periods, have not been buying lately, but are expected to be in the market again within a few weeks. Their buying amounts to more than that of dealers expecting to distribute for house consumption. There has been a fair amount of this buying in the past week.

One steel company, which does not usually buy coke, has purchased some prompt coke, presumably for a reserve, and is said to have paid up to $4, though several weeks ago some operators said the market was already $4 and ready to go higher.

Miscellaneous lots, which a fortnight ago could sometimes be picked up at as low as $3.50, are now going at $3.65@$4, depending on quality and, it would seem, also on the information the purchaser has as to what he ought to pay. The spot market thus shows quite a range.

There are reports that one or two operators are holding coke on track for a further advance. If they have guessed wrong this may cause a reaction.

The regular crushed coke having become well sold up some time ago, with asking prices shoved up to $7, several operators are undertaking to crush coke by manual labor, using sledges, etc., producing material of doubtful quality.

Spot foundry coke remains dull, and therefore quotably unchanged at $4@$4.50. Lately there has been a little loaded on track. Foundry coke, being large, is particularly unsuited to heating use. Labor troubles in the region are on the wane.

# Foreign Market And Export News

## British Coal Market Disappoints But Trade Is Hopeful

Although prospects in the Welsh steam coal trade were a little more favorable for orders at the beginning of the week, the slight improvement anticipated was not realized. With enormous quantities of coal standing, exceptionally stormy weather prevented steamers from reaching port without much delay, and this has hampered prompt shipment. Colliery owners offer concessions to buyers to take quick delivery, but with the supply of ready tonnage limited it is almost impossible for buyers to take advantage of opportunities of this kind. Several producers have decided to close down small collieries. Negotiations for the reopening of the Clydach Vale Collieries are expected to begin soon.

There has been a very small upturn in the Newcastle coal trade. Inquiry from the Continent has broadened considerably, though actual business is slow to mature. The better classes of Durham coal are a little steadier, although the inferior classes of coking and bunkering are still offered rather freely. Washed smalls and sized coals continue in fairly good request. On the whole the outlook is regarded as a little more cheerful. The fall in prices seems to have been arrested and the collieries refuse to make further concessions. With the colder weather and the longer nights setting in the demand for gas and house coal is expected soon.

Production of coal by British mines during the week ended Sept. 26, according to a special cable to *Coal Age*, totaled 4,395,000 gross tons, compared with 4,435,000 tons in the previous week.

Coal exports from Great Britain in August, 1925, totaled 3,272,110 gross tons, valued at £3,159,952 as compared with 5,074,744 tons valued at £5,732,629 in August, 1924. For the eight months ended Aug. 31, 1925, the total is 33,562,809 gross tons, valued at £34,537,380 as compared with 41,693,690 tons, valued at £50,099,242, for 1924 and 53,156,546 tons, valued at £67,571,441, for 1923.

### French Industrial Demand Easy; Domestic Call Gains

Demand in the French coal market remains moderate for industrial fuels but is gaining for household grades. Bituminous large coals are more sought, especially by Belgian consumers in the neighborhood of the frontier.

Last week several cargoes of Welsh anthracite were received at Rouen. The Soviet commercial delegation were asked whether they intended to continue shipments of anthracite to France. They answered that all depended upon their ability to obtain sufficient orders from French importers and merchants, and added that they were prepared to increase their tonnage in that event.

Like every other year when autumn sets in, there is an increasing scarcity of empty trucks, and barges are far from plentiful. The freight rate for coal from Bethune to Paris has risen to 26 fr.

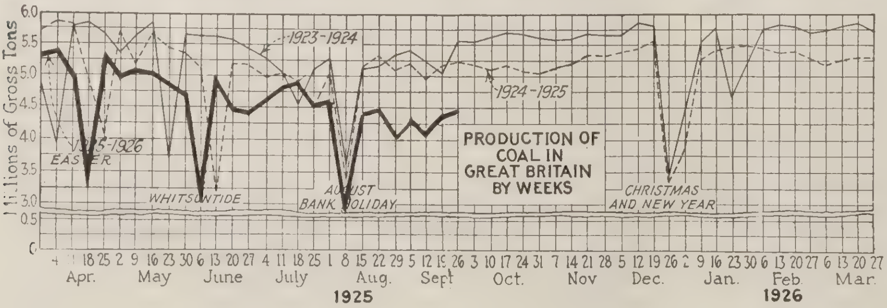
During the first twelve days of September France received from the Ruhr 254,900 tons of indemnity fuels, including 146,400 tons of coal, 97,400 tons of coke, and 11,100 tons of lignite briquets, a daily average of about 21,250 tons. During the first twenty-one days of September the O. R. C. A. received from the Ruhr 154,673 tons of coke, a daily average of 7,400 tons.

### Competition and Iron Strike Hamper Belgian Trade

There is really no change in the situation in the Belgian market. The iron works strike is still on and continues to affect the consumption of industrial coals, already none too good, and, notwithstanding the exchange rate, foreign competition is unabated.

Full-sized briquets continue to be in rather poor request.

Domestic fuels, on the contrary are extremely firm. Anthracite in particular, is rising steadily and is quoted at the Brussels Bourse 5 fr. above the price of last week. All other domestic grades, as well as ovoids, are enjoying the same favor. Foreign demand in domestic fuels is active at firm prices.



### Movement Slow and Scattered At Hampton Roads

Movement at Hampton Roads was slack last week, the slow-down of the Western market having had a similar effect on New England shipments. Many mines serving this port, which took on big activity a month ago, again are down to a three-day schedule.

Scattered foreign shipments have been recorded and bunker trade is holding its own.

# News Items From Field and Trade

## ALABAMA

The Montevallo Coal Mining Co. is planning extensive improvements in its plant facilities at Aldrich Mines, in Shelby County, a large steel washery and tipple being under consideration, in which will be installed the most modern machinery and equipment for handling and preparation. An 800-hp. electric hoist is now in process of installation, which will take the place of the steam engine in use at present. A substation has been provided at Aldrich by the Alabama Power Co., which will provide ample power facilities for the operation of the electrical equipment to be added. The mines are now operating at capacity on full-time schedule.

## ARKANSAS

Samples of coal are being collected from all the working mines in the State by N. T. Bourke, research engineer with the University of Arkansas engineering experiment station, so that the Arkansas coals may be analyzed, the heat content computed, the sulphur determination made and the fusing point of the ash found. There are approximately 100 working mines in the state.

## COLORADO

John Riffey has acquired an interest in the Valley View coal mine, Mancos, hitherto owned and operated by Karl Hauert. The owners are putting in a 600-ft. tram to convey the coal from the mine to wagon road on the lower level. They also are taking steps to put in a fan and ventilating system and to hire the necessary mine foreman in compliance with the new law regulating the operation of coal mines.

## ILLINOIS

The Illinois Miners' Examining Board will hold examinations at Johnston City, Oct. 15; West Frankfort, Oct. 16, and Duquoin, Oct. 17.

Decreased coal production, unemployment among miners and idle equipment are pictured by the annual coal report of the State Department of Mines and Minerals for the year ending June 30. With an output of 66,144,361 tons, Illinois mines fell 6,164,304 tons short of last year's total. The mines employed 81,605 men this year, a decrease of 18,160 from the previous year. Only 898 mines were operative during the last year, a loss of 134. District No. 10, with a gain of 1,065,111 tons, was the only one showing an increase in production.

Announcement has been made by the Saline County Coal Corporation that its big Harco mine will resume operations at once after several months of idleness. The shaft employs 750 men and is one of the largest in the Harrisburg district.

The Worthuskey Coal Co., operating near Cambria, south of Duquoin, has resumed operations.

The Ward coal mine, at DeSoto, which has been idle for nearly two years, has been sold to a company which will handle its output to the Illinois Steel Co. Preparations are being made to put the mine in working condition. Practically all of the homes destroyed at DeSoto in the great cyclone last March have been rebuilt.

With less than two fatalities for each million tons mined during the year ending June 30, Illinois now leads all the states in the Union for safety in coal mining operations. The annual report of the state department of mines and minerals says only 117 fatalities were reported during the year in coal mines. Falls of roofs and sides took the heaviest toll, killing 57 miners, and accidents in the handling of pit cars and motors came next with a grist of 30 lives. Electricity caused ten deaths and explosives nine.

The Coal Mine Service Co., 307 North Michigan Avenue, Chicago, was incorporated in Illinois recently to supervise, superintend and act in an advisory or directing capacity in connection with the operation of coal mines and by-products plants. The capital is $10,000. The incorporators are D. Harold Davis, John M. Tueby and M. Hayes Kennedy.

After being closed since early last spring the Brewerton Coal Co., Lincoln, opened for operation late in September. The decision to open came following a conference between the pit committee of the local and the officials of the mine. Immediately following the conference the seals were broken and the fans started for the clean-up.

The properties of the St. Louis Coke & Iron Co., at Granite City, will be offered for sale Oct. 20 by Special Master in Chancery Edward P. Allen to end the receivership of the company and pave the way for its reorganization. The company was organized by financial interests largely identified with the National Enameling & Stamping Co., headed by George W. Niedringhaus, to manufacture coke from bituminous coal from the southern Illinois fields under a new process. The original organization was the St. Louis Coke & Chemical Co., but the name was later changed to the present one. The company's properties are valued at $12,000,000 and the plans for reorganization contemplate $3,000,000 in improvements and enlarging the plant. It is understood that the bondholders will bid in the property when it is offered for sale.

Charles Sulski, Spring Valley, has been appointed county mine inspector of Bureau County. Mr. Sulski was mine manager at No. 1 mine of the Spring Valley Coal Co. until that mine was abandoned last May.

## INDIANA

A heavy slate fall in Binkley Mine No. 3, south of Jacksonville, Oct. 1, killed four men and seriously injured two others.

The Sunlight Coal Co., owning extensive strip mines near Boonville, is working to its full capacity as are the Enos and Gray strip mines of Oakland City.

Among mines which have reopened recently are Somerville No. 2, at Somerville, where the management has promised miners steady employment for an extended period: Fork Ridge mine, near Oakland City, which was closed four years ago. The Pike County Coal Co. mine No. 3, at Petersburg opened Oct. 1 with a full force of men. The mine has a capacity of 900 tons and normally employs 100 men. No. 1 mine, owned by the same company and the largest in Indiana south of the B & O. R.R., has been in operation since Aug. 1, employing a force of 475 men.

Announcement has been made that Jackson Hill mine No. 6, in the Terre Haute field, has resumed operations. The mine has been down for several months and about 300 miners were put to work.

A campaign to induce manufacturers, business men and citizens generally to use Indiana coal has been inaugurated at Brazil. Officials of the United Mine Workers of Indiana plan to begin a statewide campaign to have residents of the state to use coal mined in Indiana. Ora Gasaway, board member of the union, told a meeting of business men at Brazil that they had been preaching to miners to trade at home and that the miners now ask them to trade at home and start by using Indiana coal. A slogan "Trade at Home by Using Indiana Coal" was proposed by him. He will go before the Indiana State Chamber of Commerce in his first step to start a state campaign.

Sale of approximately 6,117 acres of

coal lands in Sullivan County to the Connery Coal & Investment Co., of Chicago, Ill., has just been announced by the law firm of Hays & Hays, of Sullivan, who acted as agents for the Indiana Coal Co. and R. R. Hammond, of Chicago, in the deal. The consideration was not given. Hinkle C. Hays, of the law firm which acted as attorneys for both buyer and sellers in the deal, said that no time had been fixed for opening of the new property, but that it was certain that the sale presaged additional coal mines in Sullivan County.

Miami mine No. 6, in the Clinton field, was closed recently for an indefinite period. Another mine operated by this company in the same field will be continued in operation. This company's business virtually is all railroad business and can be handled by the one mine. Mine No. 6 is said to be nearly worked out.

## KANSAS

One hundred and twenty-five miners employed at No. 21 mine, near Scammon, leased from the Western Coal & Mining Co., and 150 employed at No. 18 of the Clemens Coal Co., four miles west of Pittsburg, went on strike Oct. 5. At both mines the cause assigned was that the companies have increased the charge for explosives and supplies, notably raising the price of fuse from 40 or 45c. to 70c. The miners contend that no greater charge should be made than prior to the signing of the Jacksonville agreement. Matt L. Walters, president of District 14, United Mine Workers, stated that the strike has the approval of the district executive board.

The strike at Mine No. 2 of the Young Coal Co., near Weir, which had lasted five months, was ended Oct. 3 by agreement between the operator and the miners' union. The cause of the strike was the allegation of the union that the company advanced new men ahead of their turn on the waiting list.

James Sherwood, state mine inspector of Kansas, has issued a warning to all coal operators in the state to take special precautions against explosions. Atmospheric conditions augment the natural hazard of dusty mines at this season, Mr. Sherwood said, and strongly urged wetting down the dust.

The Sheridan Coal Co. has leased its mine No. 18, near Arma, to Andrew Gaslein, of Arma, E. M. Roberts, Sr., superintendent of the Sheridan, announces. The mine, which has been idle since February, will have to be cleaned and extensive repairs made before production is resumed. Throughout most of last winter this mine employed 200 men. Mr. Roberts stated that mine No. 20, in the northern part of Crawford County will be leased soon if the coal market continues to show improvement. Several prospective lessees are negotiating for the mine. Having been sunk in recent years, the mine is capable of one of the largest productions in the district, but has not yet been developed to that point. This mine is located on a 1,000-acre tract on which the coal is said to be of good quality and thickness.

**The Colored Section of a Southern Mining Town**

Contrast the appearance of this street in Edgewater, Ala., with the negro section in many a Southern community of 25 or 30 years ago and it is easy to understand the present urban trend of the colored man. Like anyone else the negro will seek the place where conditions in general are most nearly to his liking. And logically he prefers such dwellings and other surroundings as are here depicted to the back-alley abodes which have long been considered as his natural habitat.

The Domestic Fuel Co.'s mine No. 3, near Gross, has been leased to the George T. McGrath Coal Co., which is speeding up repairs on the property preparatory to operating. This shaft has not been worked since the World War and is practically unexploited. Labor and market conditions caused it to be shut down soon after the shaft was sunk.

Negotiations are under way for the lease by the Central Coal & Coke Co. of its mine No. 49, near Frontenac, to Mark Knott and Frank Cumiskey, both of Pittsburgh. The mine, one of the largest in the district, employing normally between 300 and 350 men, has been idle since the general strike of three years ago. In the meantime its smokestacks have been blown down and other damage of unknown extent has resulted. A smokestack now is being built to permit the operation of fans to rid the shaft of gas. As soon as it is considered safe to venture into the mine an inspection will be made which will determine the lease.

## KENTUCKY

At Madisonville, preparations are being rushed for the opening of the Rich Coal Co. mine No. 11, which, when completed, will have a daily capacity of 1,000 tons. Northern and Middle-Western railroads are reported as furnishing the largest market for coal mined in that vicinity.

With the fall elections drawing close more and more is being heard regarding the proposed legislation featuring a coal tonnage tax in Kentucky during the 1926 legislative session starting in January.

After a long argument for better passenger train service in the Hazard district, on the Eastern Kentucky Division of the Louisville & Nashville R.R., in which coal operators were quite active, the road has agreed to give better service on the First Creek and Lotts Creek branches, and between McRoberts and Hazard. Heretofore much time was lost by sidetracking the passengers for coal trains and running mixed freight and passenger trains, which meant that operators from Cincinnati, Louisville, Lexington and other points were subjected to delay and inconvenience in efforts to visit their mine properties.

The Hatfield-Reliance Coal Co. has been busy in having the mine plant of the Mitchell-Willis Coal Co., at Gorman, on First Creek, cleaned up and placed in condition to start operations after a long shutdown. The Adkins mines, at Dakota, and Alex McIntyre mines at Fusonia also are getting ready to resume.

The Cornett Lewis Coal Co., Harlan Collieries Co., Kentucky Cardinal Coal Co., Creech Coal Co., Harlan Wallins Coal Corporation and R. C. Tway Coal Co. recently answered a call sent out by H. A. Robinson, field representative of the Kentucky Childrens' Home, at Lyndon, for fuel supplies. Each of these companies donated a car of eastern Kentucky coal.

It is reported from the Elkhorn and Hazard fields of Eastern Kentucky that the Kentucky & West Virginia Power Co. is enlarging its transmission lines in that district to reach more mines and give better service in the Kentucky coal fields. Considerable improvement is under way also in West Virginia, connecting into the Charleston, Logan and other districts and with some points in Southern Ohio. The company is operating a large central power plant at Lothair, near Hazard, and is furnishing about 90 per cent of the mine power in the Hazard and Elkhorn fields. The company recently entered a contract to furnish power to the Consolidation Coal Co. plants, which will add considerably to its output. Connections have recently been made to a power plant at Betsey Lane, in Pike County; Appalachian Power Co., at Bluefield, W. Va., and Norton, Va., so that surplus power can be transferred from one section to another.

Ray Moss, of Whitesburg, when in Cincinnati recently, confirmed the report that he had purchased the holdings of the White Star Coal Co., operated by the Detroit City Gas Co. at Wilhoit. These properties were taken over during war times at a figure said to be in the neighborhood of $450,000. Though the repurchase price was not disclosed it is said to have been considerably less than the former transaction involved.

A. L. Allais, president of the Columbus Mining Co., of Chicago, at the late September term of the Perry County

Court was appointed receiver for the Montgomery Coal Co., at Vicco. It is understood that the liabilities causing the receivership amount to $53,000 while the mines are valued at four times that amount. Mr. Allais is receiver also for the Daniel Boone Mines, also in the Hazard district.

Under the direction of J. S. Oldham, of Whitesburg, the new owners of the Mitchell Willis Coal Co., on First Creek, near Typo, have cleaned up the company's mines and resumed operation. These properties were obtained from the Hatfield Reliance Coal Co., of Cincinnati, and the work of putting them in shape for operation required four months. A new name will be used by the corporation.

## MINNESOTA

Formal notice has been served upon the railroads of Minneapolis that the city ordinance against the use of soft coal other than smokeless in switching engines will be enforced hereafter. The ordinance was passed in 1909 and was upheld as constitutional by the State Supreme Court in 1911. It declares the use of other soft coal to be a nuisance and carries a fine of $25 to $100 for violation.

The Superior coal dock at Duluth, operated by the Henry Ford interests, is now nearly full of Kentucky coal, which is still being handled on this market through the auto sales agency. The company has taken steps to obtain ownership of the Duluth dock through bond foreclosure proceedings and after title has been obtained it is understood that steps will be taken to increase the coal handling and storage capacity of the dock in addition to providing handling facilities for autos and auto parts.

## MISSOURI

A. M. Boudinier has just installed a new coal shed, scales and office building to be used in the operation of a coal mine at Perry.

A new mine has been opened at Crescent Lake and coal is being taken out. The mine is owned by the Fair Play Mining & Development Co. The coal was found at a depth of about 200 ft. and the bed is about 26 in. thick and said to be of good quality. Mining operations are being pushed and just as fast as the excavation is enlarged men will be added to the working force.

## NEW YORK

In connection with the application of Burns Bros. to list on the New York Stock Exchange 16,421 additional shares of Class A common stock and 16,427 shares of Class B common stock, it was reported that the proceeds from these issues is to pay for Steamship Fuel Corporation and the Wyoming Valley Coal Co. and subsidiaries, recently acquired from S. A. Wertheim.

## OHIO

The tipple at the Fort Pitt mine of the Central Coal Co., operating at Dillies, opposite Moundsville, W. Va., was destroyed by fire last week, entailing a loss estimated at $30,000, partly covered by insurance. According to A. H. Smitherman, superintendent of the company, the mine has been closed down for some time and the cause of the fire is therefore unknown.

David Watkins, of Buffalo, Ohio, was named Oct. 1 to succeed William Roy, Bellaire, as vice-president of the Ohio Mine Workers' union. Watkins was nominated by Lee Hall, president of the union, and the executive committee approved the nomination. Roy recently resigned.

Coal is being mined in the Vulcan Coal Co.'s mine at Pomeroy on a co-operative basis. Coal will be shipped in the current week. Prior to its shutdown because of the Jacksonville agreement it empolyed 350 men. A number of Pittsburghers own the mine.

A meeting in connection with the old Interstate Coal & Dock Co.'s financial affairs, which have been more or less involved since a receivership four or five years ago, was held in the Business Men's Club in Cincinnati on Oct. 2. Present were C. H. Mead, of the Mead Coal Co., of Beckley, W. Va.; M. M. Tyree, of Huntington, W. Va., and J. A. Teegarten, of the Low Volatile Coal Co. of Columbus, and others from the east. What further steps were taken or what plans were outlined were not made public.

Reports from the four mines of the Pittsburgh Coal Co. in the Pomeroy field operating under the 1917 wage scale show that output is increasing rapidly. About 500 men are employed at the four openings and production is in excess of 8,000 tons weekly.

The international office of the United Mine Workers has revoked the union charter of the local at Bellaire. Two unauthorized strikes at the Franklin mine of the Cleveland & Western Coal Co., at Stewartsville, within four days led to the action. The same coal company has started up its Johnson mine.

The Webb mine of the Cambria Collieries Co., Shadyside, resumed operations Oct. 1 after being idle for two years. Seven hundred and fifty men are employed at the plant. United Mine Workers officials were informed by the company that operations are expected to be continued at capacity throughout the winter. Announcement was made that 200 men have been added to the force of the Elm Grove Coal Co. mines, also operated under union scale.

Because of changes made in their Sullivan-Pond Creek holdings the Corey Mann George Co., of New York City, has decided to discontinue its Cincinnati offices as of Nov. 1, according to notices sent to Frank and Ed. Holyoke, in charge there.

A deed containing 39,200 words, but lacking internal revenue stamps to indicate the value, has been filed at St. Clairsville, covering transfer of several thousand acres of coal land in Washington and Wayne townships, Belmont County, by S. H. Robbins, Cleveland coal operator, to the Cleveland Trust Co. The consideration is given as $10.

## PENNSYLVANIA

The first violence in the anthracite strike was reported Sept. 29 in the dynamiting of the pump house at the Quinn mine in Dunmore. The blast caused a loss of $3,000. Blame has not been fixed.

An increase of three mines shipping by rail is shown in the operations of the Pittsburgh district during the week ended Sept. 26. There were 75 mines working which produced a total of 316,479 tons of coal, compared with 290,395 tons in the preceding week. The Pittsburgh Coal Producers' Association reports production of 15 mines out of 78 for that week as 74,388 tons, which is 12.2 per cent of capacity. This figure compares with 10.1 per cent in the preceding week and 40.5 per cent in the corresponding week last year.

A new steam tipple is being put in at the Adrian mine of the Rochester & Pittsburgh Coal & Iron Co., now operated by the Jefferson & Indiana Coal Co., which will much increase its handling capacity.

At a meeting of the Central Pennsylvania Coal Producers' Association directors and the board of managers of the Bituminous Coal Operators' Association held in the headquarters of both concerns in Altoona, Pa., on Sept. 29, an answer to the recent inquiry of John Hays Hammond relative to prepared sizes of bituminous coal for use in New England states was prepared and sent. The reply signed by Charles O'Neill, secretary, stated that the district was ready to supply the New England States with 1,106,917 tons of prepared sizes monthly, the mine-run capacity being 5,420,000 tons per month.

**This Lamp Rack Saves Time and Steps**

At Dawson, N. M., the Phelps Dodge Corp. has worked out this arrangement of revolving hangers in front of the charging racks. Thus the clerk brings every man's lamp to hand readily.

## UTAH

A local mining engineer named J. B. Jensen has completed a process that he believes will make Utah coal smokeless. Experiments were begun years ago. The process is to be exploited by a company which is being formed. A plant is already under consideration for the preparation of coal for the local market. Mr. Jensen says that at a cost not to exceed 30c. a ton Utah coal can be made smokeless without detracting from its fuel properties.

Miles L. Jones, prominent Ogden coal retailer and former city commissioner, is running for office again this fall.

## WEST VIRGINIA

Brooks S. Hutchinson, of Fairmont, vice-president of the West Virginia Coal & Coke Co., announced Oct. 7 that M. Benton Mitchell, formerly Marion division superintendent of the Bethlehem Mines Corporation, in charge of the Barrackville and Dakota mines, had joined the operating forces of that concern. Mr. Mitchell will be located outside of Fairmont, although no definite announcement is made as to his location or position with the concern, which has mines in 12 counties in northern West Virginia and four divisions—the Kanawha, Logan, Elkins and Bower. Mr. Mitchell was formerly connected with the Consolidation Coal Co. at Jenners, Pa.; in the Elkhorn field in Kentucky and in Utah.

L. E. Linkous and Joseph Ponton on Oct. 2 purchased the Vulcan mine from the receivers of the Brady-Thacker Coal Co. The Vulcan mine was one of the largest owned by the defunct company and employs 75 men when operating at normal capacity. The sale was given the sanction of Judge George W. McClintic, of the U. S. District Court for the southern district of West Virginia. The mine will be placed in operation at once by the new owners, it has been unofficially announced.

Miners from the Pittsburgh area, according to J. A. Martindale, examiner of the U. S. employment office in Huntington, are turning to the mines in southern West Virginia and eastern Kentucky for employment.

September will rank as one of the best coal tonnage months the railroads serving southern West Virginia have ever enjoyed. The total output of the mines served by the Norfolk & Western for September will equal almost four million tons, breaking all previous records. The Pocahontas district shipped 1,737,550 net tons, but did not reach its record of May, 1922, when 1,919,289 tons were shipped. The Chesapeake & Ohio handled about five million tons and the Virginian transported over 600,000 tons.

The Mercantile Trust Co., Fidelity Trust Co., Robert Garrett & Sons, of Baltimore, and Spencer Trask & Co. and Hambleton & Co., New York City, have underwritten an issue of $4,500,000 Elk Horn Coal Corporation six-year 6½ per cent first mortgage bonds. The issue will be offered publicly in the near future. Proceeds will be used to retire the $6,000,000 issue of ten-year 6 per cent bonds of the corporation which mature Dec. 1, 1925. The New York Stock Exchange has received notice from the Elk Horn Coal Corporation of its intention to change the authorized issue of common stock from $22,000,000 of $50 par to 440,000 shares of no par value.

Negotiations are in progress for the purchase by the Ford interests of Detroit of about 50,000 acres of coal and timber land on Elk River, in Webster and Braxton counties. Among those active in conducting negotiations have been Former Senator W. E. Chilton, of Charleston; Cary Hines, attorney, of Sutton; G. E. Kesterton, of Huntington, and John Newton, of Sutton. Engineers and geologists representing the Ford interests have made a survey of the land and have reported their findings to the Detroit office.

## WYOMING

The coal companies' payroll in the Rock Springs district on Oct. 1 was the largest to be distributed among the miners in the past year and a half. Steadily increasing railroad traffic, with resultant increased tonnage demands upon the mines supplying railroad coal, has had much to do with this increase in production.

The Inland Coal Co. has opened a wagon mine near Saratoga for production of domestic coal for local consumption.

The Blazon Coal Co. has added a night shift at its mine south of Kemmerer. Recently fifteen men were placed on night shift and on Oct. 1 several more men were employed for that shift. This is said to be the first night force to be worked in the Lincoln County field for many years. The Blazon camp, the youngest in the Kemmerer district, now employs more than 100 men underground.

No. 6 Mine at Sublet, owned by the Kemmerer Coal Co., which was the scene of Wyoming's last explosion disaster, was reopened for production recently. This mine has been on the non-producing list since the blast on Sept. 16, 1924, which claimed 39 lives. At that time the mine was badly wrecked and several months' work was required to place it in condition for operation.

## CANADA

A seam of coal has been discovered at Tranquille, near Kamloops, British Columbia, and the Tranquille Mining Co. has been organized by local interests to develop it. Details as to size of seam and quality of coal are lacking. Efforts to develop a coal field at Chu Chua, near Kamloops, have been futile to date, owing to the poor quality of the coal and the lack of continuity of the seams.

The government of Nova Scotia has announced that the British Government has designated Sir Andrew Duncan, K.C., M.L.A., LL.B., formerly Coal Controller for the British Government and now chairman of the Advisory Committee of the British Mines Department, to be chairman of the Commission of Inquiry into the coal industry of Nova Scotia. The commission will be composed of a chairman and two associate members.

The Princeton (B. C.) Collieries are preparing to open a new seam of coal, which is expected materially to increase the company's output.

Charles McCarthy, a Toronto barrister, claims to have discovered coal deposits near Smoky Falls, in the Nipissing District of Ontario, within a short distance of railway facilities. For the past five years Mr. McCarthy has been conducting diamond drilling operations and states that he has struck a bed of coal at a depth of about 115 ft. varying in thickness from 7 to 11 ft. The known area of the coal, according to his statement, is about two miles long by three-quarters of a mile wide. The quality of the coal is described as between a bituminous and a lignite. Samples have been brought to Toronto for analysis.

Fred De Sieyes, manager of the Canadian Coal Sales Co. Ltd., of Winnipeg, Man., was on Oct. 2 committed for trial by the Winnipeg Police Magistrate on a charge of fraud in connection with the supplying of coal to the military barracks. He was released on bail for $50,000. A second charge for fraud in connection with a coal contract is pending.

Since the resumption of work in the coal mines of the British Empire Steel Corporation operations have been speeded up and maximum production is being maintained. The report for September shows a total output of 447,111 tons, as compared with 385,061 tons for September, 1924.

A. Slade, director and secretary of the British Colonial Coal Mines of Canada, Ltd., states that reports from the Larchwood basin property, in the Sudbury district of Ontario, have been so encouraging that the company has decided to sink a shaft.

## Coming Meetings

**Electric Power Club.** Fall meeting at Briarcliff Manor, N. Y., Oct. 19-22. Secretary, S. N. Clarkson, B. F. Keith Bldg., Cleveland, Ohio.

**American Welding Society.** Fall meeting, Oct. 21-23, Massachusetts Institute of Technology, Boston, Mass. Secretary, M. M. Kelly, 33 West 39th St., New York City.

**American Iron and Steel Institute.** Twenty-eighth meeting, Oct. 23, at Hotel Commodore, New York City. Secretary, Howard H. Cook, 40 Rector St., New York City.

**American Society for Testing Materials.** Committee meetings, Oct. 27-29, Hotel Cleveland, Cleveland, Ohio. Coal and Coke Committee at 2 p.m., Oct. 28; A. C. Fieldner, chairman.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting, Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Illinois Mining Institute.** Fall meeting, Nov. 6 and 7 at West Frankfort, Ill. Secretary, Frank F. Tirre, St. Louis, Mo.

**Harlan County Coal Operators' Association.** Annual meeting, Nov. 18, at Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering.** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## New Companies

**The Conveyor Sales Co., Inc.**, New York City, has been chartered at Albany, N. Y., with 400 shares of no par value to manufacture coal and mineral mining machinery. J. E. and N. A. Hurwitz, Manhattan Beach, and C. L. Young, 532 West 111th St., New York City, are the incorporators.

**The Connery Coal & Investment Co.**, an Illinois corporation, has qualified to transact business in Indiana. Harry V. Sherburne, Terre Haute, Ind., has been named state agent.

**The Portsmouth Coal & Mining Co.** has been chartered with an authorized capital of $10,000 to mine and sell coal. Incorporators are: John P., Ben H., Raymond F., Walter L. and Matilda Jones.

Articles of incorporation have been filed in Jefferson City, Mo., by the **LeFlore Coal Co.**, of Kansas City, Mo., capitalized at $12,000. W. L. A. Johnson, general commissioner of the Southwestern Interstate Coal Operators' Association, and his sons, L. W. Johnson and L. M. Johnson, were the incorporators. The company owns and is operating a shaft mine at LeFlore, Okla., where it has a branch office.

**The Empire Coal Sales Corporation**, Wilmington, chartered under Delaware laws, capital $50,000. G. W. Shillingford, president, has filed a certificate of statement and designation in the office of the Secretary of State of New York. The New York office is at 1 Broadway.

**The Process Fuel Co.**, Covington, Ky., capital $50,000, has been chartered by E. O. Martin, W. G. Eston and E. P. Hettinger.

**The Chelsea Coal Co.**, incorporated for $25,000, has been granted a charter by the Kansas State Charter Board. The company consists of L. E. Compton, W. O. Myers, and J. F. Downs, all of Pittsburgh, and J. A. Holland, of Mulberry, Kan. A steam shovel has been ordered and will be installed on 600 acres of land owned by the company near Chelsea, Okla. The Frisco will lay a switch to the mine. Sale of the coal will be through the Security Coal Co., with which Holland is connected, and which has an office in Kansas City. Myers is secretary and treasurer of the Pittsburg & Midway Coal Co.

**The Ford Coal Co.**, Cleveland, Ohio., has been chartered with an authorized capital of $10,000 to mine and deal in coal. Incorporators are J. C. Herbert, J. F. Wieser, K. Wirching, M. L. Deaver and M. Rush.

# New Equipment

## Air Cone Prevents Spray From Wasting Paint

In the accompanying illustration is shown a type of pneumatic painting outfit that is rapidly gaining favor with mining companies particularly throughout the West and Middle West. It is manufactured by the W. N. Matthews Corporation of St. Louis, Mo., and can be employed for painting a great variety of surfaces both wood and metal ranging all the way from machinery to dwellings.

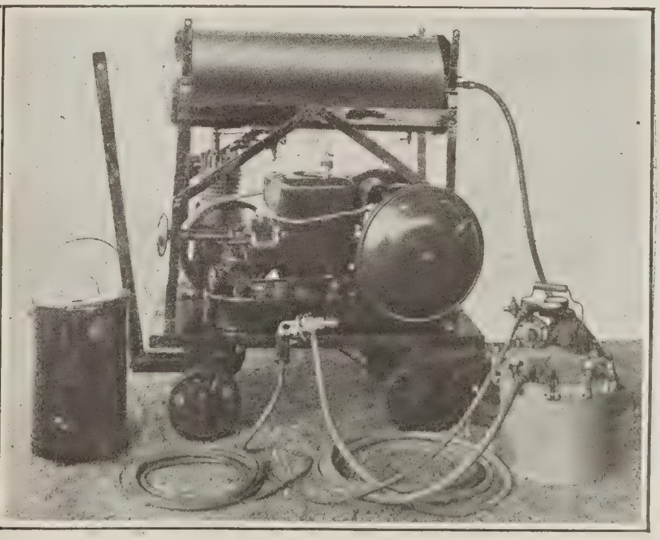
As normally constructed and here illustrated the outfit consists of a small gasoline or kerosene engine, an air compressor, a storage tank, a paint reservoir and a pneumatic brush or gun together with the necessary hose, regulating valves, pressure gages and the like. With an outfit of this kind one man can cover from four to six times as much surface as can a man with a hand brush. Furthermore, the paint is applied more evenly and is driven into every crack and crevice of the surface coated, thus affording a degree of weather protection impossible of attainment by hand-brush methods.

One of the chief advantages of this equipment is the "Volume F" gun. This is a patented air brush so constructed that a cone of air at high velocity completely surrounds or envelops the paint spray. By this means the mist or fog common to most pneumatic painting devices is reduced to a minimum and paint waste practically eliminated. This is particularly advantageous in outdoor work where paint sprays are liable to be affected by the wind.

There is no question but that mechanical painting is rapidly gaining in favor throughout the country. At first this method was applicable only to large single-color surfaces. With improvement in the equipment employed and a closer control of the paint spray has come a better appreciation of the advantages of this method of surface preservation and a wider adoption of pneumatic painting.

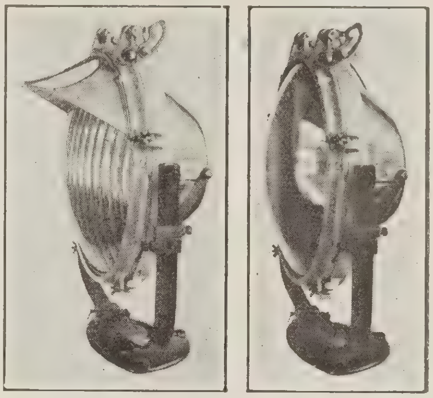
**Complete Paint Outfit**

*Engine, compressor and air tank are all permanently mounted on an easily portable truck. The balance of the equipment, paint container, hose, gun and the like may also be placed on this truck for transportation over short distances if desired.*



## Floodlight Projectors Have New Features

More or less of a radical departure from usual floodlight projector design is represented by the projectors shown in the accompanying illustrations and manufactured by the Pyle-National Co. of Chicago. In these devices ventilation has been dispensed with and the case made tight by means of a lead gasket. Dust, gas, moisture and insects are thus entirely excluded.



**Tight-Case Projectors**

These projectors, which may be turned and tilted into any position, are made air tight, thus effectively excluding all foreign material. Ventilation of these projectors is unnecessary.

The case is of cast aluminum alloy fitted with a drawn aluminum back and small parts of either this metal or bronze. Either crystal or "non-glare" glass reflectors 23 in. in diameter are provided and rectangular divergence lenses may be employed if desired. This projector is the latest addition to a line of similar lighting devices built by this manufacturer.

## Motor and Control Passes Bureau Tests

A new type of totally inclosed motor with control, especially adapted for use in gaseous mines and designed by the General Electric Co., has successfully passed the tests of the U. S. Bureau of Mines. This equipment, the first to pass the tests, will be approved by this bureau as a permissible motor when used with a suitable mine pump or other device to which it may be applied as a means of drive. The primary use for which the motor was designed is for driving mine gathering pumps, but it is expected that other uses will be developed.

The motor is a direct-current machine and, so far, has been made in but one rating—5 hp., 900 r.p.m., 550 volts, compound wound. Other ratings, however, are to be designed and submitted for approval as required. The General Electric Co.'s designation for the new motor is Type ME-6, Class BM construction.

The development of the motor followed insistent demands from the mining industry for a permissible motor for small pump work. The construction is such that all current-carrying parts are totally inclosed. Wide machined flanges are used at all joints, rather than the baffle plates for cooling escaping gases from internal explosions. There are no through bolt holes, all bolt holes being bottomed. The control switch is built on the same principle and is mounted directly on the motor.

The motor is started by being thrown directly across the line. No fuses are used in the control circuit, protection being secured by a thermal overload relay.

When the cover is removed from the controller all circuits are automatically de-energized except two shielded terminals of the incoming lines. Thus it is impossible to start the motor or draw an arc with the controller cover removed unless it is done maliciously.

By means of this construction no heat, from any cause, whether sparking or explosion, can be transmitted to the outside of the motor in such intensity as to ignite any gases surrounding the equipment.

## Safety Switch Design Gives Full Protection to Operator

A study by Westinghouse Electric & Manufacturing Co. of industrial switch requirements brought to light many definite ideas concerning the features required in a safety switch that was to give full protection to the operator and motor under all conditions.

As a result of this survey, the Westinghouse WK-55 full safety industrial switch was designed, embodying many important and practical features. The result is a switch that can be designated as both "fool proof" and "ignorance proof."

One of the problems which had to be contended with was that no live parts be within reach of the operator when he finds it necessary to change fuses. This requirement led to the development of the distinctive double door construction of the WK-55 switch. Within the main door of the switch is a smaller door giving access to the fuse compartment. This fuse-compartment door is interlocked with the operating handle in such a way that it will not open until the switch is thrown to the off position. In this position, even with the door open, no live parts are accessible and as long as the door remains open the switch can not be thrown on.

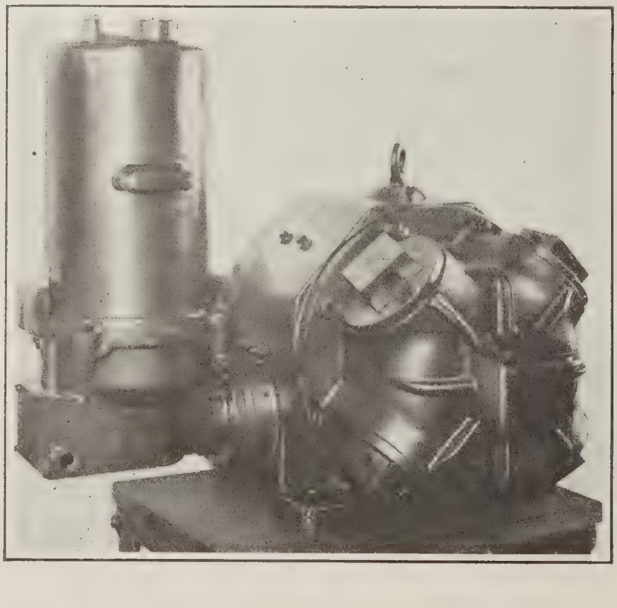
While the fuse-compartment door gives access to the fuses only, the outer door covering the entire switch inclosure is arranged for padlocking so that it can be opened only by an authorized person. This door can thus be opened for inspection and testing without interrupting the service.

Another requirement to be met was the simplification and elimination of parts within the switch box that would be subject to failures and thus form a hazard for dangerous short circuits. This problem was solved by designing a new make-and-break mechanism that is entirely contained in the operating handle outside of the cabinet. This innovation removes the danger of loose parts coming into contact with current-carrying parts of the switch and leaves more space for wiring.

**A Safe Industrial Switch**

Besides being safe to operate, a switch should be constructed so that it will not short circuit or start fires. Both personal injury and fire hazards are eliminated by the construction of this switch.

Probably the most difficult requirement was that of developing an arc quencher of simple design that would serve to extinguish the arc quickly and efficiently when the circuit was opened. Westinghouse engineers studied this problem and evolved a quencher which consists of metal laminations, separated by layers of insulation and air space. As the blade traverses the quencher, the arc is broken into a series of sparks that are cooled by the metal plates and by the air currents between them. As the blade passes through the quencher, the arc is dissipated and cooled to such an extent that the current drops to zero and the circuit is interrupted without danger or damage. The arc quencher of the WK-55 switch is capable of breaking circuits carrying from 50 per cent more current in the larger sizes to 300 per cent more in the smaller sizes than the rated amperes of the switch, even at 600 volts.



**Inclosed Motor And Control**

Here is a motor and starter designed for pump service in gaseous mines. It is started by being thrown directly across a direct-current 550-volt line. A thermal relay protects equipment from excessive overloads.

## Industrial Notes

**Foote Bros. Gear & Machine Co.**, Chicago, Ill., is about to place on the market a new series of reduction units equipped with the Sykes generated continuous tooth, herringbone gears. They will also publish a list of Sykes herringbone gears, which gives standard sizes and prices.

A one-reel motion picture entitled "Letting Dynamite Do It," has just been made by the explosives department of **E. I. du Pont de Nemours & Co.**, Wilmington, Del., and can be had for distribution on application to the company. The scenes show the use of explosives in many lines of industry and under many conditions without particular reference to coal.

**The Joseph Dixon Crucible Co.**, Jersey City, N. J., has added an aluminum graphite paint to its paint line. This paint is for use on all metal surfaces exposed to weather, gases, acids and smoke. It is composed of aluminum combined with the flake silica-graphite pigment and boiled linseed oil. Aluminum when used for paint making is of flake formation and, when combined with the Dixon pigment, each flake laps over, after the manner of fish scales, forming a covering of great elasticity and durability.

## Climbing the Backstairs to Victory

THE PRESIDENT of the United Mine Workers has a genius for extricating himself from dangerous positions by unexpected rear-guard attacks planned to divert public attention from fundamental issues. Mr. Lewis succeeded measurably in 1922 by berating the operators of western Pennsylvania and southern Ohio for refusing to meet him in joint conference, and the technical charge of contract-breaking obscured discussion of the real issue of wages. He is attempting to repeat that strategy in his present campaign to wrest an undeserved victory from the anthracite operators. Afraid to submit the justice of his cause to an impartial tribunal, he resorts to his old tactics and endeavors to heighten public distrust of his opponents in the hope that the public will forget the intrinsic weakness of his own case.

Mr. Lewis' onslaught upon the standardization program adopted by the anthracite operators last April is part of his campaign to becloud the issues and win victory from panic and prejudice. When he says "the retailers feared that, if they protested, they would be cut off and given no more coal to sell," he feigns an amazing ignorance of the history of the events leading up to the promulgation of those standards. Not that the standards are perfect: they are merely the first steps in a program of sounder merchandising that must progress upward and onward if Mr. Lewis will be content with a reasonable wage for his followers and will support the producers in their efforts to discipline the workers who load dirty coal.

The whole question of sizing is still in a state of flux. The final answer must be reached by experiment and experience. The question cannot be solved by denunciation. The facts are that before the anthracite operators made the new schedule of sizes there was no general standard. Each company had its own. The retailer was in doubt as to what he was receiving when he specified any given size of coal.

Before the sizes were determined they were made a matter of conference between retailers and operators and the making of them was heralded by the former with acclaim, first because it replaced uncertainty by definite standards and secondly because on the whole it constituted an increase in size over the current practice. What the new standards provided was broadcast when they were announced. What is more the public which is the best judge, by its satisfaction shows that the new standards in general have improved the product, despite Mr. Lewis' belated discovery that their effect was harmful.

Time and accumulated experience must settle the question of what will prove the most satisfactory sizes. Attacks so palpably insincere as that unloosed by Mr. Lewis at Atlantic City last week will contribute nothing to a constructive decision in the public interest.

Of course, the public interest is a matter of no concern at all to the G.H.Q. strategists of the union. Their sole concern is in devising ways and means to so alarm the public that the consumer will set up a wail for anthracite coal at any price. That is why Mr. Lewis' attack on standardization was coupled with a warning that the public was living in a fool's paradise and was due for "a rude awakening" when the last ton of anthracite had been scraped from the planks in the dealers' yards. If Mr. Lewis and his aides can again sell the public the idea that a cessation of anthracite production means freezing to death in the New England and Middle Atlantic states, Mr. Lewis will again triumph. The selling talk sounds thin to those who know the facts, but Mr. Lewis knows the effectiveness of outmoded slogans—especially when fighting opponents so cursed with modesty in the expenditure of money on publicity that that very virtue is vicious.

## Getting Their Due

A NEW POLICY has been pronounced by the American Federation of Labor with great *éclat*—that hereafter the workman in industry shall be permitted to enjoy the benefit of the decreased cost of production. As a matter of fact he has been enjoying it. Only the other day an eminent barrister in Illinois pointed out how in Washington's time a wealthy planter would leave to his daughter three pans and a large boiling kettle and to his son six chairs and a table. After all the nicknacks which today we would never mention had been distributed in the will, the eldest son was left several thousand acres of land. So much did they think in that day of forms of wealth which in these times everyone can have in abundance and no one values. The working man has his phonograph, his radio, his automobile. Who shall say he has not benefited and rightly from the cheapening of manufacture?

But if the profit of all this cheapening is to go to the man in the industry thus developed, the miner and the farmer will be greatly disadvantaged. They have proved themselves little more productive than they were several decades ago. The miner being in an industry where large masses must be handled and faced with greater depth and distance has not increased his output a thousandfold like the makers of pins, horseshoes and knives. The farmer confronted with soil of diminished fertilitiy does little better than his forbears or barely as well. The profit of invention, systematization, power, simplification and standardization must go to consumers generally and not solely to these industries that are peculiarly adapted to such development.

So long as we have the unlimited action of supply and demand whether as to labor or capital, the consumer (subject of course, to patent intervention) will get the full advantage of cheapening processes. The principle of wage control favored by the Federation would try to keep from the public and give to the worker in any given industry the advantage of progress for which he was in nowise responsible. Such a restricting to certain persons of the advantages of changes in method of manufacture, by depriving the consumer of participation in the profits, would result often in there being no changes.

If, for instance, when pins were made by hand hammers, a machine had been invented to make them by the gross, that machine would have never been constructed had this rule been in force; first because there would have been no advantage to the constructor, because only the workman who used it would profit and second because if someone were willing to build and exploit the machine the cost of the pins being no lower than that of the hand-hammered variety would be so high that no one would have been willing to purchase a gross of them. The new principle of the Federation is none too clear but, if it is just what it appears to be, it will put an end to a progress that has been quite helpful to the health, wealth and happiness of all mankind including above all the workman.

If it simply means that the laboring man must share in economies of production without regard to the industry in which he may be employed then there is no new principle involved. Because it is alleged to be new it is natural to assume that it reserves to the men in any industry the economies in that industry, a principle which seems fair till the conditions are examined. Had this been the old rule our mechanics would have lived in palaces, our railroad men in fine houses and our masons, carpenters and miners, and especially our farmers would have nothing but the sky as a covering for their heads.

## Repeal of Certification Law

ALL THAT HAS BEEN said by John Hays Hammond as to the need for a repeal of the certification law in the anthracite region is correct. A law requiring the specific instruction of the miner before forminig his duties would be more efficacious in promoting his safety and would not act as a barrier to prevent those men who desire such work from entering the industry.

The certification law prevents any prospect of introducing men into the mines to replace those who are striking, but after all if the law were taken off the statute books the attempt of the other men to accept work would be just as effectively prevented by the violence of the strikers, so its annulment would serve but little purpose. However, if removed, it would give a Governor, determined to keep order and maintain the rights of the individual, an opportunity to solve the anthracite puzzle by some other and better way than by another surrender to the demands of the mine workers.

The protection of the right to work for whom one will is believed to be inherent under the Constitution, but the exercise of that right would be as foolhardy in the anthracite region as it was in Herrin, and if the law restricting the right to work to certificated miners were repealed, much would need to be done before it would be prudent for a man to accept work from a coal company prior to a settlement of the present wage dispute.

Our practices are defective in that they wait till a dangerous condition arises before an attempt is made to correct it. To draw an analogy: Suppose a rule were somehow enforced prohibiting the rock dusting of a mine till it had been the scene of a disaster. Similar to this is the requirement that martial law shall not be declared or troops introduced till the sheriff confesses the situation is beyond his control, which means until acts have been committed by which the lives and properties of the citizens are destroyed. We have so safeguarded ourselves against the misuse of laws that they are not preventive of damage till much damage has already been done.

## Hope for the Oil-Burners

SAD IS THE FATE of the consumer of oil whose apparatus smokes and spoils the interior and exterior of his house, for his insurance does not protect him. Anyone who has burned oil in an oil lamp recognizes this danger. If the flame is ill-adjusted it does not have enough heat to consume the carbon and a greasy, nonremovable smut covers everything. Nevertheless the householder cannot make a claim for damages to the company that carries his insurance.

But there is hope. The Insurance Department in New York State by James A. Beha, the superintendent, has ruled that a rider specifically stating the purpose of protecting the insurer from the effect of the smoke and indicating plainly the additional coverage applicable can be added to the policies of underwriters.

A householder in New Jersey recently left his home for a day without shutting off his oil-heating equipment. The draft of his flue carried the smoke and soot out of the chimney to fall as a pall all over his newly painted roof. Incidentally it settled on the roofs of his neighbors and on the wash hung out to dry.

With some such new clause as is to be provided he can be protected, even if his neighbors are not, by the payment of additional insurance. Thus is the damage done by oil-burning apparatus recognized commercially. Another way to obtain protection is not to use oil at all, thus protecting, if the fuel is a suitable one, not only the householder but his neighbors also and preserving peace in the community.

## Speculation Must End

TO MAKE A STAKE has been the aim of too many operators. They rush into the enterprise during a strike or shortage, borrow all they can and plunge deeper and deeper in the hope of making big profits, interfering with the old timers in the industry. They go up like a rocket and descend like one. After the inflation of the industry ends, as it does, in a few short months, they flounder in debt and being burdened with many obligations, having agreed to pay all manner of royalties, and having mines ill-equipped and badly laid out, they mine and sell solely to keep up an appearance before their creditors. Having "high-price" mines, they have to sell coal below cost. They embarass everybody and by their shoddy construction, their poor housing and their accidents they disgust all good operators and the public.

Coal mining should be an investment. The operating company should be ready to shut down and should shut down the moment operating proves unprofitable. No royalties, bond payments or debts should make it fearful of such a wisely conceived suspension. However, a company that has invested in a plant and not merely taken a flier in coal will be likely to be able to run steadily through a depression at a little profit. If the industry is to attain the stability that sound financing requires, bankers must refuse to back fliers in coal.

# These Mines Run On Schedule As Railroads Do

## Island Creek Has Room-and-Pillar Plan Much Concentrated—Haulage Timed with Precision

**By Alphonse F. Brosky**

Assistant Editor, *Coal Age*,
Pittsburgh, Pa.

MINING AND HAULAGE in the group of 12 Island Creek Coal Co. mines in West Virginia have been developed systematically to meet the conditions in those properties. Room-and-pillar mining on a panel basis proceeds with noteworthy concentration and extraction has been improved considerably over that obtained with old-time methods. Wide rooms and double tracks at the faces plus a haulage system timed to give every man a full opportunity to load coal have combined to keep output up to maximum. The various operations within the mines are scheduled to occur with the precision of railroading and the results of this system are uniformly good.

The 25,000 acres of Island Creek coal owned outright, together with the 5,000 acres of the same measure held under lease by the company constitute practically one unbroken tract. This lies chiefly in Logan but partly in Mingo County, W. Va. Although this bed is fairly level there is an extreme variation amounting to 474 ft. in the relation between the bottom of the coal and the tipple-track grade. This disparity reaches its limits at mines Nos. 18 and 20. At the former operation on Mud Fork, the coal lies 189 ft. above the railroad tracks under the tipple, whereas at the latter it is 285 ft. below them.

Conditions underground, however, are fairly uniform over a considerable area of the property except for those variations which accompany differences in the thickness of cover. In the four mines on Mud Fork, where the roof has a tendency of flake, conditions are least favorable but on the whole permit adherence to the uniform system and methods of mining which have been adopted for all the mines.

### SEAM IS 80 IN. THICK

The average thickness of the Island Creek seam under this property is 80 in. The seam is composed of splint and gas coal in approximately equal proportions. Roughly, it is divided into two benches separated by a 1- to $1\frac{1}{2}$-in. slate parting which does not crumble in shooting and is easily separated from the coal. Above this parting and in the upper bench is a 30-in. thickness of hard splint coal topped by a 4-in. thick softer coal.

Below the parting and in the bottom bench is a 42-in. bed of semi-splint coal underlaid by about 12 in. of softer coal. The bottom is of hard slate, the top of massive slate 40 ft. thick. The entire property is free from drawn slate and the cover over it varies in thickness from nothing at the outcrop to a maximum of 1,200 ft. under the highest mountain peak. Strata of sandstone in this cover are estimated to aggregate a thickness of 140 ft.

These massive strata make possible the driving of wide rooms without support by timbers. At the same time, particularly under heavy cover, they interfere with economical drawing of pillars by usual methods, no matter what proportion between first and second mining might be established.

### ROOF HAD BEEN TROUBLESOME

In days gone by in all its mines the company drew pillars methodically in a concentration system. Great pains were taken to maintain straight robbing lines on a 40-deg. angle to the room entries. Despite every precaution toward successful pillar extraction associated with room-and-pillar mining, difficulties in holding the roof were encountered; and almost without exception the quantity of timber required in pillar sections was greater than would be justified today by the additional recovery which the standard room-and-pillar system yields.

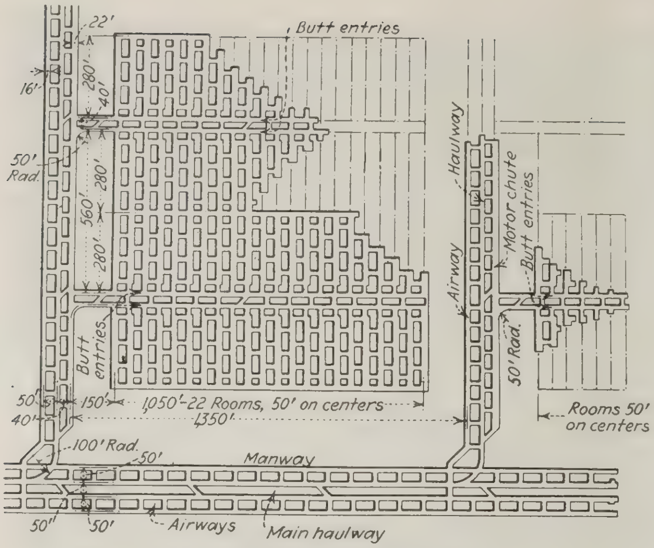
The company has modified its earlier methods. Rooms are now driven as wide as the cover will permit without the use of timbers and the pillars are made only wide enough to hold this cover until parts of the pillars can be extracted by honey-combing. Recovery in first mining is 67 per cent. Second mining in the future is expected to bring up the total recovery to a minimum of 80 per cent.

The mining system which has been approved for standard practice is a true panel system in that the room workings are completely surrounded by barriers of solid coal, which are broken through by butt entries on one side only.

Main entries are projected in groups of four or six headings, depending on the haulage and ventilation requirements. These are driven 16 ft. wide on 50-ft.

---

In the headpiece is shown a wide span of unsupported roof in No. 8 mine. From rib to rib along a line making equal angles with the sides the distance is about 35 ft. Under such sound roof it is possible to lay turnouts on large radius curves. Rail braces back the right-hand switch point.



**Standard Mining System Layout**

Between cross entries are panels which are pierced from only one side by the butt entries from which wide rooms are driven in two directions. The company intends, when it can get to it, to install rock dust barriers at the outlets of each of the panels. Rooms are 28 ft. wide on 50-ft. centers leaving room pillars 22 ft. wide which later will be partially recovered by "honeycombing." Recovery is now 67 per cent but the second mining is expected to raise this to 80 per cent.

centers and are protected by 280-ft. wide barriers. Crosscuts driven through the middle chain pillar of the main entry at the widely separated intervals of 420 ft., eliminate many expensive stoppings and minimize leakage of air from the intake to the return. Cloth brattices and sometimes a blower with flexible canvas tubes are used for conducting fresh air to the heading faces being advanced.

Cross entires are driven at intervals of 1,440 ft., center to center, in groups of three headings which are flanked by 150-ft. wide barriers. The airway and haulway are 16 ft. wide on 50-ft. centers. Adjacent to the haulway and on its inby side is a car storage entry termed the "motor chute." It is on 40-ft. centers with respect to the through haulway and is mined 22 ft. wide. Between live butt entries the motor chute is double tracked.

Pairs of butt entries are driven 16 ft. wide on 40-ft. centers at intervals of 560 ft. On each side of the butt entries are turned 22 rooms. These are 28 ft. wide on 50-ft. centers and are 280 ft. in length They are driven to their extremities on a front of 45 deg. to the butt entries.

Undercutting machines with 7½-ft. cutterbars are standard in these mines. Seventy-three of these machines are in current use. In 25 working days during May of this year these machines in the 12 mines cut 527,000 tons of coal, or an average of 289 tons per machine per day. This is a remarkable average for a large number of machines over a month's period in so many mines, the more so because the Island Creek bed of coal is hard to cut.

### Operates 34 Electric Drills

Mine operation is not truly modern unless shotholes are drilled either pneumatically or electrically. The Island Creek company uses 34 electric coal drills for this purpose. Holes are started with a 24-in. stub auger having a diameter of 2¼ in. A standard 2-in. auger with an effective length of 7 ft. is then inserted in the drill for the completion of the hole. The use of the stub auger enables the driller to start the holes in this hard coal without difficulty and with a saving of time. All drilling is done at night by contract. From 600 to 700 tons of coal per shift is drilled by each drill crew of two men.

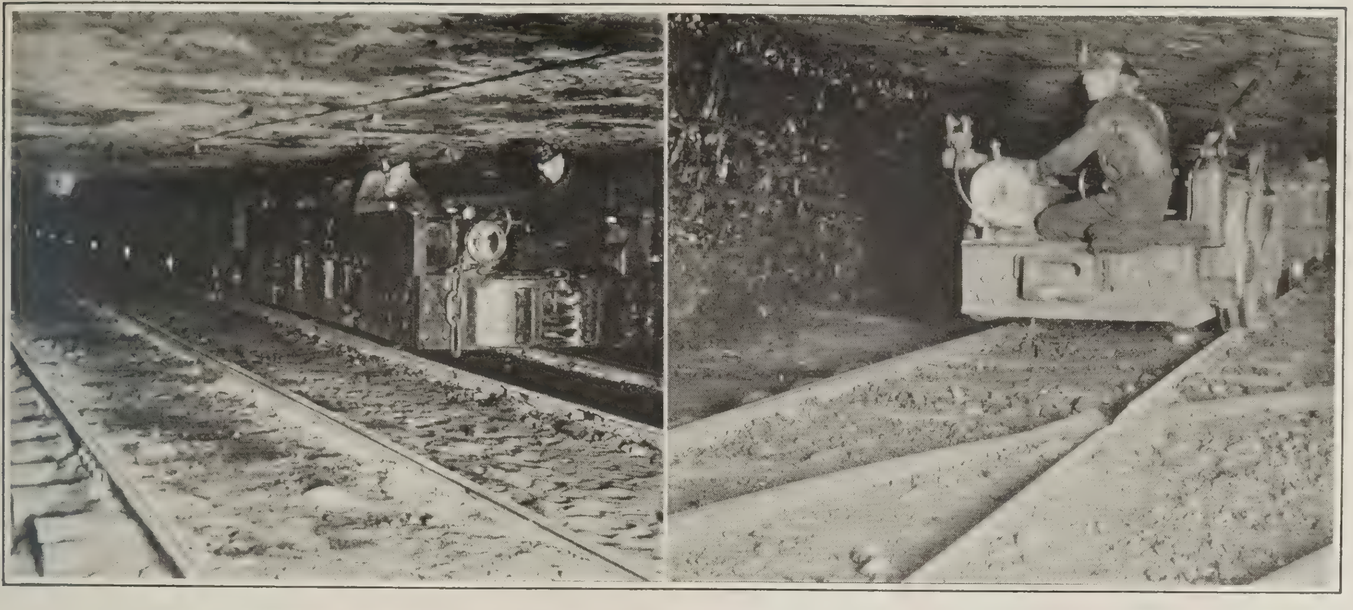
Each room is shot with three holes. The center hole is shot first and the coal which it yields is loaded before the rib shots are fired. This hole is started about 3½ ft. from the bottom and is angled slightly upward. It is charged with 16 in. of black powder in the non-gassy mines and four sticks of permissible in the gaseous operations. The two rib shotholes are started 4½ ft. from the floor, about 6 in. from the rib, and are angled upward and outward toward the roof and rib. These are charged with 8 to 12 in. of black powder or 1½ to 2 sticks of permissible.

The same general specifications cover the drilling and shooting of heading coal except that in narrow places the charges are correspondingly decreased. All stemming is of yellow clay hauled into the mine from the outside. Electric detonators, of course, are used for discharging permissible explosives.

Every advantage and facility is given the miner to

**Face of Island Creek Seam**

This miner is easily a 6-footer and, though he is standing slightly above the mine floor, above him is head room to spare, showing how thick is the seam. The characteristic slate parting is clearly seen about 3 ft from the roof. The miner is charging a center shot hole while cross-cutting a room pillar.



**Main Line and Gathering Haulage Are Both Operated on Schedule in These Mines**

At the left is a view of the main double track leading to the bottom in Mine 21, a shaft operation. A standard trip of 20 cars pulled by a 15-ton locomotive is shown. The last 2,000 cars purchased by the Island Creek company are lower than the ones in this picture. At the right is a 6-ton gathering motor at work on a butt entry. The soundness of the heavy main track and of the side-entry tracks where 25-lb. rails are laid is evident from a study of these illustrations.

enable him to do a good day's work. With sound roof above him it is the exception rather than the rule to set timbers. If the need for them is pressing they are set by company men. Practically the only duties of the loaders are to shoot and load coal. The miner is not required to drill shotholes. He is assured an adequate supply of cars, thanks to the concentration of the workings and the system of distribution and gathering which is scheduled with surprising precision.

Rooms are provided with double tracks so that loading from rib corners into the low cars provided is a comparatively easy task. Face tracks are extended by company men. Generally only one man is assigned to a room which, when newly cut, provides him with ample work for two or three days, depending on his speed of loading. If he is a good loader, conditions and facilities are such as to enable him to load 20 tons or more a day. Only the best loaders are assigned singly to faces of entries. One cut per day must be taken from each advancing entry.

The company assumes full responsibility for safety and regularity in haulage. In the mines of few other companies is haulage arranged with any better eye for safety and efficiency or scheduled with any greater precision.

### HAULAGE OPERATES ON SCHEDULE

Modern rolling stock, straight, and rigidly secured track and easy curves, in a haulage system closely co-ordinated with the more actual mining operations, eliminate from the mines of this company many of the uncertainties of balanced production, which the difficulties in mining engender. Trips are standardized as to number; gathering locomotives are assigned only as much territory as they can traverse in a specified time and, most important of all, haulage equipment is so carefully inspected and so exactingly maintained that breakdowns and derailments are rare. In fact the system is worked out to that nicety which enables a mine official to predict with a fair degree of certainty the time of arrival of a main-line locomotive at any station.

The track gage is 44½ in. Tracks on the main haulways are laid with 60-lb. rails, on the cross entries with 40-lb. rails and on butt entries and in the rooms with 25-lb. rails. In the main and cross haulways the tracks, which in the first instance are laid with 25-lb. rails, are relaid with 60- and 40-lb. rails, respectively, with each advance of 300 ft. Rails of 40- and 60-lb. weight are supported by 7x9- or 5x7-in. wooden ties as conditions require.

In butt entries the 25-lb. rails are held in place by 4x6-in. wooden ties. Normally these ties are placed on 18-in. centers; but where conditions are such as to

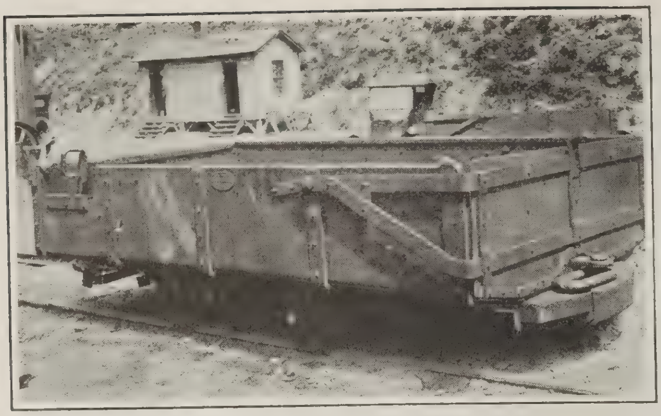
**Specifications for Frogs, Switches and Curves**

The Island Creek company finds it pays to adopt standards like these for the construction and laying of turnout track equipment.



**A New Low-Type Mine Car**

The top of this car is about 33 in. above the rail. It has a 35-in. wheelbase. Because of this it is well balanced and comparatively free from rocking. Grades in these mines are easy so that steel strap brakes applied to only one pair of wheels supply adequate friction to check the motion of, or stop, the car. Acid-resisting steel is used in its construction.

require more support under the rails the ties are spaced closer. Those ties also which do not quite measure up to specifications as to size are more closely spaced. Room track is anchored by steel ties and room switches are laid on 3x5-in. wooden ties. The latter serve their purpose effectively for just about the time required (four to six months) to drive a room in these mines, after which they are discarded.

On the main haulways the rails are braced from the ribs by ties, which are staggered, on 50-ft. centers and closer where necessary. This practice has been found especially useful during the time required by a new track to settle completely. It also tends to keep in alignment those stretches of track which are flanked by drainage ditches.

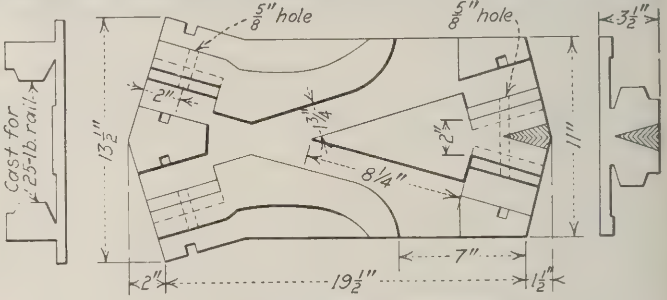
In those sections which are not level and where track is laid with 40- and 60-lb. rails, the average grade is about 1½ per cent. All humps and swags on main-line haulways must be graded to, or below, this limit. The mine floor is of slate which is so hard as to make extensive ditching prohibitive. Fortunately, not much water finds its way into these mines and where it tends to collect, shallow drains provide sufficient grade for the run-off. Wide entries permit plenty of clearance between mine cars and ribs. At no point is this clearance less than 2 ft.

**Drilling Shot Holes Electrically**

The time is not far off when shotholes will be drilled by power in all mines. This company has drilled holes in this way for several years past and has appreciated the many advantages of this practice. This crew can drill about 700 tons of coal a shift.

The radii of curves at switches vary from 50 to 200 ft. In turnouts to flats the curves are made either 150 or 200 ft. in radius. Butt turnouts have a radius of 100 ft. and those to rooms 50 ft. Data relating to frogs and switches in entry turnouts and details of the standard room frog appear in accompanying illustrations. Frogs Nos. 5 and 4½, respectively, rest on four 7x9-in. and four 5x7-in. hewn ties to provide greater support where haulage moves swiftly on turnouts.

It is customary in these mines to elevate 2 to 3 in. the outer rail of curves traversed by the main-line locomotives. Curves in room switches are slightly banked. This practice may seem far-fetched but actually it has been found justifiable because it lessens the thrust which tends to throw switch curves out of alignment and reduces wear and tear on track equipment and mine cars generally. This feature is particularly helpful where mine cars with a comparatively long wheelbase are used.



**Cast Frog for Room Switches**

This type of room frog has been made standard because it has caused the least trouble. Resistance to wear and easy assembly are its chief merits.

Under rails which are curved tie plates are sometimes inserted. Where excessive lateral thrust is likely to be imposed upon a rail, pressed steel rail braces are used.

In the twelve operating mines of this company are approximately 5,000 mine cars, each with a capacity of 2½ tons and all equipped with roller bearings. They are of composite construction, the steel being acid-resisting. Not all of these are of the same general design though all are of the end-gate type. Within the last year the company has installed about 2,000 new mine cars to replace those which were considered antiquated.

The tendency in the design of the new cars is to lower the height and to increase the wheelbase. Thus the latest car installed has a height of about 33 in. and a wheelbase of 36 in. giving a well-balanced car which has little tendency to rock or jump the track—as against a height of about 40 in. and a wheelbase of 31 in. on the older cars.

The height of the new car is lowered 1 in. by the use of 14-in. wheels instead of 18-in. wheels. It is further lowered by incorporating wheel housings in the bottom of the car allowing the wheels to extend through the flare plates of the bottom. Inasmuch as excessive grades are not encountered in these mines brakes are applied only to one pair of wheels The brake shoe is of the flexible steel band type, the first and maintenance costs of which are lower than those of a wood-block brake shoe. On this car the brake lever is on the side, and in the clear.

**Nearest Approach to the Immaculate In a Coal Mine**

Many accidents can be avoided by keeping clean the roadways of mines. The haulage entries in these mines are not always as clean as the one here shown, but an attempt is made to keep them so. Clean-up men are constantly employed for this purpose.

A "motor chute" increases the efficiency of mine car gathering and distributing operations. Of the three headings composing a cross or flat entry from a main entry, that heading on the side from which butt or room headings are turned is driven 22 ft. wide and is referred to as the "chute." Within the limits of the live workings this heading carries a through track and parallel side tracks. These are laid as required between live butt entries and, of course, are maintained only so long as sufficient coal to warrant their existence is hauled from the butt entries at their extremities. After that they are torn up and moved to an advance position in the same motor chute. Each side track is 375 ft. long, allowing a storage capacity for 25 cars.

Although generally it is the practice to drive butt entries and work rooms from only one side of a flat entry, a double flat entry of six headings may be driven to pierce an extensive body of coal. This digression has been followed in the layout of the Main Flat East entry in the new No. 20 mine which in the future will reach a capacity of 4,000 tons a day. The variation is limited only to a large mine area which of itself requires a main flat entry in every way equivalent to a true lateral main entry. In the haulway of this main flat entry, track similar to that of a lateral main entry will be laid to serve as a cross-mine thoroughfare from distant parts of the mine.

As the double flat entry is advanced, butt entries are turned and rooms worked to the right and left of it. Of the six headings in a double flat entry, the two outer headings are driven 22 ft. wide as "motor chutes" and the remaining four which are 16 ft. wide are devoted one to a main haulway and three to man travel and airways.

Trips from the side tracks to the dumping points are handled by 15-ton locomotives; gathering is done by 6-ton locomotives of the cable-reel type. Each of the former will haul an average of 1,000 tons and each of the latter 300 tons of coal in an 8-hr. shift. A standard trip consists of 20 cars, though in the larger mines, as in the new Mines Nos. 20 and 21, it may be increased to 40 cars coming from large mining areas. The maximum speed of main-line locomotives is 12 m.p.h.; that of the gathering locomotive is 8 m.p.h.

### REQUIRE DEFINITE TONNAGE PER SHIFT

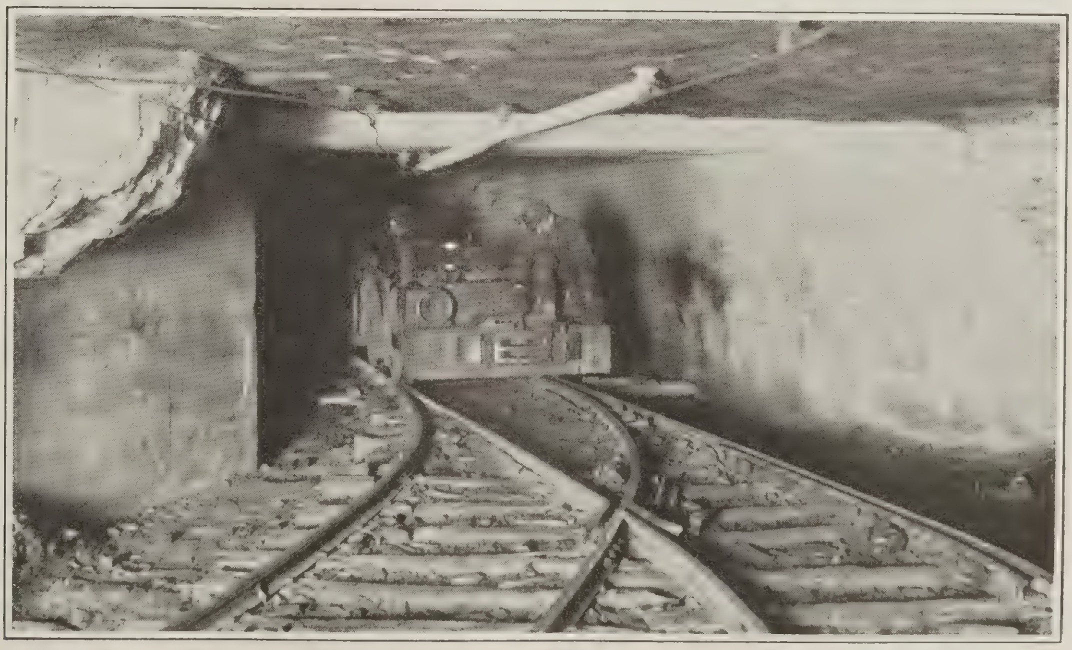
Promiscuous gathering operations are not tolerated. Working places are concentrated to facilitate the work of the gathering locomotives. Each locomotive is assigned definite places which it must serve and the schedule is so arranged as to require of each crew a definite tonnage per shift. For this tonnage a crew is paid a contract rate by the car with compensation for time lost due to delays beyond the control of the crew.

In the make-up of a 20-car trip, gathering locomotives may work singly or in pairs. A cycle in which 20 cars are distributed and 20 gathered by a single locomotive requires an average of 1⅓ hr. However, where hauls are long, gathering locomotives work in pairs, each gathering simultaneously 10 cars for the make-up of a 20-car trip. This arrangement is favored and is practiced wherever it is feasible. A pair of locomotives thus working will make up a 20-car trip every 40 min.

A haulage system is no more efficient than the job it serves. Realizing this, the Island Creek company maintains schedules in mining as well as in haulage.

**Trolley Guard Is Rubber Hose**

Though its first cost is higher than a wooden guard, the company leans toward the hose trolley guard because it is flexible and requires no further attention after it is once installed. The sturdiness of track construction is obvious in this illustration.



A loader is given only as many cars as his records show he can load in a shift. The wide rooms which yield as much as 60 tons per cut and the double track help loaders to maintain high average tonnages.

As far as possible loaders on heading work are provided with reserve cars. Gathering locomotives make frequent visits to these places. Where a heading is not double tracked the reserve car is stored in the nearest room neck or butt-off. In advancing the 22-ft. wide "motor chutes," which are always double tracked, it is customary to work two miners.

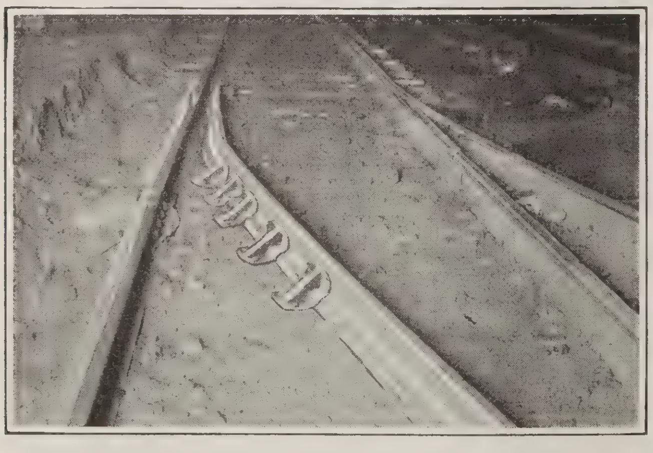
### Discipline Aids Efficient Haulage

Haulage accidents are few and far between in these mines. Before a man is assigned a job as a motorman by the company, regardless of his experience elsewhere, he must have served an apprenticeship as a trip rider so as to learn the company's system. Then he must pass a test on an easy haul before he is allowed to assume the responsibilities of a regular motorman. Absolute discipline is required and a man guilty of malicious misconduct is punished by dismissal, not by compulsory layoff. No arguments between miners and motormen are tolerated. If either has a complaint to make it must be to the boss in charge of the section in which the controversy originates.

An electric lamp signalling system informs each motorman before he reaches the main entry track of the moves scheduled for him by a trip dispatcher. Incidentally, by this means also the dispatcher knows when and where to send a locomotive with its trip of empties. The system eliminates collisions and confusion.

The Island Creek safety club, through the agency of which the miners levy fines upon themselves, has done much to decrease fatal and lost-time accidents generally and those in haulage in particular. Good illumination where it is required along main entries has lessened the hazards of haulage. Electric lamps are installed at all junction points and switch-throw stations. Rock dusting, which is beginning to be a practice of the company, will do much for safety by bettering illumination.

Crossover tracks are never employed; so their dangers do not exist. On permanent haulways, rerailers are placed along each rail abreast of groups of timber sets and in the approaches to automatic doors.



**Steel Braces Stiffen Transfer Rail**

A derailment on this double-track landing in No. 7 slope mine would curtail production temporarily, particularly if both tracks should be tied up by a mishap at the transfer point. To prevent spreading of the transfer rail, braces are used where the thrust is greatest.

**Sound Track in a Wet Place**

The Main West haulway in No. 8 mine passes under a creek. Water from the stream finds its way to this entry; but even so, the presence of water is no excuse for poor track. This stretch of track is probably as good as any to be found in any mine in the country. It is laid with 60-lb. rails.

All trolley wires at junctions are guarded either by boards or by a covering of flexible hose. This hose guard is much preferred though its first cost is higher. It is the equivalent of a 2½-in. diameter fire hose and is made of rubber-reinforced fiber especially for the purpose.

Equally as influential for safety in haulage are factors which have to do with inspection and maintenance of haulways and rolling stock. Responsibility for the condition of track in a mine section is vested in the boss of that section. It is incumbent upon him, therefore, to inspect closely and regularly that part of the track which is allocated to his care. The permanent track is watched by all men of official capacity and in particular by the mine boss who is held directly responsible for its condition.

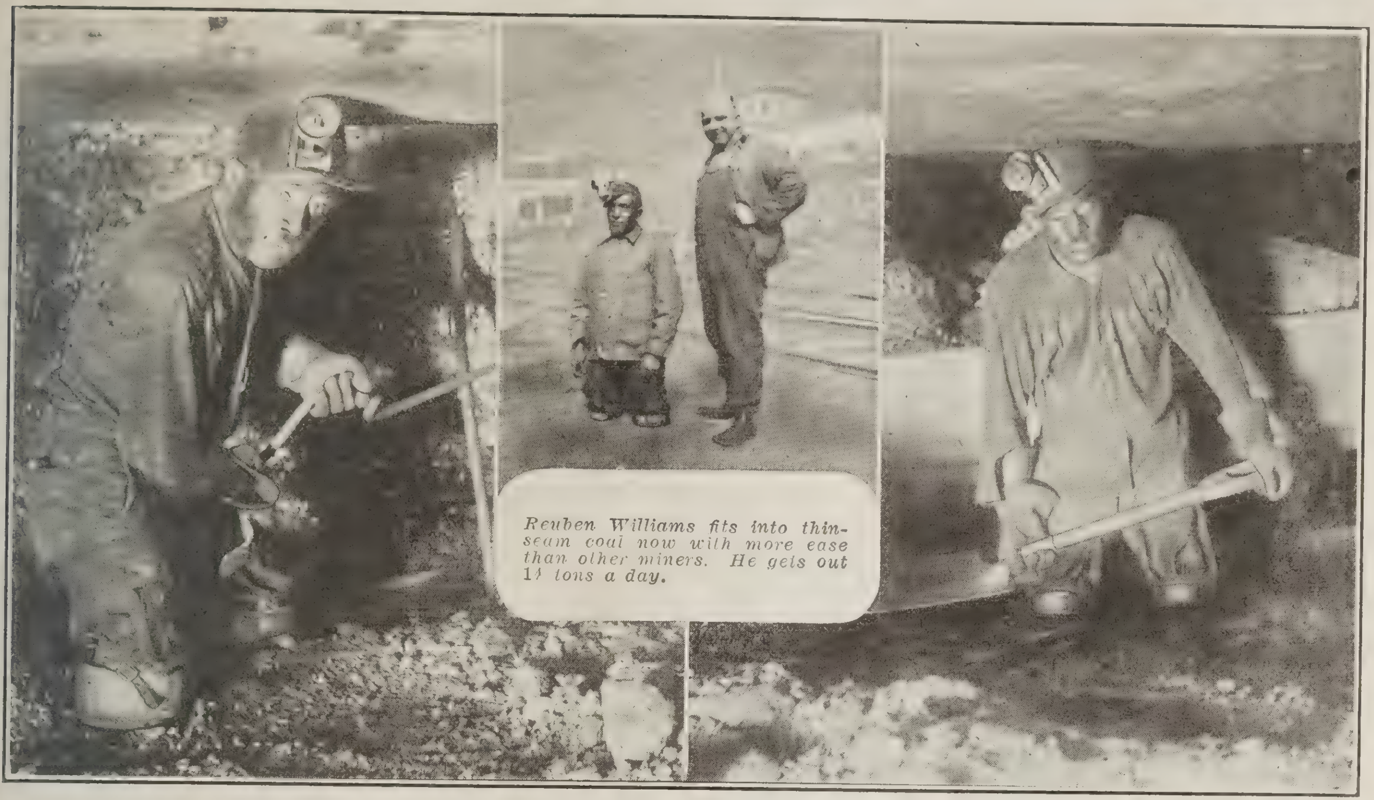
### Track Crews Organized

The maintenance, repair and extension work on 40- and 60-lb. track is executed by crews of as many men (usually three) as are required for a given length of track, headed by a track boss. Butt entry and room tracks are repaired and extended and otherwise maintained by crews of two men. As a general rule one such crew is employed for each gathering locomotive in service. In the precinct of a gathering locomotive where rooms only are being driven, one man is sufficient for the maintenance of the required track.

Perhaps the most important factor in maintaining safety is the effort exercised by the mine bosses to keep the haulways clean. Every day is "house cleaning day," for crews of men are always engaged in shoveling trip spillage from the haulways in one part of a mine or another.

The company is of the belief that the results of inspection are more material than those of repairing and in this it includes the inspection of rolling stock. One man is stationed at the landing at each mine, whose duty it is to inspect all cars before they enter, or after they leave, the dump or cages. Defective cars are marked "shop" and a locomotive side-tracks these for repairs. Trivial adjustments are made by the inspector but cars requiring larger repairs are sent outside to the car shop. The thoroughness of the system in Island Creek mines makes both mining and haulage highly effective.

# Losing His Legs Only Made Him a Better Miner



*Reuben Williams fits into thin-seam coal now with more ease than other miners. He gets out 14 tons a day.*

**By W. J. German**
Huntington, W. Va.

WHEN HE WAS A YOUTH, Reuben Williams worked as a miner in thin coal. The constant stooping soon drove him outdoors as a laborer for a railroad. But fifteen years ago an evil day befell Reuben—or he thought at the time that it was evil. While he was standing in a deep railroad cut a landslide occurred and he was pinned between two boulders. Both his legs were crushed. They had to be amputated just above the knees. Lying in the hospital, Reuben suffered mentally as well as physically. If he ever got out, how would he ever earn a living without legs? Must he beg?

Finally he was discharged from the hospital. He hobbled about on the tender stumps until they became calloused. For awhile he used short crutches. But he hated the crutches. They made a "cripple" of him. He could walk without them but the ends of his poor, short legs hurt him. Finally he had a pair of "shoes" made. These were equipped with springs so that they served him more or less as knee joints. Then he was comfortable and could navigate as sturdily as anybody, albeit slowly.

But he had no job, and his dependents had to be fed. He says he saw two paths to follow: one led to a battered hat and humiliation on a city sidewalk, the other to an endless round of employment offices where nobody would be able to think of a single job he could hold. It was disheartening. But Reuben Williams didn't quit. He thought.

One day he was standing before a mirror viewing his full 42 in. of height. Only 42 in.! What a tragic joke those boulders had played on him! But as he looked, there flashed across his mind a picture of himselm standing under the low roof of a coal mine such as the one out of which he had been driven by back ache. He would be able to stand upright in that mine now. He would just fit! He could work there more comfortably than any man with full-length legs. Why not? Well, he induced them to let him go back to the trade he had quit. He went to mining coal again.

Today Reuben is an expert miner in the Glen Morrison mine of the Morrison Coal Co. in West Virginia. It takes him longer to walk to his working place each morning, but he starts earlier and arrives when the rest do. Not having to stoop so much, he drills, blasts and loads his coal more easily than most men. The short-leggedness which is a handicap on the surface, stands him in good stead underground and his output of coal is as good as anybody's. Over a month's run he is among the leaders of the mine. During two months recently he averaged 14 tons—drilled, blasted and loaded—each working day.

In the illustrations Reuben is seen loading coal at the right with hardly a feel of "crick" in the back. At the left he is drilling a shothole, gaining extra force by bracing his head against the roof. The inset shows him standing beside the author of this article, a man of average height.

When he goes home at night he finds his wife and child—a boy now about six years old—in a neat, comfortable house. They have plenty of food and good clothes and occasionally they take a little trip somewhere. Indeed the Williams family is a good deal envied in a friendly way by some of the other colored folks whose men never have lost so much as a finger. Reuben is a success. Thin seam coal drove him to lose his legs and now it is giving him back an honest, independent living and a lot of personal satisfaction.

# Coal Soon Will Help Supply Nation's Gasoline

**By A. C. Fieldner and R. L. Brown**
Chief Chemist and Organic Chemist, U. S. Bureau of Mines,
Pittsburgh, Experiment Station

### HOW IT CAN BE DONE

SOME DAY—maybe five, maybe twenty-five years hence—coal is going to come to oil's rescue as a producer of gasoline for motor fuel. The question is: What process is to be used? Not byproduct coking, Mr. Fieldner and Mr. Brown conclude, because that would have produced, from the whole 1923 bituminous coal output of the country, a bare 18 per cent of the 7,600 million gallons of gasoline America consumed in 1924. Low temperature distillation, now in its infancy but developing fast, would have made the yield only 20 or 30 per cent. Both these processes may help in the future but the real solution of the motor fuel problem, these authors think, lies in making synthetic gasoline from coal gas and water gas. It is time coal producers delve into this subject, they say.

UNMINED coal of the United States existing within 3,000 ft. of the surface is estimated by M. R. Campbell of the U. S. Geological Survey at 3½ trillion net tons. The exhaustion up to the end of 1918 amounted to only about one-half of 1 per cent of the original total supply. There seems no doubt that most of this great mass of coal, constituting over 60 per cent of the world's reserve, will still be in the ground when all the petroleum available by drilling and pumping methods becomes exhausted in the United States. For the United States, coal is the logical source of liquid fuel substitutes for petroleum gasoline.

It is recognized that shale oil and alcohol from vegetable matter will contribute considerable quantities of fuel, but they can not carry the bulk of the load if we are to continue using anything like the amount of gasoline consumed today.

The processes for obtaining motor fuel from coal may be grouped in three classes:

(1) The carbonization of coal, including the gas manufacturing and coking industry, and low temperature carbonization. (2) the hydrogenation of coal by the Bergius process. (3) The complete gasification of coal and conversion of the resulting gases by pressure synthesis into methanol, "synthol," and other liquid combustibles.

Of these processes only the high temperature carbonization process is in actual commercial use, if we except the distillation of brown coal in Germany which is done at low temperature.

### DEVELOPING LOW TEMPERATURE PROCESS

A number of large-scale, low temperature experimental units still in a developmental stage are operating intermittently in both this country and abroad. The principal object in most of these experiments is the production of a convenient form of smokeless solid fuel. Any considerable increase in the price of liquid fuel would probably make some of these low temperature processes commercially successful.

The partial liquefaction of coal by hydrogen under pressure according to the Bergius method has been under laboratory investigation in a number of European laboratories, and one of us saw a 2-ton-per-day unit operated by Dr. Bergius at Rheinau near Mannheim, Germany. This demonstration took place a year ago.

In the modern byproduct coke oven a ton of coal yields from 3 to 4 gal. of crude light oil of which 60 to 70 per cent, after proper refining, may be utilized as motor fuel. During the year 1923 the total coal coked was 55½ million net tons, of which two-thirds was made in byproduct ovens. The light oil recovered was 135 million gallons, of which 95 millions would have been suitable for motor fuel. This figure is approximately 1¼ per cent of our gasoline requirement of 7,600 million gallons for the year 1924.

If all the coal carbonized in 1923 were put through byproduct ovens, the yield would not exceed 2 per cent of these requirements, and finally if the entire 1923 output of 545½ million tons of bituminous coal was subjected to the byproduct coking process, it would furnish only 1,335 million gallons, or about 18 per cent of the gasoline used in 1924. Obviously the ultimate production of benzol possible can only serve to furnish a limited quantity of blending agent for gasoline-alcohol mixtures. In this connection there is a possibility of virtually doubling the quantity of motor fuel from the carbonization of coal through the conversion of ethylene in coal gas into ethyl alcohol.

Low temperature carbonization, according to many writers, affords a means of replacing our petroleum resources. It is an established fact that the low temperature distillation of coal yields from two to two and a half times as much tar per ton as high temperature carbonization.

Carefully conducted large scale tests by the Fuel Research Station in England gave 1.4 gal. of light oil distilled from the tar and 1.6 gal. scrubbed from the gas—a total of 3 gal. per ton of coal. Fischer and Gluud in Germany obtained 2.0 to 3.8 gal., and Davis and Parry, of the Bureau of Mines, obtained 4.5 gal. of light oil suitable for motor fuel from the low temperature distillation of a Pittsburgh district coal on a laboratory scale.

These yields are of the same order as the benzol yields of high temperature carbonization. However, they can be augmented by the pressure cracking of the low temperature tars as shown by Morrell and Egloff, who report a yield of 17 per cent of the total tar converted into oil distilling below 230 deg. C. Assuming an average yield of 25 gal. of tar, this would mean

---

Published with the permission of the Director, U. S. Bureau of Mines. From a paper read at the Tenth Exposition of Chemical Industries, New York City, Oct. 29, 1925.

4.25 gal. of motor fuel per ton of coal or a total of 6 gal. including that scrubbed from the gas.

Low temperature coke is not suitable for metallurgical purposes, hence the development of this industry will not reduce the quantity of high temperature coke made. Its logical field is in the processing of our poorly coking and non-coking coals and lignites for the production of smokeless solid fuel. It is reasonable to expect in the relatively near future that 100 million tons of bituminous coal will be carbonized at low temperatures. This amount would yield 600 million gallons of motor fuel, or about 8 per cent of the 1924 gasoline requirement.

Another reasonable expectation is that super power stations will carbonize coal at low temperature, and generate steam from the pulverized residue. The 60 million tons of coal burned in central power plants would thus provide 360 million gallons of motor fuel which added to the yield from plants making domestic fuel would furnish a total of 960 million gallons, or 13 per cent of the annual requirement.

### Must Be a Principal Product

Thus it is evident that the maximum possible development of low temperature carbonization can not serve to furnish more than 20 to 30 per cent of the annual requirements, based on present day consumption. We must turn to processes in which motor fuel is one of the principal products rather than a minor byproduct.

Of these the Bergius process deserves serious consideration since it converts from 25 to 50 per cent of the coal into tar and oils, the yield varying with the type of coal and the conditions of hydrogenation. In this process, pulverized coal mixed with oil or tar to form a thick paste is heated at 400 to 450 deg. C. in an atmosphere of hydrogen under a pressure of 150 to 200 atmospheres of hydrogen. Under these conditions the coal is converted into a black, tarry liquid which, on distillation up to 300 deg. C., yields oils and tar to the extent of 20 to 40 per cent according to various reports.

We may regard the Bergius process as one of the possible future methods for making a petroleum substitute from coal. But it must be emphasized that in this process, a gasoline substitute is only one of the products, the gasoline being in about the same proportion as in a light crude petroleum. From the standpoint of motor fuel production, the direct synthesis from gases seems more economical.

### Investigations Show Possibilities

The investigations of Patart and Audibert in France, and of Fischer and the Badische Anilin and Soda-Fabriken in Germany together with the production of methanol from carbon monoxide and hydrogen on a commercial scale by the latter has put a totally new outlook on the entire subject of our future motor fuel supply. In this process, pure methanol is produced from two volumes of hydrogen to one of carbon monoxide when subjected to pressures of 150 to 250 atmospheres and temperatures of from 300 to 425 deg. C. in a copper lined reaction chamber, containing one or more of a number of catalysts which include zinc oxide or oxides of chromium, vanadium, manganese, tungsten, uranium, lead and bismuth. The cost reported from both French and German sources varies from 18 to 27c. per gallon. About 18 per cent of the heat value of the constituent gases is consumed in the conversion. There are no byproducts. One ton of coke should yield 350 gal. of methyl alcohol.

However, we need not confine ourselves to methanol, the experiments of Franz Fischer, director of the Institute for Coal Research at Mülheim-Ruhr, show that fuel mixtures of higher heating value can also be synthesized from carbon monoxide and hydrogen. Fischer and his associates have produced on a laboratory scale from water gas a mixture which they term "synthol" that consists of a mixture of alcohols, aldehydes and ketones with small quantities of hydrocarbons.

Water gas plus hydrogen is subjected to a pressure of from 75 to 150 atmospheres at 400 to 425 deg. C. in a steel reaction chamber containing a catalyst prepared from iron and a solution of sodium carbonate and consisting presumably of sodium ferrite. Byproducts of this reaction are carbon dioxide, methane and water. By recirculation of the gases, about one-third of the original water gas is converted into liquid products, having a distillation range similar to gasoline, and a heating value of 8,200 cal. per kilogram. This process is yet in its early laboratory stages.

*(Wide World Photo)*

**Dr. F. Bergius**

German scientist whose new process of liquefying coal is attracting wide attention.

Where will these processes fit into our present and future industries? Will the petroleum or the gas and coke industry be in the better economic position to make synthetic fuel?

The large refineries have the organization, financial resources, and the distributing systems to market the fuel. The methanol and synthol processes are peculiarly adapted to this purpose since the entire product can be converted into motor fuel. But the petroleum industry is likely to have strong competition from the manufactured gas industry which has an inherent economic advantage in that it is engaged in the manufacture of water gas, the raw material for methanol and "synthol." The summer months when the need for motor fuel is greatest is the period when gas plants have much idle capacity.

The public utilities distributed in 1924 some 500 billion cubic feet of manufactured gas, of which 74 per cent was carburetted water gas. The estimated annual idle capacity of these water gas plants is 350 billion cubic feet. This amount of gas will produce 1,500 million gallons of methanol or 300 million gallons of the mixture "synthol." Fifteen hundred million gallons of methanol is 13 per cent of the "gas" used in 1924.

The most promising solution of the motor fuel problem of the distant future is in this synthesis from coal gas and water gas, since there are no inherent quantity limitations imposed by the market for other products.

# Why Are Loading Machine Operators Paid $10.07?

### Rate Now Used in Illinois and Indiana Was Fixed At New Orient Mine in 1924—First Loader Scale Was Made at Petersburg, Ind.

IN THE Central Competitive Field, where loading machines are working in several mines, operators of the machines are paid at the rate of $10.07 per 8-hr. day. This rate was agreed upon for New Orient mine of the Chicago, Wilmington & Franklin Coal Co., at West Frankfort, Ill., in a joint conference of operators and miners July 9, 1924, to consider the demand that the miners be paid on a straight tonnage basis. The same rate also applies now at other coal mining properties.

Many operators have asked the question, "Why the seven cents?" To get to the origin of this $10.07 rate takes us back to the earliest contract with the United Mine Workers covering the operation of mechanical loading machines. This contract, signed Jan. 15, 1921, pertained to the experimental mine of the Pike County Coal Corp., at Petersburg, Ind. The body of the contract reads as follows:

> This agreement has been reached between the Simplex Coal & Mining Co., hereafter called the company, and local union No. 5122 U. M. W. of A., to govern a new system of mining undertaken by this company until such times that a scale of wages may be reached between the Indiana Bituminous Coal Operators' Association and the district officers of District No. 11 U. M. W. of A., which will be asked for after the different types of machinery required in this new system of mining have been thoroughly tested out in wide work.
>
> The following conditions of employment will govern all employees of the company under the jurisdiction of the U. M. W. of A.; namely: (1) That all men performing such work as the existing Terre Haute agreement covers will be governed by said agreement. (2) That all men performing such duties not covered by the existing contract will be known as machine operators who will do all work they are called upon to perform by the company. These men will be paid at the rate of $1.50 per hour. (3) That all men being employed by this company will be known either as machine operators or day laborers—it being understood that a day laborer's work and conditions of work are the various types of shift labor covered by the Terre Haute Agreement. (4) That any day laborers called upon to perform machine operators' duties will be paid at the rate of $1.50 per hour while performing such duties. (5) In case of incompetency in the judgment of the company a machine operator may be changed to laborer. Such men, upon being changed, will be paid laborers' wages.
>
> [Signed]..................this 15th day of January, 1921.
> Local Union No. 5122 U. M. W. of A.
> By PHILIP C. SCANLON, President.
> By GEORGE W. BARNES, Secretary.
> By MORRIS YATES, Committee.
> By ED. HARRISON, Committee.
> By GEORGE W. BARNES, Committee.
> SIMPLEX COAL & MINING CO.
> By EARL B. SMITH.

In a recent interview, N. H. McClevey, manager of the Pike County Coal Corp., pointed out that, although the $1.50-per-hour rate ($12 per day) might appear rather high, this is paid to only one man of the five who compose the crews of the Ace loaders which he is using. The other four men are paid the laborers' rate of $7.50 per day. This makes the average rate of the crew $8.40 per man per day.

Some time after mechanical loading was started at the Petersburg mine of the Pike County Coal Corp., the Ingle Coal Co., operating near Oakland City, put Joy loaders into one of its mines. These machines required crews of but two men each. It was only natural that the miners should demand a rate of $12 for the machine operator, as was being paid at Petersburg. This was granted, and the other man paid $8.14 as established by the Terre Haute agreement. These two men began to split their pay, making their earnings $10.07 each. Later the men made an agreement with the company to have the rate split on the payroll.

### RATE ACCEPTED IN ILLINOIS

This rate of $10.07 has spread from the Indiana mines into Illinois and is now the generally established pay for loading machine operators in the coal mines of that state.

The agreement made in conference and now in effect at the New Orient mine follows:

> The undersigned commission created by action of Joint Group Board No. 3 to consider case No. 9,705 from the No. 2 Orient Mine of the C. W. & F. Coal Co., where the miners demand that the mine be put on a straight tonnage basis, met at the mine July 8 and 9 and agree as follows:
>
> The company states that the working of the loading machinery at this mine is still in an experimental stage and for this reason we agree that it will not be possible at this time to place the mine on a straight tonnage basis in its entirety.
>
> In view of the above we agree that the rate of pay for men operating loading machines will be $10.07 per day. These men to be under direct instructions of the managemen and they will work full eight hours at whatever work they are instructed to perform. We would recommend in this connection that where a loading machine is broken down the men operating that machine be given either hand loading or other work for the remainder of the day.
>
> The work being performed by the undercutting machine men is similar in character to that performed by all other cutting machine men throughout the district and we see no reason why these men should not be placed on a tonnage basis, which we agree will be done. The rate of pay per ton for under-cutting machine men to be thirteen cents per tons for all coal cut by them. It being understood that as conditions of employment in this mine differ from the same employment in other mines no specific territory will be assigned to machine men, but all under-cutting machine men will be under the direct instructions of the management.
>
> Further, all under-cutting machine men shall remain in the mine and cut all places that are cleaned up in time to be cut. This is necessary to furnish coal for the loading machines, which under our joint agreement the company is entitled to work full eight hours per day. It is not intended by the above that undercutting machine men will be required to remain in the mine when there is reasonable assurance that they will not have more work to perform that day.
>
> In consideration of the above the company agrees that the cutting machine men shall have the places they cut as near together as it is possible and that all cutting machine men will be treated fairly in this matter, no discrimination will be shown between cutting machine men under this system in assigning them places to cut. With the further understanding that if the men who operate the cutting machines are required to do other work in connection with their ordinary duties as cutting machine men they will have the right to take the matter up in line with section thirteen of the state agreement.
>
> Inasmuch as the company states that it is still experimenting as to methods of mining and nothing definite has been decided upon at this time as to what method of mining will finally be adopted at this mine, we agree that, should the company decide to experiment on any other system of mining it will have that right to pay for same on a day-wage basis, provided the wages paid are equal to the established day-wage rates for similar labor in accordance with the award of the Bituminous Coal Commission.
>
> It is also agreed that should the company desire to place any part or all of this mine on a regular hand loading basis

it will have that right and the miners will be paid for such system the same as at other machine-mining mines where the coal is hand loaded.

When two systems of mining are used—straight machine mining with hand loading and loading machine mining—it is understood that there will be no interference with the amount of coal or the number of pit cars loaded by the loading machine operators, it is further agreed no turn of cars will be kept between the loading machines themselves or against any other system of mining, thereby restricting the number of cars loaded by any loading machine to the same number loaded by the loaders working at any other system of mining. This does not mean that cars will be supplied to any part of the mine that is on hand loading in such few numbers that it will deprive the hand loaders of an opportunity to make a reasonable day's wage in line with Section twenty-eight of the state agreement.

The method of checking coal loaded that has been cut by undercutting machine men under this agreement is left to the machine men involved and to the management to work out some plan that will give the machine men due credit for all coal cut by each of them.

The rate of pay for men snubbing and drilling and shooting will be $8.04 per day.

The above agreement is to become effective July 16, 1924, and extend during the life of our present state agreement. However, in case the company is unable to weigh the coal on and after July 16, the machine men and management will agree upon some system of payment until the coal can be weighed.

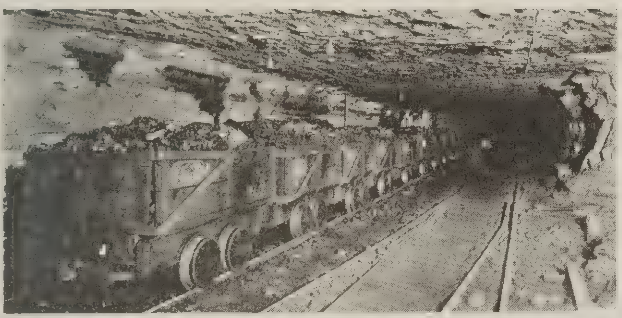
# Women Officials Run Old Kentucky Operation



*The underground illustration on the left is a view of the Eureka mine of the Reinecke Coal Co., near Madisonville, Ky. The coal at this mine (No. 11 seam) averages 6 ft. in thickness.*

*Top-works of the Reinecke company's Eureka mine. This operation produces 1,300 to 1,600 tons daily.*

*This is one of the oldest operations in the western Kentucky field, the Reinecke company being organized in 1886. Women are prominent in the company's organization. Mrs. Caroline Penn, of Belleville, Ill., is president and Mrs. Grace Reinecke, of Madisonville, Ky., is secretary and treasurer.*

# When Explosion Occurs Men Should Know What to Do

## Davis Coal & Coke Co. Has Schedule of Procedure Which Is Intended to Reduce Confusion Around a Mine During Any Emergency

WHEN A MINE fire starts or an explosion occurs just what is every man connected with the mining company expected to do? In some cases nobody knows definitely. The Davis Coal & Coke Co., operating in Pennsylvania, West Virginia and Maryland, believes a definite program of action should be followed after every such occurrence and has worked out such a program and is instructing its men in it. This line of procedure is expected to cover every emergency so that there will be little danger of confusion and misfunctioning when trouble starts. Here is the Davis schedule in cases of mine fires or explosions:

**Vice-President and General Manager:**

Should be immediately notified by the general superintendent or superintendent if general superintendent cannot be located, in case of mine fire or explosion, no matter how slight or serious, and he should be kept in touch with same at all times.

**General Superintendent:**

1. Should be immediately notified by superintendent or foreman in case of mine fire or explosion, no matter how slight or serious, and he should take charge in accordance to specified duties at the scene of trouble.
2. Notify district mine inspector and chief of department of mines.
3. Notify U. S. Bureau of Mines, if thought necessary.
4. Clerk to remain in your office constantly and one other person for errand duty.
5. Arrange for an operator constantly at the telephone exchange.
6. Arrange for general supply clerk to be near the telephone at all times and an assistant for errand duty.
7. No oxygen breathing apparatus or oxygen equipment be sent from a division at any time unless authorized by general superintendent or safety director.
8. No official or apparatus men be sent from any plant unless authorized to do so by general superintendent or person designated by him.
9. Call any officials necessary for the work at hand.

**Duties**

If possible, two men should be assigned to each position. One from the mine where accident happened and one from the nearest adjoining mine. They should be assigned under duties respective to their regular occupations, and designated by the general superintendent; i.e. outside foreman from another mine with outside foreman, checkman with checkman, etc.

**Superintendent:**

**Guards, Mine Clerk, Outside Foreman, Supply Clerk:**

1. Rope off all mine entrances. Guards stationed along rope and under directions of designated official.
2. Provide general headquarters at the plant and keep a man at the telephone constantly. The mine clerk should be assigned this work and have two men with him for errand duty.
3. The outside foreman to provide for information bureau, mess rooms, emergency hospital, commissary, provisions, rest rooms, sleeping quarters, morgue, etc.
4. The supply clerk to provide for nails, brattice cloth, hatchets, axes, picks, boards, props, shovels, identification checks, electric cap lamps, flame safety lamps, telephones, wire and insulators, rope, blankets, stretchers, first aid cabinet, etc. Also provide for checkmen and lampmen to distribute; overalls, gum shoes, gum boots, gloves, caps, electric safety lamps, flash lights, etc.

**Electrician:**

1. Pull all electric switches where electricity enters the mine and lock same in case of explosion.
2. See that fan is started and kept in operation. Have an attendant stationed at fan constantly.
3. Provide for telephone communications on outside with telephone man, and on inside of the mine if necessary.

**Machinist:**

See that fan is in operating condition. Have an attendant stationed at fan constantly.

**Fire Chief:**

1. Should assemble immediately all available fire fighting equipment, which should be on hand at the mines when needed as the recovery work progresses.
2. Report to superintendent. Consult him for additional apparatus.

**Other Superintendents:**

1. Keep by telephone of your respective plants until advised to leave by the general superintendent, and upon leaving assign a responsible man, possibly the clerk, to your place and have another responsible official with him to perform any errand duty.
2. If called to scene, report immediately to general superintendent for your duties.
3. If advised to bring or send apparatus men, or other crews of five men other than apparatus men, have them report to director safety and inspection immediately.
4. If requested to send or bring other officials; have them report immediately to general superintendent.

**Check and Lamp Men:** (stationed in lamp house with adjoining room)

1. Each man reporting to be equipped for entrance into the mine should be known to the check and lamp men as approved by the superintendent.
2. Each man should be given a check with number and this number, as well as his name, should be recorded in a book.
3. A record should be kept of all equipment issued to each man opposite his name and number in preparation to his entrance into the mine. For example; overalls, gum boots or shoes, caps, safey lamps, flashlights, etc.
4. Each man to carry a safety lamp should be qualified by a responsible official or he cannot so enter, and all safety lamps should be examined by the lamp man.
5. Upon the return of each man so equipped as above, the said equipment should be credited to the name and number that received it.
6. Each man should be examined carefully without exception for smoking articles or combustible material. This examination to consist of going through each pocket or any other place of concealment.
7. Each safety lamp should be of permissible approved lock type. Each man should be equipped with flashlight.

**Final Check Men:** (stationed within the roped-off area at each entrance)

1. At least one check man at each entrance and stationed within the roped-off area.
2. Working crews should only be permitted to enter the mine in groups of five, one of whom should be in charge. The one in charge should be an official, or a person approved by the district mine inspector, but at least one official, who knows the mine or section where party is going, should be in the party.
3. All men entering the mine must be known to the checkmen or be approved by the superintendent.
4. Each man having a check with a number, and said number as well as name recorded in a book.
5. The time of entering and leaving the mine should be recorded in a book opposite his name and number.
6. Each man should be examined carefully without exception for smoking articles or combustible material. This examination consists of going through each pocket or any other place of concealment.

**Attendants:**

Direct all persons equipped for entrance into the mine from the check and lamp men to final check men, and when said persons leave the mine, see to it that they report back to where they originally started.

**State Mine Inspector:**

A mine fire or recovery work after a mine explosion is always in charge of the chief of the Department of Mines followed by the district mine inspector and assisted by other district mine inspectors upon their arrival at the mine.

**Director, Safety and Inspection:** (assist the state mine inspectors)

1. Assemble all the available apparatus for rescue and recovery work in that division.
2. Call all apparatus men as thought necessary promptly.
3. If apparatus men be needed from other plants, call general superintendent immediately, who shall call the respective superintendents at plants designated.
4. If apparatus and men be needed from other divisions, call general superintendent.
5. Assist in picking well balanced crews of five men each for apparatus or other designated work, and do whatever possible until the arrival of state mine inspector, when they will report to him. Assist in making final check on men and equipment and assist the attendants and final checkmen in their duties.
6. If additional apparatus or men are needed other than company equipment and employees, call the general superintendent.
7. Call for ambulance.
8. Call physicians necessary and appoint one in charge.
9. Keep in touch with emergency hospital.
10. Make hospital arrangements with physician in charge at the plant.
11. Call Red Cross county chairman and arrange the duties.

**Official in Charge of Guards:**

Report to superintendent and consult with him in regard to additional duties.

**Chief Engineer:**

1. Arrange for a man in your office constantly. Report to general superintendent.
2. Immediately go to scene with maps showing regular coursing of air, regulators, overcasts and doors in same, stoppings and doors. Also have maps of adjoining mines.

**Chemist:**

Arrange laboratory and report to general superintendent to co-operate with Bureau of Mines officials in handling samples, etc.

**Foreman Central Shops:**

1. Immediately dispatch a man or go yourself to plant and assist machinist and electrician on fan.
2. Arrange for men constantly on duty in the shop.
3. Report to general superintendent.

In case of mine fire or explosion the above procedure must be carried out in detail by those designated for specific duties.

R. P. MALONEY,
Vice-President and General Manager.

# New Coal Cleaning Plant Has A Pneumatic Process

### Gulf Smokeless Coal Co. at Covel, W. Va., Sizes Output Carefully Before Putting Four Small Classifications on Air Tables

By Ray W. Arms
Contracting Engineer, Roberts & Schaefer Co.,
Chicago, Ill.

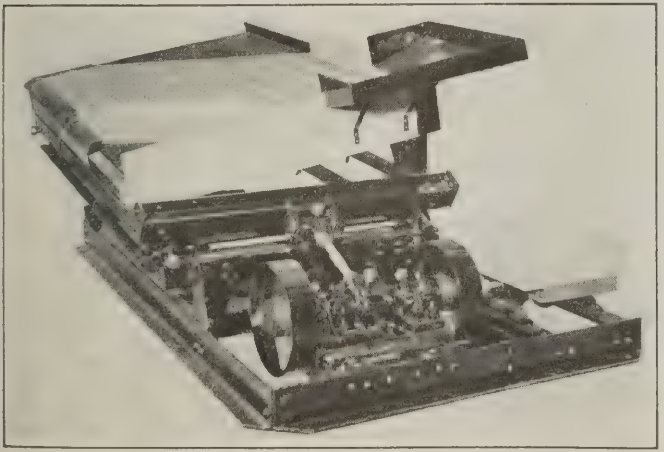
A new coal cleaning plant employing the pneumatic process has just been completed for the Gulf Smokeless Coal Co. at Covel, W. Va. This plant is located on the Virginian R.R. midway between Princeton and Mullens on a steep mountain grade now being electrified by the railroad. Several novel features are embodied in the design of this cleaning plant, chief among them being the use of a new type of horizontal screen for the preparation of sizes for the cleaning tables, and a new type of air concentrator.

Since the advent of pneumatic cleaning, opinions of its exploiters as to the necessity for closely sizing the coal before cleaning have been divided, some maintaining that more efficient machines can be built to clean coal with less sizing and others believing that close sizing is essential for good results. The latter view is fostered by the designers of this plant who also have firmly held as a basic principle that air itself is, after all, the separating agent and no mechanical nicety of construction could possibly increase the effectiveness of air as a separating medium beyond its natural limitations. Furthermore, it is recognized as a principle that devices involving simultaneous classification and concentration require more air-power and cannot be as accurate as those preparing the coal by sizing screens.

## SCREENING OPERATION SIMPLIFIED

Following out this principle, efforts have been made to simplify the screening operation as much as possible commensurate with sufficient accuracy to arrive at the best cleaning results. The outcome of three years of research and experimentation with that end in view is the Arms horizontal screen, a high-speed shaking screen with a motion capable of propelling the coal along a level or nearly level surface.

This screen as installed at Covel has an upper deck covered with a large-mesh screen cloth over which an oversize finished product is removed, and a lower deck through which a finished undersize is partially removed. The intermediate product is unfinished and is passed on to a second screen, the top deck of which is equipped with wire mesh sufficiently smaller than the first screen to make the next cleaning size. The lower deck of the second screen is provided with the same mesh cloth as the first screen. The coal then passes to the third and last screen with a still smaller top screen and the same size lower screen. From these three screens five finished products are removed: one oversize each from the three top screens, oversize from the third bottom screen and undersize from all three lower screens. Patents are now pending on this screen and screening system.



Arms Air Concentrator for Cleaning Small Sizes of Coal at Covel, W. Va.

Tipple and Air Cleaning Plant of Gulf Smokeless Coal Co. at Covel, W. Va.

The coal at Covel is rather characteristic of the district, the impurities being slate and a high-ash cubical coal. Previous experiments had determined the fact that the coal smaller than ¼ in. was quite free from these impurities and needed no treatment on the air concentrators, hence it was decided to bypass all coal smaller than that size and air clean all coal between 2 in. and ¼ in.

## METHOD OF SIZING COAL

Coal is brought down the hill by a retarding conveyor and fed to a horizontal picking table screen which first removes the 4-in. lump coal for hand picking on the top deck of the screen. The 4-in. undersize is further screened through 2-in. perforations on the lower deck which delivers the 2x4-in. egg coal to picking wings along the side of the screen where it is carefully hand picked.

The 2-in. undersize from the screen is delivered by a chute to the boot of an elevator which lifts it to the top of the dry cleaning plant. From this elevator it is fed by a chute directly to the three Arms sizing screens which divide the coal into five sizes: four for cleaning over the air concentrators and the fifth to be bypassed without further treatment. The four sizes to be cleaned are passed to small pockets directly over the four cleaning tables to which they are delivered by special chute feeders.

The cleaning is done on Arms air concentrators. This concentrator is a newcomer in the field of air cleaning, simple and rugged in construction and designed to fit into a compact and accessible arrangement scheme.

From the concentrators the coal is delivered to a gathering conveyor which receives also the undersize from the screens above. This conveyor then delivers the coal via a chute to a run-of-mine loading boom or to a slack loading chute, as desired.

A separate compartment in the gathering conveyor collects middlings products from the air concentrators and returns them to the boot of the slack elevator by which they are returned to the plant for retreatment. Refuse from the four cleaning tables is fed by chutes to a belt conveyor which delivers into a second stacking belt conveyor. Arrangements are now being made to load the cleaned nut coal, as made on the first two cleaning tables, directly to railroad cars.

Considerable progress has been made in the collection of dust in air cleaning plants as evidenced by the results at Covel. This plant is remarkably free from dust both on the cleaning table floor and at the screens. The reasons for this improvement are, first, that a more efficient application of suction to the critical points has been made; second, the screens remove the fine dust-bearing undersize more perfectly; third, a new type of table dust hood controls more effectively than heretofore the air currents issuing from the cleaning tables.

The Covel plant handles nut and slack coal smaller than 2 in. at the rate of 150 tons per hour. Chemical results of the cleaning are not yet available but inspection of the products indicates that the impurities are effectively removed from the coal with an inconsequential loss of coal in the refuse.

# *Newly Equipped Power Plant of Fordson Coal Co. In Kentucky Pulverizes and Burns Low-Grade Coal*

*This central power plant for the Stone division of the Fordson Coal Co. at Stone, Ky., has been equipped for burning pulverized laminated slate and coal. The old stoker-fired boilers at the plant have been replaced by three new ones, each of 600-hp. rating. The first was put into service Aug. 1. Natural draft is provided by the new brick stack.*

*The lower photograph shows the new steel-and-concrete powdered fuel mill standing beside the tipple at Stone. The pulverized product is borne to the power plant through 680 ft. of 4-in. pipe which is installed underground. The conveying capacity is 15 to 20 tons per hour.*

*This is one of the first coal mine power plants to use the low-grade fuel which usually must be dumped for lack of market. The pulverization process is to prevent this ordinary waste. This method of turning bone into power is already in successful use at the central power plant of the United States Coal & Coke Co., Gary, W. Va.*

# News Of the Industry

## Pinch Near in Anthracite Strike Indicated by Recent Developments; Amenities by Lewis and Warriner

A number of developments which took place last week in connection with the hard-coal strike marked a decided change from the inactivity prevalent for several weeks. In making a bid for indorsement of the strike at the annual convention of the American Federation of Labor at Atlantic City, Oct. 14, John L. Lewis, president of the miners' union, charged the anthracite operators with mulcting the public of sixteen to twenty million dollars annually by the adoption of the new sizing standards, which he alleged had been forced upon retailers. He also pictured a harsh winter for the public due to a shortage of coal.

Arrangements have been made to suspend ordinances prohibiting the use of soft coal in New York City as well as in upstate cities of New York and New Jersey, in order to meet any possible emergency due to a dearth of anthracite.

Samuel D. Warriner, president of the Lehigh Coal & Navigation Co. and chairman of the Anthracite Operators' Conference, denied Lewis' charges in a statement made at Harrisburg, Pa., Oct. 15. Speaking before the Pennsylvania State Chamber of Commerce, Mr. Warriner said that the industry decided last April to standardize the sizes of coal at the request of the retail trade.

The American Federation of Labor, at its annual convention in Atlantic City, Oct. 14, indorsed the anthracite strike, unanimously passing a resolution approving "the efforts of the mine workers in their demands for increased wages, improved working conditions and complete recognition of the union." The Executive Council of the A. F. of L. also was directed "to co-operate in every possible and practical way to the end that the anthracite mine workers achieve complete success in their efforts."

### Public Has Been Fooled—Lewis

"During the past sixty days," said Lewis, "the people have been told, first, that they need not fear a suspension, and then that there was ample coal on hand. Foolish public men have created for the American people a fool's paradise, and they are due for a fool's awakening. If the mines were to start tomorrow it is extremely unlikely, from present prospects, that production and distribution would catch up with fuel requirements before the coming of next spring."

In the meantime, he said, wholesalers and retailers would be "making hay while the sun shines." He said chestnut coal was already selling at $18 a ton in Philadelphia and as high as $19.50 on Long Island, which he declared, represented advances of $4 to $5 a ton over the price listed at the beginning of the present suspension, Sept. 1.

"It will be sold at an additional increase far in excess of these figures," he said.

As to substitute fuels, Mr. Lewis quoted engineers as saying the by-product coke industry was able to produce only enough of that commodity to care for its own needs, and could not increase facilities to meet additional demands from hard coal users. Scrapping of anthracite-burning equipment for installation of oil burners he called prohibitive to the wage earners in most sections of the anthracite market.

### Attacks Use of Soft Coal

Soft coal, as another substitute, was dangerous, he said, because in homes where chimneys were built for hard coal, burning of bituminous coal "will mean the wholesale asphyxiation of families." Furthermore, he said, railway facilities would be unable to transport enough soft coal into the 60,000 communities commonly using anthracite to meet the needs, "even if they could burn it."

Reviewing the controversy between the miners and operators up to the breaking off of negotiations at Atlantic City on Aug. 4, Mr. Lewis announced that "there is not now, nor will there be later, any question of the mine workers faltering in the step they have undertaken or departing from the policy which they have laid down. They have every appreciation of the responsibilities of such a contest, but they believe that thrice armed, indeed, is he whose cause is just, and they have decided to carry on, come what may."

Mr. Lewis said 70 per cent of the 158,000 anthracite mine workers averaged between $4.62 and $5.96 per day and the remaining 30 per cent of skilled contract miners averaged substantially less than $2,000 a year.

Yet, he said, in 1924 30,241 men were injured and since 1870 "the anthracite industry has butchered 1,210,000 of our people."

### *Won't Settle Anything by Strike, Says Debs*

Eugene V. Debs, chairman of the National Socialist Party, addressing an audience of about 1,000 persons in Scranton, Pa., Oct. 16, condemned the suspension of mining in the hard-coal region. "My sympathies are with the miners," he said. "They are engaged in a sharp, fierce, trying struggle. They will be tested to the core, yet I realize that no matter how the strike turns out it will not settle anything. There will be a temporary agreement and after that agreement has expired there will be another strike and another strike. We have had strikes for fifty long years," he continued, "and we will continue to have them as long as the mines are privately owned." Following an argument for government ownership of the mines and other industries, Mr. Debs added, "I do not like strikes. I am not fond of riots and disturbances and bloodshed. All of my life I have opposed violence and brute force."

Debs' attitude on the suspension came somewhat as a surprise to the mine workers who heard and read his address. It was thought that he would urge a continuance of the "strike" policy of the United Mine Workers and give it his indorsement.

In reply to Lewis' charges S. D. Warriner said that "when a man who has arrogantly declined to face the facts in the anthracite situation by submitting them to arbitration takes it upon himself to vilify the industry in words which are so far removed from the truth as to approach libel and actual falsehoods a reply is definitely required."

Last April, when the industry standardized its sizes of coal, he said, "some sizes were made slightly larger, some were made smaller. This was done at the urgent request of the retail trade, who desired more completely to conform to the requirements of their customers. The step was only taken after the operators had made careful experiment as to the feasibility of the changes suggested, had subjected the new sizes to most careful analytical and engineering tests, and had been assured that the public would be protected in any action that might be taken.

"So far as the results obtained in

realization or profits to the industry as a whole are concerned, there was no benefit. As evidence of this, the realization from the production of the Lehigh Coal & Navigation Co. for the month of August of this year, after the change was made, was $5.68 per ton, as compared with $6.14 per ton average realization from the production of our company for August of last year, before the change was made.

"The charge that the industry has been a slaughterhouse, where since 1870, 1,200,000 employees have been 'butchered,' is equally false. He implies, at least, if he doesn't say, that an average of 2,000 men annually have been killed in the anthracite industry. The statistics of the Mine Inspection Bureau of the Commonwealth of Pennsylvania show that since 1870 the fatal accidents total 23,745, or an annual average of 431.7. The total number of fatalities in the fifty-five years from 1870 to 1924, inclusive, was a little more than the average number per year which Mr. Lewis states as the number 'butchered.'

"Relative to Mr. Lewis' remarks that the public is lulled into a fool's paradise and due for a fool's awakening, not much more need be said than that it is a palpable effort of a man to manufacture a panic for his own selfish purposes."

Major General Charles W. Berry, chairman of the New York State Coal Commission, recently created by Governor Smith, said last week that $16 a ton was a fair price for hard coal in the boroughs of Manhattan and the Bronx, and urged the public not to pay more except in the outlying districts.

After a conference with an advisory committee composed of Eliot Farley, representing the anthracite operators, Roderick Stephens, for the retail coal dealers, and J. W. Searles and Charles B. Ebbert, representing the bituminous coal producers, General Berry issued a statement, in which he said that "there is an ample supply of soft coal available for the New York market and retail coal dealers are advised to avail themselves of such opportunity."

A threat to publish the names of coal profiteers is expected by the commission to keep prices down.

## Rioters Injure Ten and Wreck Washery

The first disturbance of a serious nature in the hard-coal field since the suspension of mining operations on Sept. 1 occurred Oct. 17 at Throop, near Scranton, when about 700 mine workers, using bricks, stones and blocks of wood, stormed Carlucci's washery at that place and practically wrecked the structure, causing several thousands of dollars damage. Ten men were injured in the rioting.

The demonstration resulted from the refusal of the owner of the operation, Frank Carlucci, of Scranton, to suspend work at the plant. The owner of the washery, along with those of other small operations, was requested by District President Rinaldo Cappellini, of the United Mine Workers, to cease operations during the strike.

Following the attack the district union chief issued the following statement from union headquaraters in Scranton: "I regret the action of the men who yesterday gathered at the Carlucci washery in Throop. The men were not authorized to take such action, as it is the wish and hope of the union to carry out the suspension in an honorable and peaceful manner."

**William Green**

The former international secretary-treasurer of the United Mine Workers was reelected president of the American Federation of Labor by acclamation at the annual convention of that organization, held in Atlantic City, Oct. 12-16. His entire executive council also was returned to office. Among those elected as delegates to the British Trades Union Congress was Frank Farrington, president of the Illinois miners' union.

The U. S. Engineers for the Pittsburgh district, in their report for September, just issued, show the coal movement on the Monongahela River was 1,655,340 tons, and coke, 79,818 tons; on the Ohio River, coal 374,586 tons and coke 39,000 tons; on the Allegheny River, coal, 88,350 tons and coke 18,000 tons.

## New Low-Volatile Rate to New England in Operation

The Norfolk & Western Ry. placed in operation on Oct. 15 a new schedule of all-rail rates on prepared sizes of bituminous coal from low-volatile districts in West Virginia to New England and other Eastern points. The Interstate Commerce Commission issued an order directing the new rates, and these rates are expected to make it possible for the West Virginia producers to enter the New England market in competition with anthracite for the first time.

The new rates to New England points are as follows, per gross ton:

Massachusetts—Lowell, $7.10; Waltham, $7.10; Worcester, $5.83; Cambridge, $6.70; Fall River, $5.83; New Bedford, $5.83; Springfield, $5.45; Boston, $6.70 (Boston & Maine), $5.58 (New Haven); Haverhill, $7.10; Lynn, $7.10; Salem, $7.10; Chelsea, $6.70, and Amesbury, $7.20.

New Hampshire—Manchester, $7.20; Concord, $7.35; Bennington, $7.20, and Portsmouth, $7.20.

Connecticut—Norwalk, $4.69; New Haven, $4.69; Bridgeport, $4.69, and Hartford, $5.45.

Rhode Island—Providence, $5.45.

Maine—Portland, $7.20.

The low-volatile soft-coal producers believe that they have a permanent substitute for anthracite, which each year will cut heavily into anthracite sales in New England, as it has already in other parts of the country.

Modification of the present bituminous rate structure so as to "more equitably" protect the people and the bituminous coal industry of Pennsylvania is asked in a resolution adopted at Harrisburg, Pa., Oct. 15, at the seventh annual meeting of the Pennsylvania State Chamber of Commerce.

## *W. H. Turner, Mine Foreman, Believed to Be Dead, Is Arrested for Murder in Kentucky Explosion*

William H. Turner, formerly foreman of a coal mine at McCarr, Ky., was arrested as a fugitive from justice Oct. 15 when he arrived at New York on the United American liner Resolute, from Hamburg. He was taken to Police Headquarters and held for Sheriff William Johnson of Pike County, Ky., who sought him with a first degree murder warrant. Sheriff Johnson came to New York in response to a wireless message from Turner saying that he wished to give himself up, according to the police.

The Sheriff and other authorities of Pike County had been looking for Turner since he was indicted as the result of an explosion on Jan. 17, 1925, in the Auburn Mine at McCarr, in which two miners were killed. One mangled body had been identified as that of Turner, according to the police, and $85,000 in insurance on Turner's life was collected by relatives.

Turner is reported to have said that after the explosion in the mine he was met by a relative by marriage who plied him with whiskey, placed a pistol at his side and told him to take the first train that night out of McCarr. Another relative is alleged to have bought passage to Norway for himself and for Turner. Turner maintained he did not know what had become of the insurance and that his wife, who was a $25,000 beneficiary, was in no way concerned with the scheme by which one of the victims of the explosion was identified as Turner.

Turner was taken back to Kentucky Oct. 16 by two deputy sheriffs on extradition papers charging him with murder in connection with the death of two men in the explosion of last January. Before the officials started with him for Kentucky, however, his wife, Margaret May Turner, who the prisoner had declared was in no way connected with the conspiracy, identified her husband in New York police headquarters.

The Pike County Circuit Court Clerk's office announced Oct. 19 that indictments had been returned by the Grand Jury against Joe Jack, Jr., Turner's brother-in-law; Joe Jack, Sr., Mrs. William H. Turner and Mrs. F. F. Farley, a sister of Turner.

# Uncertainty Regarding Attitude of Hard-Coal Interests Deters Stocking Of Substitutes by Retail Dealers

**By Paul Wooton**

Washington Correspondent of *Coal Age*

To make good the deficit in anthracite it will be necessary to provide substitutes from this time forward at the rate of 1,500,000 tons per week. As no such tonnage is going into distribution in the anthracite-consuming region at this time it is apparent that cumulative requirements soon will have to be met at a much higher rate. Such a gigantic task, it is apparent, can be accomplished only with the whole-hearted co-operation of the retailers.

One of the reasons why the Eastern retailer has hesitated to stock up heavily with substitutes for domestic anthracite is the uncertainty as to how his activities in introducing substitutes will be regarded by the anthracite interests. He realizes that all the propaganda urging the use of substitutes has not weakened the preference of the majority of householders for anthracite. The minute anthracite begins to move again the retailer will want his full share. He regards his allotments, if he has "company" connections, as his principal business asset. Moreover, he does not want to be caught with a surplus of bituminous coal which he would have to sell at a loss.

Officials in New England declare that the feeling of uncertainty among the retailers is an important factor in discouraging the purchase of other fuels. To overcome that uncertainty it is being suggested that the states concerned call meetings of the retailers for a conference with the anthracite distributors, with the idea of working out a definite program of distribution to apply as soon as the strike is over. A definite assurance doubtless could be obtained that as soon as work is resumed distribution will be made in accordance with the 1922 allotments.

Some such plan as this, it is believed, would remove the uncertainty and enable the retailers to make definite plans and to place orders at once for bituminous coal. The orders for current shipments could be made subject to cancellation a certain number of days after the resumption of anthracite production. By this means the elaborate machinery of distribution throughout the anthracite-using region would be thrown open to move substitutes.

If the anthracite interests helped bring about such an understanding it would help them to realize their often-repeated wish that the government allow the industry to settle its own troubles. State and federal executives can stay out only so long as substitutes are available.

As this is written six weeks of the strike has passed. Federal officials appear to be as grimly disposed as ever to keep hands off. The anthracite operators show no signs of weakening. The belief is growing stronger that Congress is likely to prescribe some form of regulation for coal. The record shows clearly that drastic legislation goes through promptly in times of emergency—legislation that would have no chance under normal conditions.

Despite the formal action of the American Federation of Labor in approving the strike, it is said that some labor leaders feel that it was a great mistake to take that action. President Green is thought to share that opinion.

---

## Samuel A. Taylor May Head A.I.M.E. Next Year

Samuel A. Taylor, well known Pittsburgh consulting coal mining engineer and operator, may be president of the American Institute of Mining and Metallurgical Engineers for 1926. Official notice of his nomination for the office was revealed at a dinner given in the University Club, Pittsburgh, on Oct. 19 by the Pittsburgh section of the Institute in honor of President Reynders and Secretary Bain. President Reynders made the announcement.

The dinner was attended by twenty-five members and an equal number of ladies of the auxiliary. Graham Bright, chairman, presided as toastmaster. Secretary Bain emphasized that the chief aim of the Institute is the more liberal exchange of technical information, pointing out the part such an exchange plays in the welfare of present and future generations. Many engineers, said he, do not realize the importance of revealing and recording technical and practical knowledge. There is grave danger that knowledge not opportunely recorded may disappear and be forever lost, as much of it has in the past.

F. L. Bishop, dean of the mining and engineering unit of the University of Pittsburgh, reported on the progress being made by the committee appointed by the Carnegie Corporation for study to promote and guide engineering and mining education and training. The study has been conducted over a period of eighteen months and is showing signs of achievement. The corporation has appropriated $108,000 for these studies. Dean Bishop would have national engineering societies professional not only in name but in membership also. It is not right, said he, that one year of practical experience should carry as much weight as four or six years of engineering training in college toward entrance into what we term professional societies.

---

The gross tonnage of bituminous coal (revenue) transported by the Reading Company during August, 1925, was 1,724,894, compared with 1,182,624 tons in August, 1924.

## *Fuller Scraps Anthracite; Will Use Soft Coal*

Governor Alvan T. Fuller, of Massachusetts, the moving spirit in the plan of New England Governors to solve the fuel problem of the Northeast by substituting soft coal for anthracite, has had thirty tons of hard coal removed from his cellar. The coal, which was stored for winter use, is being replaced by bituminous.

"The anthracite industry would freeze us to death," the Governor told thirty-five Southern business men here on a "good-will" tour. The group included several coal operators from the West Virginia coal field whom he asked to co-operate in his drive. The Governor has urged the general public to "strike off the shackles of bondage" in which New England is held by the hard-coal industry. He declared his action typical of the fighting mood prevailing in New England in regard to the coal situation.

He said that he had received a telegram Oct. 16 announcing the shipment from West Virginia of a trainload of low-volatile bituminous coal to New England for household use.

## Pinchot May Call Special Session on Giant Power

Talk of a special session of the Pennsylvania Legislature during the coming winter has been revived at the Capitol, at Harrisburg. Governor Pinchot has spoken of such a possibility but has never been definite in his attitude in the matter. Giant power would be one of the objects of a special call should he issue one. All of the twenty-six giant power bills sponsored by the Governor died in committee during the regular 1925 session.

It is not considered likely that a call would be sent out for a special session until after the November election, as the Governor has been accused of permitting the special session talk to continue for political purposes only. His opponents assert that if a call is issued it will be to foster the Governor's Senatorial aspirations.

Charles Penrose, an electrical engineer of Philadelphia, speaking before the Pennsylvania Chamber of Commerce at Harrisburg, Oct. 15, assailed Governor Pinchot's giant power proposal as "a fallacy and menace," declaring that there were no mines in Pennsylvania large enough to supply the amount of coal that would be required by a huge power station to make possible the low electrical production cost estimates given in the giant power report submitted to Governor Pinchot by the Governor's survey board.

Certain proposals in the giant power project, he said, warranted the application of the term "fantastic," which has been applied.

## Nova Scotia Coal Inquiry Soon to Be Under Way

Sir Andrew Rae Duncan, who has been chosen by the British Government, at the request of the Government of Nova Scotia, to head the commission of inquiry into the coal mining industry of the latter province, planned to sail from England last week, and it is expected the inquiry will be started before Nov. 1, according to information given out by E. N. Rhodes, Premier of Nova Scotia.

The Government of Nova Scotia has been advised, stated Mr. Rhodes, that W. Armour, of the staff of the British Department of Mines, will accompany Sir Andrew, as a technical expert, to assist in the work of the commission. Mr. Rhodes also announced that T. J. Brown, Deputy Minister of Mines for Nova Scotia, will be appointed secretary to the commission.

This completes the personnel of the commission, which will include Sir Andrew Rae Duncan, London, Eng., chairman; Dr. H. P. MacPherson, president-rector of St. Francois-Xavier University, Antigonish, N. S.; Hume Cronyn, London, Ont., former member of Parliament for that city; T. J. Brown, Deputy Minister of Mines, Nova Scotia, secretary; W. Armour, of the British Mines Department, technical expert.

That the coal industry of Nova Scotia is now well on the way to recovery and stabilization as a result of the truce negotiated by the Rhodes government two months ago, which terminated the five months disastrous wage war between the miners and the British Empire Steel Corporation, is evidenced by the signs of returning prosperity in the mining districts of Cape Breton as well as in the mainland colliery towns. The mines have been operating with scarcely a break since Aug. 9, the day following the signing of the new wage agreement.

With the exception of mines Nos. 6, 15, 11 and 21, practically every colliery in the Cape Breton field is working steadily, the daily average output comparing favorably with past production records. The average daily output for the past several weeks is in excess of 20,000 tons though on several occasions a much larger tonnage has been hoisted.

### *"Hero" in Tight Place*

While Mr. Caillaux, French Minister of Finance, went home something of a hero for having resisted the "greedy" demands of the Americans, it is becoming increasingly apparent that the American commission maneuvered him into a position that is going to be hard to defend. If the French refuse to accept the American proposal to pay $40,000,000 for five years, they must decline to pay an amount which they themselves offered to pay.

It is known that French industrial interests have applied recently to American bankers for large loans. Since it is apparent that the administration would look with disfavor on private loans pending an agreement as to the debt, it is probable that none will be made until satisfactory settlement is made. This will mean strong pressure at home for action.

## Rehearing Denied in Cement And Flooring Cases

The U. S. Supreme Court on Oct. 12 refused to grant a petition for rehearing filed by the government in the Maple Flooring Manufacturers' Association and the Cement Manufacturers' Protective Association cases. This action definitely closes the proceedings.

It was in these two cases, decided against the government, that the Supreme Court last spring laid down its important decisions defining legal and illegal trade association activities, particularly with reference to the collection and dissemination of statistics, and thereby removed the uncertainty which has surrounded such association work for several years.

Immediately after the decisions in the spring the Department of Justice announced that it would accept the principles laid down by the Court but would move for a rehearing in these specific cases on the ground that the evidence showed that the two associations had committed illegal acts within the principles announced by the Court.

## Midland No. 1 Resumes With 107 Men

One hundred and seven men went to work at Midland Mine No. 1 on Oct. 15, when the Pittsburgh Coal Co. reopened it for operation at the November, 1917, wage scale. The mine, which is 27 miles from Pittsburgh and 3 miles from Canonsburg, Pa., is the first of this company in the Panhandle district to resume operations. Banning Nos. 1 and 2 being in the Youghiogheny Valley. This is the seventh mine of the company in operation at the 1917 scale, including four mines in the Pomeroy district of Ohio, which have made a successful record.

The tipple of the Midland mine is one mile from Houston, Pa. Fourteen deputies of the Sheriff of Washington County are on duty at the mine property, but they do not expect any disorder. The normal capacity of the mine is about 400 men. H. M. White is division manager, in charge of operations, and John Bertram is superintendent. Production of coal is expected to start within several days.

Banning No. 2 is running approximately 1,000 tons of coal a day, with 264 men at work. This was the first mine opened, on Aug. 16. Banning No. 1, opened in the middle of September, is producing an average of 500 tons a day.

The Midland mine was closed in November, 1923. The company still has 37 idle mines in the Pittsburgh district. Any one of these will be reopened, according to company officials, as soon as a sufficient number of former employees in any district evince a desire to return to work.

---

The By-Product Coke Corporation, the largest producer in the United States of commercial coke, having plants at South Chicago, Ill., has sold a new issue of $5,000,000 first mortgage 5½ per cent gold bonds to Lee, Higginson & Co. and the Continental & Commercial Trust & Savings Bank. The bonds are priced at 94¼, are dated Nov. 1, 1925, and are due Nov. 1, 1945. The purpose of this issue is to effect a saving in interest charges by refunding existing funded debt, chiefly bearing 8 per cent and 6 per cent interest; two issues of mortgage bonds, in fact, have been called in.

# Output Higher in Strike Zone Of Northern West Virginia Since Lewis' Call to Non-Union Miners

Non-union coal production shows signs of increasing since the second strike call was issued to the non-union miners of northern West Virginia on Sept. 26, when John L. Lewis, international miners' union president, visited Fairmont. In the first four days of last week the non-union mines produced 6,821 cars of coal, an increase of 184 cars compared to the first four days of the previous week. Non-union output all over the field is showing increases, although no production records have been established recently.

The open-shop tonnage is especially strong on the Monongahela Ry. and the Monongah Division of the Baltimore & Ohio. Non-union mines along the Monongahela produced 537 cars Oct. 15, the largest daily tonnage reached there since Aug. 11. Non-union production was increasing on the Wyatt-Bingamon and Helen's Run branches of the Western Maryland until a car shortage developed.

### Union Production Increases

Union production in Northern West Virginia also showed signs of increasing slightly last week, when 1,157 cars were loaded in the first four days, or 48 more cars than in the corresponding period of the previous week. More union coal is being produced on the Monongahela Ry., the plants working under the Jacksonville agreement having loaded 222 cars on Oct. 14, which is the heaviest since the strike started, on April 1. At present the union tonnage on the Scott's Run branch of the Monongahela Ry. exceeds the open-shop tonnage.

Mines in northern West Virginia produced 569,200 net tons of coal in the week ended Oct. 10, compared to 531,400 tons in the previous week, 514,000 tons in the corresponding week of 1923 and 398,250 tons in the corresponding week of 1924. The non-union mines in the field produced 9,782 cars of coal in the week ended Oct. 10, compared to 9,146 cars in the preceding week. Union mines loaded 1,587 cars, compared to 1,382 cars in the previous week.

Injunctions against the United Mine Workers of America and its officers and other members granted on behalf of virtually every mine in a belt south of the Kanawha River and running almost to the southern end of the state were made permanent Oct. 16 by order of Judge McClintic in the U. S. District Court.

The decision was handed down in twelve injunction cases, consolidated for hearing, in which the total number of plaintiff companies reached 309, some being plaintiffs in more than one suit.

Judge McClintic held that the United Mine Workers had "unlawfully combined and conspired absolutely to monopolize and control all labor in the United States and on the American continent engaged in mining and producing coal."

Due to a strike of engine drivers, firemen and hostlers on the Western Maryland Ry. coal mines along the Wyatt-Bingamon & Helen's Run branches in West Virginia suffered from car shortage for several days last week. Rail officials assert that the lack of empties was not due to the strike as much as to the equipment being delayed on foreign railroads. The W. M. officials predicted that this would be corrected and the equipment would soon be flowing back to the mines. No serious complications are expected because of the strike.

Many operators believe the union not only has absolutely no chance to win out in the field but will never come back. Union officials refuse to make any such admission and are busy erecting barracks for the winter.

### Says Union Output Is Heavy

In a statement issued last week Mr. Bittner claims that certain non-union mines along the Monongahela River front in the Brady section of Monongalia County are working with reduced forces and that many strike breakers have left the region. "The fact that all the union mines in northern West Virginia are operating at more than full capacity clearly shows that the United Mine Workers have in no way destroyed the coal mining industry in this field and proves that all the mines necessary to furnish the coal coming from northern West Virginia could be operated on the Baltimore and New York agreements," says Bittner in his statement. He adds: These facts more clearly than ever demonstrate the perfidy of the coal operators, who abrogated the wage agreement with the United Mine Workers."

Three large miners' houses at the Berry Mine of the Monongah Coal Co., formerly controlled by the Soper-Mitchell interests, in Scotts Run, Monongalia County, near Morgantown, were burned down Sunday night, Oct. 18. Fumes of gasoline caused county officials to be suspicious concerning the origin of the fire.

---

## Wertheim Elected President Of Burns Bros.

Sanders A. Wertheim, vice-president of Burns Bros., New York coal dealers, was elected president and J. S. Bache was elected a director on Oct. 13. Mr. Wertheim has filled the office since the resignation of Frank L. Burns, a few months ago. He became actively identified with the firm at the time that S. M. Schatzkin and interests represented by him gained control of the firm. Mr. Wertheim organized the Steamship Fuel Corporation and the Wyoming Valley Coal Co., both acquired recently by Burns Bros. Regular dividends were declared.

*Photo by Harris & Ewing*

**Wayne P. Ellis**

The Lake Superior Coal Dock Association, with headquarters in Minneapolis, has formally dissolved, by unanimous vote of its members. The membership owned coal docks at Duluth, Superior and Ashland, and was a continuation of the Northwest Coal Dock Operators' Association. To continue the work of freight and traffic matters performed by the dock association, Wayne P. Ellis, formerly secretary, has formed a private business, known as the Ellis Coal Bureau, with offices at 1001 Plymouth Building, Minneapolis. He has taken over the organization of the dock association and will provide for clients the service formerly supplied by the retiring association. It will include statistical information as to coal production, movement and stores, credits and trade matters, and legislation.

---

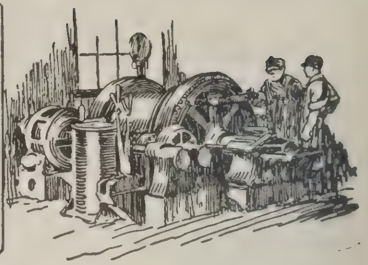
## Seek Broad Gage Director for Bureau of Mines

Developments at the Pittsburgh meeting of the U. S. Bureau of Mines advisory committee, Oct. 19 and 20, foreshadow clearly that the economic phases of mining will be emphasized in the renascent Bureau. It seems probable that the coal and minerals divisions of the Bureau of Foreign and Domestic Commerce will be transferred to the Mines Bureau.

The committee is anxious to recommend for the directorship, it was revealed, one who has had experience in the practical operation of mines, mills and smelters. At the same time the director must be well grounded in the scientific questions which confront the industry, including geology. He shall, also, preferably have had experience in coal mining as well as in metal mining. A knowledge of the mining situation in Alaska is desirable, and there is real need that the man shall have had foreign experience, particularly in Latin America.

An engineer who has had enough contact with the government service to be familiar with its machinery and methods of procedure would appeal to the committee. Transportation has come to have a more important bearing on the mining industries than ever before, so the qualification that the new director be familiar with transportation matters has been added.

# Practical Pointers For Electrical And Mechanical Men



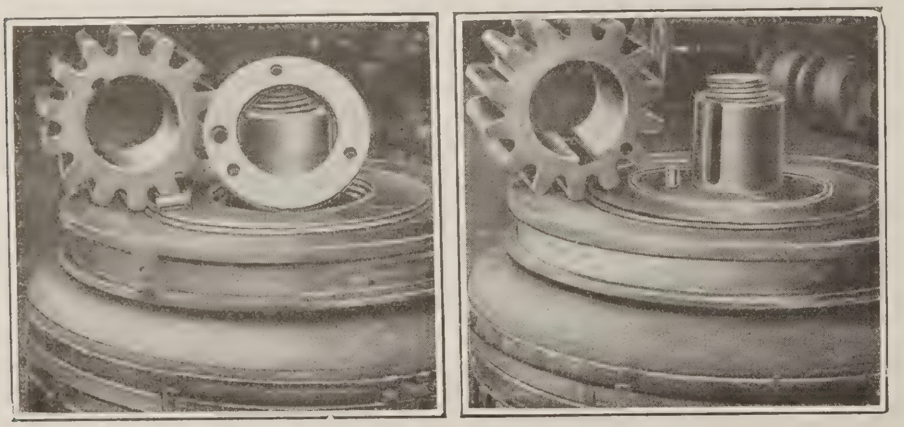
## Locks Ball-Bearing Nut on Shaft By Pinning to Pinion

Most mine electricians will agree that a need exists for a more satisfactory method of locking the ball-bearing nut on the pinion end of mine locomotive armatures. The chief objections to the method commonly in use are a lack of reliability, damage to threads and difficulty in removing the nut.

A method of locking which is, perhaps, somewhat out of the ordinary has been adopted as standard at the mines of the Island Creek Coal Co., in West Virginia. Instead of the nut being fastened directly to the shaft it is locked to the pinion by means of a pin, consisting of a $\frac{3}{8}$ x 1 in. counter-sunk head rivet. The pinions, which are hardened steel, are ordered from the factory with a $\frac{3}{8}$ x $\frac{3}{4}$-in. hole drilled in one end at a point near the keyway. A $\frac{3}{8}$-in. rivet projecting from the bearing nut extends into this hole in the pinion.

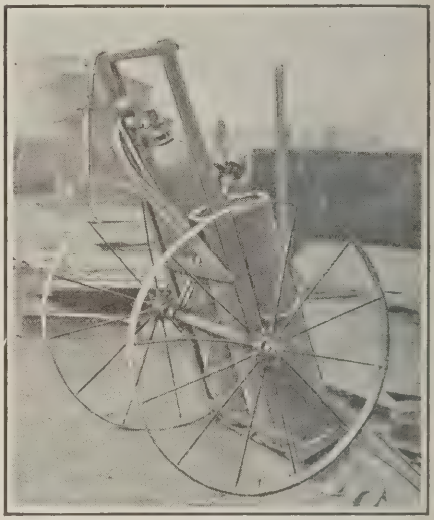
This device is assembled in the following manner: The bearing nut is first set down to its limiting position, then the pinion with a dummy or pilot pin inserted in the hole is assembled loosely on the shaft and the exact position of the pin marked on the nut. This latter is then removed and drilled, the hole being counter-sunk on the bearing side. The rivet is then slipped into place and the nut screwed tight into its final position. Placing the pinion on the shaft and keying it in place completes the lock.

A natural question to ask in regard to this method of fastening is this: Does not the hole in the side of the pinion reduce its strength? L. D. Thompson, chief electrician of direct-current equipment for the Island Creek company, answers this as follows: "The hole is only $\frac{3}{4}$ in. deep and we have had no broken pinions." He has found this method of nut locking to be a big improvement over others with which he has had experience.



**Removing the Pinion Unlocks the Bearing Nut**

In the illustration on the left the bearing nut has been removed from the shaft in order to show the counter-sunk hole and the rivet. At the right the nut is in place and the rivet is held secure by the butting of its head against the ball bearing beneath it. The lock is completed by the end of the rivet fitting into the hole in the end of the pinion.



**Welding Outfit and Cart**

This cart built up chiefly of structural shapes and mounted on steel wheels of large diameter, furnishes a ready means of moving the welding torch and its necessary equipment to any point where desired. One or two men can pull it almost anywhere but if time is short and the distance long a horse, wagon or automobile may be used to furnish the motive power for transportation.

---

## Welding Cart Facilitates Odd-Job Repairs

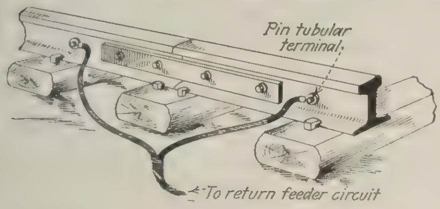
With the extensive use of the oxy-acetylene torch for various purposes in and about the mines has come the need for some means of readily transporting the necessary outfit from place to place. The accompanying illustration shows the "welding cart" built and used at the Valier mine of the Valier Coal Corporation, Valier, Ill.

The outfit used in both cutting and welding consists of the oxygen and acetylene cylinders, the torch, and the hose connecting it to the cylinders, together with the necessary regulating valves and pressure gages. When work has to be done anywhere about the plant, except at the shop where permanent arrangements have been made for autogenous welding, it is necessary to transport the entire outfit to the point of application.

The cart here shown consists of a framework built up of light structural shapes, chiefly angles and straps, picked up from odds and ends about the shop. This is mounted on an axle carried between two light steel wheels of large diameter. These wheels look as if they had at some time graced a corn cultivator or similar agricultural implement. Their light weight and large size make transportation of the outfit easy even though this be over fairly rough ground.

## Simple Attachment Gives Good Service

The accompanying sketch illustrates a method by which a return feeder cable may be successfully attached to the haulage road. I have seen employed around the mines many different methods of attaching return feeders to the rails but most of them are not one hundred per cent perfect. That this particular method is good is evidenced by the fact that it has been in service for twelve years and a recent test on it with a standard bond tester (it acts as a bond also) shows that it is comparable to any pin tubular bond that recently has been put in service.



**Return Feeder Connection Is Easily Made and Lasts Long**

A double attachment is made to the track by a connector which also serves as a bond. The fact that it can be easily installed and protected makes it most valuable.

Although it has given no trouble this method of fastening cables to the rails possesses more than one advantage. In case the cable is cut by a car jumping the track, a new connection can be made quickly and permanently installed.

Another big advantage is that the connection cannot readily be sheared off by the flange of a wheel because it can be buried deeply in the dirt around the ties and thus be protected.

Harry Guilford.

**Bearing Reinforced by Forged Band**

This bottom plate with step plate assembled has just come out of the Holden shop of the Island Creek Coal Co. and is ready for sending to any of its mines. Because in some instances the casting surrounding the intermediate bearing of the step plate has broken in service, this part is now reinforced by a $\frac{1}{2}$ x $1\frac{1}{4}$-in. forged band shrunk around the top.

## Roof Leaks Stopped by Changes to Idler

At Orient No. 2 mine, located at West Frankfort, Ill., a short-center, belt drive, with idler, forms the connection between the 300-hp. motor and the fan. As originally installed, the idler pulley was held up against the belt by a weight suspended from a wire rope which passed through sheaves hung from the steel purlins of the roof structure.

This proved unsatisfactory because vibration from the idler was transmitted to the roof and caused leaks in the joints between the concrete roof tiles. The roof span of this building, which houses the auxiliary hoist and substation equipment as well as the fan, is approximately 40 ft. and was not designed for additional loads such as imposed by the idler.

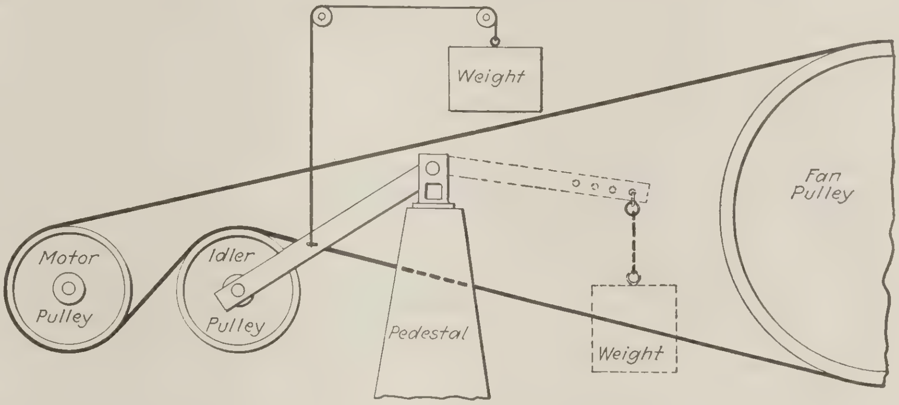


**Fig. 1—Dotted Lines Indicate Changes Made to Idler**

The arms supporting the idler pulley were keyed to the pedestal shaft. The weight was removed from the ceiling mounting and hung on an arm which was added and likewise keyed to the shaft.

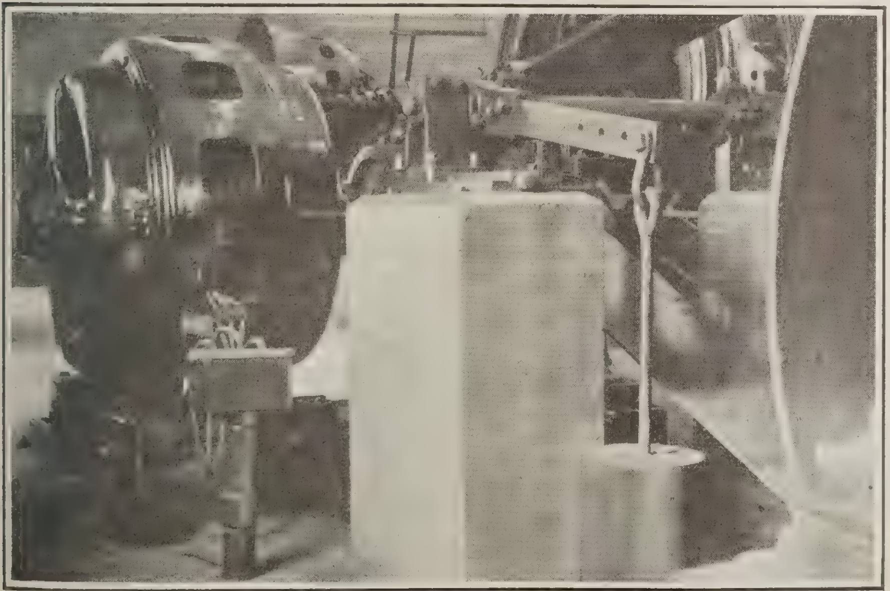

**Fig. 2—The 300-Hp. Motor Driving New Orient's Fan**

The weight hanging on the projecting arm tends to rotate the shaft, thus holding the idler pulley up against the belt. Originally idler tension was maintained by a weight hung on a cable carried through sheaves attached to the roof. Vibration caused leaks in the roof, these occurring between the concrete roof tiles.

### Weight Can Be Shifted

The trouble was overcome by changing the idler weight to the position indicated by the dotted lines in Fig. 1. Originally the arms supporting the idler pulley were not keyed to the shaft. Keys were applied, a third arm added, and the weight hung near the end of this arm. Adjustment of the belt tension is accomplished by changing the weight to the various holes in the arm. This gives the weight more or less leverage as may be desired.

Orient No. 2, known also as New Orient, is equipped for an ultimate capacity of 12,000 tons per day, and now holds the world's record, having hoisted over 10,000 tons in one shift.

## Should U. S. Exchange Ideas With Germany?

Dr. Franz Fischer, director of the German Coal Research Institute in the Ruhr, recently has visited America upon the invitation of Dr. A. C. Fieldner, chief chemist of the U. S. Bureau of Mines, who, himself, had been Dr. Fischer's guest in 1924.

In conversation with a man like Fischer one very soon becomes aware of one great difference between American and German industrial establishments. The latter employ more scientists and men of broad technical training, while the former operate with relatively fewer men and bosses in every plant. This is true in mines as well as in factories. In a German coal mine not less than 800 men would be required to produce 2,000 tons a day, and too much work is done by hand—for instance in dumping and screening coal, many cars are pushed by man-power, and there is more bossing of men than is necessary. The German has no idea of American speed, but he wastes no material and every mark invested in the plant has to bear interest. Byproducts are utilized with the utmost care, and the greatest scientific ingenuity shows itself in the development of highly complex chemical compounds out of inferior raw materials.

Recently the Germans have developed a system of producing synthetic petroleum from heated cokes and water-vapors. This artificial oil is called "Synthol" and can be produced at an expense of 24c. a gallon. In America, oil is pumped out of the ground much cheaper than we could make it, but in a country which has almost no oil wells and whose supply of kerosene depends entirely upon foreign sources, the people may, under certain circumstances, be willing to pay $7.50 for a barrel.

### FOLLOW ECONOMIC FORCES

The early American industries were handicapped by a shortage of workmen and, therefore, developed labor-saving devices. Germany's natural resources are small in proportion to her population, and she had to economize in material. One country has become a leader in labor management, the other in the saving of raw materials and byproducts.

In Germany some coal companies want to organize mines on the American plan. They are beginning to learn American labor methods, and we might well adopt some of their scientific spirit and give more chance to highly trained coal mining engineers. Surely an exchange of ideas between two progressive nations will help both.

## Value of Compensation Rates As Measure of Hazard

In reference to the article appearing in *Coal Age,* Aug. 13, 1925, p. 217, entitled "In Ohio Sixty-nine Industries Pay Higher Compensation Rates than Coal Mining" I agree with you that maximum and minimum limits on compensation necessarily affect the compensation rate. However, the effect it has within a given classification depends on the average wage levels of such classification.

Consequently, compensation rates are not always an exact index of the hazard of an industry. For instance, the compensation rate of house wreckers is much higher than that of structural steel erectors. This is due to the steel erectors working shorter hours, being more intelligent men and having a higher wage scale than house wreckers.

### LAW AMENDED IN 1923

You quote the law as it stood in 1921. In 1923 it was amended so that for an injury resulting in partial disability the compensation, while still 66⅔ per cent of the impairment of the earning capacity of the injured, was limited to a maximum of $18.75 per week and to an aggregate limit of $3,750, such compensation being in addition, however, to the compensation allowed to the claimant for the period of temporary total disability, resulting from such injury.

The compensation in case of permanent total disability was also still 66⅔ per cent but the maximum was set at $18.75 per week and at not less than a minimum of $5 per week unless the employee's average weekly wages are less than $5 per week at the time of injury, in which case he shall receive compensation in an amount equal to his average weekly wages.

Again in case of death, the $15 becomes $18.75 and the maximum, $5,000 becomes $6,500.

Since July 1, 1925, the flat rate for occupational diseases has been 1½c. per $100 in all industries, no classification rating being made on occupational disease.

E. I. EVANS, Actuary.
The Industrial Commission of Ohio
Columbus, Ohio.

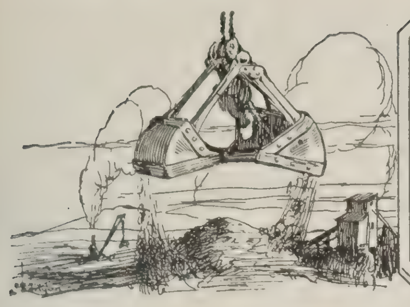
As $18.75, the maximum compensation, corresponds to a wage of $28.12 per week instead of to $22.50 per week as did the maximum former compensation of $15, the change in the compensation law has made it necessary to place the rates more nearly in accord with the hazard. The maximum of $6,500 is, however, less than $18.75 a week for eight years and is only about $15.62 which would correspond to a wage of $23.43 per week.

The effect of the hours of working on the relation of the compensation rate to the hazard is not of primary interest. What we are desirous of knowing is the hazard in relation to duration of life and not the hourly, though that may be the true hazard of the occupation. If a man worked only one hour a day his real hazard as a worker would only be one eighth that of the man who worked eight hours at the same job, and we are interested solely in the possibility of his being hurt, no matter how his immunity is attained, whether by abstention from work or in any other way. EDITOR.

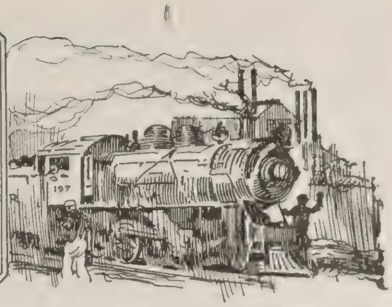
## Should Be Arched and Packed

I concur with your editorial of June 4, entitled "Coal-Dust Shelving," in which you remark that the big cavities above mine roadways are a dangerous feature. It would be much better if we would pack such places with loose rock over either arching or iron timbering, and if circumstances require cribbing, such cribs should be plentifully covered with rock dust.

GEORGE S. RICE,
Chief Mining Engineer,
U. S. Bureau of Mines,
Washington, D. C.



# Production And the Market



## Bituminous Coal Market Has Healthy Tone Though Surface Change Is Slight

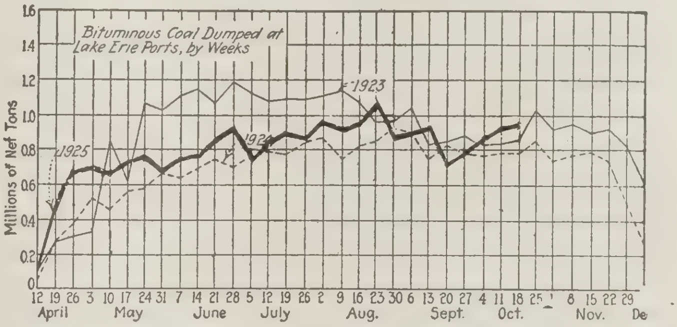
That the bituminous coal business as a whole has undergone comparatively little change in the past week is distinctly in its favor. An increase in demand appeared about two weeks ago with a cool wave, and that the trade has been able to hold its gain despite a moderation in temperature is indicative of healthy underlying conditions. There is not much balm, of course, for those who were banking on a panicky public willing to pay any price for coal as a sure result of the suspension of operations at the anthracite mines. As a matter of fact, the hard-coal strike has had far from the expected effect on the soft-coal trade; nor, for that matter, does the regular steam coal trade give any marked outward indication of increased activity, but liberal shipments are being taken on contracts and consumers are building up stocks. All in all, the tone of the market is better, shopping around and price shading being less in evidence.

"No bills" are less numerous in Illinois and though shipments of screenings have been heavier the market has been able to absorb them and maintain prices firmly. West Virginia smokeless is regaining strength, especially in Midwest markets, though the demand is quite light in New England. Strangely enough, Pennsylvania coals show a firmer price tendency than West Virginia fuels in the Northeast.

Business in Kentucky has been shifting back and forth with the weather, with a slight net gain. Production is a little lighter and screenings in active demand. Normal seasonal trade prevails at the Head of the Lakes and the outlook is thought to be promising. Shipments to the lakes are heavy, all records having been broken last week according to railroad figures.

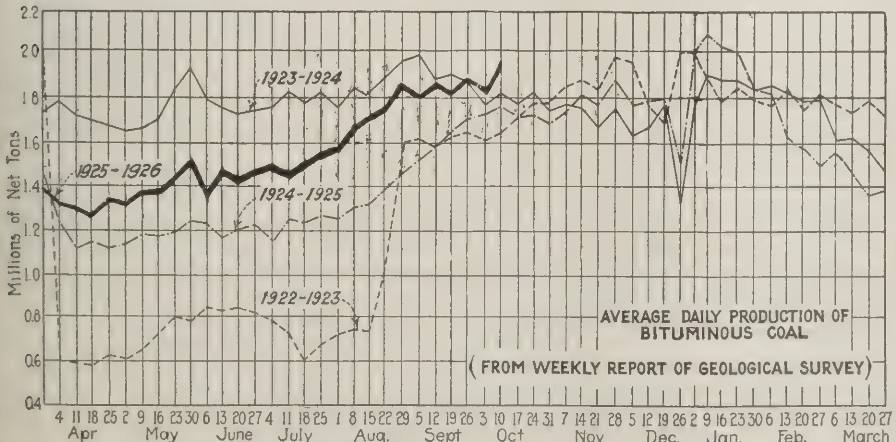
As the supply of anthracite continues to dwindle the interest of retailers and public in substitutes increases, the demand of late having become quite heavy. Coke is far in the lead, but the supply is much short of the demand, many shippers of byproduct coke being already out of the market. Sized bituminous coal is beginning to have a better call, and this is expected to improve with the suspension of the ban against soft coal in many Eastern cities. Shipments of pea coal are somewhat slower and the price of buckwheat has been advanced 25c. by one of the old line companies. Some independent pea and buckwheat can be picked up in in New York harbor, but there has been no clamor for it because of the prices asked. Though $16 has been pronounced a "reasonable" price for domestic coal in New York, retail quotations are as high as $23.50.

Bituminous coal production in the week ended Oct. 10 is estimated by the Bureau of Mines at 11,696,000 net tons, the largest weekly output since last January. This compares with 11,008,000 tons in the preceding week. Anthracite output was 13,000 net tons.



*Coal Age* Index of spot prices of bituminous coal on Oct. 19 stood at 176, the corresponding price being $2.13.

Dumpings at Lake Erie ports during the week ended Oct. 18, according to the Ore & Coal Exchange, were: Cargo, 885,659 net tons; steamship fuel, 48,774 tons—a total of 934,433 net tons, compared with 924,668 tons in the preceding week. Hampton Roads dumpings in the week ended Oct. 15 totaled 355,202 net tons.



### Estimates of Production

(Net Tons)

(*a*) Revised since last report. (*b*) Subject to revision. (*c*) Minus two days' production to equalize number of days in the two years.

## Midwest Thankful in Holding Its Own

There has been remarkably little change in the Chicago market in the last week. Demand for prepared coals keeps up fairly well, but not enough to warrant operators increasing prices; in fact, producers are thankful it has not slumped enough to necessitate a cut. Six-inch lump is still most wanted, with 6x3-in. furnace and 3x2-in. small egg running fairly close.

Illinois operators have reduced "no bills" at mines in the last ten days, principally on account of a little cold weather. This more or less implies a production of more prepared sizes, and this has brought about somewhat heavier shipments of screenings. The market has absorbed these extra screenings and prices remain firm at the old level—$1.60@$1.75 for Franklin County and good southern Illinois 2-in.

Coal from strip mines in the north central part of Illinois and the Clinton field of Indiana are coming into Chicago in increasing quantities. The fact that operators of strip pits can put their coal on the cars at a relatively low figure is the main thing that keeps prices so low on the much higher grade steam coals from the southern part of the state.

No one pays much attention to the anthracite situation, as there is no shortage of hard coal in Chicago and apparently dealers have in reserve enough to take care of their needs for the next two months. The coke people have taken advantage of the situation, however, and have increased prices on domestic grades approximately $1 a ton. This is not particularly noteworthy, as coke prices in Chicago have been relatively low for the last six months.

Pocahontas coal coming into this market sells at around $4.25@$4.50 for domestic sizes; mine-run around $2. Shippers of smokeless think the price slump is about over, and a gradual improvement can be looked for. High-volatile coals from Kentucky and West Virginia are moving through Chicago in fair volume, although little of them is being disposed of in Chicago. Prices vary from $2.50 to $3.50 for 4-in. block, according to quality, and on egg run all the way from $2 to $2.75.

Cold weather is beginning to move southern Illinois coal, especially the domestic sizes. The lump is moving freely, egg fairly well, but nut is slow and steam sizes are heavy. Better working time prevails in a general way throughout the field at the shaft mines, although rainy weather has stopped the activities at strip mines to a considerable extent. All mines have a large number of "no bills" of different sizes on hand and are trying to keep the sizes most in demand ahead. Many mines in the field have not opened up but gradually they are beginning operations and it is evident that some of them will not resume this winter.

In the Duquoin field there is no change. Four and five days a week seems to be the best working time a couple of the mines get and the others average three. Small sizes are heavy here with no change in prices. In the Mt. Olive

|---|---|---|---|---|
| | Oct. 19 | Oct. 12 | Oct. 5 | Oct. 20 |
| Index | 176 | 175 | 175 | 176 |
| Weighted average price | $2.13 | $2.11 | $2.11 | $2.12 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

district there is an improvement in railroad tonnage and domestic sizes are moving well. Steam is a little heavy. Mines here are getting four to five days a week.

The Standard field is having a hard time pulling through. Prices are low and demand is not good. Working time at mines that are working ranges from three to four days a week, with the usual exception, and railroad tonnage is light. No immediately bright prospects are in line for this district and there is still considerable discontent among the miners, who know that a lot of western Kentucky coal moves through their territory and is delivered at a much lower price than Illinois can hope to meet and that serious inroads have been made in the Standard market by strip mines in southern Illinois.

There is an improvement in the domestic situation at St. Louis. Middle grade coals are moving fairly well and high grades show some improvement. There is little activity in the movement of anthracite, coke and smokeless. Country domestic is picking up fairly well, but country steam is slow. Local carload steam is fairly good and wagonload shows considerable improvement. There is no change in prices.

### Kentucky Perks Up Some

A touch of cold weather early last week resulted in somewhat better demand for prepared sizes in Kentucky and helped to clean up some of the distress and "no bill" coal on tracks in the state. But a warm turn toward the end of the week caused a slump. Prices improved a trifle over the week, eastern Kentucky screenings having advanced until about $1.20 a ton is the low. Western Kentucky prepared also took a hitch to a high of $2 for 6-in. block.

Production has been a trifle weaker, resulting in smaller offerings of screenings, which continue in active demand. Operators still have a good deal of "no bills" on track, but with cold weather due are not trying to force the market too much by cutting prices.

The trade feels rather optimistic concerning the future, in spite of complaint about present movement and price, which has been largely due to very open weather so far. Kentucky mines ask $2.50@$2.75 for best 4-in. east Kentucky lump, with some special coals selling to the trade at $3. Two-inch lump, egg and nut prices are around $2@$2.25, some fine grade bringing $2.50; mine-run, $1.40@$1.65; screenings, $1.20@$1.35. Western Kentucky 6-in. is $1.75@$2; lump and egg, $1.50@$1.75; nut, $1.35@$1.50; mine-run, $1.10@$1.50; screenings, 90c.@$1.10.

Heavy rains over the state have given good boating stages for movement of coal, but have virtually drowned out some of the west Kentucky strip mines, production being curtailed.

### Normal Trade in Northwest

The coal trade at the Head of the Lakes is fairly normal. Colder weather has given an impetus to orders from retailers. Dock officials note an increase in the proportion of anthracite substitutes while shipments of hard-coal have been correspondingly cut down. Shipments from the docks continue in good volume, the gains being well distributed between commercial, industrial and domestic consumers.

The industrial outlook is promising and the trade figures on larger shipments to iron foundries and other plants over Minnesota. Loadings of both anthracite and bituminous coals at the docks for shipment to the Twin Cities continue to expand as a result of the revisions in freight rates on all-rail coal from Illinois, Indiana, Kentucky and Virginia made effective last spring. The docks in fact claim to be gradually regaining the trade they formerly held down there.

Thirty-four cargoes of bituminous were received by lake last week, compared with twenty-nine cargoes in the preceding week, and fourteen were reported en route.

Consumers show no disposition to fall into a panic over the anthracite strike. Many are switching to Pocahontas and other smokeless coals and demand for coke and briquets is gaining ground. Quotations are firm and unchanged in both bituminous and anthracite coals.

There seems to be a serious backwardness to the seasonal activity of the coal market in the Twin Cities. So far this fall, there has been but the customary demand for hard coal, and but a moderate demand for steam and other soft coals. Industrial demands have not picked up to the extent that they were counted upon to do. The price situation holds steady, because of the support from other districts, quite as much as from any help in this market. Southern Illinois lump is steady at $3.25; Indiana, $3@$3.25; central Illinois, $2.75@$3; western Kentucky, $2. Hocking and Youghiogheny generally hold at former figures.

The coal business in Milwaukee is brisk and seasonable, and an increase in the demand for all grades of coal would indicate that consumers are rapidly filling their bins. Pocahontas is scarce and there is almost no anthracite to be had. The last cargo of hard coal was received here more than a month ago. To Oct. 16 this season 488,234 tons of anthracite and 2,330,350 tons of bituminous have been received. In the corresponding period of 1924 623,461 tons of the former and 1,834,917 tons of the latter were received. Prices remain unchanged.

### All-Round Situation Better in Kansas

Demand for domestic sizes of Kansas coal remains strong in the Southwest and the screenings situation has improved in the last week. Screenings were beginning to pile up and the contract price of $2.35 a ton was being shaded by some operators on large contracts. The situation in Oklahoma and Arkansas remains about as it has been since Sept. 1, with buyers hesitant because of uncertain labor conditions.

Quite an improvement in demand for domestic coal took place in Colorado last week, due to cooler weather, which has speeded up production. Some mines are forced to operate on night shift to take care of the sudden demand for domestic lump and steam size. Nut continues to be a drug on the market. Anthracite mines are working full time, which is something they have never done heretofore. There has been no change in prices, the present level seeming likely to hold for the balance of the current year.

Due to weather conditions, the coal business in Utah is very "spotty." On the whole business is not as good as it ought to be, considering that few people ordered their winter supply of coal during the summer months this year. Lump coal is selling best, but no size is a drug on the market at this time. Coal for heating purposes is selling better. The car situation is no worse and it would seem that the serious shortage feared some weeks ago has been averted. There are few "no-bill" cars on the tracks now. Prices remain steady and the labor situation is all that could be desired.

### Smokeless Lively at Cincinnati

At Cincinnati smokeless egg sizings still hold the center of the stage. With added inquiries from the seaboard the asked price has gone 25c. a ton above lump, the range last week being steady at $4.75@$5 for egg and $4.50@$4.75 for lump. Practically all of the direct sales offices on Pocahontas say they are sold up for the rest of the month on sized coals and New River firms are pretty near in the same boat. Mine-run is steady and firmer and slack steady with very little to be had under $2. Trial orders for New England, following the inauguration of an all-rail rate, were another interesting feature of the low-volatile market.

Lake business still is getting a good deal of attention in the bituminous market, but hurrying consigned coal to the lakes proved costly for some concerns, as quite a bit of it got into distress and went away under the price of Cincinnati wholesalers. All records to the lakes were broken last week, according to the railway figures, which show 3,507 cars moved there, an increase of 357 cars—and this in a season where the tapering off process sometimes becomes violent.

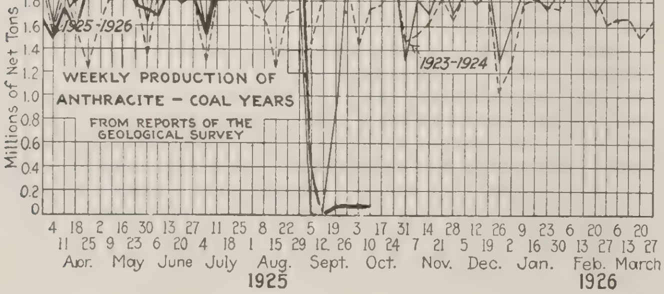
Demand for domestic sizings fluctuates with the weather. River business is back to normal with rains raising the stage. The sole menace now is the possibility of too many of the tributaries rushing in and bringing about a flood stage, which is almost as bad as no water at all.

The Columbus domestic trade is strictly a weather proposition. Retailers are fairly well stocked, but many are getting low on certain varieties and are gradually replenishing their reserves. Householders are coming into the market fairly well. Retail prices are fairly steady, smokeless grades selling at $8.25@$9; splints, $7.25@$7.75, and Ohio grades, from $6.25@$6.75 delivered. The desirable grades of Kentucky lump sell at the same levels as West Virginia splints. There is little free domestic coal on the market and as a result prices at the mines are fairly well maintained. The lake trade still holds the interest of shippers, however, providing an outlet for surplus domestic stocks. Dealers are making a good margin on their business as price cutting is not in evidence to any extent.

The steam trade is running in about the same channels as for two months, the bulk of orders being for current needs. Some contracting, generally to provide stocks up to April 1, is reported. Most of the larger consumers and many of the smaller users are covered by such agreements. Screenings are rather firm, due to the larger amount of small sizes being shipped to the head of the lakes.

Production in the southern Ohio field shows little change from the preceding week. The output in Pomeroy Bend is about 40 per cent of capacity, but in the Crooksville, Cambridge and Hocking Valley fields it is about 20 to 25 per cent of capacity.

In eastern Ohio market conditions and prices are practically unchanged as compared with a week ago. Production in eastern Ohio in the week ended Oct. 10 was the largest of the year. Three hundred thousand tons was produced, or 43 per cent of capacity, an increase over the preceding week of 10,000 tons, but a decrease under same week last year of 30,000 tons. Colder weather is stimulating domestic demand.



### Better Market Tone at Pittsburgh

The Pittsburgh district coal market had a slight increase in demand and a slight hardening in prices last week. The tone of the market is distinctly improved, but no little of the better sentiment is traceable to improvement in some West Virginia markets, expected to be reflected locally in due time.

Industrial and railroad conditions are much the same as formerly, except that steel mills in the Pittsburgh and valley districts are running somewhat heavier than two or three weeks ago. Some departments are at practically 100 per cent, and the average of mill operations all around in the two districts seems to be distinctly above 80 per cent.

Demand for domestic coal has not improved much, hardly reflecting the marked change in the weather in the past fortnight.

The Pittsburgh Coal Co.'s Midland No. 1 Mine, near Canonsburg, in the Panhandle section, just started, may be regarded as practically in the heart of the union district.

Some Connellsville coal is moving in the open market at $2 and slightly more by operators who have no coke ovens. The high price of coke attracts all coal that producers have facilities for coking.

Central Pennsylvania is now feeling the first reaction of the strike in the anthracite field as reflected in the production reports. Operators, generally, did not expect a material increase before Oct. 15, and some are finding themselves with more orders than they are able to fill promptly, but are fast overcoming this by increasing forces.

The soft-coal trade at Buffalo languishes, as soft coal, but it is doing all sorts of things trying to play the game as hard coal. With straight bituminous more complaints of no business and cut prices have come lately than in a long time. Slack moves slowest; nobody seems to want it and yet it keeps coming this way.

Quotations are weak at $1.60@$1.75 for Fairmont lump, $1.40@$1.50 for mine-run and $1.25@$1.40 for slack; $2.25@$2.50 for Youghiogheny gas lump, $2@$2.25 for Pittsburgh and No. 8 steam lump and $1.25@$1.60 for slack; $1.75@$2 for Allegheny Valley mine-run.

### New England Shows Lack of Interest

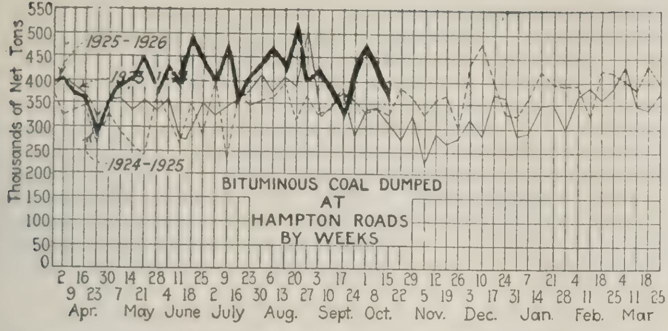
Further recessions in prices of smokeless coals have been characteristic in New England in the past week. Inquiry is light and no large buyers have shown interest in the current market. There is a general disposition to regard present quotations as not excessive and consumers will buy only from hand to mouth until there are more tangible indications of higher figures.

High-grade Pocahontas and New River continue to accumulate at Hampton Roads and in consequence the spot range has eased to $4.50@$4.75. Strictly No. 1 navy standard is being sold at $4.65 or so, but coals not so desirable are to be had at $4.50 and less. The $4.50 level means a net return of not over $1.90 per gross ton at the mines, and slack is being offered at $1.30@$1.40 per net ton, also at the mines. Movement coastwise is for the most part restricted to deliveries on contract and off shore there is little tonnage materializing.

On cars Boston and Providence, Pocahontas and New River are only in moderate request. For inland delivery prices hover around $6 per gross ton, with occasional instances of $6.10 and $5.90. On the part of retail dealers there is some call for screened smokeless coals, but in most cases the cargoes received carry so large a proportion of slack that no figure obtainable would make the practice at all profitable as a steady thing.

All-rail from Pennsylvania an active demand is developing for prepared sizes of the coals that are more favorably known. Part of this inquiry is in anticipation of probable retail demand when cold weather sets in, but it is plain that many householders are already taking low-volatile bituminous in place of anthracite. Several shippers have all the business now that can be delivered during the next there or four weeks and are expecting to realize higher prices when they again have coal available. Prices range up to $4 and $4.50 per net ton, f.o.b. mines.

Cargoes of Welsh anthracite continue to arrive from week



to week. Stocks of Pennsylvania hard coal are dwindling, but on the part of the public there seems no anxiety whatever.

### Movement Improves at New York

Better movement features the bituminous coal situation at New York. Prices show more strength in spots, but the general range continues as of last week. Some operators report better figures for the higher grades of coal. Industrial consumption has been sufficient to prevent overstocking and contract coal continues to move uninterruptedly. Screened bituminous coal gradually is coming into its own, some dealers displaying various grades, including coals from the Pocahontas and New River fields.

The Philadelphia market remains very quiet and all demands are quickly met. Meantime mining continues at the strong pace established some weeks back and of necessity some new business must be developed if the output is to be absorbed. Offerings on the spot market have been plentiful during the past week, and prices have been maintained but not without occasional evidence of softness. Those houses endeavoring to find a domestic market for soft coal are making progress, most sales being confined to low volatile coals of hard structure. Business at tide is unusually quiet and is practically confined to bunkering.

At last there is some real excitement in the Baltimore bituminous market as prices keep jumping on prepared sizes. The coke market also is doing a runaway stunt, and it would not be at all surprising to the trade generally to see a big upward swing soon in industrial coals other than prepared sizes. Surpluses are disappearing at tide and apparently the trade will soon be out of the long era of oversupply and under-prices. After a long lapse, the bringing of coals by steamer from Norfolk to this port has been resumed. Export movement has fallen flat, no shipment having been made since Oct. 5.

At Birmingham the demand for steam coal continues very good with no change of importance in market conditions from a week ago. Inquiry is fairly active in the open market and the aggregate of orders booked amounts to considerable tonnage. Industrial, utility, railroad and general demand calls for a record weekly production for the year. High-grade mine-run and washed coals have the best call, but the more inferior qualities are being moved with little delay. Byproduct coke ovens are running full, there being need for a large amount of furnace coke, while foundry and domestic sizes are finding a ready market.

A short spell of cool weather in the past week gave an impetus to the retail domestic market and dealers throughout this territory booked sufficient business to keep them busy for a week or so, but yards which had considerable stocks are still holding up on contract deliveries to a great extent. A large number of small orders on the mines for prompt shipment helped to relieve the situation to some extent. Quotations on steam and domestic grades are stable on the basis of schedules in effect for several weeks.

Production has improved materially during the past three months, the output for the week of Sept. 26, the last figures available, being 404,000 net tons. The total production to date is now only slightly under that for the corresponding period of last year.

### Hard-Coal Substitutes in Heavy Demand

A dearth of anthracite at New York has resulted in heavy demand for substitutes, especially coke. Retail dealers are carefully doling out their remaining supply of hard coal, knowing that it will be some time before they will be able to obtain further shipments. Some independent pea and buckwheat can be picked up in the harbor, but because of the prices asked retail dealers are not importunate. Quotation of $14.75 was heard for pea coal, alongside, but it was rejected by the prospective buyer.

Users of hard coal are advised by the State Coal Commission to use substitutes, and city officials, where there are anti-smoke ordinances, are to be asked to suspend such laws during the duration of the anthracite strike.

Retail prices in Greater New York range as high as $23.50 for domestic coals, though some dealers are taking care of their regular customers at the prices prevailing prior to the inauguration of the strike. Independent buckwheat was quoted at $3 to $3.50. Rice and barley are not being quoted generally.

Coke is in good demand. Large tonnages have been received in this market and retail dealers are finding a ready market for it. Manufacturers report heavy bookings. Quotations for Latrobe egg, stove and nut sizes range from $7.50 to $8 per ton at the ovens, with furnace coke quoted at $5.50@$6.50.

Philadelphia consumers remain calm, though shipments of pea by the companies who have it in storage are a little slower. As the strike wears along retailers are slowly turning to substitutes. Most shippers of the byproduct coke are out of the market, having more orders than they can ship. Sized bituminous also is finding a slightly better market. One of the big company shippers increased buckwheat to $2.75 a ton Oct. 15, an increase of 25c. since Oct. 1.

Demand at Baltimore continues rather light considering all circumstances. The public does not seem to be uneasy about the strike, in view of the many substitutes offered. There probably is sufficient anthracite in the yards of local dealers to take care of all demands to Dec. 1. Some dealers are apprehensive that if the public gets into the habit of using cheaper substitutes for anthracite they will be lost as buyers in the future.

The Buffalo public is getting pretty wide awake to the fact that no anthracite is coming from the mines and that there is no apparent effort to get the miners to go back to work. Some seem positive that the anthracite people are going to see consumers taking up new fuel that is cheaper, or at least handier and cleaner, and will never return to high-priced egg coal. Coke goes up $1 or so every time it is sampled. It used to sell as low as $9 at the curb, but now it is often more than $12.

### Domestic Coke Trade Active at Connellsville

Eastern interests, chiefly distributers of fuel for domestic consumption, became very active in the Connellsville coke market a little over a week ago, buying both run of oven blast furnace coke and regular crushed coke. Evidently there was sharp competition in the buying. Some buyers came to Pittsburgh and Uniontown, practically picking up all offerings. The market advanced about 50c. a day for several days, having previously been a trifle weak at $4 for furnace coke. Last Friday an Eastern representative was in Uniontown and is understood to have picked up all offerings of crushed coke at $8, getting about 50 carloads.

Blast furnaces have no occasion to buy coke at this time, being covered to the end of the year at old prices, but are much concerned as to what the situation will be for first-quarter deliveries. They are not disposed to quote on pig iron beyond this year, but there is inquiry and advanced prices will have to be quoted at a venture.

Foundry coke had no strength of its own, spot buying being quite limited, but production has simply decreased when there was so much better sale for 48-hour coke, and foundry coke could hardly be bought now at less than $7, the market ten days ago having been $4@$4.50.

Production by the merchant ovens has now advanced three-fifths of the way from the low level of last summer to the high level of early in the year, and even that did not tax the resources of the region in equipment or men. The main point is whether production can be increased further without labor unrest developing.

# Foreign Market And Export News

## Contracting in British Market Hampered By Uncertainty at Subsidy's End

The expected improvement in the Welsh coal trade has not yet materialized. General inquiry for coal appears to have improved a little but the chief difficulties of colliery owners are the enormous stocks at the pitheads and the failure to obtain day-to-day clearance of rolling stock. This means that on many days two-thirds of the pits are idle. A few contract inquiries are coming to hand, but the difficulty of arranging contracts over next year lies in the uncertainty as to what will happen when the subsidy comes to an end—in April. This is a problem both for the colliery owners and the buyers. Some little business has been arranged for delivery over the next few months. Small coals still constitute a big problem, as there are immense supplies and there is little demand even at the extremely low figures quoted.

At Newcastle-upon-Tyne prospects are unexpectedly good. It is evident that buyers abroad now recognize that it is futile to hold out for lower prices, since the economic limit had been reached. In fact the tendency of prices is now upward, and but for keen German competition values would be very much higher; as it is they are firmly held and traders regard the situation now as one which justifies an advance. In view of the steady demand for deliveries of gas coke up to December, prices are firm. Contract business is in fair evidence, but mainly for small quantities. Coal and coke shipments from the Tyne are improving a little, though they are still substantially below last year's figures.

Output by British collieries during the week ended Oct. 3, according to a special cable to *Coal Age*, totaled 4,620,000 gross tons, compared with 4,395,000 tons the week before.

### Domestic Trade and Prices Weak At Hampton Roads

Hampton Roads business shows little improvement, Western and New England trade having fallen off. Warm weather seems to have cut down buying to a considerable extent and the trade at tidewater is marking time. Some fair foreign shipments are reported, but bunker trade is barely holding its own and coastwise business is at a low ebb. Domestic business is below normal for the season and prices show a tendency to weaken.

### Belgian Trade on Upgrade

A slight improvement is to be noted in industrial coals in the Belgian market, the rise in sterling and French currencies, together with a new reduction in Belgian prices, for bituminous coals in particular, having caused a drop in importations of British and French coals. In addition demand from some industries is better. Imports of German and Dutch fuels, however, have not decreased.

For domestic fuels the demand continues excellent. Since they started rising, anthracite sorts have increased on an average about 20 fr. per ton for inland sales.

On shipments to France beginning Oct. 1 Belgian producers of domestic coals raised the prices of anthracite and half bituminous grades 5 to 10 fr.

### French House Coals More Active; Industrial Grades Quiet

In the French coal market industrial coals are quiet and domestic grades increasingly active. None of the output now seems to go to pithead stocks.

No agreement having been reached at the recent meeting at Douai between the mine owners and miners of the Nord and Pas-de-Calais on the fixation of the bounty for living costs, the matter was placed in the hands of the Minister of Public Works. On the government's promise to accord French collieries all necessary measures of protection, the companies agreed to raise the bounty from 20 to 40 per cent. Loire operators also have consented to raise the allowance to 40 per cent under certain conditions.

Arrears in the shipments of domestic coals are marked, due not only to the fact that demand exceeds supply but also to a scarcity of railway trucks and to difficulties in river and canal traffic. The prices of domestic coals from Belgian collieries having been advanced Oct. 1, French mines of the Nord and Pas-de-Calais raised theirs correspondingly.

# News Items From Field and Trade

## ALABAMA

The Erskine Ramsay Engineering Hall, located on the grounds of the Alabama Polytechnic Institute, Auburn, was dedicated on Oct. 10, the ceremonies being attended by a large number of engineers and technical men from throughout the South, many of whom were alumni of the school. The new hall is the largest and most modernly equipped building of its kind in the South and was erected at a cost of around $300,000. The building is named in honor of Erskine Ramsay, of Birmingham, noted mining engineer and capitalist, who launched the movement for the building with a subscription of $100,000. The principal address at the dedication ceremonies was delivered by Charles H. Markham, president of the Illinois Central R.R.

The County Coal Co., with head offices at Birmingham and mines near Grant's Mill, on a branch of the Central of Georgia Ry., has been reorganized and passed from the control of the Sossong interests of Pittsburgh, which developed the properties and have been operating the mine for several years. The new officials are: Mr. Pritchard, president; T. M. Nesbitt, vice-president; Thomas Bowron, secretary-treasurer.

The Semet-Solvay Co., with local offices and byproduct plant at Ensley, is understood to be considering the sinking of a slope on its properties in the Blue Creek field, where the company has extensive holdings of valuable coal properties. The company at present is getting its coal supply entirely for the operation of its large battery of byproduct ovens from outside sources.

The Black Diamond Coal Mining Co. has leased the properties of the Tennessee Coal, Iron & Railroad Co. in the Blue Creek field, where the Adger and Johns operations formerly were conducted by the latter, but which have been idle for a number of years. These properties carry a considerable tonnage of the Blue Creek seam. The Adger mine has been placed in operation and is now producing several hundred tons per day, which is to be increased materially. The Black Diamond company is building a new steel tipple at Johns, in which will be installed automatic car dumpers and other modern equipment for handling the output, and a Deister concentrating table will be provided for use in the preparation of the coal. Inside haulage will be taken care of by the use of electric motors. Camp houses will be rehabilitated for the use of employees and other necessary buildings will be provided. The Black Diamond company operates a number of mines in the district and also conducts a large sales agency for coal. C. E. Bissell is president; M. O. Travis, secretary and treasurer, and Carl McFarlin, general superintendent.

The Republic Iron & Steel Co. is erecting an emergency hospital and doctor's office building at its Sayreton mine, near Birmingham. The building is of tile and concrete construction and will be modernly equipped for the care of injured employees and the medical work of the camp.

F. J. Immler, formerly superintendent of the Flat Top Coal mines of the Sloss Sheffield Steel & Iron Co., has been transferred to Bessemer as superintendent of Sloss ore mines, succeeding C. E. Barrett, who died recently. Mr. Immler was succeeded at Flat Top by J. S. Chalmers.

The Barrett Company, of Fairfield, has placed in operation a battery of twenty-six ovens for the production of coke from pitch. These ovens have been under construction for some time.

---

## CALIFORNIA

The three coal mines in Oak Run and Clover Creek, twenty miles east of Redding, have become sufficiently important to want electric power. A power line four miles long is being built to tap one of the trunk lines of the Pacific Gas & Electric Co.

---

## COLORADO

H. Van Mater, receiver for the National Fuel Co., Denver, and one of the largest coal operators in the state, has been appointed a director of the Colorado and New Mexico Coal Operators Association to fill the vacancy created by death of L. A. Hayden.

Warning that any attempt to put into effect a 20 per cent reduction of miners' wages on Oct. 15 would result in prosecution for violation of the state industrial laws, was given Oct. 8 to H. H. Parker, of the Boulder Coal Mining Co., at Boulder, by William I. Reilly, chairman of the State Industrial Commission. Parker notified the commission by letter that such a reduction in wages would be made on Oct. 15, and Chairman Reilly pointed out that the state laws require a 30-day notice of any change in wages or working conditions to be sent to the commission before such change is put into effect.

The general store of the Colorado Supply Co. at Segundo, and its entire contents were destroyed by a fire at 1 a.m. Oct. 12. The loss is estimated at $30,000. The fire is believed to have been started by incendiaries, and an investigation is under way. There have been a dozen fires in the various Colorado Fuel & Iron Co.'s camps in southern Colorado during the past two years, all of which are believed to have been of incendiary origin. The Colorado Supply Co. is an auxiliary of the Colorado Fuel & Iron Co.

---

## ILLINOIS

Zeigler Mine No. 2, of the Bell & Zoller Coal Co., at Zeigler hoisted 7,447 tons of coal in seven hours and forty-three minutes on Sept. 22. This beats the mine's previous record of 7,251 tons hoisted, made Feb. 21, 1925.

Negotiations with six major mine operators in the Fifth and Ninth Illinois districts with a view to merging their interests in a $30,000,000 corporation headed by Herbert E. Bell, of Chicago, resulted in unfavorable replies, according to an announcement by Henry R. Platt, counsel for Mr. Bell.

The St. Clair County Board of Supervisors has ordered all abandoned coal mines closed, the shafts filled with earth and then securely fenced to prevent accidents. A recent inspection tour conducted by Supervisors C. D. Schafer, O'Fallon; Hugh Bevirt, Caseyville, and William French, of Lenzburg, revealed six open shafts in O'Fallon and Lebanon townships. In a few instances the shafts were not even protected by a fence.

The B. F. Berry Coal Co.'s mines at Granville, which have been idle for two years, were sealed up Oct. 8. A concrete layer has been spread across the shaft mouth. Many of the miners who formerly lived in Granville have moved away, several business houses have closed and the town has almost become deserted.

Announcement recently was made that Dr. G. H. Cady, head of the department of geology of the University of Arkansas, Fayetteville, Ark., will return to the staff of the Illinois Geological Survey Jan. 1, 1926, to serve as senior geologist, in charge of coal studies, to succeed H. E. Culver, who has accepted the position as head of the department of geology at Washington State College, Pullman, Wash. Dr. Cady was a member of the Illinois Geological Survey for nine years, leaving in 1919 to undertake investigations in China for the Yunnan Ming Hsing Mining Co. In 1920 he returned to this country and became head of the department of geology at the University of Arkansas. He has the distinction of preparing more bulletins for the Illinois Geological Survey than any other author, including reports of several of the coal districts of Illinois. Upon his return he will undertake the writing of a comprehensive volume on the coal beds of Illinois.

Diminished coal traffic is blamed for the smaller September earnings of the Chicago & Alton R.R., announces H. L. Stutz, assistant to the receivers of the company. The railway operating income of September, 1924, was $524,709, but will be lower for September last, Mr. Stutz said. The outlook for traffic, with the exception of the coal mining district, he added, was good.

## INDIANA

The Linton Gas & Coke Co., at Linton, will soon begin the manufacture of coke on a more extensive scale. W. H. O'Brien of the Sterling-Midland Coal Co., of Chicago, has leased the gas and coke plant and has started operations. The capacity will be increased to fifty tons of coke daily, together with all byproducts, and the output will be further increased later. The Linton Gas Co.'s business will not be affected. This company takes over from O'Brien all gas manufactured.

## IOWA

The Arbogast mine, Numa, opened Oct. 2 with fifty-nine miners. The mine is working with a smaller force than in years past due to the installation of new machinery.

## KANSAS

With five mines, employing a total of 500 men, on strike with the approval of the executive board of District 14, United Mine Workers, John L. Lewis, international president of the union, on Oct. 7 named a commission of three men, J. X. Cochran, of Iowa; Andrew Steele, of Missouri, and D. H. Watkins, of Iowa, to make an investigation. The strike resulted from the miners' contention that they are now required to pay the operators 70c. for dynamite fuse instead of 40c., the price that had prevailed since 1923. Mines affected are Jackson-Walker No. 42, Clemens Nos. 17 and 18, Western No. 21 and Mayer No. 7. The present contract provides no specific charge for powder and most companies through the Southwest have made no changes in their charges since the war.

A campaign to organize chapters of the Joseph A. Holmes Safety Association in the Kansas-Missouri coal mining district was launched at a meeting held in Pittsburg the night of Oct. 12. J. J. Forbes of Pittsburgh, Pa., chief engineer of the safety extension service of the U. S. Bureau of Mines, spoke. District officials of the miners' union, representatives of the operators and members of the Kansas State Teachers College, of Pittsburg, are co-operating in pushing the movement. Simultaneously the safety movement is being promoted from another angle, Clyde Sheridan and Alex Weir being in the district with car No. 6 of the Bureau of Mines with the announced purpose of staying in the Kansas field until every miner has been given an opportunity to receive training in mine rescue and first aid.

**Physician's Bungalow at an Alabama Mine**

The company physician comes into more intimate contact with the people of any community than any other individual. If he is the right kind of man he merits and receives the full confidence of all those with whom he comes in touch. This picture shows the neat, clean, "homey" dwelling that the Tennessee Coal, Iron & R.R. Co. has provided for the company doctor at its Edgewater Mine.

Night classes for miners in mining subjects are being organized throughout the southeastern Kansas field under direction of the extension division of the Pittsburgh Kansas State Teachers' College. The subjects being taught are mine gases, mine ventilation, mine timbering and safety lamps. Miners are displaying interest in the work, and teachers are having no difficulty filling their classes.

The Western Coal & Mining Co. began sinking the shaft for its mine No. 22, near Arma on Oct. 15. The coal is at a depth of 250 ft. It is predicted that when this mine is fully developed it will be the largest in the Kansas field. Coal was reached recently with the shaft in the Western's mine No. 23, near Minden, Mo. The main and air shafts will soon be connected, a tipple erected and the mine put on a tonnage production basis.

## KENTUCKY

Ray L. Phillips, Ray B. Moss and others have purchased the property of the White Star Coal Co., near Pineville, from the American Light & Traction Co., and will reopen and operate the mines.

The Old Hickory Coal Co., Prestonsburg, a new concern, formed by Julia May, A. J. May, A. J. May, Jr., and others, has arranged to start a new development in the Beaver Creek coal field, where leases have been taken on some good coal acreage. The company has been incorporated with a capital of $25,000.

The Dawson Daylight Coal Co., Louisville and Dawson, is completing a new drift mine to operate in connection with its strip mine, having three openings. Coal will start moving from this mine soon and will be loaded over the 5,000-ton tipple used in strip mining production. Another drift mine is being opened and will start loading in about sixty days.

## MINNESOTA

Henry Ford's Kentucky coal is now being handled in the Duluth market by a regular dealer, in line with the policy adopted by the Fordson Coal Co. some time ago. The Ford interests are counting upon a heavier tonnage of their coal being handled this season, over the Superior dock at Duluth, under lease to them.

At a meeting in behalf of the barge line project for the Upper Mississippi River, held in Minneapolis last week, it was stated that a 1,600-ton bargeload of coal could be brought from southern Illinois to the Twin Cities even under temporary operation at a saving of $1.30 a ton over the present all-rail freight rates. If facilities were made to cover at 2,400-ton load the saving could be made $2 a ton.

## MISSOURI

The coal mine at Bucklin, which had been idle for two years, has resumed operations on account of the increased demand for coal. The output at the mine is about one carload per day.

The Missouri State Penal Board has entered into a contract to operate inactive coal mines near Holt's Summit, Callaway County, with convict labor. The contract was executed by Lawson Price, of Jefferson City, trustee for the heirs of the Thomas B. Price and L. C. Lohman estates. The board agreed to pay a royalty of 15c. a ton for coal mined. It is hoped that sufficient coal can be mined to provide the 23,000 tons needed annually to supply the penitentiary, Bots Reformatory at Boonville and the industrial school for girls at Chillicothe and Tipton. Dr. Cortez P. Enloe, Director of Penal Institutions, estimates that the state can save $1,500 a month on its coal bills by producing its own coal with convicts.

## OHIO

Union miners, who had been on a strike at the five mines of the Ohio Collieries Co., near Athens, for three weeks, returned to work Oct. 13, pending a settlement of the difficulties. The men went out because the company refused permission to have miners at other operations in the neighborhood of the mines share the work of the regular miners. As far as loaders and the ordinary miners were concerned permission was given but when it came to drivers, track men and engineers the company desired that the same men remain on the jobs. About 1,800 miners were called out on the strike and the loss in wages has been heavy. The men went back on the understanding that the company would have its way in the matter of employment.

Striking union miners at the plant of the Brocalsia Chemical Co., at Syracuse, have been ordered back to work by union officials. The men struck because one of their number had been discharged.

Officials of the Ohio organization of the United Mine Workers have ordered 35 miners who walked out of the Syracuse mine, near Gallipolis, back to work. The walkout was caused by the company fining a miner for violation of rules.

Dumpings at the Toledo docks of the Hocking Valley Ry. from Oct. 1 to Oct. 14 inclusive amounted to 8,030 cars or 474,393 tons. Up to Oct. 14 the total dumpings for the year were 117,659 cars, or 6,694,379 tons. This is almost 1,500,000 more than last year up to that date, when the dumpings were 98,408 cars, or 5,370,523 tons. Activity is marked also at the other Toledo docks.

President Heywood, of Toledo; Vice-President G. H. Merriweather, of Chicago; R. B. Stirek, secretary and treasurer, Chicago, and R. A. Cochran, of Washington, commissioner of the American Wholesale Coal Association, were the guests of the Cincinnati members at a dinner held at the Chamber of Commerce, Oct. 9. Commissioner Cochran predicted that the hard-coal strike would be dumped in the lap of Congress before the next session was well under way. He said, also, that a survey showed that a large proportion of the legislators were determined to act on some sort of legislation that would prevent further upheavals in the industry.

Earnings of 499 miners employed in the four mines of the Pittsburgh Coal Co. in the Pomeroy for the last two weeks in September were $31,933.34, or an average of $72.58 for each man employed at the operations. These mines have been operated under the 1917 scale for the past few months and are loading about 8,000 tons of coal weekly.

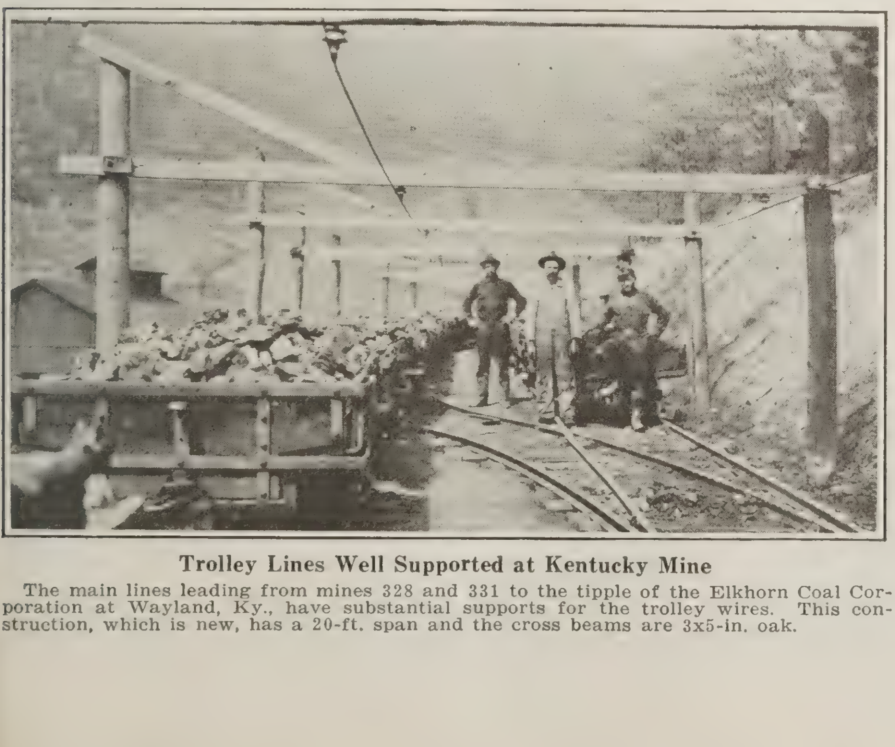
## OKLAHOMA

Following examination of fifteen witnesses for the plaintiff coal operators, who are asking injunctions to restrain miners in the Henryetta and McAlester fields from alleged interference with the operation of mines with non-union labor, Federal Judge R. L. Williams resumed the hearing Oct. 17. It was expected to require about three more days to complete testimony and it was expected that when court adjourned at McAlester it would convene the following Saturday at Okmulgee.

## PENNSYLVANIA

A. P. Cameron, who has been general manager of the mines of the Westmoreland Coal Co., with offices at Irwin, Westmoreland County, for many years, was elected vice-president in charge of operations at the regular monthly meeting of the board of directors on Oct. 14.

Railroads report that 75 mines operating in the greater Pittsburgh district produced in the week ended Oct. 10 a total of 334,886 tons of coal. This compares with 328,722 tons in the preceding week. Included in this total, according to the report to the Pittsburgh Coal Producers' Association, were the member mines which produced a total of 71,805 tons, or 11.8 per cent of capacity. This compared with 12 per cent in the preceding week and 42.4 per cent in the same week last year.



**Trolley Lines Well Supported at Kentucky Mine**

The main lines leading from mines 328 and 331 to the tipple of the Elkhorn Coal Corporation at Wayland, Ky., have substantial supports for the trolley wires. This construction, which is new, has a 20-ft. span and the cross beams are 3x5-in. oak.

After over 24 years' service as a mine inspector, Joseph Williams, of Altoona, retired from the service on Oct. 1. His territory was the Tenth bituminous district, embracing Blair and a portion of Cambria county. He came from Wales to America at the age of 25 and went to work in the mines in Jefferson County, later going to Cambria County, being employed at Vintondale when he received the state appointment. Upon a recent visit to Altoona, Governor Gifford Pinchot took occasion to highly commend Mr. Williams upon his long and faithful service to the state and to the coal mining industry. His place has not been filled. An examination was held in June for applicants for the place and there is a long list for the Governor's selection.

Announcement was made last week of the purchase by the Lehigh Valley Coal Co. of the coal tracts owned by the Stevens Coal Co. in Exeter borough, Luzerne County, near Pittston. The Stevens company suspended mining some years ago. The coal lands, though not extensive, are considered valuable. The new owners will start at once to remove the water from the abandoned workings in order to have the mine ready for resumption of production following the suspension. The coal mined will be carried underground to a nearby Lehigh Valley company breaker.

The Corrado Coal & Coke Co. announces the resumption of 186 coke ovens at Fort Hill, Raineytown and Clarissa plants. The Peerless Coke Co. started 36 ovens at Alverton and the Southern Connellsville Coke Co. started 50 at Cheat Haven.

## WEST VIRGINIA

On Oct. 15 the West Virginia Coal & Coke Co. resumed operations at its Coalton mine, in Randolph County, which had been idle for some time. One of the battery of coke ovens long in idleness also was put in blast.

M. L. Garvey, president of the New River Operators Association, with headquarters at Mt. Hope, was injured in an automobile accident Oct. 10 on the Midland trail while on his way to White Sulphur Springs. Mr. Garvey also is president of the Maryland New River Coal Co., operating at Winona, in Fayette County.

There is to be no increase in the wage scale for miners in the Williamson field of West Virginia for the time being. That was decided at a meeting of the Williamson Coal Operators Association held on Oct. 7, when the question was brought up. The banquet and meeting was attended by 150 coal operators who reported increasing activity in the field. Figures made public show that 95 per cent of the mines in the field are working at capacity.

A coroner's jury investigating the death of two miners at the No. 2 mine of the Lake Superior Coal Co., four miles from Welch, on Oct. 3, found in a verdict rendered on Oct. 6 that gas, probably ignited by an arc from the connection of a cable "nip" and trolley wire, caused the explosion. The inquest was conducted under the direction of R. M. Lambie, chief of the Department of Mines. The explosion was local in character and the mine was only slightly damaged. Operations were resumed on Oct. 7.

The Bethlehem Mines Corporation announced on Oct. 9 that Norman A. Emslie has been appointed superintendent of the Marion Division; Charles F. Welty, chief mine inspector, has been named superintendent of Barrackville mine, No. 41; G. H. Thorn made chief engineer of Marion Division in place of Mr. Emslie, and C. R. Bissell, chief engineer of the Preston division.

Due to accumulated coal loads an embargo was placed on Baltimore & Ohio R.R. coal shipments to the lake docks at Fairport, Ohio, last week. The embargo will continue until further notice, according to the railroad officials. Lake shipments continue to Lorain, however, but this port also is likely to be embargoed any time, it is feared.

Four night classes for miners employed in the mining industry recently were organized in McDowell County under the asupices of the extension department of the College of Mining of West Virginia University. A fifth class, at Gary, is already scheduled with an enrollment of 33 men. The classes so far organized show Welch with 15 members, Twin branch with 15, Kimball with 12 and Coalwood with 24. A mining class has been started at Mt. Hope, in Fayette County, under the same direction, as well as at Williamson, Montgomery, Logan and Wheeling.

Announcement of the incorporation of the Logan Block Coal Co., with an authorized capital of $125,000 was made at Huntington Oct. 5 by the incorporators. The company is to operate in Logan County, on mining property formerly owned by another company. Incorporators are A. J. Dalton, J. A. Kelly, C. B. Brown, S. M. Sowder and E. L. Hogsett, all of Huntington. A. J. Dalton was for a number of years president and general manager of the Main Island Creek Coal Co. and J. A. Kelly was vice-president of the same company. The Main Island Creek mines are now owned by the West Virginia Coal & Coke Co.

### CANADA

The International Coal & Coke Co., Ltd., Coleman, Alta., has given a contract for a pneumatic coal separating plant and tipple to the Manitoba Bridge & Iron Works, Ltd., Winnipeg. The tipple will be equipped with a balanced Marcus screen and the separating plant will have three type SJ 60-84 American pneumatic coal separators to treat sizes from 3 in. to ⅜ in. and three type Y to treat sizes up to ⅜ in. The separators will be manufactured in Canada for the American Coal Cleaning Corp., Welch, W. Va. The screening will be done by "Hum-mer" screens. The separating plant will have a capacity of 200 tons per hour.

## Traffic

### State Commission Lacks Power To Award Reparation

The Kansas Public Service Commission can simply pass on the reasonableness of intrastate freight rates and is without power to award reparation if exorbitant rates have been collected, the commission announced in Topeka, Oct. 14. In refusing the Western Shale Products Co.'s petition for reparation on freight paid on coal shipped from Arcadia, Kan., to its plant in Fort Scott, Kan., for a 3-year period ending May, 1925, the commission said the rates were too high, as evidenced by the fact that they have been reduced, but that it was without authority to make an order allowing reparation for alleged overcharges.

Approval has been given by the New York Public Service Commission of the cancellation of commodity rates of the Erie R.R. on bituminous coal and coke, carloads, minimum weight 40,000 lb., except when contents of car weigh less than minimum the car must be examined by weighmaster and if loaded to full carrying capacity shipment will be billed at actual weight, from Corning to local stations, and the restoration of mileage rates; effective Oct. 29. Also the cancellation of commodity rates on coal and coke on carload shipments of the Erie R.R. from Elmira to local stations and restoration of mileage rates; effective Oct. 28.

The Lehigh Valley R.R., with the approval of the New York Public Service Commission, has cancelled the carload commodity rate of $1.76 per net ton on coke from Geneva to Lockport (on the Erie) and restored the combination rate; effective Nov. 3, 1925.

Freight rates on bituminous coal from points in southern Illinois to points in southeastern Missouri and northeastern Arkansas are not unreasonable in the opinion of the Interstate Commerce Commission examiner who has considered a complaint from the Scott County Milling Co. He recommends that the complaint be dismissed.

## Association Activities

At the annual meeting of the board of governors of the **Alabama Mining Institute** held Oct. 13, Frank Nelson, Jr., was re-elected president, and Charles A. Moffett, president of the Gulf States Steel Co., was elected to the vice-presidency, succeeding George F. Peter. Mr. Peter is a member of the new board of governors. James L. Davidson was again named as secretary, a position he has filled with distinction for several terms and under whose administration the Institute has greatly extended its usefulness in the compilation of statistical records and the dissemination of information of much benefit to the members of the organization. H. E. Mills, assistant secretary and statistician, has been connected with the Institute for a long while.

## Coming Meetings

**American Iron and Steel Institute.** Twenty-eighth meeting, Oct. 23, at Hotel Commodore, New York City. Secretary, Howard H. Cook, 40 Rector St., New York City.

**National Association of Manufacturers of the United States of America.** Thirtieth annual convention, Oct. 26-28, Hotel Statler, St. Louis, Mo. Noel Sargent, secretary to Fuel Supply Committee, 50 Church St., New York City.

**American Society for Testing Materials.** Committee meetings, Oct. 27-29, Hotel Cleveland, Cleveland, Ohio. Coal and Coke Committee at 2 p.m., Oct. 28; A. C. Fieldner, chairman.

**Canadian Institute of Mining and Metallurgy.** Annual western meeting, Nov. 3-5, Winnipeg, Manitoba, Can. Secretary, George C. Mackenzie, Drummond Bldg., Montreal, Que., Can.

**Illinois Mining Institute.** Fall meeting, Nov. 6 and 7 at West Frankfort, Ill. Secretary, Frank F. Tirre, St. Louis, Mo.

**Harlan County Coal Operators' Association.** Annual meeting, Nov. 18, at Harlan, Ky. Secretary, E. R. Clayton, Harlan, Ky.

**American Society of Mechanical Engineers.** Annual meeting at New York City, Nov. 30-Dec. 3. Secretary, Calvin W. Rice, 29 West 39th St., New York City.

**Fourth National Exposition of Power and Mechanical Engineering.** Nov. 30 to Dec. 5, at Grand Central Palace, New York City.

**Coal Mining Institute of America.** Annual meeting, Dec. 9-11, Pittsburgh, Pa. Secretary, H. D. Mason, Jr., P. O. Box 604, Ebensburg, Pa.

## Obituary

**Joseph H. Bartley,** 44 years old, mining engineer for the Elmgrove Mining Co., Elmgrove, W. Va., and formerly connected with the McBride Engineering Co., of Pittsburgh, died Oct. 11 in Philadelphia. He resided in Pittsburgh until seven years ago, when he moved to Elmgrove. He leaves his wife, two sons and one daughter.

**W. E. Turkington,** 73 years old, a retired coal operator of Cherokee, Kan., was killed when a passenger train struck the sedan in which he was driving in Pittsburg on the afternoon of Oct. 13. Mr. Turkington was a resident of the Pittsburg district for more than half a century. He was active in coal development in the early days when the name "Cherokee coal" won a standing in the market of the Southwest which still retains value as a trade title. He retired as an operator several years ago and lived on a small farm on the outskirts of Cherokee.

**Henry E. Kinloch,** who retired on Jan. 1, 1925, as general manager of the Valley Camp Coal Co., died Oct. 14 at his home in Parnassus, Pa., following a long illness. Mr. Kinloch was well-known in the coal industry in the Pittsburgh district. Starting in the mines of England when a boy, he migrated to America after the death of his mother, and went to work in the pits at Roscoe, Pa. Twenty-five years ago he became general manager of the Crescent Coal Co., at Snowden, and twelve years ago became general manager of the Valley Camp company. He prided himself that no strike ever occurred at a mine of which he had charge. He leaves a widow.

## New Companies

**The Black Diamond Coal Co.,** Clarinda, Ia., was incorporated Sept. 23, with capital of $50,000, to engage in coal mining and to develop coal mining lands. The officers of the company are as follows: E. D. Morris, president; L. V. Harbour, vice-president and general manager; Samuel Barron, secretary; Earl Richardson, treasurer.

**The Quality Coal Co.** has been incorporated in Knoxville, Tenn., by James C. Walker, J. W. Chamberlain, 136 Hiwassee St., and others.

**The Canon Quality Coal Mining Co.** has been chartered in Canon City, Colo., with a capital stock of $125,000, by D. J. Madone, J. Madone and others.

**The Stigler Coal Co.** has been incorporated in Muskogee, Okla., with a capital stock of $250,000, by W. B. Badger, G. F. Gaffney, of Henryetta, and others.

## Supposings

UNDER A THREAT to start municipal coal yards, it is said, the retailers of New York have consented to lay in a supply of soft coal, despite all anticipated danger that the strike might be settled and the coal left on their hands, a consummation not immediately to be hoped or to be feared.

Now supposing these retailers had been mine workers—they would have made the municipal authorities afraid of executing any such move by sundry burnings and bombings, shootings and slayings,—and then they would not have had to bow to coercion.

But these are mere "supposings." They serve the purpose of showing how amenable business is to pressure and how difficult it is to coerce labor. The retailers, facing possibilities of a real loss, have done their duty and have agreed to lay in soft coal. The public will please remember that it must see that this action is not accompanied by loss. It should not leave coal on the retailers' hands after the suspension is over. It seems likely, however, that if the soft coal is used for a few months or more there will be no difficulty in getting rid of a surplus, for some, perhaps many, will be permanently wedded to the new fuel.

## Apprenticeship as Proof of Skill

A CERTAIN New York paper says, "Hard coal mining is a skilled trade. Pennsylvania laws specify a certain length of apprenticeship before the miner can be licensed to dig coal." Because this law perpetuates this conception is one reason among many for its abolishment. Hard coal mining is not a skilled trade. For many years men fresh from European farms who knew no English and had no preliminary training went into the mines and did well from the start.

A little preliminary training of say a day's duration and a little knowledge of English is what is needed and not the licensing system which is a relic of the ancient system of apprenticeship which had no excuse except where a real art had to be acquired. All that is learned from the miner with whom the laborer works could be acquired in a day. We do not say, of course, that what is learned is all that a miner should know. Somewhat more than a day, indeed, might be given to that instruction.

In some cases the miner's advice and instruction when given is unfortunate and misleading. Many bad practices are advocated and even urged on the neophyte. A day's instruction by a safety inspector would be far more efficient. The relation of miner and mine laborer is largely a case of privilege, the laws of Pennsylvania being used to keep one man subservient to another.

It has been well said that the work of the metal miner is more expert than that of the anthracite miner. That is frequently though not universally true. Yet in so far as it is true, it is interesting to note that no one has as yet advocated the licensing of metal miners.

## When Winter Comes

A WELL TIMED WARNING has been sent out by Joseph J. Walsh, the Secretary of Mines, of Pennsylvania, to all bituminous coal operators warning against the dangers of the winter, calling for the lavish use of water or rock dust in all dry mines throughout the cold weather, and bringing to the attention of operators the fact that "thousands of gallons of water are each day carried in the air current from a single mine."

Strong effort should be made to prevent the recurrence of mine explosions during the coming winter. This is not a matter to be regarded as purely personal. Each operator has a large interest in the safety of other mines than his own. The reputation of one operating concern reflects honor or discredit on all the others in the same business. Safety is a matter the coal industry cannot ignore.

The public forgets that the coal man probably has done more than any other industrialist to promote safety, but it wrongly believes that coal mining is the most hazardous of occupations and blames the operator in part for that fact. Nothing will do more to make treating with the public easy than to be able to show that the interest of the operator in safety is making the mines safer year by year.

The action of the National Coal Association in forming a safety committee and its activity in interesting the membership in safety work is one of the gratifying signs of the times. Operators everywhere should stage safety. A definite propaganda should be started to that end. In fact not only the National Coal Association but every local producers' association and every local technical institute should have a safety committee and busily promote safety.

## Bettering Ventilation

AS MINES EXTEND and the passages become longer the problem of reducing the air resistance becomes insistent, but in many cases a little patient effort at improvement will make it possible to fit conditions to the existing fan.

Thus when swags have been encountered and water gathers, the roof rock should be brushed so as to fill the space occupied by water, thus leaving room in which the air can travel. In general, also, a little shooting that will result in an even and uniform airway will be found advisable. Especially should care be taken in places where the larger volumes of air have to circulate, such as between the fan and the first or second splits. At such places every effort should be made to provide for large volume, smooth walls and rounded corners.

A little projected concrete on the ribs and roof will aid in preventing the formation of wasteful eddy currents and if this coat is made strong enough to make timbering unnecessary or to blank the spaces between timbers the gain will be considerable. The importance of all work should be rated on the volume of air to be carried per lineal foot of perimeter. Where this ratio is large, smoothness and straightness of the airway is imperative.

At overcasts the fallen rock may be so rearranged as to aid the current of air in sweeping gently up to the overcast and gently down on the other side. At best such places are points of resisted flow even though in construction a proper talus has been built on both sides of the roadway. This talus can scarcely be made too long and, if rock falls make possible its extension on either side, advantage should be taken of that.

There are two ways of amending ventilation, in the equipment and in the mine. The opportunities in the latter are often overlooked. Sometimes the fact that airways badly laid out, swags undrained and passages cluttered with rock reflect on the management causes the mine officials to favor new fans. The question should be determined on its merits, but not without a careful inquiry into the real conditions and the possibility of ultimate saving, remembering always that more air without more area means more power consumed by the fan.

## Service Pays

SOME YEARS AGO certain street-car companies purchased equipment with furnishings as elaborate as are now found in our most luxurious buses. However, some street-car magnates thought that it was not well to pamper the public by such innovations They might have to scrap a lot of other valuable equipment and buy in its place elaborate street cars that would be more costly and perhaps less economical of space and weight. Thus reasoning, the expensive equipment was shipped to South American street railroads which could be allowed to indulge in luxuries without harm to the American corporations.

In justice to the street-car companies it should be said that they were for a long time quite generally kept to old standards of price and could hardly be expected to adopt new standards of practice under those circumstances, and that the cushions are not so necessary in street cars on a track as in buses on an uneven road. Furthermore cushions are not durable, are readily cut and insanitary.

But, be these reasons of the street-car magnates valid or not, the buses profit by the hard seats and dingy coaches that the street railroads of the United States have provided for their patrons, and now the tendency is to try to win back the public to the street cars by making them just as seductively comfortable and alluring as the buses. What has all this, however, to do with coal? Just this: The anthracite region has been trying to prevent the consumer from being spoiled. He had got accustomed to slate and bone in his coal. He was complaining, but he had shown signs of convincing himself that anthracite would always be that way, and as the industry was not actively competitive it did nothing to improve its practices. But now oil comes, and coke and bituminous coal and even gas, and the operator is not so sure.

Perhaps he has erred as the street car industry did when it allowed the bus to become synonymous with pleasing, fresh paint, comfortable leather cushions and clean windows. Perhaps a better preparation might have preserved a market that seems on the point of leaving the anthracite industry. Perhaps, after all, the public would feel a little more kindly and a little less ready to run for substitutes if the service of anthracite had been a little more satisfactory.

An industry rarely really awakens till it is too late. The sleeper seldom ends his doze just at the psychological moment.

Cleaner, better-sized, coal is one of the means to win back a trade that now seems likely to be lost, but unfortunately the standards have been set low, and the industry cannot yet realize that these standards should be improved, if not as a matter of regard for the consumer, at least as a means of retaining control of a market that is fast being weaned and driven away.

When the mines start once again, each individual operator can elevate his standards. That would help a little, but, if the anthracite producers really desire to regain what they have lost and retain what they now have, they must go farther. They must see that the public knows of their good works. They must encourage the retail distributors to hold them to strict accountability for the quality of their preparation. In that way they can protect the reputable majority and make more stony the path of the dishonest retail fringe that has regard for neither the industry nor the public and that blandly mixes a car of fireproof coal with a car of high-grade fuel and offers it to the public as standard quality.

The industry should fight the indiscriminate mixing of coal as energetically as the oil producing companies are fighting the selling of an inferior article at the stations where their gasoline is vended. Perhaps, as has often been suggested, certification of all anthracite coal by an independent authority would be a cure for the present unfortunate situation.

## Taking the Long View

NO INDUSTRY, especially that of producing and marketing coal can safely take a short view of its responsibilities. If the future is to be fortunate, its problems must be foreseen. We must earn a good horoscope if we are going to enjoy it.

Unfortunately, too many regard only the present. If they can attain an immediate end they will take the short way to accomplish it and sometimes they are not too scrupulous as to what methods they adopt.

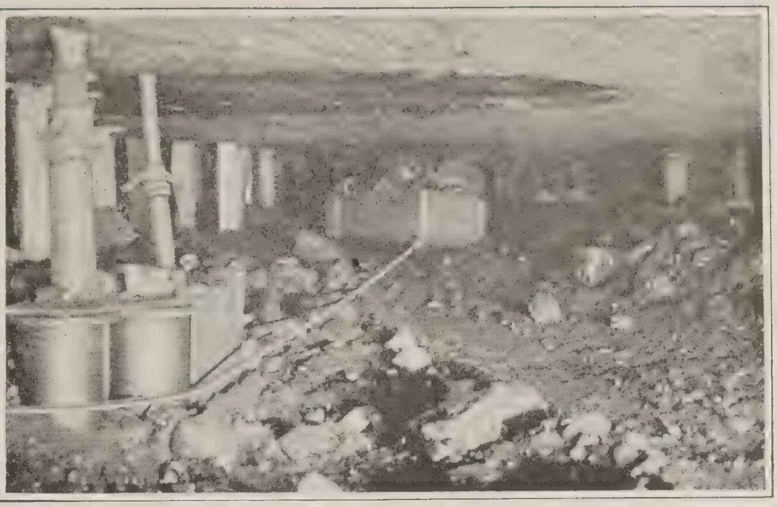
A certain degree of success by such evil methods is often attained. The miners terrorize a region and obtain advantages, only to find, after awhile, that "hard-boiled" operators alone remain in the field to do business. The more humanitarian and kindly mine owners sell out and go to other fields or change their manner of approach, and the hard or hardened men remain to make both mining and operating in the region difficult.

Nor is it different with the "hard-boiled" operator. He gets his way for a while. But quietly his best men leave and only those whom no one else will have remain. He has to take the leavings of other and better men's camps. He saves money on houses, fences, sidewalks, roads, bathhouses and safety to lose in personnel an even greater sum and to raise up difficulties that will plague him for many years.

The past is part of the present and a part also of the future. There is that in history and annals that never seems to die. For this reason, look ahead! If you wish a fortunate future in your industry and in your plant remember that you face in the present a summation of the whole past.

# Scraper Loaders Cut Cost in Two Hazard Mines

## Do Well in Thin Coal and Dipping Seams so Operators Try V Faces, Wide Rooms and Blocks



**By Alphonse F. Brosky**
Assistant Editor, *Coal Age*,
Pittsburgh, Pa.

TWO MINING companies in southeastern Kentucky are proving that in thin beds of clean coal the scraper loader fitted to a system of rather long faces produces a considerably larger output per manshift than is obtained by hand loading in conventional systems. They are demonstrating that a scraper loader will produce coal at least as cheaply from, say, a 30-in. bed as will hand loaders from a 42-in. bed, other conditions being equal.

These comparisons, which are actual, have been made without considering the indirect savings in such overhead cost items as housing facilities, track, wiring, etc., attributable to successful loader operation by reason of higher tonnages per man and greater concentration of mining. The inference is not intended that the scraper loader is adaptable only to thin beds for it has its applications to thick measures as well.

In the mine of the Ajax Coal Co., on Trace Fork, about four miles north of Hazard, Ky., two Goodman, Type 136, "Entryloader" scrapers have been in use for ten months. Three months ago the neighboring operation of the Darb Fork Coal Co. installed a similar machine. All three loaders are at work in the Hazard No. 4 bed which ranges in thickness from about 30 to 42 in., averaging about 38 in. The coal in these mines is clean from floor to roof and although comparatively soft, is tough. The floor is of hard, smooth slate which provides an excellent surface on which the scraper scoop travels. Incidentally the coal separates readily from this bottom material so that digging of the bottom is not a problem.

Massive blue slate of varying thickness forms the roof above the bed. On top of this slate is a stratum of sandstone about 5 ft. thick and above this is a lamination of shales and sandstones of undetermined thickness. The maximum depth of cover is about 1,500 ft. and the average between 400 and 500 ft.

Room-and-pillar layouts are employed for the recovery of coal by hand loading in these two mines. In the Ajax operation cross entries divide the coal into blocks 300 ft. wide. One half of the block is recovered advancing by 20-ft. rooms on 40-ft. centers. Room driving terminates at a point 150 ft. from the entry, after which robbing of the room pillar commences. The last half of the block is recovered in the retreat. In the Darb Fork mine the same general method is used except that the rooms are driven 24 ft. wide on 50-ft. centers.

The blue slate roof and the upper measures of the cover do not interfere with systematic recovery of the coal. Rooms as wide as 25 ft., or more, can be driven without much timber support. Breaks occur regularly and with little disturbance behind straight pillar lines in areas where the coal is mined completely. These experiences and the fact that the Hazard No. 4 bed is clean in these mines influenced the managements to begin loading coal with scrapers. Low coal and unfavorable room grades in parts of these mines make haulage cost excessive and sometimes prohibitive. The scraper loader gave promise—which it has since fulfilled—of simplifying haulage problems and enabling the recovery of the thinner coal.

### USED WITH LONG FACES

In a system of narrow rooms and pillars, of course, the scraper loader cannot be used to the greatest advantage. Consequently, all experiments in the Ajax mine have been with faces more or less long. While special development was being projected, two experiments with wide rooms and wide pillars were completed. In the first, a 120-ft. room face was mined advancing to a depth of 200 ft. The loading station was located on the cross-entry haulway and at one extremity of the face. The scoop was made to sweep the face and thence to traverse a dragway leading to the loading station on the entry. This dragway was protected by solid coal on one side and by rows of timbers on the other. The mined-out area in the wake of the advancing face was similarly supported.

Next, a 60-ft. room was driven to a depth of 200 ft. in a section of solid coal 300 ft. wide between cross entries, the latter being protected by 50-ft. barriers. From the side of this room a pillar 120 ft. wide was attacked from the rear and mined between the barrier limits in the retreat. Two sets of such rooms and pillars were mined in this way; but as these were not worked simultaneously, neither the loading machine, the undercutter nor the men worked during a fair part

---

So strong is the roof over the Hazard No. 4 seam in the Darb Fork mine that a dragway 20 ft. wide, as shown in the headpiece, is maintained in the robbed area leading back from the advancing face. Under few roofs could this be done. The camera set-up is on the face and in the path of the loaded scraper which is seen departing toward the entry. The two vertical pulleys held by the jack post, on the left, constitute the deflector around which the scraper swings in a right-angle turn.

of an 8-hr. shift; and the efficiency of each was rather low. Despite these handicaps the overall efficiency in these experiments, as measured by dollars and cents, was equal to that of hand loading for the entire mine.

The company was encouraged by the results of the first experiments, having mined a body of coal thinner than the average, which pitched to a greater degree than usual, under conditions impossible for hand loading methods. Not only was the cost per ton of this thin coal comparable to that of hand-loaded coal produced under the best conditions but a higher percentage of block was obtained. However, the company did not carry these experiments far enough to ascertain any marked advantage or disadvantage of the principles involved.

In the meantime the development of special loading-machine places was completed. The third experiment was carried out in a layout of V faces, inspired by the success attained with V faces and scraper loaders by the Black Diamond Collieries Co., Coal Creek, Tenn., in a bed of practically the same thickness.

In the Ajax mine the V faces were developed as indicated in Fig. 1. A 14-ft. dragway had been driven by hand loading to a depth of 250 ft. in a 300-ft. block of coal between cross entries. From each side of this dragway a block of coal, 100 ft. wide and 200 ft. long, was extracted by converging V faces, which were pocketed in the solid, leaving a 50-ft. barrier to protect each cross entry.

To develop these faces to their limits, successive cuts were "fanned out" in the manner indicated on the right side of the dragway. Having once established the V face to its full length, on an angle of about 28 deg. with the course of the cross entries, uniform cuts were made until the limit of the outby barrier was reached. Two places were worked in accordance with this plan, using one machine for each.

The disadvantages of this scheme were fully developed by the time these two places were worked out. The necessity of leaving the two barriers to protect the cross entries interfered with the successful operation of the panel. The inadequacy of ventilation in this system was another stumbling block. It was found that the development of V faces out of the solid could not be done economically with the scraper loader.

Straight-line faces could not be maintained during the pocketing operations and the natural tendency of the cutting machine crew was to round off the barrier face and to decrease the angle between faces at the mouth of the dragway, due entirely to the impossibility of tapering the cuts uniformly. When these faces were once developed, however, no further difficulty was experienced until, in the retreat, they met the outby barrier projection when again trouble was encountered in squaring up the barrier.

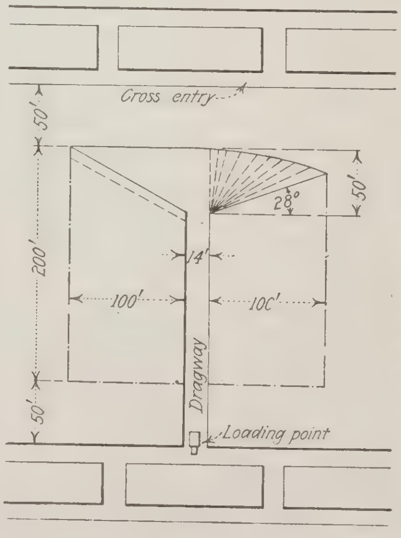


FIG. 1

**V-Face Panel In Ajax Mine**

In this layout the V faces are pocketed in the solid by successive cuts which are "fanned out" from the solitary development entry. No saving was effected by this plan of mining. Ventilation was difficult and other troubles were numerous.

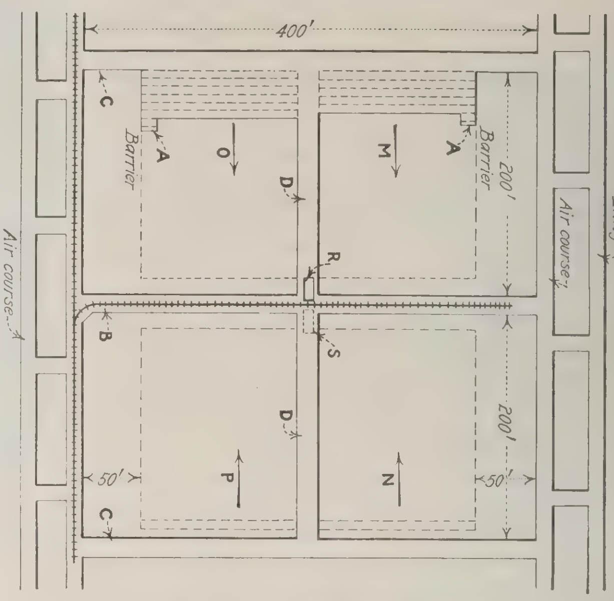

**Fig. 2—Two-Face Block Layout**

The virtue of this proposed plan is that the loading station and storage track are located in the clear of the cross entries avoiding haulage interferences. Incidentally, a comparatively large area can be mined without having to move the equipment, thus providing concentration.

Two other layouts are now under consideration. The first is shown in Fig. 2. Cross entries will be driven at intervals of 400 ft. The area between these entries will be further subdivided by single connecting entries, *B*, and single face entries, *C*, on about 400-ft. centers, respectively; also by dragways, *D*, midway between the cross entries.

Thus a block system providing great concentration will be developed. The blocks *M*, *N*, *O* and *P* will be mined as indicated, by faces 150 ft. long retreating toward the connecting entry, *B*, while cross entries will be protected by 50-ft. barriers. Cuts will be loaded from blocks *M* and *O* alternately. From the faces of these blocks the coal will be carried through the dragway, *D*, by the scraper scoop to a common loading point, *R*, on the connecting entry. The pockets *A*, will be mined slightly in advance of the faces to maintain square corners and to facilitate loading. The coal from these pockets will be shoveled by hand into the path of the scoop.

Having mined all of the coal from blocks *M* and *O*, except that in the cross entry barriers and narrow ribs flanking the connecting entry, the loading station will be transferred from *R* to *S* and mining of the blocks *N* and *P* in exactly the same way will be commenced.

This layout has an advantage in haulage in that the storage track and loading station are not on the cross entry. Thus there is no interference with haulage to and from development working faces. In developing the connecting and face entries as well as the dragways, blowers and canvas tubing could be used.

**Drilling Coal Electrically**

For rapid mining the electric coal drill is as important as the mechanical loader. These two men will drill, charge and shoot 20 holes, 7 ft. deep, on a 160-ft. face in about 3 hr.

**Scraping the Face**

A three-rope control on this type of loader imparts almost human intelligence to the scraper as judged by its movements. It hugs the face while gathering a load and then it swings clear.

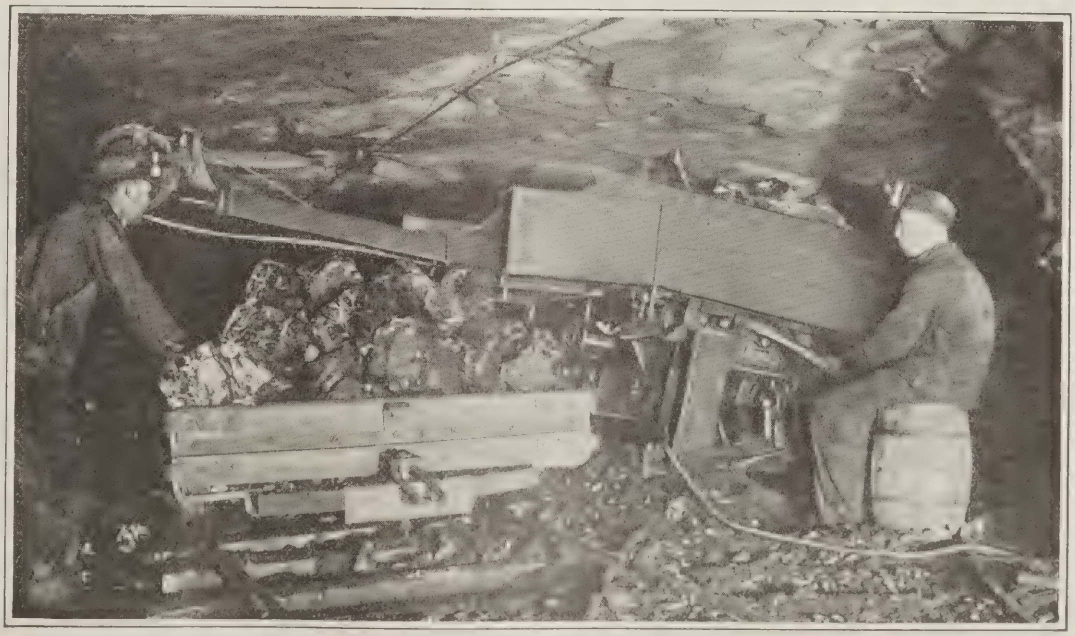
George Fitz, general manager of the company, proposes a system which avoids much of the development by narrow entries necessary to the plan last described. His idea is to drive cross entries in sets of three—a haulway and two air courses in each set—at intervals of 400 ft. From the air course and half way through the solid coal between sets of cross entries he would drive 75-ft. rooms at full width directly off the air courses, leaving 100-ft. pillars between adjacent rooms. Each room would be 200 ft. deep. One scraper would load out one cut from each of two adjacent rooms in one shift.

The average length of the cross entries from the main entry to the outcrop in the Ajax mine is about 1,000 ft. Along these stub cross entries about six such rooms driven on the advance would reach out to the outcrop. In the retreat he would mine one after another of the room pillars by slab cuts and at the same time rob the chain pillars of the cross entries. Or, in case some local condition should forbid long-face slabbing, the 100-ft. room pillars might be recovered by splitting them with 75-ft. rooms. It is this two-way attack which attracts Mr. Fitz to the plan.

As already stated, no standard system has yet been devised by this company for the operation of its scrapers. Rooms and pillars of varying widths, depending on the existing layout, are being worked with the scrapers until some definite conclusions can be reached and the development work accordingly completed. Nevertheless, even with such make-shift arrangements the machines are saving money.

Four men compose a loading machine crew—an operative who also serves as a boss, a car trimmer and two face men. These latter set the rope jacks and do what little picking and shoveling is required to clean up the face. In addition two men are engaged at night in preparing the cuts. They do the cutting, drilling, shooting and timbering of as much face as one scraper will clean up in a shift. One locomotive and two men handle a sufficient number of mine cars for two scrapers so that the time of only one of these men is charged to each machine.

A low-vein shortwall machine cuts a kerf to a depth of 6½ ft. Shot holes 1¼ in. in diameter and 7 ft. deep are drilled electrically, being slanted from a point 8 in. below the roof on the face to the roof itself at the back



**Dumping a Load**

Here the scraper bucket rides up the chute and delivers into a car on the entry. Manifestly it is simpler to haul coal to the car than to haul the car to the coal—an important advantage in favor of the scraper loader. The roof is brushed in the mouth of the dragway to give a maximum height of about 5½ ft. for the accommodation of the loading chute of the scraper. The steel mine car stands only 20 in. off the rail, yet has a capacity of 1½ tons. Lumps on this car show that the scraper handles big coal.

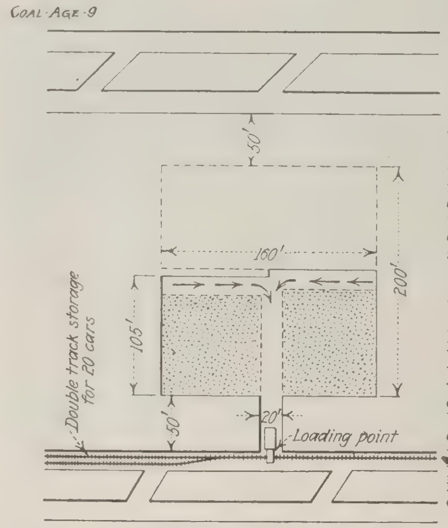


FIG. 3

**Long Face Advancing Plan**

This scheme, lately abandoned is no more than an unusually wide room layout. The dragway was placed in the middle so as to bring a longer face within the limits of a 350-ft. rope reach which is the maximum of the scraper. Maintaining a dragway 20 ft. wide through the goaf without cribs or even so much as beams can be accomplished under few roofs. The practice, of course, is not to be encouraged.

of the hole. These are placed on about 8-ft. centers: each is charged with 9 in. of black powder and fired by squibs. The holes are set off one at a time, the succession of firing being from the two ends toward the middle of a face. The roof is supported by 6-in. round posts, or their equivalent, and 10x4x1-in. cap pieces. The posts are set in rows on about 5-ft. centers each way.

Prior to August the company did little better than to break even on its costs as between machine and hand loading. A record of the performance of the two machines in twelve shifts during the first half of August shows that 1,673 tons of coal were loaded—an average of 70 tons per machine per shift—which brought about a saving of 13c. per ton. The machine loading cost analysis contains all items which should be charged against the machine such as labor, powder and shooting, miscellaneous supplies and repairs, power, interest and depreciation. The loading crew is paid a rate equal to the average daily earning power of hand loaders in the Ajax mine.

The actual saving of 13c. per ton in the cost of loading is due to the increased production per man rather than to the adoption of a flat wage rate. Thus the average output per hand loader is about 8 tons per day (low coal and unsteady labor), whereas the average per man on the loading machine crews per day during the first half of August was 17.5 tons.

### Darb Fork Mine Uses Scraper

The one Goodman scraper in the Darb Fork mine was installed at the beginning of August. Benefiting from the experience with scraper loaders at the neighboring Ajax mine, the officials at Darb Fork began to save money at the very outset. During the month of August this machine loaded an average of 75 tons per shift producing, with the additional yield of 10 hand loaders in narrow places, a total of 4,400 tons in 26 shifts.

By mid-September this machine was advancing a 160-ft. face in accordance with the plan illustrated in Fig. 3. A dragway 20 ft. wide midway between the limits of the face was driven from the cross entry through the barrier and maintained by timbers through the robbed area behind the face. First, one half, and then the other, of a cut was loaded, the loading chute being on the entry. The reason for working the long face by halves was to provide more work in one cut for the scraper. Had the dragway been located on one end of the face, the latter would have required shortening inasmuch as the rope reach of the machine is only 350 ft.

It was thought this face might be advanced in this fashion to the limits of the inby barrier. However, after the face had been advanced about one-half of the intended depth, the dangers of the layout were made manifest by weight on the face and on the timbers, particularly on those which flanked the dragway. The layout was not feasible and it was planned immediately to move the scraper to a new location. The remaining coal in front of the face can be attacked from the inby cross entry. This work proved the worth of the scraper.

### Loading Machine Crew at Work

The loading machine crew consists of an operative, a car trimmer, two face men and a boss. Half the time of the cutting machine crew or one man-shift is charged to the scraper. Actually the face is cut in 3 to 3½ hr., using a shortwall machine. Two men drill the coal electrically and shoot it. They work close behind the cutting machine so that when the face has been cut the holes are drilled, charged and made ready for shooting. The actual time required to drill and shoot a 160-ft. face, with holes on 8-ft. centers, is about 3 hr. These two men also do the timbering. Half the time of a locomotive crew is spent in serving the scraper.

Coal is loaded into 20-car trips. About 50 ft. from the loading station on the entry a storage track has been laid which will hold 20 cars. Consequently, at no time need the scraper remain idle for the want of cars. An electric hoist may be installed to facilitate car spotting. An electric bell signalling system co-ordinates movements on the face with those on the entry.

A new type of mine car is being installed for the scraper. It is of all-steel construction and holds 1½ tons of coal, stands only 20 in. off the rail and is fitted with 12-in. wheels equipped with roller bearings. The body is of the box type. It has been found desirable to

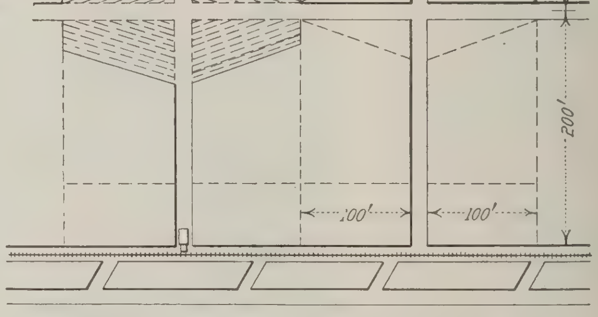

**Fig. 4—Proposed Layout of Converging Faces**

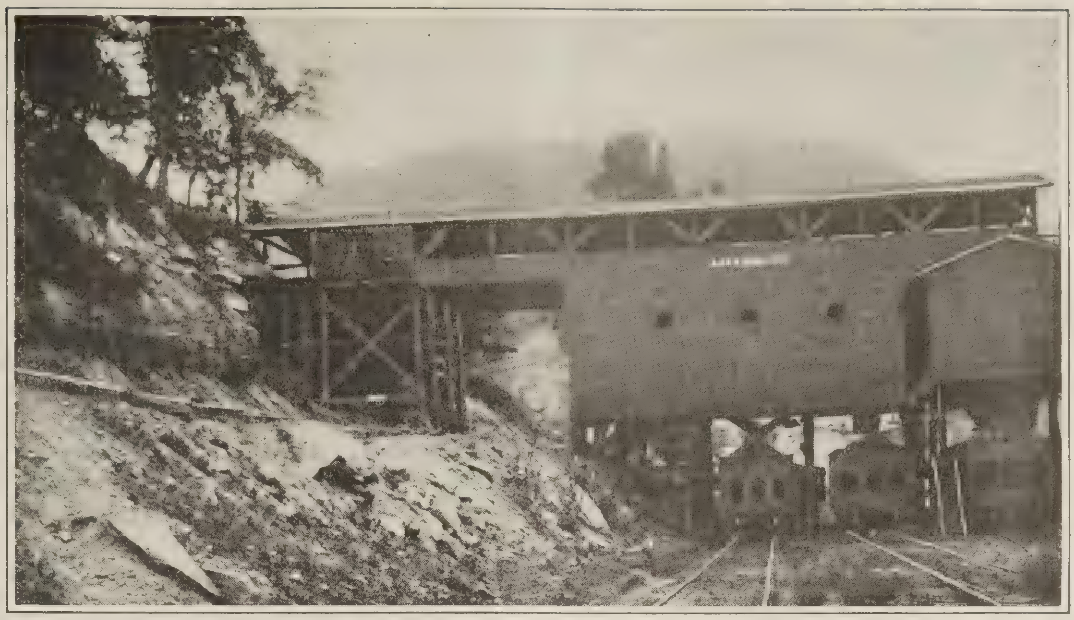
The view that the V formed by a pair of converging faces as a means of avoiding roof difficulties is of doubtful value is held by a wide circle of mining men. But in this case the converging faces have been chosen more to provide a longer face and as a convenience for the scraper than as an aid to the control of roof.



**Ajax Tipple**

This plant is one of the few in the Hazard field of Kentucky on which the coal is dumped direct from mine cars. The capacity of this tipple is about 1,000 tons a day. The scraper loading in this mine that has been going on for months has convinced the operators that this type of loading machine has great possibilities even though there are local handicaps that every mine must overcome in order to get high efficiency out of its loaders.

use 30-lb. rails on all cross-entry track. The radius of the track curve in the mouth of the dragway, on which the chute of the scraper rests during the loading operation, is 45 ft.

In this mine 6-in. round posts covered with cap pieces are set on about 4-ft. centers in rows 4 ft. apart. The distance from the face to the nearest row of posts changes from 6 to 10 ft. on alternate days. The 160-ft. face yields about 100 tons per cut and, barring protracted delays, a cut is cleaned up in one shift. This machine has been moved from one place to another through a distance of 100 ft. in 20 min., this period including delays in both taking down and setting up the equipment in the respective places.

Fig. 4 shows a system of V face scraper mining which Bruce Hardy, general superintendent of the Darb Fork Coal Co., contemplates trying out. The section 400 ft. wide between cross entries would be subdivided by dragways on 200-ft. centers and by a single intermediate cross entry, these dividing the section into square blocks. Beginning from the intermediate cross entry the blocks would be mined out as shown. The V front is not intended to aid in holding the roof but rather to assist the scoop in changing direction from that of the face to that of the dragway. Consequently, the V is comparatively flat. Its exact angle will be fixed by experiment.

Until early September of this year the highest outputs attained in any one shift had been 102 and 103 tons in the Ajax and Darb Fork mines, respectively. These companies see an opportunity to load 125 and perhaps 150 tons per machine per shift, day after day and, accordingly, to lower proportionately the cost of loading. They are realizing a larger return per ton for machine loaded coal because it contains a larger percentage of lump than that loaded by hand. Machine loaded pillar coal is being mined as cheaply as room coal, which is not the case where hand loading is followed. The scrapers have enabled the Ajax company in particular to mine areas of thinner coal and from more steeply dipping places than could have been done by hand.

Of the savings which concentration has effected, that of haulage is perhaps the greatest. Both companies will now be in a position to produce larger tonnages without employing more men or building additional houses.

So strong is the roof over the Hazard No. 4 seam in the Darb Fork mine that a dragway 20 ft. wide, as shown in the headpiece, is maintained in the robbed area leading back from the advancing face. Under few roofs could this be done. The camera set-up is on the face and in the path of the loaded scraper which is seen departing toward the entry. The two vertical pulleys held by the jack post, on the left, constitute the deflector around which the scraper swings in a right-angle turn.

**Tipple at Isabella No. 1 Mine Serves Coke Ovens**

This tipple at the Isabella No. 1 Mine of the Hillman Coal & Coke Co. is located on the Monongahela River above Brownsville, Pa. The mine, which was opened in 1908, was completely electrified in 1923. Its entire output—2,000 tons of Pittsburgh seam coal per day—goes to coke ovens, which accounts for the typical coke-region construction of the tipple.

"NO BACKWARD STEP"—meaning refusal even to consider reducing wages from the peak levels of 1920—has been the battle cry of the United Mine Workers ever since the demand for readjustment became insistent. Mr. Lewis says his stand has saved the wage structure of the country and preserved the national prosperity. In the Southwest, however, the liquidation he opposes is taking place. The union is disintegrating. In 1920 the word of the United Mine Workers was law in the coal fields from northern Texas to the Canadian border. Today Texas is wholly non-union, Oklahoma is nearly so, Arkansas is fast approaching that status. The story of the disintegration is told in detail in Mr. Hale's article.

THE GREAT SOUTHWEST came knocking for admission into the Central Competitive Field in 1906. It was denied a seat at the council table by the operators already in, who claimed that there was no commonalty of interest between the producing districts of Illinois, Indiana, Ohio and western Pennsylvania, and the states lying west of the Mississippi River. Not only was admission denied, but the Central Competitive Field producers also took their union associates to task for wasting energy on the Southwest while the Central Competitive Field was still exposed to the menace of ruinous labor competition from West Virginia.

Despite this rebuff, the union held the ground it had won for many years. The winning of the Southwest, however, had not been particularly easy. It had been necessary to wage industrial warfare against the four largest producers in that region, who declined to recognize the United Mine Workers, following the organization of the miners in Arkansas, Kansas, Missouri, Oklahoma (then the Indian Territory) and northern Texas in 1899. In June of that year, 25 of the smaller operators had agreed to the union demands for an 8-hr. day, higher mining rates and lower powder prices, but the four big companies, producing about three-fourths of the coal mined in the Southwest, held out until the spring of 1900 and then signed up, one by one, giving their employees all they had asked for except recognition of the United Mine Workers. That recognition did not come until 1903, when the producers formed the Southwest Interstate Coal Operators' Association.

### Union Never in Full Control

Even with the association firmly established and extending complete recognition to the union, organized labor has never been able to effect an absolute control over the coal fields of the Southwest. In the earlier years of recognition, the tonnage represented by the Southwestern Interstate Coal Operators' Association ranged from 64 per cent in Missouri to 98 per cent in Arkansas. In the four states having membership in the producers' organization—Kansas, Oklahoma, Missouri and Arkansas—there are a number of small mines that have always been out of the reach of the union. In Texas, the sphere of union influence did not extend beyond the bituminous mines in the northern part of the state; the bituminous mines along the Rio Grande and all the lignite operations have remained non-union.

As in other fields, the progress of unionism has not invariably been peaceful nor the exercise of acquired power without its tyranny. The very mention of Kansas inevitably recalls the turbulent reign of Alexander Howat, during which outlaw strikes became so commonplace and so dangerous to the continued existence of the United Mine Workers in that region that Howat and his lieutenants were deposed from their district offices by John L. Lewis in 1921 and the representative of the international organization placed in charge threatened to suspend 4,000 miners (Kansas employed approximately 8,200 at that time) who refused to return to work when ordered to do so by the union.

### Arkansas Had Its Troubles

In Arkansas, too, the history of union control is not unmarred by spotted pages. The celebrated Coronado Coal Co. case, in which the Supreme Court of the United States laid down the principle that an unincorporated union could be sued for damages, was based upon such a page. In 1914, a group of companies operating in the Prairie Creek valley in Sebastian County elected to abrogate a contract with District No. 21 and run open-shop. The experiment ended in murder and the destruction of "all of the property" on the premises of four of the mines. In fairness to the international organization of the United Mine Workers, it should be remembered that the Supreme Court exonerated the parent body of all direct responsibility, holding the eruption "a local strike, local in its origin and motive, local in its waging and local in its felonious and murderous ending." The same opinion, however, opened the way to the further prosecution of the district and local unions and of individuals.

Unlike the Central Competitive Field, the growth of the Southwestern Interstate Field during the period of union supremacy has not kept pace with the growth of bituminous tonnage for the United States as a whole. During the early years of organization, 1899-1906, the relative increases were on a comparable basis and Oklahoma showed a faster rate of growth than did the United States. Between 1907 and 1917 Texas forged ahead, with percentage gains from 1908 to 1915 inclu-

Fourth of a series of articles describing the changes in the labor status of the different bituminous coal producing districts of the United States in recent years. Preceding articles appeared in *Coal Age*, Sept. 25, Oct. 1 and Oct. 8. Another article will appear in an early issue.

sive, in every case outdistancing the record for the nation. Since that time there has been a slowing up, which has become most marked in the past few years. Oklahoma's progress since 1907 has been somewhat more erratic, but the slowing-up process did not set in until 1921, although its record in some of the preceding years fell below that of the United States. Arkansas, Kansas and Missouri, on the other hand, have never been able to catch up with the national percentage rate of increase since 1904, the year following the recognition of the United Mine Workers by the Southwestern Interstate Coal Operators' Association. The situation is shown graphically in Fig. 10.

The basic rates of compensation, however, have undergone a steady, unbroken advance. The union contract pick-mining rate in the thick-vein field in Arkansas in 1902 was 55c. per ton: today it is $1.15, an increase of 109 per cent. Day rates have been boosted from $2.25 in 1903 to $7.50, an increase of 234 per cent. Were the comparisons carried back to 1898, the increases, of course, would be greater. Unfortunately, authentic comparable data on those earlier years have not been compiled. The history of pick-mining rates since 1902 is set forth in Table V and is shown graphically in Fig. 11.

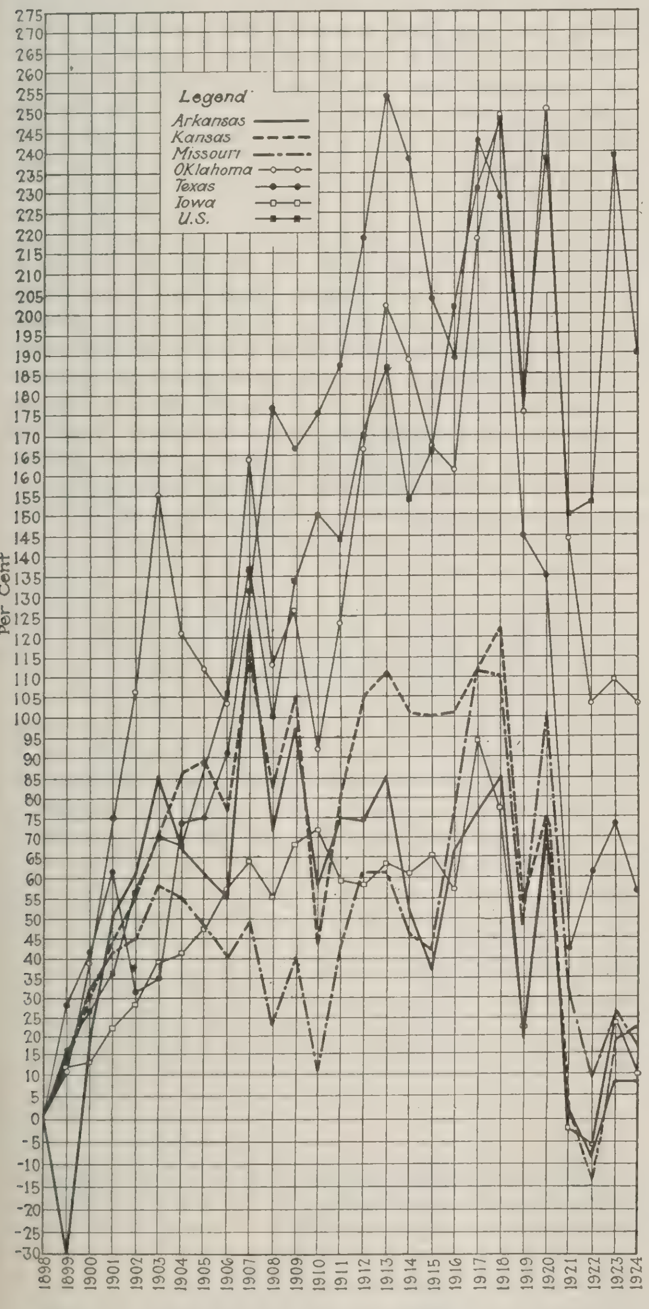

**Fig. 10—Southwest Loses Its Stride in Production**

The story of the percentage increase year by year in the output of the coal producing states of the Southwest since 1898 is one of wide fluctuation and uneven growth when comparisons are made between the individual states in that group. The region started out at a lively clip, but in recent years has been lagging behind the country as a whole in the matter of tonnage gains.

It would be shooting wide of the mark to say that the decline in the rate of growth of production in these southwestern districts is wholly chargeable to unionism. There are other factors of limitation which have had a great influence. The natural opportunities for expansion have been much smaller. The Southwest has not had the industrial development which has created an ever-widening demand for fuel in the states east of the Mississippi and north of the Ohio and Potomac Rivers. Its entrance to that charmed territory is barred by transportation adjustments, in many cases by the quality of the coal, and by the business-hungry mines of the Central Competitive Field and the long stretch of the Appalachian Region. Its westward sweep is dammed both by the lack of heavy demand and by the ability of the operators in the West to take care of home-grown requirements.

In the struggle to supply the industrial centers dotting the Missouri River, the Southwest must meet the competition of central and southern Illinois. Only the power of the Interstate Commerce Commission has prevented that struggle flaring into a bitter rate war. On top of all this is the competition of fuel oil. The Southwest was waging a losing fight against the inroads of petroleum in factory and in home when the East, so concerned since the World War over the pressure of fuel oil, never gave the liquid a thought as a possible competitor.

### Not Much Coal Shipped

There has been little direct conflict between union and non-union production in the Southwest's battle to maintain its position. Aside from a small tonnage of Missouri and Kansas coals going to Colorado, a little Oklahoma coal to New Mexico and some Arkansas tonnage to Tennessee during the war period, distribution of the output of the southwestern states has been to non-coal producing and to union coal producing states. In this competitive battle, therefore, the same rigidity of wage scales that has handicapped the producers of Arkansas, Missouri and Oklahoma has also hampered their principal rivals. Local consumption and locomotive fuel demands have absorbed the greater part of the output. Arkansas, with the smallest home market, ships little more than one-third of its product in interstate commerce—even under the most favorable conditions. Missouri is able to sell less than 10 per cent of its production outside its own borders, yet the consumption of native coal represents little more than 25 per cent of the total coal requirements (exclusive of railroad fuel) of the state.

The Southwest, nevertheless, is finding this rigidity irksome. Nothwithstanding the fact that labor costs in the Central Competitive Field are pegged at the 1920 levels, many sections of the coal producing territory west of the Mississippi River are demanding that the inflexible wage scale be done away with and that they be free to fight to retain business with the basic labor costs they enjoyed seven or eight years ago. The first break came in Texas and attracted little or no attention outside the state—possibly because public interest has been more easily centered upon the travails of the

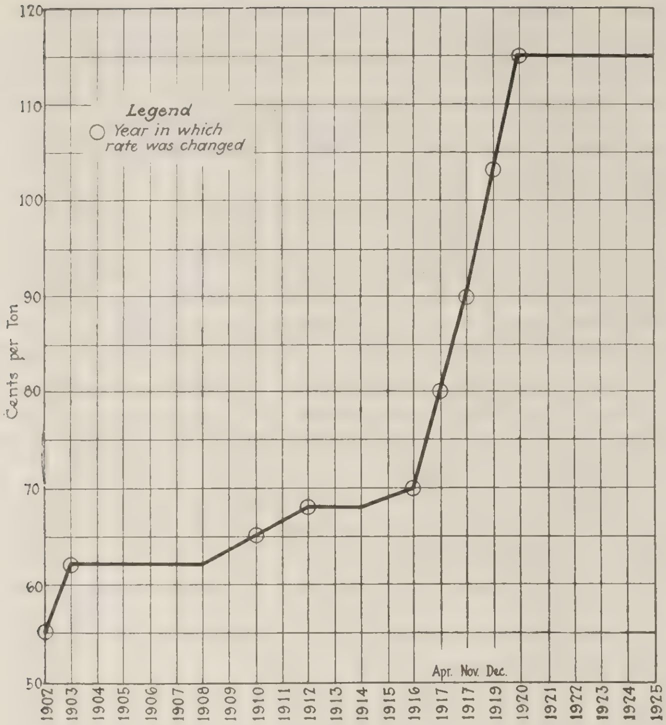

**Fig. 11—Upward the Tonnage Rate Marches Along**

The pick-mining rate in the thick-vein field of Arkansas is typical of tonnage rates in the Southwest. Every change under union leadership has been upward; even the decrease that marked the history of rates in the Central Competitive Field in 1904-06 is missing in this territory.

Southwestern Interstate Coal Operators' Association groups. Oklahoma was the next to fall away from the union. Arkansas is following in Oklahoma's footsteps. Only in Kansas have union sympathizers been able to discourage effectively open-shop longings. Missouri still remains quiescently union.

Late in the summer of 1921 Texas coal operators and representatives of the United Mine Workers met in futile conference at Fort Worth. Producers from the Thurber (Erath County), Strawn (Palo Pinto County) and Bridgeport (Wise County) fields asked that wages be reduced to the 1917 scale. This meant a reduction of the day rate from $7.50 to $5, with corresponding changes in other rates. In consideration of the acceptance of such a proposal operators were ready to agree to reopen mines then closed down. Then, as now, union officials were very solicitous that contracts *preserving* high wages be held inviolate.

The labor leaders, headed by the president of District No. 21, rejected the proposal of the operators. That rejection was the rock upon which the organization of the United Mine Workers of America in Texas was wrecked. In September, the Texas-Pacific Coal & Oil Co., operating at Thurber, announced that it would run open-shop, paying $5 to day men and $2, instead of $2.65, to tonnage men. Other mines in Erath, Palo Pinto and Young counties followed suit although complete severance of union relationships did not take place until several months after the first break. In 1923, mines in Wise County made the decision to operate nonunion unanimous.

A typical wage scale now in effect in the northern Texas field shows the following rates: Mining rate, $2 per ton; day engineers; $7.08 per day; night engineers, $6.28; top men, $4.36 per day; bottom men, $5; spraggers, $3.65; trappers, $2.65; road cleaners, $4.75; face men, $5.29; blacksmiths, $5.51; blacksmiths' helpers, $4.77; entry yardage, $1.68 per yard; back brushing, $1.47 per yard; straight brushing, 68c. per yard; cribs, $1 each.

The breaks in the union ranks of Oklahoma and Arkansas were foreshadowed when operators, members of the Southwestern Interstate Coal Operators' Association, held out from March 28 to May 3, 1924, before consenting to a three-year extension of the 1920-23 agreement. During these negotiations at Kansas City, producers vainly endeavored to persuade the union leaders to accept a reduction in days rates from $7.50 to $6. They pointed out that much of the railroad tonnage formerly enjoyed had gone to oil; that considerable industrial tonnage had also deserted coal, leaving only a precarious business to the union operations of the Southwest. Union representatives, however, insisted that they could not recognize any special conditions or handicaps in the Southwest. The Jacksonville agreement had been signed: the Southwest must accept the terms imposed by the contract entered into in the Central Competitive Field.

"Thereupon," explained one of the leading producers in the region, "operators in the Southwest advised Mr. Lewis that it would be impossible for them to survive under the 1924 agreement, and by mutual consent a provision was inserted in the union contract to the effect that at any time a coal operator withdrew as a member of the Southwestern Interstate Coal Operators' Association or the Oklahoma Coal Operators' Association he would be free from further liability or obligation under the union contract."

The change referred to was effected by making the

* Union scale rates.
† Date not available or non-comparable.
†† Rates under 1908 Contract.

first clause of section 22 of the general contract read:

> All the provisions and terms of this contract are hereby mutually agreed to by and between all the operators, *while* members of the Southwestern Interstate Coal Operators' Association and all the miners of Districts 14, 21 and 25—

instead of:

> All the provisions and terms of this contract are hereby mutually agreed to by and between all the operators, members of the Southwestern Interstate Coal Operators' Association, and all the miners of Districts 14, 21 and 25—

The same month the interstate agreement was signed at Kansas City mines in the McAlester-Wilburton district in Oklahoma made known their determination to revert to the November, 1917, scale. By July the movement was in full swing and clashes between union sympathizers and open-shop workers began to take place. From sporadic disturbances these developed into organized attacks: two were directed against the Kali-Inla mine near Cambria and a third against Rock Island No. 12 at Hartshorne. In a number of cases, workers were shot at from ambush, but no fatalities resulted and there was no destruction of property. Oklahoma guardsmen were called out to protect the operations and their rigor was not relaxed until late in the year. In the meantime organized opposition to the open-shop movement disintegrated. By the end of the year only the Henryetta district maintained its fealty to the union and the 1920 scale.

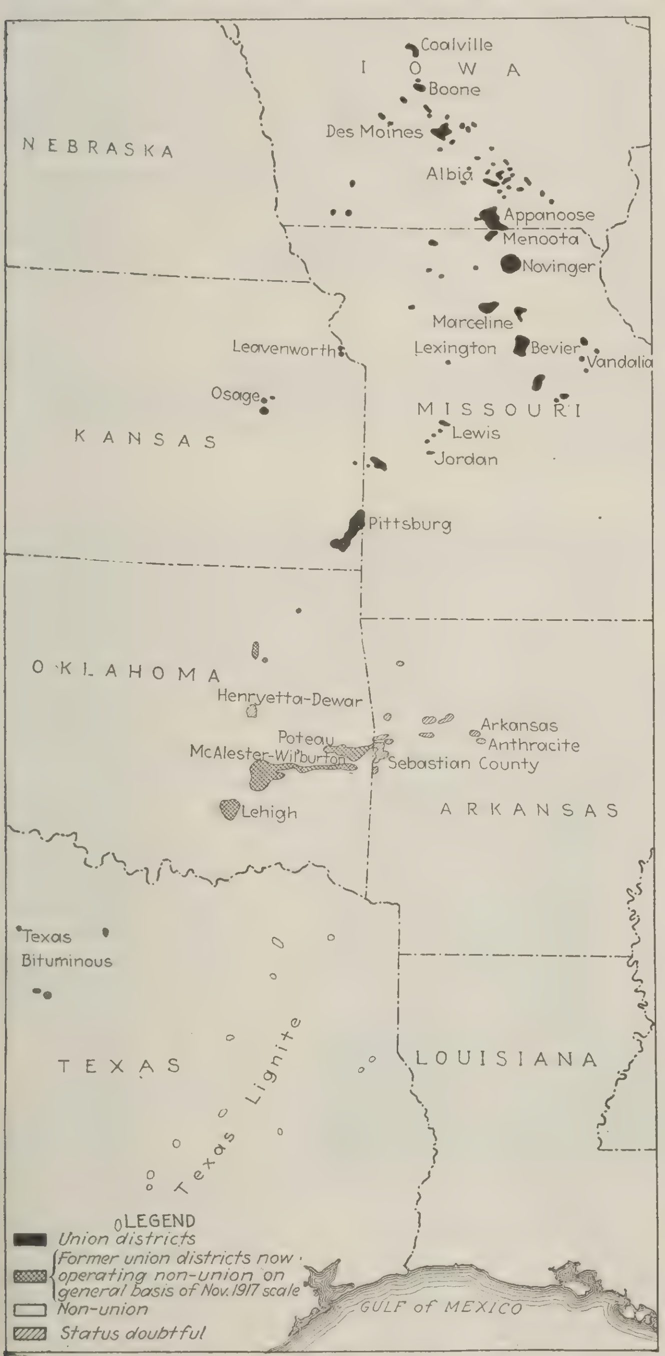

**Fig. 12—The Shifting Labor Status in the Southwest**

The Southwestern Interstate Field as a wage-making entity comprises the producing districts in Arkansas, Kansas, Missouri and Oklahoma. Texas, geographically and historically part of this field, has been acting independently for several years. As a matter of fact, the southern Texas bituminous mines along the Rio Grande, not shown in the map, have always denied the union recognition.

The Henryetta district gave up the struggle to continue operations on the Jacksonville-Kansas City basis with the beginning of the present coal year. At that time 42 mines offered steady work throughout the summer if the men would accept the 1917 scale. This meant minimum day rates of $4.36 and $5, against $6.86 and $7.50 under the union scale, and a cut of 24c. per ton in the mining rates. The miners rejected the offer. Thereupon the Puterbaugh interests took the lead in reopening under open-shop conditions by starting up the B. & A. mine at Schulter. A few days later the McAlester Colliery Co. resumed work at Kincaid and shortly after that Crowe No. 6 and the Atlas mines fell into line. By the end of July practically all the operations then working in that district were paying the 1917 scale.

The defections in the Henryetta district have aroused union officials to new activities, culminating in a general strike order issued the last of August, 1925, and directed against all mines in District No. 21 paying less than the Jacksonville-Kansas City scales. This latest drive has been centered, not against the Henryetta field, where picketing by prayer has already led to several court clashes, but against the McAlester-Wilburton district, the scene of the original revolt against the union. Rock Island No. 12 at Hartshorne seems to be the first main objective in the new campaign, as it was in the earlier attempts to stop the collapse of the union in Oklahoma. The final outcome is still in doubt, but judging by the developments of the past year, the present chances of the United Mine Workers to regain lost ground in that state are dubious.

Although the movement was slower in getting under way, in its major aspects the situation in Arkansas has paralleled that in Oklahoma. The first definite break with the union came in January, 1924, when C. L. Melton announced that he would run open-shop. The majority of the operators, however, held aloof for more than a year after this pioneer took his stand. This delay upon the part of other producers to follow the lead of Mr. Melton—and of the stripping operations at Charleston and Branch and certain shaft and strip pits in the Spadra field—may be explained by their reluctance to sever their union connections so long as there was any hope that the officers of the United Mine Workers would consent to a modification of the Jacksonville-Kansas City agreement. Up to the time William Dalrymple succeeded Andrew McGarry as president of District No. 21, optimists cherished the delusion that the election would usher in a change in policy. Mr. Dalrymple soon undeceived them.

With that hope gone, the movement to abandon the union has been accelerated. By the first of July the list of open-shop operators had been swelled by the Bernice mine at Russellville, the Collier-Dunlap at Hartman, the Arkansas Mining Co. operation at Montana, the Warner and the Semi-Anthracite company at Coal Hill. A little later the Greenwood Coal Co., one of the largest producers in the state, posted notices that it would reopen on the 1917 basis. The Backbone Coal Co. at Excelsior and the Mammoth Vein colliery at Hartford, controlled by the same interests, also shifted to the non-union column. The announcement that they would run open-shop was not in every case followed by an immediate resumption of operations, but enough mines started up again to convince the miners that the declaration was not an empty gesture.

### FAMILIES HOLD "PRAYER MEETINGS"

There have been the usual appeals to court against intimidation by union pickets, and some destruction of property. As one part of the campaign of the operators to cripple the fighting strength of the labor organization application was made for the appointment of a receiver for District No. 21 of the United Mine Workers of America. More recently temporary federal injunctions were issued against 32 locals in Sebastian, Franklin, Logan, Johnson and Pope counties, prohibiting intimidation. As in Oklahoma, miners' wives and daughters have held "prayer meetings" at the open-shop mines in the Alix and Denning Districts "in an effort to influence the men who have gone to work at a reduction in wages, taking the places of the striking miners in this field."

It is, of course, too early to make any prophecies as to the ultimate outcome. The movement has not developed the sweep of the Oklahoma revolt, but the drift is strong. The largest producer in the Southwest is not now operating its Arkansas and Oklahoma mines, so the union can receive no help from that quarter.

In Kansas the union has been much more successful in holding its lines. Several attempts have been made to evade the 1924-27 scale by co-operative mining, but demonstrations by union sympathizers appear to have checked them. Missouri pursues the uneven tenor of its ways with no signs of open rebellion against the union scale. Iowa, not a part of the Southwestern Interstate Field, but closely allied to it geographically and geologically, also seems resigned to, if not content with, its lot. This state, like the Southwest, was long ago denied admission to the Central Competitive Field councils, although in the case of Iowa the opposition was confined to the operators of Indiana, Ohio and Pennsylvania. It has given the United Mine Workers of America two of its international presidents of the past decade, and remains strongly union.

# Experts Talk Anthracite and "Contract Breaking"

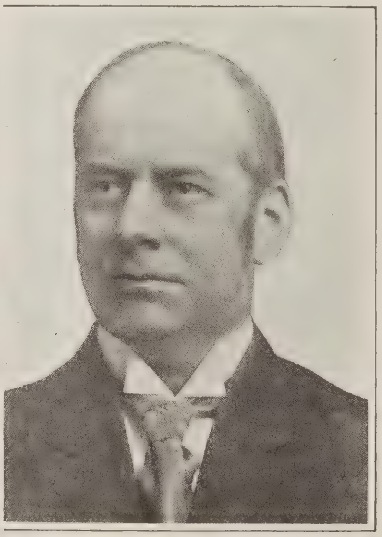
**By Paul Wooton**

Washington Correspondent of *Coal Age*

NEW ENGLAND RETAILERS will not jeopardize their anthracite allotments in the slightest by handling bituminous coal or other substitutes. On the other hand they will be doing just what the operators want them to do if they will protect users of anthracite by meeting their fuel requirements in any way within their power. Assurances to that effect were given by Dr. E. W. Parker, of the Anthracite Bureau of Information, in the course of remarks last week before the Washington Section of the American Institute of Mining and Metallurgical Engineers.

George S. Brackett, vice-president of the Northern West Virginia Coal Operators' Association, defended bituminous operators—especially those of northern West Virginia—who have reopened their mines at wages less than those specified in the Jacksonville agreement. He held that union miners, by going to work at non-union wages in other and competing regions had already scrapped the contract. Allen H. Willett, economist for the National Coal Association, also spoke.

George S. Brackett



Dr. E. W. Parker

Dr. Parker raised some significant points thus: "Rumors are current that other agencies of mediation, political or otherwise, are actively at work endeavoring to devise some plan by which the opposing forces can be called together and at the same time not prove to be a boomerang to the mediator. There does not appear to be any apprehension of the federal government mixing in unless or until there is danger of suffering or inconvenience on the part of the public from a scarcity of fuel. To my mind such a danger is somewhat remote.

"From April 1 to Aug. 31 the mines have produced, according to the U. S. Bureau of Mines, approximately 32,800,000 gross tons, of which about 70 per cent, or say 23,000,000 gross tons, were of the domestic sizes, pea and larger. By far the greater part of it is in the cellars of consumers. Moreover, as last winter was unusually mild, considerable quantities of hard coal were left over.

"I feel safe in saying that if the local distribution has been looked after as systematically as has the distribution from the mines to communities every user of anthracite should have enough coal on hand to last him well after the first of January, and if the lighting of furnace fires this fall is put off until they are absolutely needed the next year will be at least a month old before it will be necessary to indulge in the use of substitutes for anthracite.

"The present suspension may last three or four weeks longer; it may last until the robins appear again next spring. Its duration depends upon a number of contingencies and it will continue until this time next year if it depends for its termination on the operators acceding willingly either to adding any more to the consumer's burden of fuel cost, or of saddling the check-off on the industry. What they may be forced to do is another question.

### Recalls President Harding's Warning

"It is as true now, so far as anthracite is concerned, as it was in 1922, when on Aug. 18 the lamented President Harding, after being flouted and defied by John Lewis, reported to Congress that 'the country is at the mercy of the United Mine Workers' and the quality of that particular kind of mercy is not strained.

"Another chief executive, President Wilson, on an occasion produced by events similar to the present, said: 'The business of government is to see that no other organization is as strong as it is; to see that nobody or group of men, no matter what their private business is, may come in competition with the authority of society.' He further declared that the conduct of the mine workers' union 'had been not only unlawful but unjustifiable.' "

Mr. Brackett made the most convincing case, some of his hearers thought, that has yet been put forward in behalf of those operators who have ignored the Jacksonville agreement. He said:

"As the large union companies were forced to close their mines, many of their operatives, chafing under the idleness imposed by what they considered impossible conditions under the agreement, requested the companies to resume on a basis similar to that prevailing in non-union fields. These requests came up in the form of demands from individual miners requests from groups headed by a spokesman, resolutions by local unions and finally by legal petitions prepared by the miners, through legal advice.

"Thousands of union miners had individually withdrawn from the wage contract as individuals and obtained employment in the non-union mines of competing fields.

### Contract Already Broken

"The alternatives as stated by Senator Watson, of the consolidation Coal Co., to John L. Lewis, facing both the union operator and the union employee were 'not the choice of both working under the contract and either breaking it. The contract, being in its essence a collective agreement, was already broken and gone.' Nothing remained then but those alternatives 'between sharing idle mines and unemployment on the one hand, and sharing competitive production and prevailing wages on the other.'

"The pressure brought upon the large companies to do the latter was gone. The economic situation in the district was acute. The belief prevailed that northern West Virginia, by reason of isolation, freight differentials, etc., was faced with economic ruin unless a level could be found where mines could be operated on a basis of sustaining both employer and employee. All classes of people—union men of every craft and trade, merchants, professional men, property holders, and in fact, every class of citizenship, approved of the step to be taken—all, I say, but the officials of the international mine union.

"Local autonomy in District 17 of the miners' union had been suspended. The affairs of the men were in the hands of personal representatives of President Lewis. The regularly elected officers of the local organization had been supplanted and had no voice in matters of government.

### Union Repudiated Contract

"In other words, so far as the miners' individual action is concerned, the union contract relationship had been specifically repudiated by an overwhelming majority of the union members.

"Public opinion on all sides urged a resumption of mining and the disregard of an agreement that all thought did not legally exist.

"If a contract was disregarded, it was done by the individual members of the union, who accepted a choice between idleness and employment. The companies, watching their organizations disintegrate and their best men forsake their union and go to work, and urged and supported by universal public opinion, fell into line.

"These are the facts of the controversy, if there be a controversy. By far the majoritiy of the coal companies had no agreement, and their employees would listen no longer to the dictation of the unions' international representatives without voice or vote or district autonomy. Very able lawyers on both sides examined the contract. No suit in our courts has ever been filed.

"Under such conditions the issue to be decided is not the technicalities of a document which exists only in the files of the operator and employee, but their mutual decision on the obligations which they owe to the families and to the properties entrusted to their care. These obligations existed prior to and independent of the relationship to the third party of the union.

### Accuses Seven Union Operations

"I would like to say a few words as to the seven union companies still operating in northern West Virginia. I know that one of the largest of these companies has a three-year contract covering their tonnage which does not expire until next April. One company is the only operating mine, producing a suitable byproduct coal within the first zone freight rate to a local industry. One other company is operating under a contract by which the employees place the coal on the railroad car at a fixed price lower than that justified by the union wage scale. One other company controls docks at the lake front and is in a position to protect its coal in the markets of the northwest, and I have no hesitancy in saying that it is my firm belief that every one of these seven companies is violating the Baltimore agreement in some way.

"It is also my belief that, in the so-called union mines, these violations of the agreement are permitted by the international officials of the union with their full knowledge and consent; and by such permission they are tacitly recognizing the economic impossibility of the Baltimore agreement in northern fields of West Virginia."

# Uncle Sam Can Aid Public by Leaving Coal Alone

**By Harry L. Gandy**
Executive Secretary, National Coal Association,
Washington, D. C.

THE COAL INDUSTRY has enjoyed the unenviable distinction of being the favorite object of attack by advocates of the extension of governmental control of industry. My observation is that at times there has been a quite ready welcome for suggestions of federal interference in the industry on the part of otherwise supposedly fair-minded and conservative organs of opinion. What is the explanation of the prevalence of this uncritical bias?

Many advocates of federal interference with the bituminous coal mining industry usually fall back on one or an other of the following assertions:

(1) *That the government must prevent any interruption in the supply of coal and excessive prices.*

(2) *That the government must deprive monopolistic bituminous mine owners of their ill-gotten gains.*

(3) *That the government should require the elimination of surplus mine capacity and a less wasteful operation of the mines.*

Interruption of supply and high prices will be treated together, because they are mutually interdependent and one is obviously affected by any change in the other.

### A WARNING

IN A PART of his address not reported here, Mr. Gandy told his audience of industrial leaders that the demand for governmental interference just now is not due to any crisis in bituminous coal but only to the hard-coal tie-up. He solemnly warned coal consumers that if they permit themselves to get panicky they will begin bidding against each other ruthlessly as they did in 1920, creating the demoralized conditions of that year and thus probably bring down government action. Once recognize the principle that the coal industry cannot solve its own problems and "no industry will be safe," he warned.

## Debates Three Questions

It is my purpose to take up each of these lines of argument in turn and to consider briefly, on the one hand, what basis, in fact, there is for the implied accusation, and on the other hand what hope of improvement lies in governmental interference, whether state or national.

(1) *Must the government prevent any interruption in the supply of coal and excessive prices?*

Nothing is so apt to arouse the wrath of the American people as the sudden increase in price of some commodity in general use. During the World War when the prices of other commodities were rapidly advancing, that of bituminous coal was kept down by the regulations of the Fuel Administration. As the result of a remarkable combination of circumstances, the withdrawal of regulation, the bituminous coal miners' strike of 1919, the switchmen's strike of mid-summer 1920, and the failure of consumers to use ordinary business precaution in obtaining their future requirements of bituminous coal early in the season, the late summer and fall of 1920 witnessed an unprecedented advance in the price of bituminous coal. On that occasion an insistent demand for federal regulation of the industry swept over the industrial East and was especially vociferous in New England. The fact that only an insignificant proportion of the bituminous coal marketed sold at high mine prices, had no weight; isolated instances of excessive prices were quoted as though they were typical.

The fact is that bituminous coal operators took less advantage of profit-making opportunities than did many other industries in those troublous times. It was by no means an unusual thing for an operator, even when not bound by contract to continue to furnish coal to his regular customers at prices little, if any, above his then normal fair-profit price. That the 1920 bulge in prices was due to temporary conditions was conclusively shown by the steady reaction which resulted in the depressed market in 1921.

There are two characteristics of the bituminous coal industry that should lead any observer to accept as proper the somewhat wider fluctuation in coal prices, with changing conditions, than in the prices of most commodities. On the one hand no adequate substitute for bituminous coal as industrial fuel can be obtained in a short time. On the other hand, the cost of fuel constitutes so small an item in the total cost of the finished product of most lines of manufacture that manufacturers are prepared to pay high prices if such prices are necessary. For these reasons, even a slight shortage of coal causes a rapid advance in prices. But it is a remarkable fact that few staple commodities have shown smaller general fluctuations in price year in and year out than has bituminous coal.

Such variation as there has been, except during and immediately after the war, has been brought about by one of three things, namely: general industrial depression; strikes in the industry; or inadequate transportation. The bituminous coal operators are prepared to mine and ship, at short notice, all the coal that the country can possibly need, and so long as an adequate supply is available it is obvious that unfairly high prices are an impossibility. Reduction in output in times of general industrial depression is economically desirable, for coal is not a commodity which can be conveniently stored in large quantities far in advance of the time of its need.

Interruptions in supply on account of inadequate transportation facilities are very largely a thing of the past, if the recent performance of the railroads in handling 11,000,000 and 12,000,000 tons of coal every seven days for weeks in succession without a car short-

---

From an address made by Mr. Gandy before the National Association of Manufacturers at St. Louis, Mo., Oct. 26, 1925.

age is an indication of their future ability. Interruptions as a result of strikes of mine employees are still a possibility and will be so long as the mine workers' organization sets its face against the peaceful settlement of wage disputes in the union fields, but even interruptions from that source will be less felt today than at any time for many years, on account of the growth of so-called non-union production.

Advocates of interference who base their demand on occasional interruptions of supply or advances in price, should be made to explain in detail how they think the situation can be remedied by governmental action. Regulation of the mining end of the industry will not make good deficient transportation, and unless a soldier is to stand at the back of every miner, no governmental orders will compel men to mine coal against their will. Strikes do not become an impossibility through governmental operation or regulation, as is shown by the history of our railroads since the establishment of the Interstate Commerce Commission. Peace in the mining industry could be purchased even by governmental agencies only at the expense of yielding to every demand of the mine workers.

(2) *Must the government deprive "monopolistic bituminous mine owners of their ill-gotten gains?"*

When mine prices are high some operators make money. During the runaway market of 1920 a few operators made big profits. The public became convinced that big profits were a normal characteristic of the bituminous coal mining industry and it became fashionable to speak disrespectfully of coal barons and coal profiteers. Here again let us briefly consider how much truth there is in the charge and what remedy the government would have to offer.

The normal condition of the bituminous coal mining industry is one of low mine prices and little or no profit for the operator. For many years before the war it is unquestionable that the bituminous coal mining industry operated on a lower margin of profit than any other important mining or manufacturing industry in the country. During and immediately after the war prices were relatively higher. Today, however, the industry is running true to form and is again fueling the country at little or no profit to itself.

### PROFIT WAS LESS THAN TAX

What the slump in prices that occurred in 1921 after the so-called run-away market in 1920 meant in terms of profits to the bituminous coal mining industry may be seen from the fact that of the companies reporting to the income tax unit on that year's transactions more than half showed a loss on the year's operation, and the net gain to the entire industry, obtained by deducting the losses of the unprofitable operations from the gains of the profitable companies, was less than the amount paid as tax to the federal government. In other words after taxes were paid, the entire industry showed in red ink in the ledger the results of the year's operations. The condition today in that respect is not far different from the condition in 1921.

Even if it were true that at current prices some operators made large profits, how would the government go about correcting that situation? So long as coal must be mined from operations with higher costs, the price must be high enough to induce operators of such mines to turn out coal. Is the government going to insist that the operator with the low cost operation must sell his coal at a low price in the same market in which the coal of the high cost operator is sold at a high price? Such an attempt would be doomed to failure not only because of the impossibility of tracing individual shipments of coal to make sure that their selling price did not yield more than the government regarded as a fair margin above cost, but the confused market conditions that would result would cause far more loss to consumers of coal than would be involved in paying a quite uniform market price regardless of cost.

(3) *Should the government require the elimination of surplus mine capacity and a less wasteful operation of the mines?*

Much is heard about the one-third excess of mine capacity and the 200,000 excess coal miners.

Undoubtedly if every bituminous coal mine in the country operated 300 days in the year, more coal would be produced than the country could consume, but as a matter of fact, surplus producing capacity is a typical and healthy characteristic of a rapidly developing industrial community. I very much doubt whether the much bruited excess in the bituminous industry is any greater than in many other lines of activity.

### WOULD PREVENT EXCESS CAPACITY

It has been suggested that the government should acquire title to all bituminous coal deposits and should lease the privilege of operating under such regulations and restrictions as would prevent the development of excess capacity. I need not dwell upon the difficulty or practical impossibility of determining just what is necessary and what is excess capacity. It would be the most short-sighted of policies to limit mine capacity to the point where a sudden demand for a large output could be met only after opening and equipping new mines.

Then there is the inevitable tendencies which would develop in a democracy like ours for any bureau having such tremendous powers as would be involved in the authority to regulate the opening of coal mines all over the country, to use that power to further personal ambitions, personal friendships or political expediency. Such a power would go far beyond that now lodged in any federal agency, even the Interstate Commerce Commission.

Surplus labor in the industry is not held there by force of arms. The door of employment swings outward as well as inward. In modern machine-equipped operations, bituminous coal miners are no longer especially skilled men. Unskilled labor is mobile labor and can easily flow from industry to industry. Unskilled labor is in demand in this country owing to the restrictions put upon immigrants coming from other countries. And yet in 1923 there were nearly 10 per cent more men in bituminous mines than in 1920 producing about 1 per cent less coal. Is it any wonder that the average days worked dropped from 220 in 1920 to 179 in 1923? Thus there was no flow of labor away from bituminous coal mining.

Figures become still more significant if we compare the record of the three union states, Ohio, Indiana and Illinois, on the one hand, with that of the two predominately non-union states of Kentucky and West Virginia on the other hand. Production in the three union states in 1923 was 11 per cent less than it was in 1920, while the number of men employed in the same states in 1923 was 12 per cent greater than the number employed in 1920. On the other hand, production in the two non-union states was 22 per cent larger in the later year and the number of men employed 16.8 per cent greater. These figures being interpreted mean that in the non-union fields, demand for increasing production was met partly by more efficient operation and partly by increasing the labor force, whereas in the union fields just named, with their high wage scale, the number of men increased 12 per cent at the same time that the output diminished 11 per cent.

The point that I am leading up to is this: It is easy to deflate mine capacity. Unprofitable mines will close voluntarily or under compulsion in due time. It is not so easy to deflate the labor supply of an industry whose rates of pay and working conditions are so attractive that more and more men flock into it at the very time that the number of days of operation is falling off.

There is one way to deflate the labor supply, and that is to allow economic forces to work themselves out, and to reduce the inflated wage scale to a point where the earnings of part-time operation will no longer be so attractive as to draw a constantly increasing supply of men into the industry. That one and only method of deflating labor in the industry is the one method which no government in a democratic country could undertake to enforce. There are unmistakable evidences that natural economic forces are rapidly accomplishing this reform.

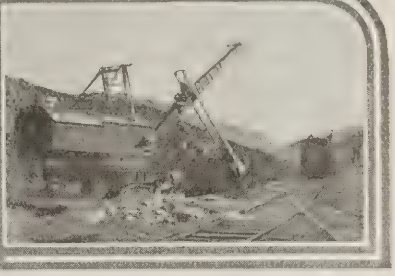
There are people so seemingly ignorant of what is going on about them and so apparently incapable of learning from experience as to advocate governmental interference in the coal mining industry for the sake of promoting efficiency. It has been a common-place of economic philosophy since the days of that canny Scotchman, Adam Smith, that governmental handling of industrial matters is sure to be inefficient. For evidences of the wisdom of that doctrine we need look no further than to the record of our own government's handling of railroads, airplanes and ships during and since the war.

Bituminous coal operators are not as inefficient as critics of the industry seem to believe. In the matter of extraction, for instance, whether 60 per cent or 80 per cent or 90 per cent should be extracted depends largely upon the prices which consumers are willing to pay for coal. Practically 100 per cent extraction is possible if the operator can obtain a price to recoup him for the large expense involved. If the government is going to undertake to obtain a higher percentage of extraction, it must compel consumers to pay the price.

**These Mining Men Are Keen to Swap Ideas**

Every year the Southern Mining Co. holds a technical conference for its own mechanical and electrical men and those of its affiliated companies at Williamsburg, Ky. It is a sort of mining institute where operating ideas from the several mines are discussed. This year the attendance reached 100. Part of the group is shown in the large picture below. F. A. Signer, electrical engineer, who presided at all the sessions for two days, had to be carried into the hall (see inset) and used a wheel chair, thanks to a broken leg and sprained ankle suffered in an accident underground. Bearing him out of the automobile are: G. L. Birch (left), chief electrician of the company's Balkan mine, and Bryan Harkness, chief electrician of the Insull mine.

# News Of the Industry



## Rumors of Peace in Hard-Coal Strike Denied by Operators and Union Heads; Coolidge Asked to End Suspension

Unqualified declarations on Oct. 26 by both operators' and miners' leaders that no settlement proposal was under consideration or in prospect indicated that the possibility of peace in the hard-coal field was not yet in sight. Speaking for the producers, Samuel D. Warriner, chairman of the Anthracite Operators' Conference, told General Charles W. Berry, chairman of the New York State Coal Commission, that "there isn't even a hen on the nest." John L. Lewis, president of the United Mine Workers, was equally emphatic in denying peace reports, declaring that the 158,000 hard-coal miners are standing firmly for the demands served on the producers.

Mr. Warriner said there was not the slightest chance of an early settlement of the strike, as the operators were determined to fight to "a final showdown" in the effort to reduce "labor cost per ton" and obtain a guaranty that the miners will not strike in the future when a contract expires and a renewal is being negotiated. While the vigor of these denials would seem to foreshadow a long and bitter struggle, it is recalled that in the past equally blunt statements have been quickly followed by a resumption of negotiations.

Reports that were current throughout the anthracite field over the week-end and which were given publication in daily papers in the region as well as in New York and Philadelphia to the effect that a compromise had been effected between the miners' union and operators were emphatically denied by officials of both interests.

### Name Father Curran as Mediator

The story had it that the operators, through the mediation of Rev. J. J. Curran, of Wilkes-Barre, had advanced the proposal to the miners that a 5 per cent increase in wages and a modified form of the check-off would be granted in exchange for a long-term agreement.

W. W. Inglis, chairman of the anthracite operators' negotiating committee, when interviewed concerning the rumor, declared: "Reports that the anthracite operators have offered the mine workers a 5 per cent increase in wages and that we have partially accepted the check-off demand are absolutely and entirely untrue. My first knowledge that such a proposition had even been spoken of came when I read the reports of the rumor in the press. The statements are without foundation."

When asked if there was any likelihood of an early resumption of mining Mr. Inglis said: "From present indications I would judge that it will be quite a while before work is resumed."

Thomas Kennedy, international secretary-treasurer of the miners' union, flatly denied the story of the reported proposal, as did Chris J. Golden, president of District 9, United Mine Workers. Both are members of the miners' scale committee. The Philadelphia headquarters of the miners' union also issued a denial of the report.

It is understood that the proposal was actually made by Father Curran to John L. Lewis, president of the union, at Atlantic City some weeks ago, but without the authority or knowledge of the operators.

President Coolidge, Governor Pinchot of Pennsylvania, and John L. Lewis, international president of the United Mine Workers, were asked to aid in an early settlement of the "suspension" in a resolution adopted Oct. 23 by the Bronx Grand Jury, New York City. The resolution followed a hearing on coal conditions in that borough at which Major Gen. Charles W. Berry, chairman of the State Coal Commission; Edwin J. O'Malley, Manhattan Commissioner of Markets; Chief Sanitary Inspector Joseph Lonergan, representing Dr. Frank J. Monaghan, Health Commissioner, and Roderick Stephens, vice-president of the Stephens Fuel Co., Inc., were among the witnesses.

The resolution stated that "a distressful condition has arisen and that unless immediate steps are taken to adjust the present strike, untold misery and suffering will befall many poor families in our country. In order to prevent the dire consequences resultant from a continuation of the strike we urgently and respectfully ask you to take such steps as will bring about an immediate and peaceable settlement between the operators and miners."

Many dealers object to laying in heavy stocks of soft coal, contending that an unexpected ending of the strike would find them loaded up with soft coal which they could sell only at a loss. On the whole, said Major Deegan, foreman of the Bronx Grand Jury, the coal trade had acquitted itself commendably in its expressed willingness to co-operate in the present situation.

**Major General Charles W. Berry**

Chairman of the New York State Coal Commission, recently revived by Governor Smith to act in the emergency brought about by the suspension of operations at the anthracite mines, advises the public to lay in soft coal at once, "and not wait until dead of winter." He also abandoned his previous stand on $16 as a "fair price" for anthracite, saying that "there is no anthracite."

General Berry said that rumors of a strike settlement which had drifted in from the mine fields were not borne out by opinions he had received "from men supposed to know something about the mines." He quoted his informants as saying the strike "is going to be fought out and there is not likely to be an end within six months." On the other hand, he said, Wall Street men who were generally well informed had held that the strike would end soon.

Spokesmen for the mine workers' union said positively that nothing was under way to their knowledge, and, further, President Lewis, it was learned, is scheduled for addresses at Shamokin and Mahanoy City, Pa., on Oct. 29.

Unless New York City coal dealers provide an adequate supply of soft coal and sell it at reasonable prices, Major Gen. Charles W. Berry, chairman of the New York State Coal Commission, asserted Oct. 24 that he would urge the city to open municipal coal depots for the sale at cost, of soft coal and other substitutes for anthracite.

"The commission," he said, "is making every effort to persuade dealers to obtain soft coal, but if they fail to do so we must act in the name of public welfare and see if the city authorities cannot provide fuel for the people.

"There is no doubt in my mind that

### *Urges Retailers to Stock Substitute Fuels*

"Stock substitute fuels," was the warning sent out to the country by the board of directors of the National Retail Coal Merchants' Association at a meeting held at Toledo, Ohio, last week. "Pending the resumption of anthracite mining," the board urged "all retail merchants who deal in hard coal to immediately obtain a supply of substitute fuels, sufficient to offset the loss of tonnage due to the refusal of the miners to continue at work pending negotiation of a new working agreement in the hard coal fields."

The board also recommended full co-operation with all properly constituted public authorities "in every practicable effort to assure equitable distribution of available supplies and the avoidance of hoarding, speculation or unreasonable prices." In a third resolution the directors asked the producers to discourage pyramiding by stipulating that coal sold to a jobber should not be resold to another middleman. The same resolution called upon retail dealers to confine their sales to established team and consumer (household) trade.

---

if there were places in New York City where anybody could buy soft coal at a reasonable price there would be an end to the present situation."

Health Officer J. J. Hagan, Fuel Administrator of Jersey City, announced that he had obtained 1,000 tons of anthracite from Pennsylvania, which would arrive in Jersey City this week and be sold to poor families at 60c. per 100 lb., a rate equal to $12 a ton. Peddlers in Jersey City are now charging $1.25 per 100 lb.

Mr. Hagan said the city coal would be distributed by city employees with city shovels and city trucks, and would be sold only in small lots to persons who could not afford to buy in the open market. The coal was originally bought by a Western firm, which cancelled the order, and it was obtained while in shipment by a Jersey City firm, which turned it over to the city at cost.

Hagan told of taking an option on all the Welsh coal he might want at $18 a ton, which he said would mean $21 a ton on this side of the Atlantic, and of planning to import it if the famine became acute.

S. A. Wertheim president of Burns Brothers, New York City, who arrived on the "Berengaria" Oct. 24, said that he had made large contracts for shipments of British anthracite to New York and that two 5,000-ton ships had already left laden with the fuel for this port.

Mr. Wertheim declined to tell how much coal he had bought in England. He said that he would not comment on the coal situation in New York until he had conferred with the directors of Burns Brothers.

---

# Anthracite Field Has 670,000 Tons Of Domestic Coal Now, Survey Shows

By R. J. Arthur
Scranton, Pa.

The volume of anthracite coal left in the field or in railroad yards near the producing districts is small, judging by a survey made for *Coal Age*, Oct. 24. The total of domestic sizes is estimated at 670,000 tons and of steam sizes (buckwheat and smaller), 1,190,000 tons. These tonnages were determined with indifferent assistance from anthracite producers and official agencies. Statements from these sources were withheld because of the difficulty of arriving at definite figures, due to constantly changing tonnages at various storage points.

By observation and from unofficial sources the following information was obtained:

In the Hampton storage plant of the D. L. & W. Coal Sales Co., at Scranton, about 200,000 tons of coal is stored. About half this quantity is domestic fuel. In one trimmer 70,000 tons of chestnut coal reposes; about 40,000 tons of pea coal and approximately 90,000 tons of buckwheat comprises the remainder of the storage. In cars on the D. L. & W. R.R. throughout the anthracite field between 60,000 and 70,000 tons of coal, domestic and steam sizes, is said to be awaiting shipment. Lines of filled cars are in evidence on sidings and switches throughout the Northern field. A representative of the D. L. & W. Coal Sales Co. declared that the company "has enough coal to last throughout the suspension." It is understood that a rationing system is in effect by this company and that hospitals, charitable institutions and industries which have a direct bearing on the public welfare will be the first among its customers to be served. This policy is said to be in effect by other distributors also.

The Hudson Coal Co. has instituted a program which calls for the rapid movement of stored coal. This is evidenced by the fact that the company has emptied its Carbondale (Pa.) trimmers of 400,000 tons of prepared sizes since the suspension started. Dealers in Hudson coal are required to stock the fuel in their own storage plants. Storage of Hudson company coal at Parsons, Pa., is estimated to total 70,000 tons. This is birdseye coal. In Olyphant, Pa., the Hudson storage piles contain about 300,000 tons of buckwheat coal.

The Lehigh Valley Coal Co. at its Ransom (Pa.) storage plant has about 25,000 or 30,000 tons of pea coal. This does not represent one-half of the total storage in piles and cars held by that company's coal selling agent.

The Scranton Coal Co. at its Cadosia and Middletown (N. Y.) storage plants two week ago had approximately 350,000 tons of coal, the greater part of which was domestic fuel. This coal is being moved rapidly.

In the lower field the Philadelphia & Reading Coal & Iron Co. is said to have larger storages, especially of smaller sizes, than any of the other hard-coal producers.

No estimates were available on the Lehigh Coal & Navigation Co.'s storage.

The Temple Coal Co. of Scranton is said to be in about the same condition as the Scranton Coal Co. Other independents throughout the region are understood to have a total of 800,000 tons of various sized coal on hand.

Reports from all of the "old line" companies and their selling agencies quote prices the same as those which prevailed previous to the suspension of mining. A check is being made on dealers by the sales agencies in an effort to uncover profiteering. A threat of loss of supply is held over the heads of dealers or retailers who sell coal at premium prices.

**Anthracite Tonnages Now in Storage in Piles or on Wheels, Estimated**

| | Domestic Sizes | Buckwheat and Smaller |
|---|---|---|
| D. L. & W. Coal Co., Hampton Yards . | 110,000 | 90,000 |
| D., L. & W., on cars elsewhere ....... | 30,000 | 30,000 |
| Hudson Coal Co... | ...... | 370,000 |
| Lehigh Valley Coal Co. .............. | 30,000 | ...... |

## Johnstown Men Discuss Top Rock Blasting

At the first 1925 meeting of the Pennsylvania Coal Mining Institute of Johnstown, in Johnstown, on Friday, Oct. 16, the blasting of top rock as a means of preventing the cutting and breaking of roofs in mines was one of the practical theories advanced by mine officials and employees. President Charles Enzian, of Windber, presided and led the discussion. Safety lamps and other safety appliances and measures were discussed. Secretary William Flemming of Johnstown presented a financial report of the Institute.

Among those who took prominent parts in the discussions were Nicholas Evans, local mine inspector; John Ira Thomas, mine inspector; A. E. Roberts, of Revloc; A. C. Cook, Windber; Lewis Evans, Cardiff Coal Co.; David Davidson, Nant-y-Glo; Martin Ankeny, Johnstown, and Prof. W. G. Duncan, State College. It was planned to hold meetings in the future every two months, the next session to be held in December. The executive board of the Johnstown branch is composed of Prof. W. R. Chedsey, State College; Dennis Boyle, Johnstown; Patrick Frear, Seward; Patrick Nairn, Johnstown; Archie Miller, Cairnbrook; Professor Duncan, Mr. Evans and Mr. Thomas.

# Survey Shows Bitter Anti-Anthracite Campaign in New England

Previous to and during the suspension of anthracite mining, which is now ending its second month, the anthracite operators, as well as other agencies, pointed out that a cessation of anthracite production would result in further loss of hard coal markets, especially in New England. President Lewis, of the United Mine Workers, scouted this prophecy on the basis that the installation of special apparatus to burn oil was too costly, that oil itself was a more expensive fuel than hard coal and that bituminous coal would be generally unsatisfactory.

After a trip to the section involved and consultations with governmental organizations, coal-trade leaders and others concerned, a *Coal Age* correspondent reached the following conclusions:

> New England, through government and civic organizations, is conducting a far-reaching campaign to displace by substitute fuel 10,000,000 tons of anthracite which is used yearly in that territory. And further, the campaign is meeting with success.
>
> Anthracite is being singled out, pictured as an ogre and practically boycotted.
>
> Coal consumers in New England feel they are being tricked and mulcted by the anthracite industry. They are sure they are being made the goat of profiteers. Collusion between the producers and the miners' union is charged openly. Recurring strikes and suspensions are regarded solely in the light of trade politics to bring about an advance in the price of the commodity concerned.

Since the present suspension of mining the consumers in the northeastern states have assumed a determined attitude. They are going to destroy what they term "the anthracite bogey." The reassurance is given New England coal consumers that bituminous coal can be adopted readily, with little or no more trouble than anthracite and with less expense.

### Attack Supply, Quality and Price

New England is basing its case against anthracite on three fundamental objections: uncertainty of supply, poor quality and high price. Another argument advanced against the continued use of hard coal is summarized in a recent statement by the New England Governors' Fuel Committee as follows: "Experts report that the easily mined anthracite is being rapidly exhausted, and in the future the cost of mining anthracite will increase." It is then added, "Geologists estimate the supply of bituminous coals to be adequate for more than 2,000 years; consequently, the ultimate depletion of bituminous coal is not a factor affecting the price to the present generation."

The New England Governors' Fuel Committee is the principal agency in the campaign against the use of anthracite. It is headed by John Hays Hammond, a national figure. Eugene C. Hultman is vice-president and Bernard P. Scanlan is secretary of the committee.

The commissioners explain that the only power they wield is that of public opinion and this they endeavor to create favorably toward the use of anthracite substitutes through the medium of newspapers. They are getting unprecedented co-operation both editorially and in the news columns of New England papers.

The issuance of pamphlets and circulars also is a part of the day's work. These are distributed to consumers, to public organizations, chambers of commerce, Rotary and Kiwanis clubs and other civic organizations. Speeches advocating the use of substitute fuels are "always in stock."

Not a small part of the work of the fuel committee is the assistance it is giving to retail coal dealers in the actual handling of bituminous coal. Sources of supply, quality, freight rates and methods of shipment of bituminous coal as well as other pertinent facts regarding soft coal are regularly sent out to dealers.

### Distributed Under Rationing System

At the present time New England is short three million tons of its annual supply of anthracite. According to the best available figures the northeastern states have less than seven million of the ten million tons of anthracite which they burn annually. The tonnage now stocked in coal yards is being distributed under a rationing system and with what approaches discrimination. The retail marketing is being done on a "substitute selling" plan, by which the retailer induces the customer at first to take deliveries of both hard and soft coal. Later the buyer gets nothing but soft coal.

New England is primarily concerned, however, with its industrial welfare. Comparison shows, according to a statement issued by the Governors' fuel committee, that the annual household heating bill of New England is at least double that of other sections of the country having a similar climate and with which it competes industrially. Translated into dollars this means that about $70,000,000 a year additional is included in wages and living costs in New England due to its dependency on anthracite.

There is a saving grace in the situation for the anthracite producers—with conditions. The present price of anthracite delivered in the cellars of consumers in New England is being paid with little complaint. By reason of the campaign against the fuel, however, anthracite will gradually lose its market in the Northeast. An indication that it has been losing its market continuously is shown in that its tonnage has not increased in the past half-dozen years, despite increases in population and homes.

### Supply Must Be Assured

The anthracite producers' best weapon in combating the campaign against them is the assurance to New England consumers of continuous supply of fuel. This can be done only with the co-operation of the men who mine the coal—through agreement with the United Mine Workers. That such an agreement would benefit the worker as well as the owner goes without question.

**Samuel A. Taylor**

Pittsburgh's choice for A.I.M.E. president is a graduate of the Western University of Pennsylvania (now University of Pittsburgh), of which he is now a dean in charge of the School of Mines. He was technical adviser in the Fuel Administration during the war and in 1912 was the president of the American Mining Congress. He also is a coal operator, banker and consulting engineer.

---

Figures on the shipments of various fuels to New England in 1922, 1923 and 1924, which will undoubtedly prove of much interest to those studying the fuel situation, follow:

RECEIPTS IN 1922

| | |
|---|---|
| Anthracite (strike), tons | 6,471,000 |
| Bituminous, tons | 18,807,000 |
| Mineral crude oil, gallons | 749,192,000 |

(About four barrels of oil—168 gallons—equals one ton of bituminous coal in heat value.)

RECEIPTS IN 1923

| | |
|---|---|
| Anthracite, tons | 12,184,000 |
| Bituminous, tons | 23,684,000 |
| Mineral crude oil, gallons | 582,581,000 |

RECEIPTS IN 1924

| | |
|---|---|
| Anthracite, tons | 10,608,557 |
| Bituminous, tons | 18,894,267 |
| Mineral crude oil, gallons | 637,270,000 |

---

# Veil Hoover Committee Plans Till Washington Meeting

An agreement that no publicity be given the findings of the subcommittees studying the work of the U. S. Bureau of Mines until final action shall have been taken on them by the whole advisory committee was adopted by the committee at its Pittsburgh meeting, last week. Another meeting of the committee is to be held early in November in Washington.

Every effort is being put forth to expedite the work of the committee, in order that the reorganization of the Bureau will indicate to Congress that the mining industry is prepared, through that agency, to do voluntarily some of the things which certain legislators would make compulsory. While the only drastic legislation likely to be proposed at this session of Congress will apply to coal, it is recognized that the prescribing by law of a program of returns which must be made by coal producers would establish a precedent which soon would be applied to other commodities entering into general use.

## One Dead, Four Injured In Attack on Employees Of Pittsburgh Co. Mine

In the first labor trouble growing out of the resumption of work on the 1917 scale in the Pittsburgh district, six men, all negroes, employed at the Midland Mine of the Pittsburgh Coal Co. battled their way to freedom after being attacked by a mob of 100 men at Houston, Pa., last Saturday night. One of the attackers was killed and four others were slashed. James Johnson, of Jeannette, and Arthur Thornton, of Pittsburgh, both negroes, were arrested and lodged in the Washington County jail.

The Pittsburgh Coal Co. issued a statement Oct. 26 in which it condemned the action of the union sympathizers and announced that it would "afford its employees the fullest protection, both legal and otherwise."

With Banning Mine No. 2 setting a new daily record, the three mines of the Pittsburgh Coal Co. in the Pittsburgh field operating under the November, 1917, scale, produced a total of 2,295 tons of coal in a single day, it was reported by the company Oct. 24. Banning No. 2, the pioneer mine, near West Newton, loaded 1,239 tons in a single day; Banning No. 1 loaded 638 tons, and Midland Mine, near Canonsburg, which was opened a week ago, loaded 418 tons. Each of the three mines made a new daily record.

The number of men working at the three mines is 637, divided as follows: Banning No. 2, 271; Banning No. 1, 196, and Midland No. 1, 168.

Robert Baughman is superintendent at Banning No. 2, Oscar Steckman at Banning No. 1 and John Bartrom at Midland No. 1. William Lauder is division manager in charge of the Youghiogheny Valley and H. M. White is the division manager in charge of the Midland operations.

## Connellsville Coke Ovens Blowing in Rapidly

In the Connellsville (Pa.) coke region the H. C. Frick Coke Co. has fired 200 of 352 ovens at the Whitney plant, and is firing the remainder and 50 additional ovens at Hostetter. The number of ovens in blast at the Mammoth and Marguerite plants also is being increased and by the end of this week 770 more ovens will be in than last week. The Hustead-Seamans Coal & Coke Co. has fired all its idle ovens at East Middlesboro. The Century Coke Co., at Brownsville, has all but 15 of its 205 ovens at work. The Hillman Coal & Coke Co. has all its ovens going except some at the Isabella and Brownsville plants.

The Baton Coal & Coke Co. is firing all but 7 of its 142 ovens at Linn, near Brownsville, and 240 at the Sunshine plant, near Martin. The Etna Connellsville Coke Co. is resuming operations and firing all of the 119 ovens at the Garwood plant, and the Southern Connellsville Coke Co. is firing the 64 ovens at the Marion plant. The Sterns Coal & Coke Co. is firing the 132 ovens at the Eleanor plant, between Brownsville and Uniontown. The champion Connellsville Coke Co. has resumed operations and fired 40 ovens near Brownsville.

All sorts of crushing and screening schemes are being adopted to produce different sizes of domestic coke to ship into anthracite consuming territory. Coke breeze from the yards is being screened and old breeze piles scraped up and screened to produce nut coke. Screened sizes of domestic coke range as high as $8 and $8.50, and screened breeze $6.50 and over at ovens in the Eastern market.

### *Home Coal from Factories*

Henry L. Shattuck, a Boston attorney and a former member of Massachusetts Commission on the Necessaries of Life, is urging the industrial companies of the state to screen their coal supplies and sell the large sizes to their employees. This is being done to increase the use of bituminous coal.

## Soviet Buys Locomotives Here for Mines

The Westinghouse Electric International Co. has just received an order from the Amtorg Trading Corporation, the commercial representatives of the Soviet Government in America, for twenty-five mine locomotives to be used in connection with the electrification of the coal mines in the Donetz district, near the Black Sea, in Russia.

Some of these locomotives will be trolley and the remainder are of the storage battery type. A distinctive feature is that they will have adjustable wheel gages so that they can be operated on tracks of from 24 to 30 in. wide.

### *Big Doings in Coke*

In the Uniontown-Connellsville district, where the fuel industry has been awakened from a lethargy of several months, due to the demand from the East for anthracite substitutes, independent coke operators without crushing equipment have put gangs of men to work with sledge hammers breaking coke. Crushed coke brings a premium of $2 a ton over regular 48-hr. furnace coke.

As has happened many times in the past, the operations that are making the most of the present situation are those that do not have permanent blast furnace contracts. The backbone of the coke producing industry in the beehive field is a few large companies and their product is moving to blast furnaces on $3 or $3.25 contracts in spite of the $8 market for furnace coke. The H. C. Frick Coke Co., however, is selling some domestic fuel for the first time in its history, according to reports.

## Carnegie Coal Co. Bankrupt But with Large Assets

The Carnegie Coal Co., formerly dominated by John A. Bell, bankrupt coal operator, was placed in receivership on Oct. 21 in United States District Court at Pittsburgh, Pa., following the filing of an equity suit by the Harrison National Bank of Cadiz, Ohio, which holds an unpaid promissory note for $10,000, signed by the coal company. The court appointed W. M. Wilshire, sales manager of the coal company, and C. C. McGregor, vice-president and general manager of the Montour Collieries Co., temporary receivers, to conduct the affairs of the Carnegie Coal Co. The receivership acts as a supersedeas in a suit filed by Harry F. Sinclair, New York millionaire oil man, to obtain $125,000 on a promissory note.

The Ohio bank estimates the outstanding obligations of the Carnegie Coal Co. at $9,500,000, of which $7,500,000 is in first mortgage, 6 per cent bonds and other obligations and claims. The bank believes the assets of the coal company have an aggregate value in excess of the indebtedness. J. H. Sanford, president of the coal company, in an answer to the suit admitted the allegations, and joined in the request for the appointment of receivers.

The Carnegie Coal Co. was created Dec. 12, 1923, by the merger of the Carnegie Coal Co., Verner Coal & Coke Co., the Burgettstown Coal Co. and the Wabash Coal Co. During its existence the company was dominated by Mr. Sanford, then by Mr. Bell, and recently, when the latter became in financial difficulties, the control again reverted to Mr. Sanford and associates.

## "Power Show" May Teach Coal Burning Economies

The Fourth National Exposition of Power & Mechanical Engineering will open at 2 p. m. on Monday, Nov. 30, at the Grand Central Palace, New York City. It will extend through the week, ending Dec. 5, opening each day at noon. The basic purpose of the exposition is to bring together showings of manufacturers of power and mechanical equipment so that engineers and industrial executives may have an opportunity for comparative study of the outstanding developments in the field.

Devices to increase the effectiveness and economy of combustion will be presented at the show in distinguished array. Air preheaters, pulverized fuel equipment of all types, stokers, water-cooled boiler furnace walls, soot blowers, and draft apparatus will be shown. One of the features of this group of exhibits will be the showings of recent developments in the more economical use of pulverized fuel. This will include new designs of boiler furnaces, several new types of burners for pulverized fuel and the latest achievements in crushing and drying coal. The managers of the show are Fred W. Payne and Charles F. Roth, with offices in the Grand Central Palace.

# Strike Call to Non-Union Miners In West Virginia Seems Doomed To Failure as Production Mounts

The second strike call by the United Mine Workers to the non-union miners of northern West Virginia seems to have fallen on deaf ears, and the daily non-union coal production is gradually working back to where it was prior to Sept. 25, when the last strike was declared. The general feeling is that the union has lost out unless a runaway market develops, and that is practically impossible with the present heavy flow of bituminous coal all over the country.

In an effort to furnish grist for his mill, Van A. Bittner, chief international representative of the United Mine Workers in northern West Virginia, is doing his level best to discountenance the daily production figures announced by the non-union coal operators in the Fairmont field.

"Admitting for the sake of argument, that these figures are correct, which is far from the truth," Bittner says, "we find that 203 non-union mines loaded 1,649 cars of coal" in a day, "which is an average of only 8 cars to the mine, while 16 union loaded 305 cars, an average of 19 cars per mine." Continuing, he says in part: "If these figures of the non-union operators' propaganda bureau were true, it demonstrates that each union mine that is in operation is really two and a half times as efficient as the non-union mines.

"The actual car rating of these non-union mines is more than three times as great as the actual number of cars being loaded. This is another demonstration that even according to the operators' own figures they are getting less than one-third of their production at the non-union mines that are attempting to operate."

### Union Seeks Referee

The union miners are resorting to the old play of involving the clergy and the newspapers to referee their bout with the coal operators. This developed recently, when Bittner issued a statement in which he set forth the following challenge: "If the members of the United Mine Workers are not in favor of the policies inaugurated by the officers of the union who are now in charge in northern West Virginia, then we are willing to leave this section of the country."

The challenge was made after George S. Brackett, head of the Brackett Statistical Organization, was purported to have said in an address before the American Mining Institute in Washington, D. C., recently that the international union destroyed the autonomy of the miners of northern West Virginia and left them without control over their own affairs, according to Bittner.

After a long statement in which personalities play a big part, Bittner suggests that he and Brackett make a round of the union miners in the field and ascertain if this is true. He suggests that newspapermen or clergymen of all of the Christian churches of northern West Virginia accompany them to ascertain the facts first-hand.

In the first four days of last week the non-union mines in northern West Virginia produced 6,427 cars of coal compared to 6,821 cars in the corresponding period of the previous week. There was a slight increase in non-union tonnage along the Monongah Division, B. & O., and the Monongahela toward the approach of the week-end, but no records were broken. Non-union production was reduced considerably along the Western Maryland branches in northern West Virginia, due to car shortage and the rail engine men's strike.

Union tonnage increased slightly in the region last week. In the first four days of the week 1,179 cars of coal were produced, an increase of 22 cars compared to the first four days of the previous week. Union mines in the region loaded 312 cars of coal on Oct. 22, the largest day's output since Oct. 13. Union operations along the Monongahela loaded 224 cars of coal Oct. 22, which was the largest daily union production since the strike began, April 1.

Despite the wintry weather the United Mine Workers continue to hold mass meetings in the region. Gatherings are held in halls most of the time now. Recent meetings were held at Monongah, Watson, Brady, Lumberport and other mining towns.

---

## Detroit Retailers Will Educate Public

The movement for better public education in coal consumption was forwarded Oct. 27 when the coal retailers of Detroit formed the Detroit Fuel Research Institute. This body expects to advance the cause of coal by showing the people of the community how to get the most out of their fuel.

## *Non-Union Miners Would Enjoin Prayer Meetings*

An action unprecedented in labor disputes in the Southwest was taken Oct. 6 by non-union miners in Oklahoma, when they filed an intervening petition in connection with operators' application in the U. S. District Court at Oklahoma City for an injunction against the United Mine Workers to prevent interference with workers in Oklahoma mines. The application of the non-union miners was directed principally against the "prayer meetings" which union men have been holding in the vicinity of the mines since the strike was called on Sept. 1.

## *Lilley Mine on 1917 Scale*

The Lilley Coal & Coke Co., with head offices in Charleroi, Pa., is reported to have started its Lilley Mine, near California, Pa., on Monday morning of this week on the 1917 wage scale. The normal complement of the mine is 400 men. This is the third company that has started operations on the 1917 scale in the Pittsburgh union district.

## Eleven First-Aid Teams in Tennessee Meet

Tennessee's thirteenth annual first-aid contest was held Oct. 3, at the East Tennessee Division Fair, Knoxville, Tenn., under the auspices of the Southern Appalachian Coal Operators' Association, Tennessee Mine Inspectors, East Tennessee Fair Association and the U. S. Bureau of Mines.

Eleven teams were entered, the Pruden Coal Co. having three; Black Diamond Colleries Co., two; Campbell Coal Co., Clearfork Coal Co., Cambria Coal Co., Pioneer Coal Co., Lafollette Coal & Iron Co. and the American Zinc Co., one each.

The Cambria Coal Co. team took first prize, consisting of a silver loving cup donated by the Southern Appalachian Coal Operators' Association and $28 in cash. Second prize went to the Pruden Coal Co.'s Valley Creek team, which received a loving cup given by the Provident Life & Accident Co., Chattanooga, and $20 in cash; third prize to the Pioneer Coal Co., Kettle Island, Ky.; fourth prize to the Pruden Coal Co., Pruden, Tenn.

A feature of the meeting was a demonstration in a glass gallery of the explosibility of coal dust by George Grove, engineer of the U. S. Bureau of Mines, Pittsburgh, Pa.

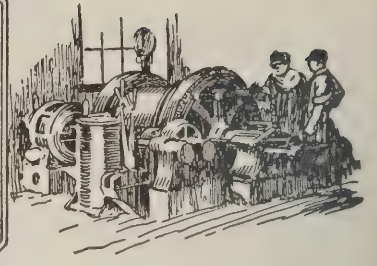
The contest was judged by Knoxville doctors. Dr. Kile Copenhaver was chairman, assisted by Dr. Merryweather, surgeon for the U. S. Bureau of Mines, Birmingham, Ala., and George K. Brown, technical engineer for the du Pont Powder Co., Huntington, W. Va.

R. E. Howe, secretary of Southern Appalachian Coal Operators Association, chairman of the general arrangement committee, and J. M. Webb, of the U. S. Bureau of Mines, trained the teams for the contest.

---

The National Coal Association has appointed the following committee to meet with the Trades Relations Committee of the American Wholesale Coal Association: A. W. Calloway (chairman), president, Davis Coal & Coke Co., Philadelphia; W. D. Ord, president, Empire Coal & Coke Co., Landgraff, W. Va.; H. N. Taylor, president, U. S. Distributing Corp., New York City, and Ezra Van Horn, general manager, Clarkson Coal Mining Co., Cleveland, Ohio. The American Wholesale Coal Association requested the National Coal Association to name a committee to confer with wholesalers on the subject of the open consignment of coal.

# Practical Pointers For Electrical And Mechanical Men



## Inexpensive Signal System Tells if Distant Fan Is Running

At Mine A of the Pike County Coal Corporation, Petersburg, Ind., the ventilating fan is located in a field about 900 ft. from the tipple and hoist house. This location makes it necessary to have an unfailing signal to indicate when the fan is in operation.

The signal system used is of the interrupted, closed-circuit type, as illustrated in Fig. 1. It consists of an incandescent lamp in series with an interrupting device on the fan shaft. The lamp is located in the hoist house, within normal range of vision of the engineer but shaded so that there is no irritating glare. The circuit is interrupted for about 1/25 of a second during each revolution of the fan shaft. This causes a perceptible winking of the lamp. The frequency of this winking indicates the fan speed, and failure to wink indicates that the fan has stopped or that the signal is out of order.

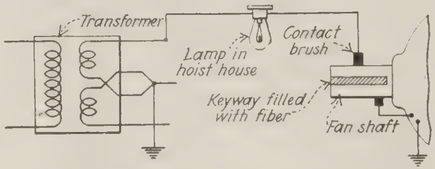


**Fig. 1—Circuit Arrangement of Indicator**

The lamp, located in the hoist house, is lighted continuously, except for a perceptible wink occurring once during each revolution of the fan. The indicator is connected to a grounded circuit, therefore but one line wire is necessary.

Inasmuch as the lamp is lighted from a grounded circuit, but one wire is carried from the hoist house to the fan. This wire is connected to a brush which makes contact to the periphery of the fan shaft. The keyway, which is in the path of the brush, is filled with fibre. The circuit is broken once during each revolution while the brush passes over this insulated section.

Fig. 2 is a close-up of the fan shaft and contact brush. The keyway does not show because the fan was in operation while the photograph was being made. On the other end of the fan shaft there is a copper ground wire which makes a continuous brush contact to the shaft. This is to avoid any possibility of the signal current affecting the bearing surfaces.

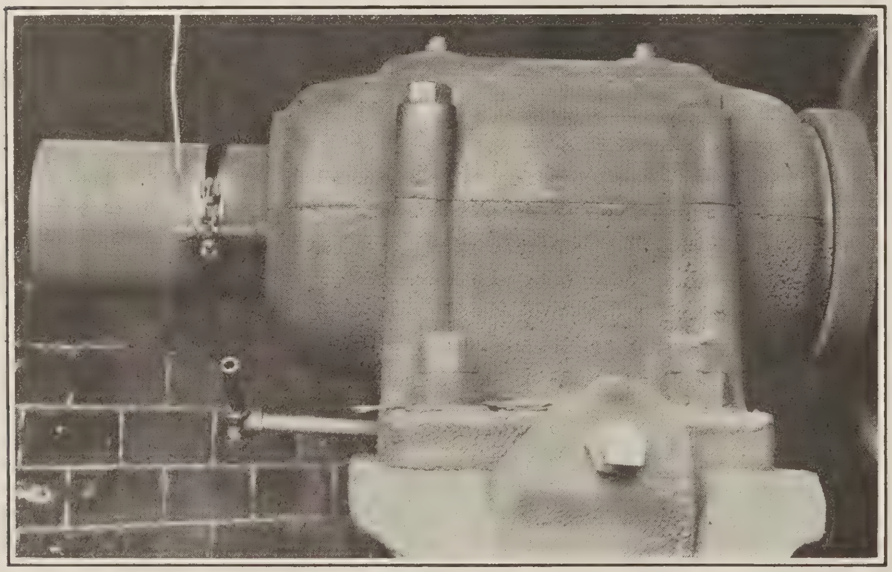

**Fig. 2—Contact Brush of Indicator, Mounted on End of Fan Shaft**

That part of the keyway which passes under the contact brush is filled with fiber. This insulated section causes the circuit to be broken for an instant during each revolution. On the other side of the fan a copper ground wire makes a continuous brush contact to the shaft, so that the signal current does not have to pass across the surface of the machine bearings.

## Homemade Press Proves Extremely Handy

Forcing bushings into or out of wheels or bearings is a job that requires a reasonable amount of precision. While solid bushings of this nature sometimes can be driven into or out of place by means of a drift and sledge, this procedure is extremely liable to batter the soft brass or other metal and seriously interfere with its usefulness and life.

The accompanying illustration shows a bushing press made and used in the shops of the Orient No. 2 mine of the Chicago, Wilmington and Franklin Coal Co., at West Frankfort, Ill. As may be seen in the illustration this device is extremely simple in construction and consists of a U-shaped channel iron provided with a cross-brace near the top, also of channel iron. An adjustable support for the part which is to be bushed is made of two channel irons which span the opening of the U. The bottom also is provided with angle-iron feet holding the entire press in an upright position. A threadbar and handwheel complete the press.

By means of a series of holes drilled in the two legs of the uprights through which suitable pins pass, the transverse support upon which the part to be bushed is placed can be raised and lowered to suit the conditions encountered. The pins can readily be removed and the crosspiece adjusted up or down as may be desired. Such a device as this finds frequent use in coal mine shops where much repair work, especially

**Easily Adjusted to Suit Work**

This device, built in the shop where it is now used, has been made of such a size as to accommodate practically any bushing work that the shop may be called upon to perform. The work support is easily adjustable up or down.

that on mining machines, locomotives and the like, must be performed. The particular device here shown has proved itself extremely handy in the shops at New Orient.

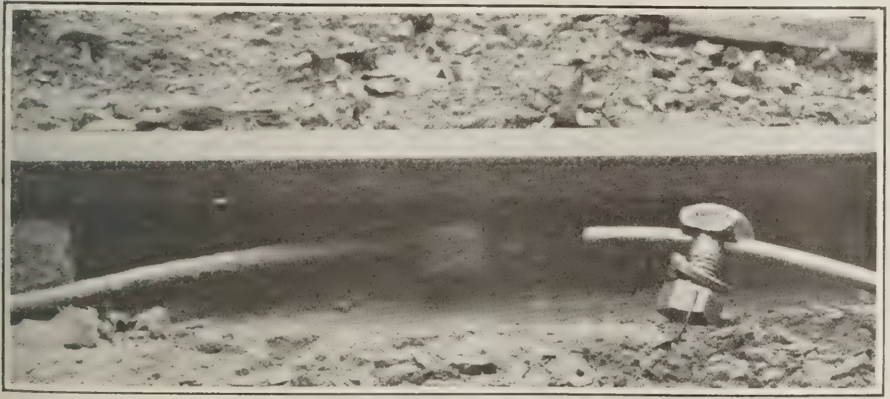
## Special Bolt Serves as Bond Terminal

In so far as permanent track is concerned there seems to be little demand for a better or less expensive rail bond than those now available, but for temporary track, such as in rooms and in certain entries, there seems to be a demand for an inexpensive but effective bond which can be removed easily and which will be in condition for further use. The accompanying photograph, taken at Nisbet No. 11 mine of the West Kentucky Coal Co. at Earlington, is evidence of this demand.

This bond consists of a short length of No. 00 solid copper wire clamped to the rails by means of bolts of special design. The application requires the drilling of a hole in the web of the rail, as is necessary also for bonds of the pin-driven, channel-pin, and compressed-terminal types. At the left in the illustration is the terminal of a bond which is in use, and at the right is one of the special bolts slipped onto a short piece of wire to show the method of installation.

### Provides Better Contact

The bolt is $\frac{11}{16}$ in. in diameter and $1\frac{5}{8}$ in. long, under the head. The hole for the No. 00 wire is drilled half in the head, and half in the shank, so that when the nut is tightened the wire is compressed between the bolt head and the web of the rail. This hole is $\frac{3}{8}$ in. in diameter, or about .01 in. larger than a No. 00 wire. The shank of the bolt is tapered between the end of the thread and the head, with the largest diameter at the head. The hole in the rail is the same diameter as the small end of the bolt, so that when the nut is tightened the bolt it pulled tightly into the hole. This feature provides for a better contact between the bolt and the rail and also helps to hold the bolt from turning while the nut is being tightened. The lock washer used is of the positive pattern.

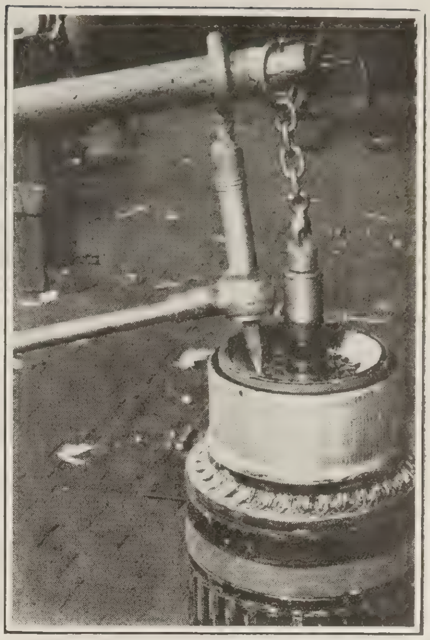


**Close-Up of Bonded Rail and Bolt**

At the right is a sample of the special bolt used in applying bonds such as that at the left. The hole in the bolt is large enough so that the No. 00 wire can be pushed through easily. Tightening the nut drifts the tapered bolt into the hole in the rail and compresses the copper between the bolt head and the web.

## Improvised Device Tightens Commutators Quickly

Loosening or tightening the flat headed cap screws holding the V-ring on the armature of a common mining machine usually is performed by the aid of a T-shaped screw driver and a wrench. This tool requires two men for its manipulation, one to push down on the screw driver and the other to operate the wrench. By this method it often takes two or three hours to tighten up a commutator. A special tool for this purpose by means of which one man can do the same work in fifteen minutes is shown in the accompanying illustration.



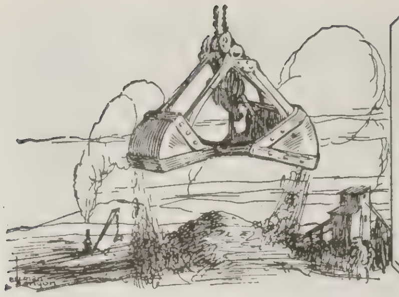
**The Cap Screw Must Move**

By the aid of this home-made device a commutator can be tightened by one man in fifteen minutes. He bears down on the lever with one hand and manipulates the rachet screw driver with the other.

### Construction and Operation

This tool consists of several parts. The first is a reversible ratchet into which is fitted a heavy screw driver bit. This ratchet is held down against the screw by means of a lever similar to a trolley pole. The lever fastens in a ring welded to the ball thrust on top of the ratchet and is anchored to the end of the shaft by means of a chain. A special fitting is provided at the lower end of this chain and screws into the tapped hole in the end of the armature shaft. This chain is fitted with a swivel to avoid twisting as the ratchet is moved from screw to screw around the circumference of the commutator during the tightening process. The man doing the work bears down on the outer end of the lever with one hand and operates the ratchet with the other. There is no slipping of the screw driver and no difficulty is experienced in exerting all the force upon the screws that they will stand.

This homemade device has been built and is used in the central repair shop of the Island Creek Coal Co. at Holden, W. Va. It is a typical example of some of the ingenious devices that have been developed in this shop.



# Production And the Market

## Bituminous Coal Market Shows Firm Tone; Prepared Sizes in Lead

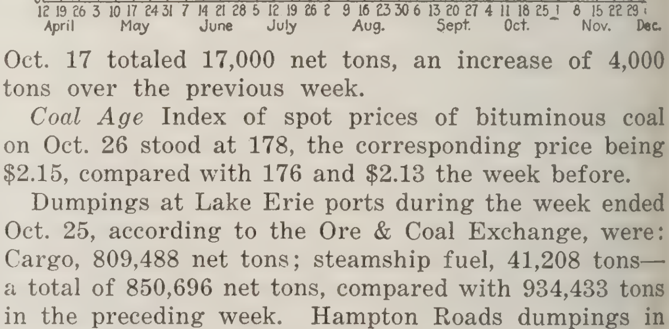
A much better tone pervades the bituminous coal trade, thanks to the stimulating influence of biting autumn temperatures over a large portion of the country. Naturally enough, the firmness is most marked in screened and sized coals suitable for domestic use. Less change is in evidence in the steam-coal business, though railroad consumption is heavy. Movement to the lakes is especially heavy for this time of year, 3,323 carloads having passed through Cincinnati in this trade last week. Embargoes were necessary on the Pennsylvania and B. & O. lines because of congestion at Toledo and Sandusky.

West Virginia smokeless is coming back strong, especially in the Middle West, where prices are mounting steadily. For that matter, Illinois and Indiana prepared coals are in such good demand that "no bills" are being cleaned up and unfilled orders are beginning to be in evidence. Screenings are a trifle weaker, however, due to the output having been too heavy for the market to absorb easily. Kentucky is getting better working time in all fields, some of the product replacing West Virginia coal now going to the East.

Seasonal briskness marks the trade at the Head of the Lakes and the Southwest. All-round firming up is in evidence at Cincinnati and the other Ohio markets also are somewhat stronger. Even Pittsburgh shows signs of a steady influx of strength. All the Eastern markets are steadily gaining except Baltimore, which is rather flat, and New England, where buying has eased off.

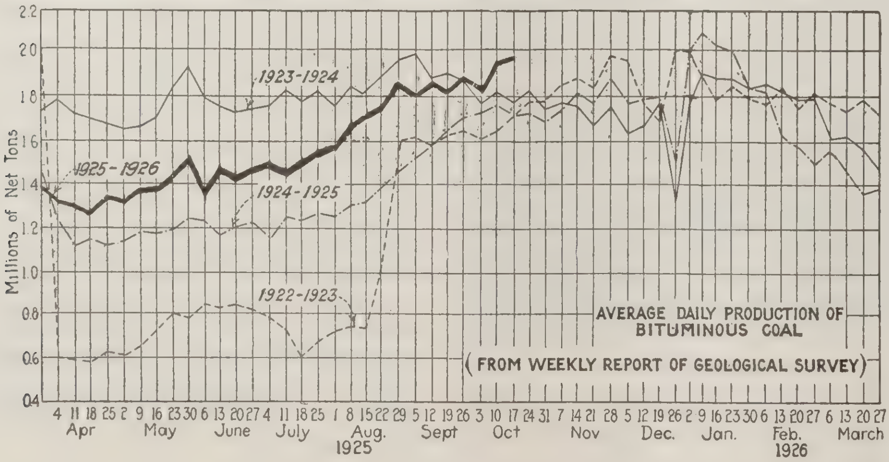
Despite rumors of a compromise being at hand, the end of the anthracite strike seems to be as far off as ever. The wholesale market has practically disappeared and retail stocks of domestic sizes, except of pea, are beginning to feel the strain of the lopsided movement. Buckwheat is still in plentiful supply, but tightening, and the end of the stock of pea is said to be in sight. Coke is the headliner in demand as a hard-coal substitute, so much so that prices are steadily advancing, but the supply, even under forced pressure, can never hope to catch up with the present demand.

Output of bituminous coal during the week ended Oct. 17 is estimated by the Bureau of Mines at 11,767,000 net tons, which again exceeded that of any week since early last January. This compares with 11,681,000 tons produced in the preceding week, according to revised figures. Anthracite output in the week ended Oct. 17 totaled 17,000 net tons, an increase of 4,000 tons over the previous week.



*Coal Age* Index of spot prices of bituminous coal on Oct. 26 stood at 178, the corresponding price being $2.15, compared with 176 and $2.13 the week before.

Dumpings at Lake Erie ports during the week ended Oct. 25, according to the Ore & Coal Exchange, were: Cargo, 809,488 net tons; steamship fuel, 41,208 tons—a total of 850,696 net tons, compared with 934,433 tons in the preceding week. Hampton Roads dumpings in the week ended Oct. 22 totaled 437,190 net tons, against 355,202 tons in the previous week.



### Estimates of Production

(Net Tons)

| BITUMINOUS | | 1924 | 1925 |
|---|---|---|---|
| Oct. 3 | | 10,614,000 | 11,008,000 |
| Oct. 10 (*a*) | | 10,904,000 | 11,681,000 |
| Oct. 17 (*b*) | | 10,599,000 | 11,767,000 |
| Daily average | | 1,767,000 | 1,961,000 |
| Cal. yr. to date | (*c*) | 371,144,000 | 394,801,000 |
| Daily av. to date | | 1,514,000 | 1,607,000 |
| ANTHRACITE | | | |
| Oct. 3 | | 1,425,000 | 14,000 |
| Oct. 10 | | 1,737,000 | 13,000 |
| Oct. 17 | | 1,750,000 | 17,000 |
| Cal. yr. to date | (*c*) | 72,283,000 | 61,710,000 |
| COKE | | | |
| Oct. 10 (*a*) | | 127,000 | 203,000 |
| Oct. 17 (*b*) | | 147,000 | 226,000 |
| Cal. yr. to date | (*c*) | 7,793,000 | 7,709,000 |

(*a*) Revised since last report. (*b*) Subject to revision (*c*) Minus two days' production to equalize number of days in the two years.

### Middle West Feels Better

A little snow and a drop of a few degrees in the temperature throughout the North and Northwest brought about an infinitely better feeling in the Midwest coal market last week. The demand for Illinois and Indiana prepared sizes took a spurt and gave most of the operators in those fields a nice volume of business. Some of them have actually cleared their tracks of "no bills" and have a satisfactory number of unfilled orders on their books, a condition which has not existed before this year. There is said to be very little coal in Iowa, as the trade there is buying strictly on a hand to mouth basis. Southern Minnesota is a little better off, as most dealers have reserve stocks. The same is true in South Dakota. Western Illinois and Wisconsin are depending upon current shipments to fill their needs, as practically no retail dealers have reserves.

Led by the smokeless operators of West Virginia, prices on Eastern coal in the Midwest market have advanced. Western sales agents of smokeless producers have not, however, increased their prices as much as they have been raised on such coals in the East. The price level today appears to be about $5.50@$6 for prepared sizes, although an increase can be expected. Smokeless mine-run has not reacted with the prepared sizes and good grades can be had in almost any quantities in Chicago at $2.25@$2.50 f.o.b. mines. High-grade West Virginia high-volatile coals are moving out here priced at $2.50@$3; egg, $2.25@$2.50. Specialty coals from West Virginia and eastern Kentucky are selling at around $4.

The steam coal market appears to have suffered a slight relapse; screenings were produced in such great volume that the market was not readily able to absorb the extra tonnage and prices weakened. There is considerable activity in the steam market, however, and it is expected to recover soon.

Colder weather has had its effect in southern Illinois and coal is moving out. Lump and egg appear to be oversold at most mines. No 1 nut is slow and the smaller sizes are heavy at the shaft mines. Railroad tonnage is just fair. The movement on the railroads is disappointing. Working time is good—four and five days a week as a rule in the Carterville field. The strip mines are working well except when wet weather interferes. Many mines in southern Illinois that have had a hard time on account of water shortage are beginning to get back to normal. There is no change in prices.

In the Duquoin field conditions show improvement; one mine is getting five and six days a week and the others four and five. All sizes except nut and screenings are moving in this field. No railroad tonnage is being shipped except from one mine. Strip properties are doing fairly well but prices are demoralizing. The Mt. Olive field has almost full working time, domestic sizes are moving un-

**Coal Age Index of Spot Prices of Bituminous Coal F.O.B. Mines**

| | 1925 | | | 1924 |
|---|---|---|---|---|
| | Oct. 26 | Oct. 19 | Oct. 12 | Oct. 27 |
| Index .................... | 178 | 176 | 175 | 176 |
| Weighted average price.. | $2.15 | $2.13 | $2.11 | $2.12 |

This diagram shows the relative, not the actual, prices on fourteen coals, representative of nearly 90 per cent of the bituminous output of the United States, weighted first with respect to the proportions each of slack, prepared and run-of-mine normally shipped, and, second, with respect to the tonnage of each normally produced. The average thus obtained was compared with the average for the twelve months ended June, 1914, as 100, after the manner adopted in the report on "Prices of Coal and Coke; 1913-1918," published by the Geological Survey and the War Industries Board.

usually well and steam has shown considerable improvement.

In the Standard district there is an increased demand and working time has shown some improvement, but prices are still about cost. Many mines are still idle and are afraid to resume at the present prices. All mines have some kind of "no bills" on hand every night and steam is not moving well, which is why some mines are idle. There is no change generally in prices.

Colder weather has caused a good demand for domestic coal in St. Louis. All grades, including Carterville, Mt. Olive and Standard, seem to be moving fairly well. All dealers have ample supplies of anthracite to pull them through the winter, but there seems to be no real demand for it. Coke is moving fairly well and smokeless is pretty well used up, but there is no unusual demand for that. Country domestic is good principally on middle grades. There is a feeling that Franklin County and Carterville are too high and the fact that western Kentucky is quoted at about $2 at the mine with a 25c. higher rate—which means $1 per ton less delivered than Franklin County—is encouraging the use of that coal. Country steam is quiet. St. Louis wagonload is unusually good; carload is fairly active but the demand is not equal to the supply. There has been no change in price.

## General Condition Better in Kentucky

Steady cold weather in Kentucky last week resulted in a much better demand for prepared sizes, resulting in better general conditions in the coal market. "No bills" and distress fuel are being absorbed, the fag end of the season finds a good deal of coal being shipped to lake ports, and as a whole business is a trifle better than it has been.

Utility, industrial, railroad and general steam demand is good and screenings are being kept fairly well cleaned up, although prices are a shade lower than they were last week on screenings. Other prices are just about as they have been for the past several days, although block is a little stronger. Railroad consumption has been especially heavy.

The anthracite situation is moving more West Virginia smokeless coal East, enabling eastern Kentucky operators to get business in replacing smokeless. Better operating time is reported in all state fields, with unbilled coal reduced to a minimum.

## Northwest Continues Active

Activity continues in the coal trade at Duluth-Superior. All of the docks operate with full crews on their loading sides. Operators have, however, noted that retailers seem to have stocked heavily. Demand from industrial companies over Minnesota and northern Wisconsin is still good. Foundries have been especially good buyers of steam and gas coal together with hydro-electric power companies which foresee water-power shortage.

Considerable anthracite has been distributed from the docks lately. Stocks of hard coal probably will be fairly well cleaned up by about Feb. 1. However, the docks are planning to reserve certain tonnages for the use of consumers unable to use bituminous coal. A survey of conditions has shown that more orders have been booked for Pocahontas and other smokeless coals than ever before in the history of the trade.

The movement of coal from Lake Erie ports to Duluth-Superior has continued in good volume. Thirty-seven bituminous cargoes have unloaded at the docks during the last week, and eighteen cargoes were reported to be en route. Prices are practically unchanged in both anthracite and bituminous coals. Domestic coke is in more active demand as an anthracite substitute and its price is unchanged at $8.50. Briquets are beginning to move at $9.

The coal market in Milwaukee seems to be irregular. Comparative slowness is reported from the docks, though retailers report a brisk demand. There is a demand for anthracite now that stocks here virtually are exhausted. Notice of a prospective advance in Pocahontas comes from the mines, and retailers will, of course, promptly pass the advance to the consumer, who now is paying $13 for nut when carried to the bins, or $12.25 shoveled, and $13.50 and $12.75 for egg. Lake cargo receipts at Milwaukee up to Oct. 23 total 2,934,934 tons—488,234 tons of anthracite and 2,446,700 tons of bituminous coal. The total for the same period in 1924 was 2,600,748 tons—667,254 tons of anthracite and 1,933,494 tons of bituminous coal. During the month of September Milwaukee received 3,650 tons of hard and 34,361 tons of soft coal by all-rail routes.

## Coal Business Brisk in Kansas

Snappy fall days have been making brisk business for the coal trade in the Southwest. Householders who were not to be persuaded to buy early have been putting in rush orders, and as a result the price of Kansas lump was advanced Oct. 19 by some producers to $4.75. Kansas is profiting most since it is the only state of the Southwestern district where production is stable, but more miners are returning to work in Oklahoma and Arkansas and operators there are finding a ready market for all the coal they can mine. Screenings are inclined to drag, but with the price for the Kansas product reduced to $2.35, some operators quoting $2.25, and some others even less, no heavy surplus has accumulated.

Cold weather during the past ten days has increased the demand for Colorado furnace coal. This has reduced retailers' stocks and, consequently, increased orders. Demand for lump now exceeds production. As the nut sizes are rather slow to move, steam call is brisk. Demand is good for Colorado anthracite.

In Utah the mines are working a little better than half time. Larger sizes of coal are selling best. The grade known as domestic lump is leading, but straight lump is in good demand, too. Slack is being dumped now, and nut is drugging the market. As a result of the nut coal accumulations some mines have had to go on short time. The car situation is not entirely satisfactory. H. F. Fernstrom, president of the Utah-Idaho Coal Dealers' Association, estimates that Salt Lake City coal dealers have about 35,000 tons of coal in their yards at the present moment. This is a little more than last year, but consumers take it slowly. Prices remain firm.

### Smokeless Skyrockets at Cincinnati

Eastern orders, favorable weather and conditions at the seaboard all contributed to throw domestic sizes of smokeless further off balance at Cincinnati last week and the skyrocketing of five or six weeks ago wasn't a patch in comparison. Lump, egg and nut for Eastern delivery wobbled somewhere between $5.50 and $7 a ton. Again egg was in the lead with nut a close competitor and lump also moving along. Inland markets failed to become unduly excited, most of the "regular" dealers being disposed to bide their time rather than force the issue. Declarations of "sold up" were met with orders for future datings. Mine-run and slack strengthened a wee bit, knocking out existing spreads.

Embargoes to the lakes by the Pennsylvania and B. & O. lines because of a jam of cars at Toledo and Sandusky helped tremendously to steady the high-volatile market, which for a couple of weeks showed signs of wobbling. Happily, this coal was sacrificed within a given area and did not force other markets out of plumb. Under the reflection of the low-volatile upturn domestic sizes stiffened up a bit. The "lows" on Hazards, Harlans, Elkhorns, Thackers and high-grade Kanawhas were virtually wiped out. Slack has weakened, however, $1.10 low grades again being "peddled."

Movement still continues at the top notch with 14,493 cars going through the Cincinnati gateways last week, according to the American Railway Association. This was 27 cars more than the week before and 682 more than the corresponding week of last year. Of these 3,323 cars went to the lakes, 184 cars less than in the preceding week, but a record breaker for this time of year.

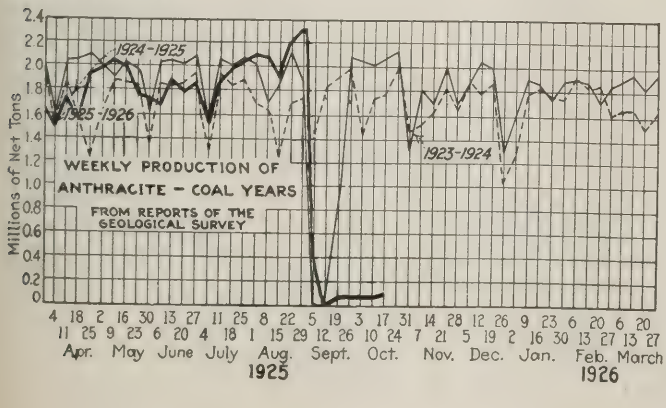
Colder weather has stimulated the domestic demand at Columbus and producers as well as shippers report a better trade with dealers. The bulk of the business is for smokeless, splints and Kentucky block, although there is a fair volume of orders for Hocking and Pomeroy lump. Retail prices are steady with smokeless at $8.75@$9.25; splints, $6.75@$7.25 and Hocking lump around $6. Kentucky grades are selling at about $7.25. Little free coal is on the local market, as the lake trade is taking all the surplus.

Steam business does not share in the activity of domestic sizes. Users are gradually building reserves up to normal but this buying has had little effect on the market. A number of short-term contracts were made recently, in most cases expiring April 1. Some of the larger users are buying on the open market, notably the Ohio Department of Welfare, which consumes about 225,000 tons of nut, pea and slack in the twenty-five state institutions.

Spot prices stiffened all along the line in eastern Ohio last week, due to much colder weather and the stronger demand in general for both steam and domestic fuel. A much better tone prevails all around. Retail yards have been drawing heavily upon stocks to supply the increase in domestic orders and have already begun replacement orders. Smokeless fuels from non-union mines to the south also have stiffened; Pocahontas lump is quoted at $5 f.o.b. mines.

The railroads have increased their commitments during the past week and are now taking a larger percentage of eastern Ohio coal. The volume of late season Lake shipping has kept up well too.

Output in eastern Ohio during week ended Oct. 17 was 287,000 tons, a decrease of 13,000 tons as compared with the preceding week, and about 41 per cent of potential capacity. This was 66,000 tons under the corresponding week a year ago.



### Market Stiffens at Pittsburgh

The Pittsburgh district coal market has been growing stronger daily. Eastern demand has even invaded this district. There is almost no demand for mine-run, either gas or steam. Buyers in search of a particular size of coal freely pay prices asked, egg actually selling above lump.

There is little if any differential on gas coal above steam, because of the demand coming from outside the regular distribution area for coal for domestic consumption. Slack naturally has sold off, with heavier shipments of lump.

At Buffalo bituminous coal has not began to feel the effects of the strike yet. Just now a stir is appearing in all sorts of egg-size bituminous, high-volatile as well as smokeless, but this hurts slack, which is often selling close to $1 and is hard to sell anyhow. When the lakes close, which they will do soon, the situation will be still worse. Prices are fully as weak as they have been at any time since the strike began, so the wise wholesaler tries to sell the coal as house fuel.

### New England Trade Easier

Except on screened sizes of bituminous the market in New England is extremely quiet. Buying has eased off in most directions and neither industries nor utilities are showing much interest in current prices. The trade hardly looks for improvement in November, and even a continuing anthracite strike is not expected to lift bituminous in general from the dullness that is its present characteristic.

Accumulations at Hampton Roads still are the rule. Nearly 300,000 tons of low volatile is understood to be on cars awaiting boats and spot demand is extremely light. Most of what smokeless coal is dumped is being applied on coastwise contracts, there being only occasional sales at the present range of $4.50@$4.75 per gross ton f.o.b. vessel for navy standard Pocahontas and New River. Smokeless slack is being offered on a basis of $1.25 per net ton at the mines, with few takers.

For delivery inland from Boston and Providence prices are easy at $5.85@$6 per gross ton on cars. There is only scattering demand, and most factors are piling up storage from current receipts.

The only active feature of the market is the steady call for prepared sizes. Pocahontas and New River lump and egg are now arriving here, but not as yet in anything approaching large volume. The operators and sales agents are exacting $6 and upward per net ton, and this, added to the high freight rate all-rail, has the effect of slowing up sales, a development that has been brought forcibly to the attention of factors who allowed coal to come forward in advance of sale. Prepared sizes all-rail from central Pennsylvania, however, have been in good request at prices running all the way from $5.50 to $7 per net ton at the mines. The minimum Clearfield rate opens a large territory to these coals, but there is danger that here, too, the shipper will overreach.

For Pennsylvania run of mine all-rail there is no better demand than a month ago.

### Active Demand at New York

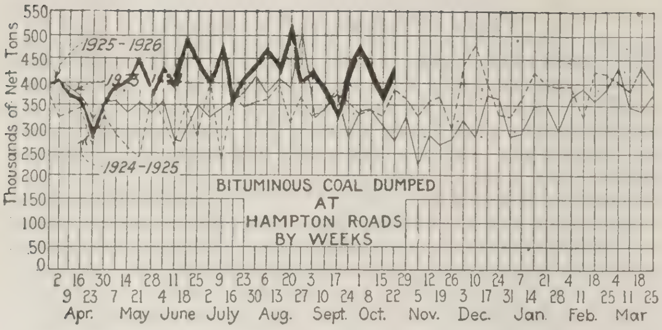
At New York in addition to a heavy run of mine-run coals there is an active demand for screened bituminous coals from central Pennsylvania and the Southern fields. As operators in Pennsylvania are well sold up the trade is turning toward the Pocahontas and New River fields for substitutes to take the place of anthracite.

Reports that the hard coals are nearly all cleaned up and fears that the strike may continue for some weeks has caused considerable anxiety among consumers, who are being advised by state and local authorities to burn substitutes.

Industrial consumers of bituminous coal continues to increase their reserves but the added demand has not yet changed prices from the levels current for the past few weeks.

Broad Top operators are finding a ready market for their prepared coals, which are quoted at $7.50@$9. High-volatile ¾ lump is quoted at $1.60@$2 and low-volatile lump at $4@$5, according to size. Pool 15 is quoted at $1.75.

Quotations by local houses for prepared sizes of Pocahontas and New River coals range around $7 for nut and egg.



Any evidence of better buying in the Philadelphia soft-coal market is confined to grades adapted to domestic purposes. Low-volatile Pennsylvania sized grades are hard to get and prices run from $4 to $5 a ton, with a tendency to rise daily. Pittsburgh seam gas coals in sizes also are in very strong demand, and prices, which were $2.25 a week or two days ago, have moved up to $3.

Since the new freight rate on Pocahontas coals became effective the first sized coals from that field have appeared, and quite a good business has been closed. Prices started at $5 for egg, stove and nut, and in a few days were quickly advanced to $6.

In the mine-run grades there is practically no change, industrial users feeling that they can get all they want at any time.

Except for prepared sizes, which are being used as substitutes for anthracite, the Baltimore bituminous market is again somewhat flat. Prepared sizes are very active, prices being frequently around $5.50 or better the net ton. A downward trend in both demand and prices on the regular runs of both gas and steam coals is due partly to a surplus having piled up. Coke is active and the price headed skyward. The export movement continues light, there having been but three shipments between Oct. 1 and 13.

At Birmingham there is a very active demand for all the better grades of commercial fuel and a large number of the mines in the Cahaba and Warrior fields are operating full time. Inquiry and consumption in the general industrial field have increased and buying in the spot market is showing steady gains. No contracting worth mentioning is being done, though there is a good movement on contracts closed earlier in the year. Most of this coal is for current use, very little tonnage going into reserve. While the cheaper grades of fuel are not as actively sought, mines of this class are getting sufficient business to operate three to five days a week. Quite a few operations in the district are still idle, production being approximately 400,000 net tons weekly.

While there has been a noticeable improvement in the open market for domestic sizes within the last two weeks, sales have not yet reached a volume adequate to meet current production, which is not being moved without effort and some delay.

The market for foundry coke has stiffened in the last week or so with quotations for spot byproduct and beehive going to $5.50 ovens. Inquiry and bookings are good also for domestic nut and egg coke, the entire production being required to meet the demand, the former being quoted $4.25 and the latter $4.50 ovens.

## Hard-Coal Trade Shifting to Substitutes

Contradictory statements as to the amount of anthracite lying in cars on the railroads has created some uncertainty in the minds of New York consumers as to the quantity available and as to the truthfulness of statements that there is a scarcity of fuel. Coal men generally assert that the favorite sizes are pretty well cleaned up, but reports in the daily papers that there are at least 1,000 cars of various sizes on the tracks near Scranton have engendered a feeling that operators are holding back shipments in order to obtain high prices.

Retail dealers with few exceptions are short of all domestic sizes except pea. They are advising customers to take in buckwheat to mix with the larger sizes in their bins. A few boatloads of pea are reported in the harbor with quotations high and few buyers. Independent buckwheat coals are quoted as high as $4 along the line.

Demand for coke is so heavy that manufacturers cannot promise prompt shipments. Quotations have advanced rapidly in the last few weeks and quotations are given subject to change at any time. Quotations for all sizes of byproduct coke range as high as $10 at the ovens, with furnace coke quotations ranging at $7@$8 at the ovens.

Screened bituminous coals are in fair demand as substitutes, but the supply is growing tighter as the hard-coal strike continues.

Some light shipments of pea coal are being received at Philadelphia, but the one big company shipper that has any left in storage estimates that by the end of next week all of its coal will have been sent to market. The retail price is about $12, a few asking $12.50. There is a plentiful supply of buckwheat, but even this size is tightening up. The Reading company last week advanced the price of buckwheat from $2.75 to $3 a ton.

Coke is extremely difficult to get, and the price has moved from $5 a month ago to around $9.50 and $10, and not much is to be had at that.

Little hard coal is left in Baltimore yards for delivery, but the Baltimore public is not at all excited over the situation, largely because of the proximity of soft-coal fields that can supply large quantities of prepared sizes of bituminous. Prices of anthracite, when it can be gotten, are around the levels that have prevailed for some time past, although in a few cases there may be some slight advances recorded in individual sizes. The Baltimore City Council has passed an ordinance introduced through the Baltimore Coal Exchange which will allow local dealers to sell hard coal in units of 2,000 lb. instead of the gross ton of 2,240 lb., as required under a state law.

Lake anthracite shippers at Buffalo say it looks as if there would be no more of it for that branch of the trade this season. About 2,000,000 tons has been shipped and the upper lake districts probably will have to get along without any more. Some of the dealers in near-by towns still have more or less coal, which they laid in while it was to be had. As a rule they are selling it in small amounts at considerable premium. For some reason the Buffalo trade did not buy any and shut off deliveries just as soon as the strike began. Coke is hard to get for less than $13 and prices are steadily advancing. Semi-anthracite producers are trying to get into this trade.

## Advances Still Feature Coke Market

The Connellsville coke market has continued to advance because of buying by Eastern jobbers. The turnover has not been as heavy, but supplies being so well absorbed, lighter buying has just as much effect on prices. There also has been buying by regular industrial consumers both in the Pittsburgh district and toward the west.

By Monday of last leek $8 had been paid, though operators had not obtained so much. By Thursday some operators had obtained $8—even $8.50 in a few cases—and Eastern jobbers had paid up to $8.75 if not $9.

Foundry coke has had no market of its own. Foundries have not taken kindly to advanced quotations and have been holding off, but the asking price advances along with prices realized on 48-hour coke, and enough production is switched from 72-hour to 48-hour to equalize. Furnace coke may be quoted conservatively at $8@$9 and foundry coke at the same range, both for practically spot shipment. There is, of course, no market for extended deliveries. The market is taken entirely out of the iron and steel trade. Furnaces are covered by contract to the end of the year and cannot think of trying to buy for first quarter. Pig-iron consumers, fairly well covered to the end of the year, are simply holding off as to first quarter, preferring to take chances. The Standard Sanitary Manufacturing Co., however, succeeded in covering for first quarter at old prices.

# Foreign Market And Export News

## All-Round Betterment in Tone Appears In British Coal Market

After several weeks of disappointment through fogs and storms, delaying the arrival of the steamers, shipping conditions at the Welsh coal port show a fairly substantial improvement. Standing stocks are enormous, and through failure to effect prompt clearance of wagons, collieries are held up from day to day in various parts of the steam coal area, particularly in Monmouthshire.

The aggregate trade is approximately two-thirds of that of the corresponding period in 1923 and at least 50,000 Welsh miners are unemployed, while many thousands more are engaged only two or three days a week. It seems that orders are coming forward more freely at the reduced prices recently asked for Welsh coal—especially from the Continent.

A much better tone has developed in the Newcastle coal market with the advent of October. Inquiry all round has improved, especially in best steams. Prices are firm and in many instances are now on the top grade. The coal position also is improving, the best classes being well booked, and bunker coals are firmer. Indications point to a steadier trade on the whole for the rest of the year. A fair amount of business has been passing in the contract market.

Production of British coal during the week ended Oct. 10, according to a special cable to *Coal Age*, totaled 4,685,000 gross tons, compared with 4,620,000 tons in the preceding week.

### Belgian Trade Slightly Better

Industrial coals continue to be in small request in the Belgian market, though there has been a slight improvement. Prices are still sagging, having fallen so low that it seems difficult for them to go lower. The situation is made worse by increasing foreign competition.
